Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Use test instruments	1.1. Electron theory, current, voltage and resistance principles are understood. 1.2. Appropriate test instruments are selected, used and maintained to determine current, voltage and resistance. 1.3. Electrical drawings and manufacturers' diagrams are correctly interpreted. 1.4. Series, parallel and series parallel circuits are correctly determined. 1.5. Basic electrical laws are understood and correctly applied. 1.6. AVR test instruments are correctly connected into circuits. 1.7. Meters are read to standard accuracy; and wave form and quantities are determined using general purpose oscilloscope. 1.8. Multipliers and shunts are correctly used and applied.
2. Test battery	2.1. Chemical battery operating principles are understood. 2.2. Electrolyte level is correctly determined and specific gravity readings temperature is corrected. 2.3. Dry charge preparation and recharging of batteries is carried out correctly. 2.4. Discharge testing is performed according to prescribed procedures. 2.5. Replacement batteries are correctly selected for application.
3. Assess and rectify wiring faults	3.1. Wiring faults are correctly isolated. 3.2. Replacement cables/wires are correctly sized. 3.3. Insulation quality is correctly determined. 3.4. Wiring looms are correctly made up for application and securely fixed. 3.5. Wiring terminations are stripped, fitted, prepared and made correctly. 3.6. Corrosion is removed, neutralised and appropriate protective coating is applied. 3.7. Relays, solenoids, contacts and circuits are correctly tested and repaired/replaced.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- selecting and using the correct test instrument for a variety of electrical circuits, to measure the current, voltage and resistance of specified circuit components or sections of circuitry
- applying Ohm's law to determine the required values of voltage, current and resistance for a range of electrical circuits
- determining the resistance of series and parallel circuits
- connecting electrical test instruments into given circuits to determine the required values of current, voltage and resistance
- connecting and adjusting a general purpose oscilloscope to a given electrical circuit to measure wave forms at nominated points in the circuit
- determining the specific gravity of the electrolyte for temperature variations
- preparing dry batteries for charging and recharging
- performing discharge testing of batteries
- testing given electrical circuits and, where appropriate, identifying wiring faults
- using supplier catalogues
- making up wiring looms
- terminating wiring
- removing and/or neutralising corrosion from terminals and connections, and applying appropriate protective coatings
- testing a range of circuit components for correct operation and identifying and repairing faulty circuit components

Required knowledge

Look for evidence that confirms knowledge of:

- the principles of electron theory
- definitions of current, voltage and resistance in terms of electrical circuits

REQUIRED SKILLS AND KNOWLEDGE

- the relationships between current, voltage and resistance for a variety of given electrical circuits
- the instruments and procedures to be used to measure current, voltage and resistance
- the procedures for maintaining electrical test equipment
- the function of a variety of electrical circuits identified from given electrical drawings/diagrams
- the symbols used in electrical drawings/diagrams
- the components of a variety of electrical circuits identified by given electrical drawings/diagrams
- the differences between series and parallel electrical circuits
- the function of a general purpose oscilloscope and procedures for connecting a general purpose oscilloscope into given electrical circuits
- the use of wave forms in the testing of electrical circuits
- the accuracy to which a range of electrical test equipment can be read
- the procedures for using multipliers and shunts in the measurement of electrical circuits
- the operation of a chemical battery
- the function of the electrolyte in batteries
- the procedures for measuring the specific gravity of the electrolyte
- the effect of temperature on the specific gravity of the electrolyte
- the procedures for preparing dry batteries for charging
- the procedures for recharging batteries
- hazards and control measures associated with charging/recharging of batteries and discharge testing, including housekeeping
- the purpose and procedures for discharge testing of batteries
- the specifications applied to batteries
- examples and causes of common faults in electrical wiring
- the test procedures for isolating wiring faults
- the specifications of cables and wires used in given electrical circuits
- the specification of the insulation materials
- the procedures for making up and fixing wiring looms can be given.
- the procedures for stripping, fitting and preparing wiring terminations
- the procedures for soft and hard soldering/crimping of wiring terminations
- the effect of corrosion on the performance of electrical circuits and connections
- the procedures for corrosion removal and/or neutralisation
- coatings available to stop/inhibit corrosion
- the correct operational relays, solenoids and contacts
- common faults and causes in relays, solenoids, contacts and circuits
- the procedures for testing circuit components
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to test and rectify low voltage electrical systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with testing and rectifying low voltage electrical systems or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess starting motor operation	1.1.Magnetism, induced voltage and electromagnetism and electric motor principles are understood. 1.2.Starting motor component functions and multi-pole/winding/shunt wiring arrangements are understood. 1.3.Cranking motor drive mechanism is correctly performance tested. 1.4.Starter locked armature current, voltage and torque are correctly determined.
2. Test and rectify starting motors	2.1.Starting motors are dismantled and assembled according to manufacturers' recommendations. 2.2.Testing is performed to determine shorts to ground, turn shorts, winding continuity, etc. 2.3.Solenoid, relays and over-temperature devices are correctly tested. 2.4.Starter engagement mechanism is tested and adjusted where possible i.e.: pinion clearance. 2.5.Starting system is free of excessive voltage drops. 2.6.Starting and charging circuit connections are correctly made, tightened and insulated. 2.7.Starter locked armature current, voltage and torque are correctly determined.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
Look for evidence that confirms skills in: <ul style="list-style-type: none"> • reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents • planning and sequencing operations • checking task-related information • identifying the construction of electric motors

REQUIRED SKILLS AND KNOWLEDGE

- testing the cranking motor drive mechanism
- using appropriate tools, techniques and equipment to dismantle and assemble given starting motors in accordance with manufacturers' recommendations/procedures
- checking given starting motors for electrical faults
- testing the solenoids, relays and over-temperature devices for given starting motors, for conformance to specification
- checking operation and conformance of the engagement mechanism for given starting motors
- checking the starting system of given starting motors for excessive voltage drops
- checking conformance of all circuit connections to specifications for given starting motors
- testing the repaired/overhauled starting motor to ensure that the locked armature current, voltage and torque conform to specifications

Required knowledge

Look for evidence that confirms knowledge of:

- the concepts of magnetism, electromagnetism and induced voltage
- the principles of operation of electric motors
- the components and functions of common starting motors
- the effect of multi-pole/winding/ shunt wiring arrangements on starting motor performance
- the tests and test procedures that can be used to check the performance of the cranking motor drive mechanism
- the hazards and control measures associated with testing the performance of cranking motor drive mechanisms, including housekeeping
- the concept of 'locked armature' in terms of current, voltage and torque
- the starter locked armature specifications
- the procedures, tools and equipment for determining locked armature current, voltage and torque
- the manufacturers' recommended dismantling/assembling procedures, tools and equipment for given starting motors
- the range of electrical tests that can be applied to starting motors and the purpose of these tests
- the equipment and procedures required to carry out the tests
- the function of solenoids, relays and over-temperature devices
- the procedures for testing solenoids, relays and over-temperature devices for correct operation
- the operational specifications of the solenoids, relays and over-temperature devices
- the procedures for testing and adjusting starter engagement mechanisms
- the specifications of the starter engagement mechanism
- the effect and causes of voltage drops on starting system operation/performance

REQUIRED SKILLS AND KNOWLEDGE

- the procedures for checking starting systems for excessive voltage drops
- the effect of loose, poorly joined and/or inappropriate insulation on starting motor performance/operation
- the specifications of all circuit connections
- safe work practices and procedures

Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess induction/exhaust system operation	1.1. Supercharging, filtering, inter/after cooling principles, terminology and applications are understood. 1.2. Relevant information is obtained and correctly interpreted prior to any testing. 1.3. Checks are undertaken safely and to prescribed procedures. 1.4. Flows, pressures and temperatures are correctly determined and recorded. 1.5. Faults are correctly isolated to component level and appropriate corrective action is determined. 1.6. Test instruments and equipment are used correctly.
2. Rectify faulty components	2.1. Component wear and clearances are correctly determined using manufacturers' recommendations. 2.2. Replacement components are correctly selected using manufacturers' data. 2.3. Components are removed and refitted to engine following prescribed procedures. 2.4. Test and rectification activities are accurately recorded. 2.5. Engine is free of air/exhaust leaks after repair work is carried out.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
Look for evidence that confirms skills in: <ul style="list-style-type: none"> • reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents • planning and sequencing operations • checking task-related information • checking for conformance to specification

REQUIRED SKILLS AND KNOWLEDGE

- identifying a variety of applications of supercharging, filtering inter and after cooling
- checking the induction/exhaust system for correct operation in accordance with standard operating procedures
- determining the flows, pressures and temperatures of the given induction/exhaust system using appropriate techniques and equipment
- isolating faulty component in accordance with standard operating procedures
- using all test instruments and equipment
- visually and dimensionally checking component parts for wear
- using supplier catalogues to select component parts
- removing components and fitting to engines
- recording all test and, where appropriate, repair activities
- checking the induction/exhaust system for leaks
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the principles and terminology of supercharging, filtering, inter and after cooling
- the performance and operational specifications of the induction/exhaust system
- the procedures and safety precautions for testing induction/exhaust systems for correct operation
- the equipment and procedures necessary to test flows, pressures and temperatures associated with induction/exhaust systems
- the procedures for recording flows, pressures and temperatures
- common faults associated with induction/exhaust systems and causes of those faults
- the appropriate action and procedures for correcting common faults in induction/exhaust systems
- the component specifications/tolerances and actions to be taken if the components are outside of specification
- the action to be taken if the components are 'just' within specification
- the measuring instruments to be used to carry out dimensional checks on components
- the procedures and safety precautions for removing/fitting components to engines
- the procedures for recording test and repair activities undertaken on induction/exhaust systems
- the consequences of air/exhaust leaks on the safe operation of the induction/exhaust system and procedures for testing for leaks in induction/exhaust systems
- hazards and control measures associate with maintaining and rectifying induction/exhaust systems, including housekeeping
- safe work practices and procedures

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Dismantle, clean and assess parts	1.1.Characteristics of surface finishes and wear patterns associated with crankshaft and piston assemblies are understood and parts are correctly assessed for reuse or replacement. 1.2.Engine is removed from plant, top-end components are removed and block assembly is dismantled according to manufacturers' recommendations. 1.3.Parts are assessed for abnormal wear or defects. 1.4.Appropriate cleaning solution and procedure is selected. 1.5.Parts are racked or set out according to their original location in the engine. 1.6.Characteristics of surface finishes and wear patterns associated with crankshaft and piston assemblies are understood and parts are correctly assessed for reuse or replacement.
2. Record and interpret measurements	2.1.Measurements are accurately obtained and recorded. 2.2.Readings are correctly interpreted regarding replacement or reuse and appropriate under/oversize of replacement parts is determined.
3. Recondition components	3.1.Ridges, gaps, tapers, ovality and protrusions are identified and necessary corrective action is taken. 3.2.Tools and equipment are correctly used. 3.3.Components are assembled according to manufacturers' specifications. 3.4.Bearing clearances are correctly determined by calculation or direct measurement.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents

- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- removing the engine and top-end components
- removing ridges, gaps, tapers, protrusions and ovality
- dismantling block assembly
- calculating bearing clearances
- checking parts for abnormal wear or defects
- identifying components for reuse or replacement
- cleaning parts using appropriate solutions and procedures
- racking and setting out engine parts according to their original position in readiness for reassembly
- obtaining and recording measurements
- identifying replacement parts required as being under or over size
- using tools and equipment
- assembling engine bottom-end components
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the characteristics of surface finishes and wear patterns as applied to crankshaft and piston assemblies
- the specifications of crankshaft and piston assemblies
- the reasons for identifying the components for reuse or replacement
- the procedures for dismantling the block assembly and removing the engine from the plant
- the procedures for removing the top end from the engine
- the tools, techniques and equipment to be used
- the reasons for selecting the chosen tools, techniques and equipment
- the hazards and control measures associated with the removal of engines/engine components, including housekeeping
- the action to be taken when abnormal wear or defects are observed in the engine components
- the procedures and solution for cleaning engine parts
- the procedures for racking and/or setting out of parts in readiness for reassembly
- the measuring instruments to be used to measure engine components
- the procedures for recording engine measurements
- the concept of under/over size of replacement parts and the reasons for identifying replacement parts as under or over size

REQUIRED SKILLS AND KNOWLEDGE

- the procedures for removing ridges, gaps, tapers, ovality and protrusions
- the tools, techniques and equipment required to correct the above faults
- the procedures for assembling engine bottom ends
- the precautions to be taken when assembling engine bottom ends
- the methods and procedures for determining bearing clearances
- safe work practices and procedures

MEM18034B Perform engine top-end overhaul

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers dismantling, cleaning and assessing parts, recording and interpreting measurements, and reconditioning the cylinder head.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit covers top-end overhaul of all types of engines and work associated with the reconditioning of cylinder heads including determining the causes of failures, replacement of inserts, guides and injector sleeves, grinding of valves and seats, and crack/twist/bend testing etc. It includes both the reconditioning of original parts, crack repairs using non-welding techniques and sizing and fitting of replacement parts.</p> <p>Where diagnostic skills are not required and where straightforward removal and replacement of pre-manufactured bearings is undertaken, Unit MEM18055B (Dismantle, replace and assemble engineering components) should be regarded as sufficient.</p> <p>Band: A</p> <p>Unit Weight: 8</p>
--------------------------------	---

Licensing/Regulatory Information

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Dismantle clean and assess parts	1.1.Characteristics of surface finishes and wear patterns associated with valve operating mechanisms and cylinder head are understood. 1.2.Cylinder head and ancillary components are disassembled according to manufacturers' recommendations. 1.3.Parts are assessed for abnormal wear or defects. 1.4.Appropriate cleaning solution/procedure is selected. 1.5.Parts are correctly cleaned and stored ready for reassembly. 1.6.Parts are racked or set out according to their original location in the engine.
2. Record and interpret measurements	2.1.Measurements are accurately obtained and recorded using appropriate measuring equipment. 2.2.Parts are replaced or reused, and appropriate under/over size of replacement parts is determined.
3. Recondition cylinder head	3.1.Cylinder head is correctly pressure tested for serviceability. 3.2.Spring tensions, valve and guide dimensions and surface flatness are measured and recorded. 3.3.Cylinder head is removed according to manufacturers' specification. 3.4.Grinding and cleaning equipment is correctly used. 3.5.Operational parameters of cylinder head components are understood and applied in determining whether components are reconditioned or replaced. 3.6.Injectors sleeves, sealing washers, plugs, capping etc. are replaced correctly.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

REQUIRED SKILLS AND KNOWLEDGE

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- removing the cylinder head from the engine
- dismantling the cylinder head and ancillary components
- identifying the cylinder head as serviceable or requiring repair/replacement
- pressure testing the cylinder head
- measuring and recording spring tension, valve and guide dimensions and surface flatness
- grounding valves and valve
- cleaning cylinder head and ancillary equipment using appropriate solutions
- identifying cylinder head components for repair or replacement
- replacing cylinder head components
- checking parts for abnormal wear or defects
- identifying components for reuse or replacement
- cleaning parts using appropriate solutions and procedures
- racking and setting out engine parts according to their original position in readiness for reassembly
- obtaining and recording measurements
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the characteristics of surface finishes and wear patterns as applied to valve operating mechanisms and cylinder heads
- the specifications of valve operating mechanisms and cylinder heads
- the procedures, tools, techniques and equipment for dismantling cylinder heads and ancillary equipment
- the hazards and control measures associated with the removal of cylinder heads and ancillary equipment, including housekeeping
- the procedures for storing parts in readiness for reassembly
- the procedures, tools, techniques and equipment for pressure testing cylinder heads
- the cylinder head specifications
- the procedures, tools, techniques and equipment for measuring spring tension, valve and guide dimensions and surface flatness
- the procedures for recording cylinder head and valve mechanism measurements
- the procedures, tools, techniques and equipment for removing the cylinder head from the engine

REQUIRED SKILLS AND KNOWLEDGE

- the procedures, tools, techniques and equipment for grinding valves and valve seats
- the procedures and solutions for cleaning cylinder heads and ancillary equipment
- the operational parameters of cylinder head components
- the procedures, tools, techniques and equipment for reassembling cylinder heads and their components
- the precautions to be taken when reassembling cylinder heads
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to perform engine top-end overhaul. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with performing engine top-end overhaul, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Check and assess braking system	1.1. Friction and heat principles, braking system types, arrangements, components including anti-lock systems, functions, and applications are understood. 1.2. Braking system is assessed for compliance with ADR regulations of appropriate standard. 1.3. Serviceability of friction materials is correctly assessed. 1.4. Braking system control devices are assessed for compliance with specifications. 1.5. Minimum operating dimensions are measured, recorded and corrective action is determined. 1.6. Faults are correctly diagnosed to component level and appropriate corrective action is determined.
2. Rectify and overhaul braking system components	2.1. Characteristics of surface finishes and wear patterns associated with braking components are understood and measurements and part condition are correctly interpreted when determining reuse/replacement. 2.2. Braking system components are removed, disassembled and handled correctly. 2.3. Components are cleaned using appropriate fluid and procedure. 2.4. Friction material to reaction member clearance is adjusted to specification. 2.5. Tooling and equipment are correctly applied. 2.6. Hydraulic/air/vacuum system is free of leaks/restrictions after repair work. 2.7. All levers, linkages and pedal clearances are adjusted to specifications. 2.8. Braking system is recommissioned and tested according to manufacturers' recommendations or appropriate standard/regulation.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- checking the braking system for compliance with ADR regulations
- checking friction materials and identifying as being serviceable or to be replaced
- measuring and recording brake operating dimensions
- identifying variation of brake operating measurement from specification
- checking the operation of the braking system for conformance to specification
- identifying faulty braking system components
- identifying given components for reuse/replacement
- removing, dismantling and handling braking system components
- cleaning braking system components using appropriate solutions
- adjusting brake clearance
- using tools and equipment
- adjusting levers, linkages and pedal clearances
- testing the braking system for conformance with specifications/regulations
- recommissioning the braking system
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the principles of friction and heat as applied to braking systems
- the function of the components of a variety of braking system types and arrangements
- typical applications of different types of braking systems
- the requirements of the relevant Australian Design Rule applying to brakes
- the procedures for checking braking systems for compliance with ADR regulations
- examples of worn and defective friction materials identified from given samples
- the specifications of the braking system
- the procedures, tools, techniques and equipment for measuring brake operating dimensions
- the procedures for recording brake operating dimensions
- the corrective action to be taken when brake operating measurement varies from specification

REQUIRED SKILLS AND KNOWLEDGE

- the corrective action to be taken when faulty braking system components are identified
- the procedures for checking braking system operation
- the characteristics of surface finishes and wear patterns as applied to braking system components
- the specifications of the braking system
- the reasons for identifying the components for reuse or replacement
- the procedures, tools, techniques and equipment for removing and dismantling braking system components
- the precautions to be taken when handling braking systems components
- the reasons for selecting the chosen tools, techniques and equipment
- the procedures and solutions for cleaning braking system components
- the procedure for adjusting brake clearances
- the procedures for checking for hydraulic, air and vacuum system leaks and restrictions
- the procedures for adjusting levers, linkages and pedal clearances
- the procedures for recommissioning the braking system
- the procedures for testing braking systems
- the tests to be carried out on the braking system
- the tools, techniques and equipment required to test the braking system
- the reasons for selecting the chosen tools, techniques and equipment
- hazards and control measures associate with testing and rectifying braking systems, including housekeeping
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess generator/alternator operation	1.1. Magnetism, induced voltage and electromagnetism principles are understood. 1.2. Alternating and direct current generating principles, voltage/current regulation methods, and diode/condenser types and action are understood. 1.3. Charging system performance is checked and variances from system specifications are accurately recorded.
2. Test and rectify generators/alternators	2.1. Generators/alternators are dismantled and assembled correctly. 2.2. Charging faults are determined to component level. 2.3. Testing is performed to determine shorts to ground, turn shorts and winding continuity etc. 2.4. Alternator/generator is tested for normal and maximum output. 2.5. Voltage and/or current regulators and cut-outs and relays are correctly tested and adjusted to specification. 2.6. Condition of power/exciter diodes is correctly determined. 2.7. All faulty components are replaced according to manufacturers' recommendations i.e.: brush gear, bearings, diodes, contacts, relays, etc. 2.8. Charging system is free of excessive voltage drops and connections are correctly soldered, tightened and insulated.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents

REQUIRED SKILLS AND KNOWLEDGE

- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- testing the charging system for correct operation
- recording variations from system specifications
- dismantling and reassembling given generators/alternators
- identifying charging faults in given generator/alternator systems
- conducting short circuit and winding continuity tests
- testing the given alternator/generator output for conformance to specification
- testing given voltage and current regulators, cut-outs and relays for correct operation and conformance to specifications
- determining the condition of given power/exciter diodes
- replacing faulty components
- checking the given generator/alternator charging system for excessive voltage drops
- undertaking calculations and numerical operations within the scope of this unit
- recording and reporting service activities

Required knowledge

Look for evidence that confirms knowledge of:

- the concepts of magnetism, electromagnetism and induced voltage
- the construction of generators
- the principles of operation of generators and alternators
- the methods of generating alternating and direct current for low voltage systems
- the methods of regulating voltage and current generated
- the function of diode and condenser types of regulator
- the tests that can be used to check the performance of the charging system
- the test procedures
- the hazards associated with testing the performance of the charging system, including housekeeping
- the charging system specifications
- the test equipment to be used in checking low voltage charging systems
- the procedures for recording charging system performance/variations from specifications
- the procedures for dismantling and reassembling generators/alternators
- the tools and equipment to be used in dismantling and reassembling generators/alternators
- the safety precautions and work procedures to be followed when working with generators/alternators
- the procedures and test equipment for identifying charging faults
- the procedures and test equipment for testing short circuits and winding continuity

REQUIRED SKILLS AND KNOWLEDGE

- the specifications of generator/alternator output
- the test equipment and procedures to be used to determine alternator/generator output
- the procedures for testing voltage and current regulators, cut-outs and relays
- the methods of adjusting voltage and current regulators, cut-outs and relays
- the operational specifications of voltage and current regulators, cut-outs and relays
- the test equipment to be used to check the operation of voltage and current regulators, cut-outs and relays
- the procedures for testing diodes and the test equipment to be used
- the precautions to be taken when testing diodes
- the components of generators/alternators that can be replaced
- the specifications of the faulty generator/alternator components
- the effect and causes of voltage drops on charging system operation/ performance
- the procedures for checking charging systems for excessive voltage drops
- the effect of loose, poorly soldered and/or inappropriate insulation on charging system operation
- the specifications of all circuit connections
- safe work practices and procedures

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess wheel condition	1.1.Rim/tyre designs, constructions, codes, balancing, fastening principles and terminology are understood. 1.2.Fastening components are correctly assessed for damage and security. 1.3.Abnormal tyre wear is recognised and cause of fault is correctly determined. 1.4.Unsafe tyre and/or wheel condition is recognised and remedial action is determined.
2. Rectify and maintain wheel	2.1.Safety procedures associated with tyre/wheel removal, handling, inflation, assembly and disassembly and fastening are understood and adhered to. 2.2.Wheels/tyres are safely removed and replaced using standard procedures and appropriate tools/equipment. 2.3.Tools and equipment are correctly applied and used. 2.4.Ballasting and/or inflation of tyres is performed safely and to specification. 2.5.Static/dynamic balancing of wheels is performed to specification. 2.6.Rim/tyre/tube faults are rectified to specifications, regulations or codes. 2.7.Rectification activities are accurately recorded. 2.8.Wheel bearings are correctly lubricated to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations

REQUIRED SKILLS AND KNOWLEDGE

- checking task-related information
- checking for conformance to specification
- identifying damaged fastening components
- identifying abnormal tyre wear
- checking wheel fastening components for damage and security
- identifying corrective action to be taken for unsafe tyre and wheel condition
- removing and replacing wheels/tyres using appropriate tools and equipment
- using tools and equipment correctly and appropriately
- undertaking ballasting and/or inflation of tyres
- balancing wheels to specification
- identifying repairable rim, tyre and tube faults
- repairing faults in rims/tyres/tubes to specification
- recording work activities
- lubricating wheel bearings in accordance with specification

Required knowledge

Look for evidence that confirms knowledge of:

- the design and construction of a variety of rims and tyres
- the principles of fastening and balancing of wheels
- the relevant codes and standards
- the procedures for checking wheels for secure fastening
- the reasons for checking fastening components for damage and security
- the causes of abnormal tyre wear
- examples and causes of unsafe tyre and wheel condition
- the procedures for removing, handling, inflating, assembling/disassembling and fastening of tyres and wheels
- the safety precautions to be taken when working with wheels and tyres
- the tools, techniques and equipment required to carry out the above procedures
- the procedures, tools, techniques and equipment for static and dynamic balancing of wheels
- the reasons for selecting the chosen tools, techniques and equipment
- the procedures, tools, techniques and equipment for repairing rim, tyre and tube faults
- examples of unrepairable rim, tyre and tube faults
- the procedures for recording repairs undertaken on rims, tyres and tubes
- the procedures for lubricating wheel bearings
- types of wheel bearing lubricant and their application
- hazards and control measures associate with maintaining and rectifying wheels and tyres, including housekeeping
- safe work practices and procedures

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess track assembly	1.1.Track type undercarriage operating principles and terminology are understood. 1.2.Links, pins, sprockets, idlers, rollers, pads, etc. are assessed for wear/damage/reuse/replacement; and corrective action is determined. 1.3.Track frame alignment is checked and variances from specifications correctly are determined.
2. Rectify and maintain track assemblies	2.1.Safety procedures associated with removal and replacement of track undercarriage components are followed. 2.2.Track tension is correctly set to specification. 2.3.Clearances are adjusted to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- checking track type undercarriage components for wear and damage using appropriate tools
- identifying worn or damaged components for repair or replacement
- checking the track frame for alignment
- identifying variations from alignment specifications
- removing and replacing track undercarriage components
- setting track tension to specification
- adjusting clearances to specification
- undertaking calculations and numerical operations within the scope of this unit
- recording and reporting service activities

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- the operating principles of track type undercarriage
- the procedures, tools, techniques and equipment for checking track type undercarriage components for wear
- the reasons for selecting the chosen tools, techniques and equipment
- the specifications of the track type undercarriage components
- the action to be taken to overcome the wear and/or damage detected
- the procedures, tools, techniques and equipment for aligning track frames
- the procedures for removing and replacing track type undercarriage components
- the precautions to be taken when removing and replacing track type undercarriage components
- the procedures for setting track tension
- the procedures for adjusting clearances
- hazards and control measures associate with testing and rectifying track type undercarriage, including housekeeping
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to diagnose and rectify track type undercarriage. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with diagnosing and rectifying track type undercarriage, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess suspension systems	1.1. Steering geometry, alignment and suspension systems operation and terminology are understood. 1.2. Components are assessed for security, wear and faults and corrective action is determined. 1.3. Spring arrangements, control arms/links, dampening and control devices are tested for correct operation. 1.4. Axle alignment/tracking is assessed and variance from specification is determined. 1.5. Auto/manual levelling devices performance is tested.
2. Maintain suspension systems	2.1. Axles are aligned to specification. 2.2. Ride height is adjusted to specification. 2.3. Suspension system is re-gassed to specification. 2.4. Suspension components are safely removed and replaced according to standard procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking the suspension components for wear, faults and security
- testing spring arrangements, control arms/links and dampening devices for correct operation
- checking axle alignment/tracking for conformance to specification
- identifying variances of axle alignment from specification
- testing automatic/manual levelling devices for correct operation
- aligning axles to specification
- adjusting the ride height to specification
- re-gassing the suspension system to specification

REQUIRED SKILLS AND KNOWLEDGE

- removing and replacing suspension components
- undertaking calculations and numerical operations within the scope of this unit
- recording and reporting service activities

Required knowledge

Look for evidence that confirms knowledge of:

- the operation of suspension systems and the effects of steering geometry and alignment
- the procedures, tools, techniques and equipment for checking suspension system components for wear, faults, security and conformance to specification
- the action to be taken to correct non-conformance to specification
- the procedures for aligning axles
- the axle alignment specifications
- the tools, techniques and equipment required to maintain and repair suspension systems
- the reasons for selecting the chosen tools, techniques and equipment
- the procedures for adjusting ride height
- the ride height specifications
- the procedures to be followed in re-gassing suspension systems
- the precautions to be taken when re-gassing suspension systems
- the procedures for the removal and replacement of suspension systems
- the precautions to be taken when removing/replacing suspension systems
- hazards and control measures associate with maintaining and rectifying suspension systems, including housekeeping
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to maintain suspension systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess steering system operation	1.1.Relevant information is obtained and correctly interpreted prior to any testing. 1.2.Performance tests are undertaken on primary and/or emergency steering systems safely and to prescribed procedures. 1.3.Flows, pressures, alignment angles are correctly determined and recorded. 1.4.Faults are correctly isolated to component level and appropriate corrective action is determined. 1.5.Power assisted steering component functions, wheel/axle alignment principles, terminology and applications are understood. 1.6.Test equipment is used correctly.
2. Repair/replace faulty components	2.1.Component wear and clearances are correctly determined using appropriate test equipment and manufacturers' recommendations. 2.2.Replacement components are correctly selected using manufacturers' data. 2.3.Components are removed and refitted following prescribed procedures. 2.4.Alignment adjustments are made that bring wheel/axles in line with specifications. 2.5.Test and rectification activities are accurately recorded. 2.6.Adjustments are made to primary and/or emergency steering systems that bring system in line with specifications.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other

REQUIRED SKILLS AND KNOWLEDGE

- applicable reference documents
- planning and sequencing operations
 - checking task-related information
 - checking for conformance to specification
 - testing steering system for correct performance
 - recording all test results and measurements
 - using all test equipment correctly and appropriately
 - measuring steering system components using appropriate tools, techniques and equipment
 - removing and refitting steering system components
 - selecting replacement components using manufacturers' data
 - aligning wheels and axles to specification
 - undertaking calculations and numerical operations within the scope of this unit
 - recording test and rectification activities
 - adjusting the steering system in accordance with specifications

Required knowledge

Look for evidence that confirms knowledge of:

- operation of the steering system and its components
- procedures for testing steering system performance and tests to be undertaken
- the tools, techniques and equipment necessary to maintain and rectify steering systems
- the reasons for selecting the chosen tools, techniques and equipment
- the precautions to be taken when testing steering systems
- procedures for recording test results
- identification of faulty components and corrective action to be taken
- the reasons for selecting the chosen corrective action
- the operation of power assisted steering systems
- the effects of wheel/axle alignment on steering system operation
- measuring equipment to be used
- the procedures for checking components for wear and clearance
- the procedures and precautions for removing and refitting steering system components
- the procedures for aligning wheels and axles
- the procedures for recording test and rectification activities
- the procedures for adjusting primary and emergency steering systems
- the effect of adjustments on the steering system specifications
- safe work practices and procedures
- hazard and control measures associated with maintaining and rectifying steering systems, including housekeeping

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess clutch/transmission operation	1.1.Clutch and release mechanism types and principles of operation are understood. 1.2.Power flows, gear types and ratios, torque multiplication, synchronising and shifting principles are understood. 1.3.Relevant information is obtained and correctly interpreted prior to any testing. 1.4.Preliminary checks are undertaken safely and to prescribed procedures. 1.5.Faults are correctly isolated to component level and appropriate corrective action is determined. 1.6.Test equipment is adapted and used correctly. 1.7.Component parts are correctly assessed for reuse or replacement.
2. Repair/replace faulty components	2.1.Component wear and clearances are correctly determined using appropriate test equipment and manufacturers' recommendations. 2.2.Replacement components are correctly selected using manufacturers' data. 2.3.Components are removed and refitted to clutch/transmission assembly following prescribed procedures. 2.4.Adjustments are made correctly using appropriate tooling/equipment and manufacturers' data. 2.5.Test and rectification activities are accurately recorded. 2.6.Clutch/transmission assembly is free of excessive noise and operates to specification after work is carried out.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

REQUIRED SKILLS AND KNOWLEDGE

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- identifying faulty clutch and/or transmission components
- checking task-related information
- checking for conformance to specification
- checking the clutch and transmission for correct operation
- using test equipment correctly
- testing the clutch/transmission components for conformance to specification
- identifying component parts for reuse or replacement
- removing and refitting components to clutch/transmission assemblies
- adjusting clutch and transmission components using appropriate tools, techniques and equipment
- recording test and rectification activities
- identifying replacement components using manufacturers' data
- operating the clutch/transmission assembly free of excessive noise and in conformance to specifications
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the principles of operation of a variety of clutches
- the functions of the components of a variety of clutches
- the principles of operation of manual transmissions
- the concepts of gear ratios, torque multiplication and synchronisation
- the procedures for checking clutches and transmissions for correct operation
- the appropriate action to correct the faulty component(s)
- the test equipment to be used in checking/testing clutches and transmissions for correct operation
- the reasons for selecting the chosen test equipment
- the procedures for testing clutches and transmissions, including any necessary adaptation of test equipment
- the procedures for checking clutch and transmission components for wear and clearance
- the tools, techniques and equipment to be used to determine component wear and clearance
- procedures for removing and refitting clutch and transmission components
- the procedures for adjusting clutch and transmission components

REQUIRED SKILLS AND KNOWLEDGE

- the tools, techniques and equipment to be used to maintain and repair clutch and transmission assemblies
- the effects of the adjustments on clutch and transmission operation
- the procedures for recording test and repair activities
- the clutch/transmission assembly specifications
- hazards and control measures associated with testing and rectifying manual transmissions, including housekeeping
- safe work practices and procedures

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess converter/transmission operation	1.1. Torque converter, simple and compound planetary gearing, and hydraulic control operating principles are understood. 1.2. Relevant information is obtained and is correctly interpreted prior to any testing. 1.3. Preliminary checks are undertaken safely and to prescribed procedures. 1.4. Faults are correctly isolated to component level and appropriate corrective action is determined. 1.5. Test equipment is adapted and used correctly. 1.6. Component parts are correctly assessed for reuse or replacement.
2. Repair/replace faulty components	2.1. Component wear and clearances are correctly determined using appropriate test equipment and manufacturers' recommendations. 2.2. Replacement components are correctly selected using manufacturers' data. 2.3. Components are removed and refitted to converter/transmission assembly following prescribed procedures. 2.4. Adjustments are made correctly using appropriate tooling/equipment and manufacturers' data. 2.5. Test and rectification activities are accurately recorded. 2.6. Converter/transmission assembly is free of excessive noise and operates to specification after repair work is carried out.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other

REQUIRED SKILLS AND KNOWLEDGE

- applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- identifying faulty automatic transmission components
- checking the automatic transmission for correct operation
- using test equipment correctly
- testing the transmission components for conformance to specification
- identifying component parts for reuse or replacement
- removing and refitting components to the automatic transmission assembly
- adjusting automatic transmission components using appropriate tools, techniques and equipment
- recording test and rectification activities
- identifying replacement components using manufacturers' data
- operating the automatic transmission assembly free of excessive noise and in conformance to specifications
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the principles of operation of automatic transmissions
- the function of torque converters, planetary gearing and hydraulic controls in automatic transmissions
- the procedures for checking automatic transmissions for correct operation
- the appropriate action to correct the faulty component(s)
- the test equipment to be used in checking/testing automatic transmissions for correct operation
- the reasons for selecting the chosen test equipment
- the procedures for testing automatic transmissions, including any necessary adaptation of test equipment
- the procedures for checking automatic transmission components for wear and clearance
- the tools, techniques and equipment to be used to determine component wear and clearance
- the reasons for selecting the chosen tools, techniques and equipment
- the procedures for removing and refitting automatic transmission components
- the procedures for adjusting automatic transmission components
- the tools, techniques and equipment to be used to maintain and repair automatic transmission assemblies
- the effects of the adjustments on automatic transmission operation
- the procedures for recording test and rectification activities

REQUIRED SKILLS AND KNOWLEDGE

- the automatic transmission assembly specifications
- hazards and control measures associate with testing and rectifying automatic transmissions, including housekeeping
- safe work practices and procedures

Unit Descriptor

Unit descriptor	This unit covers assessing drive line and final drive operation, and repairing or replacing faulty components.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit covers test and rectification activities associated with wheeled and/or tracked plant/vehicles, drive line and final drive assemblies used in conventional and all wheel drive equipment. Testing and assessment of performance would typically require operation of plant and equipment.</p> <p>Band: A</p> <p>Unit Weight: 4</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess drive line and final drive operation	1.1. Universal and constant velocity joints, conventional/limited slip and locking, differential action and conventional/swing axle operating principles are understood. 1.2. Relevant information is obtained and correctly interpreted prior to any testing. 1.3. Preliminary checks are undertaken safely and to prescribed procedures. 1.4. Faults are correctly isolated to component level and appropriate corrective action is determined. 1.5. Test equipment is adapted and used correctly. 1.6. Component parts are correctly assessed for reuse or replacement.
2. Repair/replace faulty components	2.1. Component wear and clearances are correctly determined using appropriate test equipment and manufacturers' recommendations. 2.2. Replacement components are correctly selected using manufacturers' data. 2.3. Components are removed and refitted to driveline and final drive assemblies following prescribed procedures. 2.4. Adjustments are made correctly using appropriate tooling/equipment and manufacturers' data. 2.5. Test and repair/replacement activities are accurately recorded. 2.6. Drive line and final drive assemblies are free of excessive noise and operate to specification after work is carried out.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions,

REQUIRED SKILLS AND KNOWLEDGE

- specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
 - checking task-related information
 - checking for conformance to specification
 - checking the drive line and final drive for correct operation
 - using test equipment correctly
 - testing the drive line and final drive components for conformance to specification
 - removing and refitting components to drive line and final drive assemblies
 - adjusting drive line and final drive components using appropriate tools, techniques and equipment
 - recording test and work activities
 - operating the drive line and final drive assembly free of excessive noise and in conformance to specifications
 - undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- the principles of operation of drive lines and final drives
- the functions of universal and constant velocity joints, differentials and axles
- the procedures for checking drive lines and final drives for correct operation
- faulty drive line and final drive components
- the appropriate action to correct the faulty component(s)
- the test equipment to be used in checking/testing drive lines and final drives for correct operation
- the procedures for testing drive lines and final drives, including any necessary adaptation of test equipment
- component parts for reuse or replacement.
- the procedures for checking drive line and final drive components for wear and clearance
- the tools, techniques and equipment to be used to determine component wear and clearance
- replacement components using manufacturers' data.
- the procedures for removing and refitting drive line and final drive components
- the procedures for adjusting drive line and final drive components
- the tools, techniques and equipment to be used to maintain and repair drive line and final drive assemblies
- the effects of the adjustments on drive line and final drive operation
- the procedures for recording test and work activities
- the drive line and final drive assembly specifications
- hazards and control measures associate with diagnosing and rectifying drive line

REQUIRED SKILLS AND KNOWLEDGE

and final drives, including housekeeping

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to diagnose and rectify drive line and final drives. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with testing and diagnosing drive line and final drives, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate fault	1.1. Equipment/ <i>component</i> function is determined by reference to circuit diagrams, schematics, manual and/or consultation with technical adviser. 1.2. Where required, equipment is correctly isolated from power supply. 1.3. Where appropriate, built-in fault indicators and error codes are examined and correctly interpreted, and results are recorded to standard operating procedures. 1.4. Equipment/ <i>component</i> is checked and tested using correct and <i>appropriate techniques</i> , procedures, tools and <i>test equipment</i> . 1.5. Check and test results are correctly interpreted and, where required, verified. 1.6. Equipment/ <i>component</i> fault is identified and localised. 1.7. Equipment/ <i>component</i> fault/s are correctly recorded to standard operating procedures.
2. Rectify faults	2.1. Using correct and appropriate techniques, procedures, tools and equipment, equipment/ <i>component</i> /s are repaired, replaced or adjusted to specification or manufacturers' requirements. 2.2. Equipment/ <i>component</i> is checked and tested using correct and appropriate techniques, procedures, tools and equipment for compliance with site or manufacturers' specifications. 2.3. Where appropriate, rectifications report is recorded to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
Look for evidence that confirms skills in: <ul style="list-style-type: none"> • obtaining circuit diagrams, specifications, schematics • isolating electrical equipment/<i>component</i> from the power supply

REQUIRED SKILLS AND KNOWLEDGE

- tagging and checking isolated electrical equipment/component
- locating and reading/recording built-in fault indicators
- checking and testing electrical equipment/component for correct operation
- verifying variations from specifications indicated by initial test results
- identifying and localising faults in electrical equipment/ components
- recording/reporting faults in the electrical equipment/components
- repairing, replacing or adjusting electrical equipment/components to specification
- referencing supplier catalogues
- confirming that the electrical equipment/components have been returned to specification
- recording rectification of the electrical equipment/ components

Required knowledge

Look for evidence that confirms knowledge of:

- operation and characteristics of active and passive components
- basic motor operation of various types
- function of the electrical equipment/component within the circuit
- hazards associated with the electrical equipment/component
- relevant regulatory requirements
- electrical equipment/component isolation procedures
- test equipment to be used to verify isolation of the electrical equipment/circuit
- errors indicated by built-in devices
- the procedures, tools, equipment and techniques to be used to test the operation of the electrical equipment/component
- reasons for selecting the chosen tools, equipment and techniques
- specifications of the electrical equipment/component
- variations between test results and specifications
- procedures for localising faults in electrical equipment/components
- procedures for recording/reporting faults in electrical equipment/components
- techniques/procedures for returning the electrical equipment/components to specification
- adjustments that can be made to electrical equipment/components
- procedures for confirming the electrical equipment/components have been returned to specification
- procedures for recording electrical equipment/component rectifications

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using diagnostic skills to identify correct and faulty operation

REQUIRED SKILLS AND KNOWLEDGE

- interpreting and using circuit diagrams, specifications
- isolating electrical equipment/components from the power supply
- tagging isolated electrical equipment/components
- checking electrical equipment/components for isolation from the power supply
- locating and reading/recording built-in fault indicators
- obtaining error code interpretation documents
- checking and testing electrical equipment/components for correct operation
- verifying variations from specifications indicated by initial test results
- identifying and localising faults in electrical equipment/ components
- recording/reporting faults in electrical equipment/components
- repairing, replacing or adjusting electrical equipment/components to specification
- referencing supplier catalogues
- using test instruments to confirm that electrical equipment/components are operating to specification
- recording rectification of the electrical equipment/ components

Required knowledge

Look for evidence that confirms knowledge of:

- function of the electrical equipment/component within the circuit
- hazards associated with the electrical equipment/component
- relevant regulatory requirements
- electrical equipment/component isolation procedures
- test equipment to be used to verify isolation of the electrical equipment/circuit

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Access and interpret fault codes	1.1.Applicable control unit is located and identified. 1.2.Fault codes are accessed using vehicle indicators, meters and diagnostic tooling. 1.3.Fault codes are interpreted. 1.4.Fault codes are cleared from memory according to procedures. 1.5.Diagnostic and maintenance procedures are performed using applicable techniques and precautions to safeguard electronic components and systems.
2. Locate and rectify faults using fault codes and manufactures fault finding and rectification procedures	2.1.Fault is traced from fault codes using applicable troubleshooting procedures. 2.2.Faults are rectified to required specification.
3. Locate and test input components	3.1.Input components are located and identified. 3.2.Input components are electrically tested.
4. Locate and test output components	4.1.Output components are located and identified. 4.2.Output components electrically tested.
5. Remove/replace and adjust sensors and actuators	5.1.Component part is removed correctly. 5.2.Correct replacement part is identified. 5.3.Component part replaced correctly. 5.4.Adjustments are made in relation to mechanical clearances and measured electrical and resistance values.
6. Change operating parameters	6.1.Appropriate specifications are sourced from plant/equipment identification and applicable manuals and specifications. 6.2.Appropriate tooling (software/hardware) is selected. 6.3.Plant/equipment identification is used to obtain security codes. 6.4.Data is downloaded. 6.5.Data is entered for new specifications. 6.6.Successful data entry is verified.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying the control unit
- using fault codes correctly to access fault codes with indicators, meters or diagnostic tooling
- interpreting fault codes and specifications correctly from applicable manuals
- clearing fault codes from memory and verifying using applicable procedures and manuals
- identifying and applying procedures to safeguard electronic components and systems when diagnosing and maintaining typical mobile plant electronic circuits
- locating and identifying various types of input and output components
- following manufactures' procedures to test output components
- identifying, removing, replacing component parts
- making adjustments in relation to mechanical clearances and measured electrical and resistance values
- selecting tooling (software/hardware) according to manufactures' manual
- obtaining security codes using correct protocol from manufacturer, plant/equipment identification and appropriate identification
- using computer and relevant computer applications including downloading and entering data for new specifications as per manufacturers' procedures

Required knowledge

Look for evidence that confirms knowledge of:

- applicable fault codes and their meanings
- procedures to clear fault codes and verify clearance
- sources of potential damage to typical mobile plant electronic systems when performing maintenance and diagnostic work
- techniques and procedures to safeguard against damage
- correct troubleshooting procedures
- techniques/procedures used to remove and replace faulty components
- various types of input components
- operation and principles of transducers used in control systems
- relevant testing procedures
- component types, functions and locations
- operation and principles of actuators used in control system
- concepts of EPROMs and microprocessors

MEM18048B Fault find and repair/rectify basic electrical circuits

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers locating and repairing and rectifying faults in non-interconnected electrical circuits.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to working on basic circuit which is defined as a single circuit with a single output. A single circuit may be controlled by one or more devices and the output may control one or more devices.</p> <p>Band: A</p> <p>Unit Weight: 12</p>
--------------------------------	---

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM09002B	Interpret technical drawing
	MEM10002B	Terminate and connect electrical wiring
	MEM10003B	Install and test electrical wiring and circuits (up to 1000 volts a.c./1500 volts a.c.)

Prerequisite units	
	MEM12002B Perform electrical/electronic measurement
	MEM12023A Perform engineering measurements
	MEM18001C Use hand tools
	MEM18002B Use power tools/hand held operations
	MEM18049C Disconnect/reconnect fixed wired equipment up to 1000 volts a.c./1500 volts d.c.

Employability Skills Information

Employability skills	This unit contains employability skills.
----------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate fault	1.1.Circuit function and characteristics are determined and understood by reference to circuit diagrams, specifications, schematics and/or consultation with technical adviser. 1.2.Where appropriate, built-in fault indicators and error codes are examined and correctly interpreted, and results are recorded to standard operational procedures. 1.3.Where appropriate, circuit is correctly isolated from power supply. 1.4.Faults are verified or localised using correct and appropriate techniques, procedures, tools and test equipment. 1.5.Faults are recorded to standard operating procedures.
2. Repair/rectify fault(s)	2.1.Using correct and appropriate techniques, procedures, tools and equipment, circuit/s is repaired, replaced or adjusted to specifications or manufacturers' requirements. 2.2.Circuit/s is checked and tested using correct and appropriate techniques, procedures, tools and equipment for compliance with site or manufacturers' specifications. 2.3.Where appropriate, repair/rectification report is recorded to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
Look for evidence that confirms skills in: <ul style="list-style-type: none"> • using diagnostic skills to identify correct and faulty operation • interpreting and using circuit diagrams, specifications • locating reading/recording built-in fault indicators • obtaining error code interpretation documents

REQUIRED SKILLS AND KNOWLEDGE

- isolating electrical circuits from the power supply
- tagging isolated circuits
- verifying circuit isolation
- confirming/localising circuit faults using appropriate test equipment, work techniques and tools
- recording/reporting faults in electrical circuits
- repairing/adjusting electric circuits
- confirming circuit/s against specification
- recording rectification of the circuit(s)

Required knowledge

Look for evidence that confirms knowledge of:

- circuit characteristics
- hazards associated with the electrical circuit(s)
- relevant regulatory requirements
- errors indicated by built-in devices
- circuit isolation procedures
- common electrical test instruments and their application
- common techniques for testing electrical circuits
- recording/reporting requirements for electrical circuit faults
- appropriate techniques/procedures for returning the circuit/s to specification
- site/manufacturers' circuit specifications
- requirements for recording circuit rectifications

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to fault find and repair/rectify basic electrical circuits. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with fault finding and repair/rectify of basic electrical circuits, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Circuit

A basic circuit is defined as a single circuit with a single output. A single circuit may be controlled by one or more devices and the output may control one or more devices

Appropriate techniques

Testing for voltage, current, frequency, polarity, phase, circuit continuity, insulation resistance, earth continuity etc.

Test equipment

Continuity testers, ammeters, voltmeters, multimeters, tong testers, wattmeters, cathode ray oscilloscopes, etc.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Disconnect equipment</p>	<p>1.1. Electrical characteristics of equipment and circuit are determined by reference to circuit drawings, schematics, reference manuals, equipment specifications, identification plate and/or consultation with technical adviser.</p> <p>1.2. Where appropriate, equipment characteristics are determined and recorded to standard operating procedures (rotation etc.).</p> <p>1.3. Point/s of isolation are identified using correct and appropriate procedure.</p> <p>1.4. Equipment is isolated using correct and appropriate techniques and procedures.</p> <p>1.5. All lock-off equipment and signage requirements are used correctly and appropriately.</p> <p>1.6. Electrical isolation is proven using correct and appropriate techniques, procedures and test equipment.</p> <p>1.7. Conductor layout is noted, recorded and labelled to standard operating procedure.</p> <p>1.8. Conductors are disconnected using correct and appropriate techniques, procedures, tools and equipment.</p> <p>1.9. Disconnected cables/connections are terminated and made safe to standard operating procedures.</p>
<p>2. Connect equipment</p>	<p>2.1. Characteristics of the equipment to be connected are identified and connection requirements are determined.</p> <p>2.2. Circuit is checked for safe isolation using correct and appropriate techniques, procedures and test equipment.</p> <p>2.3. Connections are checked and conductors are prepared for termination using correct and appropriate tools and procedures.</p> <p>2.4. Conductors are connected to equipment to specifications using correct and appropriate techniques, tools and equipment.</p> <p>2.5. All cables/wires/conduit are fastened/sealed to specifications using correct and appropriate techniques, tools and equipment.</p> <p>2.6. All lock-off equipment and signage are removed using standard operating procedures.</p>

ELEMENT	PERFORMANCE CRITERIA
	2.7. Equipment and circuit are checked and tested for compliance with specifications using correct and appropriate techniques, procedures, tools and equipment.
3. Perform emergency first aid	3.1. Situation is assessed to identify points of danger to the injured person and potential rescuer. 3.2. Rescue/recovery of injured person or assistance to injured person is undertaken in accordance with recognised standards/procedures. Contact is made with the appropriate medical and rescue authorities. 3.3. Details of first aid given are recorded.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- determining and recording equipment characteristics and isolation points from relevant circuit diagrams, specifications, schematics of fixed wired equipment
- isolating fixed wired equipment
- using lock-off equipment and tags/signs
- proving electrical isolation
- labelling conductors and recording their layout
- disconnecting conductors
- making safe disconnected cables/connections
- checking circuits for safe isolation prior to reconnecting
- checking connections and preparing conductors for termination
- checking continuity of the protective earth conductor to determine whether it is sufficiently low
- testing the resistance between the protective earth conductor and the neutral conductor to determine whether it is sufficiently low - not greater than 2 Ohms
- testing the insulation resistance of active conductors to confirm that it is greater than 1 Megohm
- connecting conductors to equipment
- fastening/sealing cables/wires/conduits to specifications
- removing lock-off equipment and signage

REQUIRED SKILLS AND KNOWLEDGE

- checking and testing equipment and circuits for conformance to specifications
- applying procedures for movement/treatment of injured, including:
 - safe rescue of victim from a live situation
 - clearing of airways
 - CPR (cardio-pulmonary resuscitation)
 - care of spinal injuries
 - treatment of cuts/lesions etc.
 - treatment of burns/scalds
 - treatment of shock
- using language and literacy skills to meet recording and reporting requirements related to this unit

Required knowledge

Look for evidence that confirms knowledge of:

- basic knowledge of electrical theory for the operation of the circuit/equipment
- hazards associated with the circuits and the equipment
- relevant regulatory requirements
- procedures for determining equipment characteristics
- procedures for recording equipment characteristics
- tools, techniques and equipment required to determine equipment characteristics
- point(s) of isolation for the fixed wired equipment
- reasons for selecting the chosen isolation point(s)
- safe isolation and proving dead
- the range of isolation procedures for the fixed wired equipment
- lock-off equipment and signs to be used
- reasons for using and procedures for lock-off equipment and signage
- tools, techniques and equipment to be used to prove electrical isolation
- procedures for proving and removing electrical isolation
- procedures for labelling conductors and recording conductor layout
- tools, techniques and equipment to be used to disconnect conductors
- procedures for disconnecting conductors
- procedures for terminating disconnected cables/connections
- characteristics of the circuit and the equipment
- tools, techniques and equipment to be used to terminate conductors and check connections
- procedures for terminating conductors and checking connections
- specifications for the connections to be made
- tools, techniques and equipment to be used to connect the conductors to the equipment
- procedures for connecting conductors to equipment

REQUIRED SKILLS AND KNOWLEDGE

- tools, techniques and equipment to be used to fasten and seal the cables, wires and conduits
- procedures for fastening and sealing cables, wires and conduits
- operational specifications of the fixed wired equipment
- tools, techniques and equipment to be used to check and test the compliance of the equipment with specifications
- procedures for checking the operation of the equipment and circuits
- potential dangers
- recognised procedures for the movement and treatment of the injured person
- appropriate local medical and rescue services
- procedures for recording first aid

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to disconnect/reconnect fixed wired equipment up to 1000 volts a.c./1500 volts d.c. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Equipment	As defined in the licensing requirements
Isolation refers to	Safe disconnection of all electrical power to equipment or equipment supply circuits via switching, circuit breakers or fuses etc. On circuits/equipment using up to 1000 volts a.c. or 1500 volts d.c. single or multi-phase supply
Test equipment	Voltmeters, multimeters, tong testers and a range of hand tools such as pliers, screwdrivers, sockets and spanners
Connect equipment	Refers to reconnection of existing equipment or the replacement on a 'like for like' basis with no alteration to existing fixed wiring

	2.6.All lock-off equipment and signage is removed using standard operating procedures. 2.7.Equipment and circuit is checked and tested for compliance to specifications using correct and appropriate techniques, procedures, tools and equipment.
3. Perform emergency first aid	3.1.Situation is assessed to identify points of danger to the injured person and potential rescuer. 3.2.Rescue/recovery of injured person or assistance to injured person is undertaken in accordance with recognised standards/procedures and contact is made with appropriate medical and rescue authorities. 3.3.Details of first aid given are recorded.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- determining and recording equipment characteristics from relevant circuit diagrams, specifications, schematics
- correctly identifying the point(s) of isolation of fixed wired equipment
- proving electrical isolation
- isolating fixed wired equipment
- applying earths and lock-off equipment and signs
- labelling conductors and recording their layout
- disconnecting conductors
- terminating disconnected cables/connections
- checking circuits for safe isolation
- checking connections and preparing conductors for termination
- checking continuity of the protective earth conductor to determine whether it is sufficiently low
- testing the resistance between the protective earth conductor and the neutral conductor to determine whether it is sufficiently low - not greater than 2 Ohms
- testing the insulation resistance of active conductors to confirm that it is greater than 1 Megohm

REQUIRED SKILLS AND KNOWLEDGE

- connecting conductors to equipment
- fastening/sealing cables/wires/conduits to specifications
- removing earths and lock-off equipment and signage
- checking and testing equipment and circuits for conformance to specifications
- applying procedures for movement/treatment of injured, including:
 - HV (high voltage) rescue
 - clearing of airways
 - CPR (cardio-pulmonary resuscitation)
 - care of spinal injuries
 - treatment of cuts/lesions etc.
 - treatment of burns/scalds
 - treatment of shock
- identifying possible risks associated with this work
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures
- following oral instructions

Required knowledge

Look for evidence that confirms knowledge of:

- any applicable industry standards, national/Australian standards, NOHSC guides, State/Territory regulatory codes of practice/standards
- use and application of personal protective equipment for disconnecting/reconnecting fixed wired equipment over 1000 volts a.c./1500 volts d.c.
- safe work practices and procedures
- characteristics of the circuit and the equipment
- hazards associated with the circuits and the equipment
- relevant regulatory requirements
- point(s) of isolation for the fixed wired equipment and reasons for selecting the particular isolation point(s)
- reasons for using earthing, lock-off equipment and signs
- clearances from live parts
- safe isolation
- specifications for the connections to be made
- operational specifications of the fixed wired equipment
- potential dangers of the work covered in this unit
- recognised procedures for the movement and treatment of the injured person
- appropriate local medical and rescue services
- procedures for incident reporting
- procedures, techniques, tools and equipment to be used for:

REQUIRED SKILLS AND KNOWLEDGE

- determining and recording equipment characteristics
- isolating the fixed wired equipment
- proving electrical isolation
- labelling conductors and recording conductor layout
- disconnecting conductors
- terminating disconnected cables/connections
- checking circuits for safe isolation
- terminating conductors and checking connections
- connecting the conductors to the equipment
- fastening and seal the cables, wires and conduits
- removing lock-off equipment and signage
- checking the operation of the equipment and circuits
- checking and testing the compliance of the equipment with specifications

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate fault	<p>1.1.Circuit/system function and characteristics are determined by reference to circuit diagrams, specifications, schematics and/or consultation with technical adviser.</p> <p>1.2.Where appropriate, built-in fault indicators and error codes are examined and correctly interpreted, and results are recorded to standard operational procedures.</p> <p>1.3.Where appropriate, circuit(s) are correctly isolated from power supply.</p> <p>1.4.Faults are verified or localised using correct and appropriate techniques, procedures, tools and test equipment.</p> <p>1.5.Faults are recorded to standard operating procedures.</p>
2. Repair/rectify fault(s)	<p>2.1.Circuit/system is repaired, replaced or adjusted to specifications or manufacturers' requirements using correct and appropriate techniques, procedures, tools and equipment.</p> <p>2.2.Circuit/system is checked and tested using correct and appropriate techniques, procedures, tools and equipment for compliance with site or manufacturers' specifications.</p> <p>2.3.Where appropriate, repair/rectification report is recorded to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
<p>Look for evidence that confirms skills in:</p> <ul style="list-style-type: none"> • using diagnostic skills to identify and correct faulty operation • managing multiple processes • interpreting and using relevant circuit diagrams, specifications, schematics • locating reading/recording built-in fault indicators

REQUIRED SKILLS AND KNOWLEDGE

- interpreting error code documents
- isolating electrical circuits from the power supply
- tagging isolated circuits
- verifying circuit isolation
- confirming/localising circuit faults using appropriate test equipment, work techniques and tools
- recording/reporting faults in electrical circuits
- repairing/adjusting electric circuits
- confirming circuit/s against specification
- recording rectification of the circuit(s)

Required knowledge

Look for evidence that confirms knowledge of:

- circuit characteristics
- hazards associated with the electrical circuit(s)
- relevant regulatory requirements
- errors indicated by built-in devices
- circuit isolation procedures
- common electrical test instruments and their application
- common techniques for testing electrical circuits
- recording/reporting requirements for electrical circuit faults
- appropriate techniques/procedures for returning the circuit/s to specification
- site/manufacturers' circuit specifications
- requirements for recording circuit rectifications
- any applicable industry standards, national/Australian standards, NOHSC guides, State/Territory regulatory codes of practice/standards
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to fault find and repair/rectify complex electrical circuits. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with fault finding and repairing/rectifying complex electrical circuits, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Circuit

A complex circuit is defined as interdependent circuits

Appropriate techniques

Testing for voltage, current, frequency, polarity, phase, phase rotation, circuit continuity, insulation resistance, earth continuity etc.

Test equipment

Continuity testers, ammeters, voltmeters, multimeters, tong testers, wattmeters, cathode ray oscilloscopes, etc.

Unit Sector(s)

MEM18052B Maintain fluid power systems for mobile plant

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers testing, fault finding and rectifying basic fluid power systems used in the earthmoving, agricultural and transport industries.
------------------------	--

Application of the Unit

Application of the unit	<p>The general servicing of systems is also covered by this unit and includes fluid replacement, filtration requirements and oil sampling.</p> <p>This competency does not cover skills required in the design or modification of systems, component re-manufacture or the diagnosis, maintenance and repair of control systems (solenoid and electro proportional systems).</p> <p>If these skills are required, then Units MEM18023B (Modify fluid power system operation), MEM18047B (Diagnose and maintain electronic controlling systems on mobile plant) and MEM18053B (Modify fluid power control systems) should be selected as appropriate.</p> <p>Where Unit MEM18020B (Maintain hydraulic system components) and/or MEM18021B (Maintain hydraulic systems) are selected, this unit should not be selected.</p> <p>Band: A</p> <p>Unit Weight: 4</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Secure system from potentially hazardous situations	1.1.Sources of stored energy are identified. 1.2.Mobile plant is assessed for potentially hazardous situations and conditions. 1.3.Accumulators and position actuators are bled down to remove stored energy as per manufacturers' instructions.
2. Check hydraulic system components	2.1.System <i>components</i> are identified correctly, using appropriate circuit diagrams or manufacturers' instruction. 2.2.Faults are traced and localised with reference to manufacturer troubleshooting procedures and flow charts. 2.3.The operational function of components is inspected and tested in accordance with standard operating procedures.
3. Replace faulty system components	3.1.Faulty components are correctly removed from system using appropriate tools, techniques and procedures. 3.2.Replacement components are sourced where appropriate from manufacturer/supplier. 3.3.Hoses, tubes and pipework are prepared and assembled using appropriate tools, techniques and procedures. 3.4.Replacement components and conductors are correctly assembled and refitted to system. 3.5.System is tested and adjusted for correct operation according to standard operating procedures.
4. Dismantle, inspect and rectify linear actuators	4.1.Hydraulic cylinders and rams are dismantled using appropriate tools, techniques and procedures. 4.2.Component parts are evaluated for condition. 4.3.Seals and bearings are fitted as per manufacturer specifications. 4.4.Cylinders/rams are reassembled and fitted as per manufacturer instructions. 4.5.Assembly is tested by use of machine circuit or equivalent.
5. Service hydraulic systems	5.1.Hydraulic systems are serviced according to manufacturers' schedules and instructions.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- checking for conformance to specification
- identifying sources of stored energy on mobile plant
- identifying hazardous situations/conditions and applying appropriate safety measures
- bleeding accumulators down and positioning actuators correctly
- tracing faulty components and localising using fluid power principles, procedures and safety requirements
- using equipment for testing hydraulic system component
- inspecting and testing components including hoses, pipes, actuators, pumps, valves, cylinders and rams according to procedure and using fluid power
- removing components from system
- identifying replacement pipes and hoses using catalogues or electronic media
- obtaining replacement parts using appropriate procedures
- selecting appropriate conductors and fittings from manufacturer catalogues and charts
- cutting conductors to length using appropriate tooling/machine
- assembling conductors using correct techniques
- replacing component parts correctly in system using appropriate tools and techniques
- testing and adjusting replacement components for correct operation and conformance to specifications
- conducting conductor assemblies using machine circuits
- dismantling linear actuators without damage, using correct tools, techniques/procedures and safety measures
- locating and using specifications to identify performance/condition of cylinders and rams
- identifying wear and damage to cylinders and rams
- fitting seals and bearings

REQUIRED SKILLS AND KNOWLEDGE

- reassembling cylinder/ram in correct sequence as per manufacturer instruction
- refitting assembly correctly to machine
- testing refitted assemblies and verifying repairs on machine circuit and/or test rig
- carrying out general service procedures correctly
- undertaking calculations and numerical operations within the scope of this unit
- recording/reporting service activities

Required knowledge

Look for evidence that confirms knowledge of:

- different sources of stored energy and their applications
- hazards and control measures associated with maintenance and rectification of fluid power systems, including housekeeping
- the reasons for bleeding accumulators and actuators and the hazards associated with working on pressurised systems
- the full range of hydraulic system components in a mobile plant application
- information on circuit diagram or manufacturer instructions
- the characteristics and operational function of each system component
- methods and techniques for tracing and localising faults
- the procedures and equipment for inspecting and testing hydraulic system components
- problems relating to faulty hydraulic system components/operation
- the specifications of each hydraulic system component
- the reasons for hydraulic components not operating in accordance with specifications
- all safety procedures and precautions
- common faults in hydraulic components
- removal methods for various components
- information in catalogues or electronic media
- procedures to obtain replacement parts
- typical conductor types and fittings their applications
- methods for cutting/assembling hoses/tubes/pipework
- tools and techniques for fitting replacement components and conductors
- the correct operation of hydraulic components and conductors
- the procedures for checking and adjusting the system
- the tools, techniques and procedures used for dismantling
- safety measures for dismantling linear actuators
- the methods of inspection and measurement
- guides and specifications for reusable parts
- the correct procedures for fitting bearings and seals
- the sequence and procedure for reassembly of cylinder/ram

REQUIRED SKILLS AND KNOWLEDGE

- assembly and fitting instructions
- the procedures for refitting rams
- the procedures for testing and verifying repairs using machine circuits and/or test rigs
- necessary remedial action
- manufacturer scheduled service timeframes and service items
- service procedures
- safe work practices and procedures

Evidence Guide

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Check

Pressure and flow testing, cycle times, basic interrogation of diagnostic system and basic electronic servicing

Components

Hoses, pipes, actuators, pumps, valves, cylinders and rams

Service of hydraulic systems

Change out of hydraulic components such as pumps, valves and actuators and the associated remedial actions required such as system flushing and purging and setting of component parameters

Rectify

May include the assembly and fitting of hydraulic hoses, tubing and pipework. Resealing and repairs to cylinders and rams.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Check/test control software program	<p>1.1. Program steps are checked against manufacturers' and site specifications using schematics, circuit and ladder diagrams.</p> <p>1.2. Deviations are determined and recorded.</p>
2. Correct or modify control system software/program	<p>2.1. Program deviations are corrected and aligned to specification requirements using standard operating procedures.</p> <p>2.2. <i>Modifications</i> to program are undertaken to specification requirements using standard operating procedures.</p> <p>2.3. Modification is recorded to standard operating procedures.</p> <p>2.4. Modified program is backed up to standard operating procedures.</p>
3. Check/test control system inputs/outputs	<p>3.1. Input/output signals are checked and assessed against operational specifications using correct and appropriate techniques, tools and equipment.</p> <p>3.2. Faulty signals are identified, repaired and recorded/reported to appropriate personnel.</p>
4. Repair faulty control system input/output	<p>4.1. Faulty signal source is repaired and/or replaced.</p> <p>4.2. Repaired/replaced signal source is tested for correct operation in system and commissioned in conformance to operational specifications.</p>
5. Prepare service report	<p>5.1. Service report is prepared and completed following standard operating procedure.</p> <p>5.2. Recommendations for improvement and repeat downtime avoidance analysis are included.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions,

REQUIRED SKILLS AND KNOWLEDGE

- specifications, standard operating procedures, charts, lists, drawings, circuit and ladder diagrams and other applicable documents
- planning and sequencing operations
 - checking and clarifying task-related information
 - identifying, recording and correcting deviations of control software program from specification
 - modifying control system software/program and recording modifications
 - backing up the modified control system program
 - checking the input and output signals for conformance to specification using appropriate tools, equipment and techniques in accordance with standard operating procedures
 - identifying, recording and correcting faulty signals
 - marking the source of the faulty signal for repair or replacement
 - obtaining and using supplier catalogues
 - testing repaired/replaced signal source for correct operation in accordance with specifications and standard operating procedures
 - commissioning the repaired/replaced signal source
 - documenting all required service details

Required knowledge

Look for evidence that confirms knowledge of:

- the operational specifications of the control system
- the program steps and their function
- the procedures for recording deviations of the control software program from specification
- the procedures for correcting deviations of the control system software from specification
- the modifications to be made to the control system software and reasons for modifying the control system software
- the procedures for recording control system software modifications
- the procedures for backing up modifications to control system programs
- the tools, equipment and techniques to be used to check input and output signals for conformance to specification
- the procedures for recording/reporting faulty input/output signals
- the procedures for marking items for repair or replacement
- the tools, equipment and techniques necessary to repair the signal source
- the disassembly/assembly procedures to be followed when repairing signal sources
- the specifications of the signal source
- the procedures for testing signal sources
- the procedures for commissioning signal sources into operation
- the procedures for reporting service undertaken on control systems

REQUIRED SKILLS AND KNOWLEDGE

- any trends and probable causes, evident in the data collected and collated
- reasons for recommended improvements
- safe work practices and procedures
- hazards and controls associated with modifying fluid power controls, including housekeeping

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Test instrumentation systems and equipment	<p>1.1. Work/test requirements are identified and defined to standard operating procedures.</p> <p>1.2. Correct test application principles are selected after inspection of instrumentation systems, equipment/components.</p> <p>1.3. Appropriate test equipment is selected in accordance with defined requirements.</p> <p>1.4. Device isolation methods/requirements are observed and localised.</p> <p>1.5. Appropriate test procedures and application principles are applied in assessing operation of instrumentation systems, equipment/components.</p> <p>1.6. Normal operating characteristics of instrumentation systems, equipment/components are applied to the level necessary to identify and localise faults.</p> <p>1.7. Characteristics/operational function assessment procedures are applied according to safety and regulatory/site specifications.</p> <p>1.8. Characteristics and operational function is checked and verified.</p>
2. Apply data collection techniques and localise fault conditions	<p>2.1. Drawings/diagrams and operational specifications are utilised in identifying and localising fault conditions.</p> <p>2.2. Where appropriate, built-in fault indicators, error codes are examined and correctly interpreted and results are recorded to standard operating procedures.</p> <p>2.3. Fault condition is localised to major component level using appropriate test equipment principles and procedures.</p>
3. Analyse and report test results	<p>3.1. Test results are analysed/verified against operational specifications and localised faults are confirmed.</p> <p>3.2. Potential and real faults are reported using standard operating procedures.</p> <p>3.3. Faulty conditions are evaluated and corrective action is planned.</p> <p>3.4. Action plan is recorded and documented according to standard operating procedures.</p>
4. Calibrate	4.1. Zero, span and range checks are undertaken on

ELEMENT	PERFORMANCE CRITERIA
instrumentation equipment/components	<p>indicators/controllers using correct and appropriate configuration.</p> <p>4.2. Where applicable, methods of adjustment using calibration devices are performed and documented to prescribed procedures and operational specifications.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining relevant data with respect to the operation of the instrumentation systems/equipment
- locating, inspecting and testing a range of instrumentation system components
- isolating instrumentation system/equipment
- interpreting all relevant instrumentation circuits, drawings, instructions, manuals and data sheets
- checking the individual components within the instrumentation system for correct operation
- dismantling, repairing and reassembling faulty components
- selecting correct replacement parts from the manufacturer/supplier catalogues
- checking repaired/replaced instrumentation system components for correct operation
- complete service reports, and language and literacy skills for recording/documenting test results
- checking and verifying the operational functions of the instrumentation system/equipment including reading/recording built-in indicators
- obtaining error code interpretation documents
- undertaking zero, span and range checks on instrumentation systems/equipment
- calibrating instrumentation system/equipment

Required knowledge

Look for evidence that confirms knowledge of:

- instrumentation principles such as controlling density, level, flow, temperature, composition of a range of materials

REQUIRED SKILLS AND KNOWLEDGE

- effects of resistance, capacitance, inductance and impedance (R,L,C) upon electrical circuit
- interpretation requirements of schematic, wiring and block diagrams and circuits
- principles of hydraulic, pneumatic and electrical flow
- calibration procedures of instrumentation systems and equipment/components
- purpose/operational function of instrumentation system
- procedures and equipment for inspecting and testing instrumentation system
- specifications of each instrumentation system and acceptable deviations from specifications
- procedures for repairing faulty instrumentation system
- dismantling, reassembly and testing techniques
- correct operation of the instrumentation system including the procedures for isolating instrumentation systems
- range of faults in instrumentation system/equipment components
- procedures for checking and verifying the operational function of the instrumentation system/equipment
- procedures for recording and completing service reports
- hazards associated with fault-finding, testing and calibrating instrumentation systems/equipment
- the operational specifications of the instrumentation system/equipment
- variations between test results and operational specifications
- probable causes of faults in instrumentation system/equipment components
- action to be taken to rectify the causes of faults in instrumentation systems/equipment
- the sequence of events to be undertaken to correct faults in the instrumentation system/equipment components
- errors indicated by built-in devices
- methods of determining procedures
- procedures for reporting faults
- the difference between real and potential faults
- procedures for recording/documenting test and calibration results
- the function and procedures for zero, span and range checks on instrumentation systems/equipment
- equipment required to carry out the calibration of instrumentation systems/equipment

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to fault find, test, calibrate instrumentation systems and equipment. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with fault finding, testing, calibrating instrumentation systems and equipment or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Instrumentation systems

Made up of more than one interdependent component controlling and processing multiple inputs and/or outputs

Equipment

Process machines, temperature control systems, sterilisation units, water cooling/filtration systems; equipment utilising mechanical, pneumatic/electro-pneumatic or electronic principles, associated instruments measuring level, pressure, light, flow, current, resistance, voltage, density, temperature

Components

Sensors, transmitters, converters, indicators, analysers, controllers, transducers, power supplies, removable circuit boards and sensor units associated with determining/controlling density, level, flow, temperature, composition etc. of a range of materials

Test equipment

System calibrators, manometers, dead weight testers, wheatstone bridge, potentiometers, frequency/signal generators, logic probes, multimeters, (analog/digital), test gauges, cathode ray oscilloscopes and other associated equipment

MEM18055B Dismantle, replace and assemble engineering components

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers dismantling and identifying faulty components, selecting replacements, and assembling engineering components into assemblies or sub-assemblies in accordance with standard operating procedures.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit involves dismantling, checking, replacing and assembling engineering components in accordance with standard operating procedures.</p> <p>All specifications are interpreted from manufacturers' manuals, engineering drawings, detailed/technical sketches and associated data sheets. Tasks are undertaken utilising engineering principles, designated procedures, appropriate tools, equipment and safe workshop practices.</p> <p>Work is undertaken autonomously or in a team environment using predetermined standards of quality, safety and workshop procedures.</p> <p>Where fitting techniques and principles are required to assess component condition, and/or modify components to achieve precision fits, unit MEM18006C (Repair and fit engineering components) should also be selected.</p> <p>Where precision mechanical measurement is required, then Unit MEM12003B (Perform precision mechanical measurement) should also be selected.</p> <p>Band: A</p> <p>Unit Weight: 3</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Dismantle engineering components	1.1. Engineering components are inspected and task requirements are analysed. 1.2. Appropriate tools and equipment are selected and component/s are prepared for dismantling. 1.3. Component is dismantled using standard operating procedures, tools and equipment. 1.4. Engineering components are clearly marked to aid reassembly.
2. Identify faulty components	2.1. Specifications for components are obtained from appropriate source and are interpreted and understood. 2.2. Damaged or faulty components are assessed against specifications according to standard operating procedures. 2.3. Faulty components are identified for repair, replacement or adjustment according to standard operating procedures.
3. Select replacement components	3.1. Where applicable, replacement and/or repaired parts are selected for reassembly according to standard operating procedures.
4. Assemble engineering components into assemblies or sub-assemblies	4.1. Appropriate techniques are applied in the preparation, assembly and adjustment of components using fastening equipment and methods which ensure conformance to specifications, operational performance, quality and safety of the completed assembly according to standard operating procedures. 4.2. Correct lubrication, packing, sealing materials are selected and applied correctly in conformance to job specifications. 4.3. Final component assembly is inspected, tested and adjusted as necessary for compliance with operational specifications and returned to use according to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining and interpreting all relevant instructions, standard operating procedures, drawings and specifications
- preparing component for dismantling
- dismantling components using appropriate techniques, tools and equipment
- marking component parts appropriately for identification purposes
- checking components visually and dimensionally for conformance to specification
- where appropriate, marking faulty parts for repair, replacement or adjustment
- selecting and confirming replacement parts to specifications
- obtaining and using all relevant supplier catalogues
- preparing and assembling components using appropriate techniques in accordance with standard operating procedures
- where appropriate, applying lubricants correctly to the assembly in accordance with specifications and standard operating procedures
- where appropriate, applying packing and/or sealing materials in accordance with specifications and standard operating procedures
- inspecting and checking the final assembly for conformance to specification
- where appropriate, returning the final assembly to use

Required knowledge

Look for evidence that confirms knowledge of:

- tasks to be performed in accordance with standard operating procedures
- procedures for dismantling the assembly
- tools and equipment to be used to dismantle the components
- procedures and required equipment for checking components for conformance to specification
- specifications of the components to be replaced
- features and/or dimensions upon which replacement parts are to be selected
- process of identifying replacement parts from "third party" suppliers' catalogues
- procedures for assembling components
- requirements of the assembly in terms of specifications, operational performance, quality and safety
- procedures for lubricating the assembly
- materials
- checks to be undertaken during inspection of the final assembly
- procedures for returning components/assemblies into use
- hazards and control measures associated with dismantling, replacing and

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to dismantle, replace and assemble engineering components. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with dismantling, replacing and assembling engineering components or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Engineering components

Includes a range of component parts found in equipment or product assemblies, sub-assemblies, e.g. couplings, universal joints, pumps etc. employing shafts, pre-manufactured bearings and seals, lubricants, fasteners, gaskets etc.

Appropriate tools and equipment

Includes a range of hand and power tools, bearing pullers, special purpose dismantling and assembly tools etc.

Selected

Replacement parts are selected from manufacturers' catalogues, etc.

Appropriate techniques

Are in accordance with standard operating procedures and may include the straightforward removal and replacement of pre-manufactured bearings and seals

MEM18056B Diagnose and repair analog equipment and components

Modification History

Single band identifier removed to clarify dual status

Unit Descriptor

Unit descriptor	This unit covers locating faults in analogue electronic equipment or sub-assemblies, and replacing faulty components.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit applies to electronic systems or equipment including amplifiers, analogue hardware, communication, consumer audio/video, electronic appliances, scanning systems, security/fire systems, power supplies and test equipment etc.</p> <p>All specifications and procedures are gained from schematics, circuit drawings, engineering data sheets or manufacturers' handbooks.</p> <p>Unit MEM05002B (Perform high reliability soldering and desoldering) must also be selected if soldering of components is required to advanced or military specifications, where the reliability of electrical connections is critical, or where surface mounted devices are being soldered/de-soldered. Where termination of cables is involved, Unit MEM10002B (Terminate and connect electrical wiring) and/or Unit MEM18063B (Terminate signal and data cables) must also be selected.</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C7 (AQF level IV).</p> <p>Unit Weight: 10</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate fault in electronic system/sub-assembly	<p>1.1. System/sub-assembly functions and principles are determined with reference to equipment manuals, circuit diagrams etc.</p> <p>1.2. Built-in test functions are run and fault indicator error codes and appropriate maintenance records are checked and reviewed.</p> <p>1.3. Fault symptoms are reproduced, where appropriate, and verified using appropriate fault finding techniques.</p> <p>1.4. Where appropriate, faulty sub-assembly is isolated and removed from electronic system using correct and appropriate tools and techniques.</p> <p>1.5. Sub-assembly is checked and tested using correct and appropriate test equipment and fault finding techniques.</p> <p>1.6. Faulty component/s are identified and/or fault cause is isolated.</p>
2. Repair/replace faulty components	<p>2.1. Faulty component is removed, where required, using correct and appropriate tools and techniques.</p> <p>2.2. Faulty component is repaired/replaced in accordance with manufacturers' recommended procedures or to standard operating procedures.</p> <p>2.3. Repaired/replacement components are fitted in accordance with manufacturers' recommended procedure or to standard operating procedures using correct and appropriate tools and techniques.</p> <p>2.4. Where appropriate, repaired sub-assembly is refitted to electronic system using correct and appropriate tools and techniques.</p> <p>2.5. Systems/sub-assembly is checked and tested for correct operational compliance with specifications utilising correct and appropriate test procedures and equipment.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Look for evidence that confirms skills in:

- obtaining and following relevant circuit diagrams, manuals, specifications, schematics, maintenance records, supplier catalogues, etc.
- locating, reading/recording and diagnosing built-in fault indicators
- obtaining error code interpretation documents
- running test functions and recording faults and/or equipment status indicated by built-in test functions/displays
- checking electronic equipment/sub-assemblies, components, connections and terminations for conformance to specifications
- removing and replacing/repairing faulty components from the electronic equipment
- recording results of tests undertaken on electronic equipment
- isolating electronic sub-assembly from the power supply
- adjusting/tuning and calibrating electronic equipment/sub-assemblies
- returning to service and testing to specification the repaired electronic equipment/sub-assembly
- using language and literacy skills to provide brief reports/records/results of tests
- reproducing fault symptoms in the electronic equipment and verifying faults using appropriate test equipment and fault finding techniques
- refitting repaired/replaced components into the sub-assembly

Required knowledge

Look for evidence that confirms knowledge of:

- analogue electronics including amplifiers, oscillators, power suppliers, filters
- the function(s) of the electronic equipment/sub-assembly
- symptoms of the fault in the electronic equipment/sub-assembly
- the purpose of reproducing electronic equipment/sub-assembly fault symptoms
- equipment and techniques to be used to test the faulty sub-assemblies/component
- probable causes of component failure
- procedures for:
 - running built-in test functions
 - verifying faults in electronic equipment/sub-assemblies
 - isolating electronic equipment/sub-assemblies
 - removing sub-assemblies from electronic equipment
 - testing faulty sub-assemblies
 - removing faulty components from electronic equipment
 - fitting repaired/replaced components into sub-assemblies
 - fitting repaired sub-assemblies into electronic equipment
 - testing electronic equipment/sub-assembly performance

REQUIRED SKILLS AND KNOWLEDGE

- errors indicated by built-in devices
- test equipment and fault finding techniques necessary to confirm electronic equipment/sub-assembly faults
- hazards associated with electronic equipment/sub-assemblies including electro-static discharge (ESD)
- tools and techniques to be used to remove/refit/repair/replace the faulty sub-assemblies/component from the electronic equipment
- operational specifications of the sub-assembly
- operational specifications of the electronic equipment/sub-assembly/component
- test equipment and techniques necessary to check electronic equipment/sub-assembly performance
- any applicable industry standards, national/Australian standards, NOHSC guides, State/Territory regulatory codes of practice/standards
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Fault finding techniques

Signal injection, substitution, monitoring, measurement, heating, sound, visual, touch, smell

Test equipment

Continuity testers, ammeters, voltmeters, cathode ray oscilloscopes, frequency counters, signal generators, digital probes

Components

Discrete component assemblies or individual components such as resistors, switching devices, capacitors, transformers, solenoids, tubes, semi-conductors

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Undertake maintenance checks and routine tests	<p>1.1. Electronic equipment, functions are determined and understood by reference to circuit diagrams, equipment manuals and/or consultation with equipment operator where appropriate.</p> <p>1.2. Equipment built-in test functions are run and results are recorded to standard operating procedures where appropriate.</p> <p>1.3. Built-in faults/status display is noted and recorded to standard operating procedures.</p> <p>1.4. Equipment/sub-assemblies, components, connections, terminations etc. are checked visually and with correct and appropriate test equipment and techniques.</p> <p>1.5. Faulty components are removed and replaced where appropriate.</p> <p>1.6. All results are checked for compliance with manufacturers' requirements or specification, and results are recorded to standard operating procedures.</p>
2. Maintain and/or service electronic equipment	<p>2.1. Where appropriate, sub-assemblies are isolated according to standard operating procedures.</p> <p>2.2. Electronic equipment/sub-assemblies are adjusted to specifications, manufacturers' requirements and/or standard operating procedures using correct and appropriate techniques, tools and test equipment.</p>
3. Return electronic equipment to service	<p>3.1. Equipment/sub-assemblies are returned into service utilising correct and appropriate techniques and procedures.</p> <p>3.2. Equipment/sub-assemblies are checked for operational compliance to specifications and/or manufacturers' requirements, and documentation requirements are carried out to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Look for evidence that confirms skills in:

- following relevant circuit diagrams, manuals, specifications, schematics, maintenance records, supplier catalogues etc.
- locating and reading/recording built-in fault indicators
- obtaining error code interpretation documents
- running test functions and recording faults and/or equipment status indicated by built-in test functions/displays
- checking electronic equipment/sub-assemblies, components, connections and terminations for conformance to specifications
- removing and replacing components from the electronic equipment
- isolating electronic sub-assembly from the power supply
- adjusting/tuning and calibrating electronic equipment/sub-assemblies
- returning to service and specification of electronic equipment/sub-assembly
- recording test results

Required knowledge

Look for evidence that confirms knowledge of:

- function(s) of the electronic equipment
- electrical principles associated with electronic sub-assemblies
- implications of electro-static discharge (ESD) upon the electronic equipment
- procedures for running built-in test functions
- errors indicated by built-in devices
- procedures for recording faults and/or equipment status identified by built-in test functions/displays
- safe work practices and procedures
- procedures for checking the following for compliance with specifications: electronic equipment/sub-assemblies, components, connections, terminations
- tools and techniques to be used to remove/replace components from/into electronic equipment
- procedures for removing faulty components from electronic equipment
- procedures for fitting replacement components into electronic equipment
- operational specifications of the electronic equipment
- equipment and techniques to be used to test the electronic equipment
- procedures for testing electronic equipment
- procedures for recording electronic equipment test results
- procedures for isolating electronic equipment/sub-assemblies
- electrical hazards associated with electronic sub-assemblies
- procedures, tools, equipment and techniques to be used to adjust/tune and calibrate

REQUIRED SKILLS AND KNOWLEDGE

- the electronic equipment/sub-assembly
- operational specifications of the electronic equipment/sub-assembly
- procedures equipment and techniques to be used to return the electronic equipment/sub-assembly back into service
- procedures for recording/documenting the maintenance servicing of the electronic equipment/sub-assembly
- procedures, test equipment and techniques to be used to check the electronic equipment/sub-assembly for conformance to specification

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Modify equipment	1.1.Modification requirements are determined and understood by reference to circuit diagrams, schematics, equipment manuals and /or consultation with technical authority where appropriate. 1.2.Equipment is isolated to standard operational procedures. 1.3.Equipment is removed from system, if required, using correct and appropriate techniques and equipment. 1.4.Modification is carried out to equipment/sub-assembly/component in accordance with specifications or application requirements using correct and appropriate techniques and equipment. 1.5.Sub-assembly is refitted to equipment, if required, using correct and appropriate techniques and equipment.
2. Return equipment to service	2.1.Where required, circuit diagrams, schematics, equipment manuals etc. are amended to reflect modifications undertaken. 2.2.Checks and tests are undertaken to specifications using correct and appropriate techniques, test equipment and tools. 2.3.Equipment/system is recommissioned using correct and appropriate techniques and procedures. 2.4.Equipment/system is checked for operational compliance with specifications.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining relevant circuit diagrams, schematics, manuals
- isolating, tagging and verifying isolated equipment
- removing and refitting sub-assembly/equipment from the system

REQUIRED SKILLS AND KNOWLEDGE

- carrying out modifications to specification
- amending circuit diagrams, schematics, equipment manuals, specifications affected by the modifications
- recommissioning electronic equipment
- testing, checking modified electronic equipment to ensure conformance to specifications
- entering routine and familiar information onto proforma and standard workplace forms
- locating, reading and interpreting information on written job instructions, specifications, drawings, charts, lists and other reference documentation

Required knowledge

Look for evidence that confirms knowledge of:

- system concept including software/hardware systems, feasibility analysis and circuit analysis
- diagnostic skills and implications relative to the modification
- modification requirements
- sources of technical advice
- procedures for isolating and removing equipment from the system
- specifications applicable to the modification
- permits/approvals required
- tools and equipment necessary to carry out the modification
- specialised fitting requirements
- the electronic equipment specifications
- procedures and test equipment application
- procedures for recommissioning electronic equipment
- operational specification of the equipment/system
- safe work practices and procedures
- relevant hazards and control measures related to the competency

Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Modifications

Minor adjustments and alterations requirement to experimental and development modifications of a complex nature and can include replacement and /or alterations of system equipment, sub-assemblies, PCBs and components on analog and digital electronic systems

Test equipment

Continuity testers, ammeters, voltmeters, cathode ray oscilloscopes, frequency counters, signal generators, digital probes etc.

Pre-Requisites

Prerequisite units		
Path 1	MEM05001B	Perform manual soldering/desoldering - electrical/electronic components
	MEM09002B	Interpret technical drawing
	MEM12004B	Perform precision electrical/electronic measurement
	MEM12023A	Perform engineering measurements
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18056B	Diagnose and repair analog equipment and components
	MEM18057B	Maintain/service analog/digital electronic equipment
	MEM18058C	Modify electronic equipment
	MEM18065B	Diagnose and repair digital equipment and components

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine modification	1.1.Modification requirements are determined and understood by reference to schematics, circuit diagrams, documentation and/or consultation with appropriate authority. 1.2.Where appropriate, maintenance reports and system output information is analysed to confirm the need and nature of modification. 1.3.Scope and nature of modifications are determined, recorded to standard operating procedures and confirmed with appropriate authority.
2. Undertake modification/s	2.1.Modification/s are undertaken using correct and appropriate techniques, tools and procedures. 2.2.Correct and appropriate amendments are undertaken to documentations, circuit drawing etc. using standard operating procedures.
3. Test and evaluate modified electronic systems	3.1.Modifications are checked/tested and evaluated for compliance with desired outcome or specification using correct and appropriate techniques, tools and test equipment. 3.2.Additional modification changes, if required, are recommended using standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining relevant instructions, schematics, circuit diagrams
- obtaining relevant maintenance reports and system output information
- recording proposed modifications
- obtaining approval to for the proposed modifications
- modifying electronic systems
- amending relevant documents, circuit drawings, schematics etc.
- checking modified electronic system for conformance to specification

REQUIRED SKILLS AND KNOWLEDGE

- programming computers including uploading/downloading of proprietary software
- testing and evaluating modified electronic system

Required knowledge

Look for evidence that confirms knowledge of:

- advanced analogue and digital electronics theory
- system/computer protocols including communications, networks, intranet, SCADA etc.
- modifications to be made to the electronic system
- reasons for undertaking the modification
- appropriate personnel to consult for technical advice
- hazards associated with the electronic system including electro-static discharge (ESD)
- probable causes for any detected trends and/or deviations from specification
- appropriate authority to authorise modifications to electronic systems and changes to documentation, circuit drawings, schematics etc.
- procedures to be followed when undertaking and recording modifications to electronic systems
- tools and techniques to be used to modify the electronic system
- procedures for amending documents, circuit drawings, schematics etc.
- procedures for checking the performance of the modified electronic system
- test equipment and techniques to be used to evaluate the modified electronic system
- operational specifications to be achieved by the modified electronic system
- deviations/variations of test results from operational specifications
- probable causes of any deviations/variations from specification
- likely effect of further modifications on electronic system performance

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to modify electronic systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with modifying electronic systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Modification	Approved design changes and /or replacement of components or sub-assemblies on electronic analog or digital systems
System	Interdependent equipment including computer, process, communication, digital, security/fire etc.
Test equipment	Continuity testers, ammeters, voltmeters, cathode ray oscilloscopes, frequency counters, signal generators, digital probes etc.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Determine control loop operating characteristics</p>	<p>1.1.Engineering specifications, technical information and historical trends are examined for relevant data.</p> <p>1.2.System specifications, operational data and other relevant data sources are examined, read, interpreted and relevant conclusions are noted.</p> <p>1.3.Consultation with system operators and other relevant plant personnel is carried out, and relevant data is extracted and documented by appropriate means.</p> <p>1.4.Using knowledge of all control loop device characteristics, controller mode principles and adjustment methods, operation of the system is observed.</p> <p>1.5.Appropriate test equipment and testing procedures are used.</p> <p>1.6.Fault finding and diagnostic techniques are utilised.</p> <p>1.7.Relevant data is collected by appropriate means from all sources including maintenance records, fault indicators, charts, error codes operational symptoms, observation monitoring and consultation with appropriate personnel.</p>
<p>2. Monitor and record operation of a control loop</p>	<p>2.1.Pneumatic, electrical and electronic circuit diagrams are interpreted and understood.</p> <p>2.2.Using knowledge of all control loop device characteristics, controller mode principles and calibration/adjustment methods, loop operation from the controller response to set point and manual output changes using correct test equipment, principles and procedures are check tested and monitored.</p> <p>2.3.Software configuration data for digital control systems is interpreted.</p> <p>2.4.Operational responses are monitored and recorded by appropriate means.</p> <p>2.5.Fault finding and diagnostic techniques are utilised throughout checking and testing procedures including simple and multi-controller type control schemes.</p> <p>2.6.Diagnostic results and conclusions are analysed against predetermined operational specifications.</p>
<p>3. Localise fault</p>	<p>3.1.Circuits are tested to the level necessary to identify</p>

ELEMENT	PERFORMANCE CRITERIA
condition	and localise faults. 3.2. Drawings/diagrams and operational testing data are utilised in identifying and localising fault conditions. 3.3. Fault condition is localised and verified to major component level using appropriate test equipment, principles and procedures.
4. Replace or repair faulty condition	4.1. Components are dismantled for repair or replacement using appropriate tools, equipment and procedures. 4.2. Replaceable items are selected from manufacturers' catalogues, spare parts lists, or data sheets. 4.3. Serviceable items are repaired using correct principles, tools, equipment and procedures. 4.4. Repaired and replaceable items are reassembled using appropriate tools, equipment, techniques and procedures.
5. Calibrate and adjust control instrumentation	5.1. Panel mounted, split architecture single loop/multiple loop control instruments are calibrated and adjusted using correct calibration principles, equipment and methods for all devices according to manufacturers' instructions. 5.2. Adjust controller modes and actions are adjusted according to specifications. 5.3. Zero span and range checks are undertaken using correct and appropriate configuration. 5.4. Correct and appropriate procedures, techniques, tools and equipment are used to make final adjustments to control instrumentation to specifications.
6. Complete service reports and recommission	6.1. Service reports are completed to standard operating procedures. 6.2. Appropriate follow-up procedures are adopted. 6.3. Control instrumentation is recommissioned to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining and interpreting relevant engineering specifications, technical information, software data, diagrams and drawings, historical records and documents pertaining to the system components and operational data
- consulting system operators and other relevant plant personnel with respect to the control loop characteristics
- confirming function/malfunction of the system and/or its components
- checking operational characteristics of control devices, signal conversion instruments and final control elements for conformance to specification
- identifying faults/defects in control system components
- locating/reading in-built fault indicators and error codes
- obtaining relevant pneumatic, electrical and electronic circuit diagrams
- testing and monitoring the control loop for correct operation
- monitoring and recording responses of the control system
- using appropriate fault-finding and diagnostic techniques and procedures throughout the monitoring and testing process
- comparing collected data with the operational specifications of the control system
- marking components for repair or replacement
- dismantling/disassembling serviceable items
- setting up appropriate test and calibration equipment
- setting and adjusting the controller modes
- checking the control instrumentation for correct zero, span and range
- adjusting the control system as required
- completing all necessary reports including appropriate follow-up procedures
- commissioning the control system
- interpreting trends from operational data
- interpreting information from in-built devices
- calculating control loop characteristics

Required knowledge

Look for evidence that confirms knowledge of:

- mathematical computations including algebra, exponentials and logarithms, equations, graphs, charts, vectors, complex numbers, Boolean algebra
- relevant data, including information from in-built devices on the control loop characteristics
- specifications of each system component
- control programming

REQUIRED SKILLS AND KNOWLEDGE

- SCADA systems, programmable logic controller systems (PLC) distributive control systems (DCS) and computer-based systems
- procedures for documenting/reporting information
- signal transmission including the principles of operation of the final control element, procedures for calibrating and adjusting the control system
- correct function of the circuits and components within the control loop
- calibration and adjustment methods for the control loop devices
- configuration of the digital control system software
- operational responses and procedures for monitoring and recording test and operational data
- fault-finding and diagnostic techniques throughout the monitoring and testing process
- deviations/variations from specification
- procedures for documenting control system tests and analysis
- hazards associated with testing circuits
- procedures for isolating and testing the control system and its components
- procedures for verifying apparent faults in circuits and/or control system components
- procedures for marking components for repair or replacement including procedures for dismantling/ disassembling components for repair or replacement
- correct maintenance procedures for serviceable item(s)
- procedures for assembling repaired and/or replacement items
- procedures and equipment necessary for the calibration of control system components
- adjustments which affect the calibration to control system components
- controller modes and actions
- procedures for checking control instruments for zero, span and range
- procedures for making final adjustments to ensure all control system components conform to specification
- reporting/recording requirements associated with the commissioning of the control system
- follow-up actions to be undertaken after maintaining/repairing control system instrumentation
- procedures for commissioning the control system
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Determine system specifications and control loop characteristics</p>	<p>1.1.Engineering specifications, technical information and historical records and trends are examined and relevant data is documented.</p> <p>1.2.System specifications and operational data including those for multiple loop control systems and devices are obtained, read and interpreted.</p> <p>1.3.Circuit and logic diagrams and configuration data are obtained, read and interpreted.</p> <p>1.4.Consultation with system operators and other relevant plant personnel is carried out, and relevant data is extracted and documented by appropriate means.</p> <p>1.5.Appropriate work clearances are obtained for monitoring and testing the system.</p>
<p>2. Test, monitor and record system operation</p>	<p>2.1.Relevant data is collected by appropriate means from all sources including maintenance records, chart recorders, data loggers, fault indicators, error codes, operational symptoms, tests and observation monitoring.</p> <p>2.2.Fault detection and diagnostic data are analysed against predetermined operational specifications, and conclusions are documented.</p> <p>2.3.System operation is observed using knowledge of all individual/multiple element loop device characteristics, controller mode principles, testing, calibration and adjustment methods.</p> <p>2.4.Appropriate test equipment is set up and used correctly.</p> <p>2.5.Appropriate tests are undertaken using standard operating procedures.</p> <p>2.6.Signal transmission test equipment is set up and used where applicable.</p> <p>2.7.Adjustment/maintenance needs are determined through interpretation and analysis of pneumatic, electrical, electronic, logic diagrams and configuration data for all control system devices.</p> <p>2.8.Appropriate field instrumentation is connected to test system configuration.</p> <p>2.9.Field instrumentation is connected and tested for selected control operation, and performance is monitored against specifications.</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>2.10. Diagnostics checks are carried out to ensure correct operation.</p> <p>2.11. Fault finding and diagnostic tests are undertaken using correct equipment, techniques and procedures to detect faulty control system components or elements.</p>
3. Localise fault condition	<p>3.1. System is tested to the level necessary to detect and localise fault condition.</p> <p>3.2. Fault condition is localised and verified using appropriate test equipment, principles and processes.</p> <p>3.3. Fault condition is analysed, evaluated and corrective action is planned.</p>
4. Replace faulty items or repair faulty condition	<p>4.1. Faulty items are dismantled for repair or replacement using appropriate tools, equipment and procedures according to manufacturers' recommendations.</p> <p>4.2. Replaceable items are selected from manufacturers' catalogues, spare parts lists, or data sheets.</p> <p>4.3. Using manufacturers' handbooks, correct maintenance procedures for faulty items are established.</p> <p>4.4. Faulty items and/or condition are repaired using correct maintenance procedures and equipment.</p> <p>4.5. Repaired and replaceable items are reassembled using appropriate principles, tools, equipment, techniques and test procedures.</p>
5. Calibrate, configure, adjust complex control systems	<p>5.1. Diagnostic checks are carried out to ensure correct operation of system, taking appropriate corrective action as necessary.</p> <p>5.2. Correct calibration and test equipment is selected/set up to enable calibration to manufacturers' specifications.</p> <p>5.3. Mechanical alignment of control devices is undertaken where applicable.</p> <p>5.4. System is configured using appropriate programming tools and techniques.</p> <p>5.5. Relevant alignment procedures are performed for optimum control and in accordance with specifications.</p> <p>5.6. Correct sequence of alignment is used on multiple control loops and multi-element systems.</p> <p>5.7. Correct recording equipment is set up for adjustment and monitoring during alignment.</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>5.8. Calibration and adjustment function are performed on multi-loop devices, multi-element control loops, controller modes and actions according to operational specifications using correct principles and methods applicable to the type of control loop being serviced.</p> <p>5.9. On-line changes are made to parameters in the system to meet specified requirements.</p> <p>5.10. Field instrumentation is connected for selected control operation and system is operated to a satisfactory level of control.</p>
6. Return system to service	<p>6.1. Final adjustments to align system operation to operational specifications including process and optimum control efficiencies are undertaken.</p> <p>6.2. Correct procedures are applied in return to service including configuring, calibrating, adjusting, tuning and final validation of system performance in accordance with specifications.</p> <p>6.3. System is returned to service.</p> <p>6.4. Service reports are completed to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining and interpreting relevant engineering specifications, technical information, historical records and other reference documents
- obtaining specifications of system components and operational data
- obtaining relevant circuit and logic diagrams and configuration data
- planning and sequencing operations
- checking and clarifying task-related information
- undertake numerical operations, and engineering calculations/formulae within the scope of this unit
- consulting system operators and other relevant plant personnel with respect to the control loop characteristics

REQUIRED SKILLS AND KNOWLEDGE

- documenting information obtained from system operators and other relevant personnel
- obtaining necessary work clearances for the monitoring and testing of the system
- locating and interpreting in-built fault indicators and error codes
- comparing collated data with the operational specifications of the control system
- documenting results of the analysis of collated data and any conclusions reached
- observing operation of the system confirm function/ malfunction of the system and/or its components
- setting up and using test equipment
- performing tests
- measure signals using suitable test equipment and analysis techniques
- connecting field test instruments to the system
- testing and monitoring the operation of selected controls using field test instrumentation
- performing diagnostic checks on the system
- checking operational characteristics of control devices, signal conversion instruments and final control elements for conformance to specification
- testing system using fault finding techniques including continuity testing, fault isolation
- verifying faults
- documenting corrective action
- marking items for repair or replacement
- dismantling and assembling items
- obtaining manufacturers'/suppliers' catalogues, spare parts lists or data sheets
- repairing item(s) using appropriate tools and equipment
- performing diagnostic checks of the system
- taking corrective action to bring system operation into line with specifications
- setting up test and calibration equipment
- aligning control devices to specifications
- configuring the system
- aligning controllers for optimum performance
- aligning multiple control loops in the correct sequence
- setting up and monitoring recording equipment during the tuning process to identify the effects of adjustment made to the system
- calibrating and adjusting control system components
- changing system parameters on-line to meet specified requirements
- connecting field test instrumentation to selected control system
- operating the control system
- adjusting the control system
- validating system performance
- returning control systems to service

REQUIRED SKILLS AND KNOWLEDGE

- completing reports

Required knowledge

Look for evidence that confirms knowledge of:

- the specification of each system component
- relevant data and/or trends
- system components and their function
- procedures for:
 - documenting information
 - obtaining work clearances
 - documenting control system tests and analysis
 - using test equipment
 - testing system configuration, control system components/elements, testing circuits and control lines
 - testing and monitoring the operation of selected controls
 - carrying out diagnostic checks
 - isolating the control system and its components
 - marking serviceable items for repair or replacement
 - dismantling/disassembling items for repair or replacement
 - servicing item(s)
 - adjusting the system to conform to operational specifications
 - calibrating the control system components
 - aligning control devices
 - configuring the system
 - tuning controllers, multiple control loops and multi-element systems
 - recording signals and data during system tuning operations
 - changing parameters
 - operating and monitoring a control system
 - making final adjustments to ensure all control system components conform to specifications
 - assembling repaired and/or replacement items
 - returning to service
 - reporting/recording requirements associated with return to service of control systems
- reasons for:
 - observing the system in operation
 - selecting the chosen test equipment
 - identifying the adjustments/maintenance to be carried out

REQUIRED SKILLS AND KNOWLEDGE

- selecting the chosen diagnostic checks
- selecting the chosen test and calibration equipment
- any deviations/variations from specification
- the errors indicated by in-built devices
- deviations/variations from specification
- the following for the given system: all individual/multiple element loop device characteristics; controller mode principles, testing methods; calibration methods; adjustment methods
- equipment:
 - to be used and reasons for selecting the chosen equipment
 - required to verify an apparent fault
 - used to test system configuration
 - required to undertake maintenance on item(s)
 - necessary to calibrate the control system components
 - necessary to carry out the alignment of the control devices
 - programming tools and techniques to be used
 - appropriate measuring techniques, tools and equipment
- adjustments/maintenance to be carried out
- diagnostic checks to be applied to the system to ensure correct operation of the system
- fault finding and performing diagnostic tests to be applied to control devices, signal conversion instruments and final control elements
- hazards associated with testing circuits and control lines
- causes of verified faults and the action to be taken to return the control system/component to specification
- appropriate replacement parts
- specifications of serviceable item(s)
- diagnostic checks to be carried out
- specifications of the equipment to be calibrated
- alignment specifications
- specifications of the controllers
- correct sequence of tuning
- recording equipment to be used
- adjustments that can be made to control system components
- effects of those adjustments on the calibration of the control system components
- requirements to be achieved by changing system parameters on-line
- the level of control to be achieved
- hazards and control measures associated with maintaining/calibrating complex control systems
- use and application of personal protective equipment

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to maintain/calibrate complex control systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with maintaining/calibrating complex control systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Control loop

A process of documenting and recording measurements and variables within the process

Test equipment

Engineer level, laser alignments etc., and appropriate equipment for measurement of alignment, flatness, squareness, straightness, temperature, vibration, load deflection, noise level, RPM

Tests

Measuring and analysing to ensure correct operation

Control system

Control systems include pneumatic control, analog and/or digital electronics, distributed PLC, DCS, SCADA, and computer-based control systems. Computer-based control systems may include supervisory mode

Field instrumentation

Test and measuring equipment which could include specialised testing fixtures or equipment

Unit Sector(s)

Unit sector

Co-requisite units

Co-requisite units		

Competency field

Competency field	Maintenance and diagnostics
-------------------------	-----------------------------

MEM18062B Install, maintain and calibrate instrumentation sensors, transmitters and final control elements

Modification History

Single band identifier removed to clarify dual status

Unit Descriptor

Unit descriptor	This unit covers selecting and installing appropriate sensors and signal transmitters, maintaining and diagnosing correct operation of sensors and signal transmitters, and completing fault documentation.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit applies to planning corrective action; repairing, replacing and overhauling sensors and signal transmitters; and calibrating, testing, re-installing and recommissioning instrumentation sensors and signal transmitters.</p> <p>Tasks relate to the use of mechanical, electrical, electronic (analog and digital) and associated sensing indications and signal transmitting instrumentation, representing measurement of pressure, temperature, level, flow rate, weight, density and other process variables.</p> <p>It also applies to the maintenance of control valves (including changing and reseating valve plugs); adjustment of valve actuators (pneumatic, electrical and hydraulic); and maintenance and adjustment of pneumatic, electro-pneumatic and electronic valve positioners and signal converters.</p> <p>Tasks are undertaken in workshop, laboratory or on-site environments.</p> <p>Unit MEM05002B (Perform high reliability soldering and desoldering) must also be selected if soldering of components is required to advanced or military specifications, where the reliability of electrical connections is critical, or where surface mounted devices are being soldered/de-soldered.</p> <p>If diagnosis and repair of electronic equipment is undertaken to component level, Unit MEM18056B (Diagnose and repair analog equipment and components) and/or Unit MEM18065B (Diagnose and repair digital equipment and components) should be selected.</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C7 (AQF level IV).</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Select for installation appropriate sensors, transmitters and final control elements</p>	<p>1.1. Specification requirements are determined from data sheets, circuit diagrams, engineering drawings.</p> <p>1.2. Using knowledge of device characteristics and principles of operation, specification requirements are interpreted, defined and understood.</p> <p>1.3. Having regard for measurement range, processes and environment, sensors, transmitters and final control elements are selected according to their device characteristics, principles of operation and measurement capabilities, in conformance to specifications.</p>
<p>2. Install instrumentation sensors, transmitters and final control elements</p>	<p>2.1. Sensors, transmitters and final control elements are installed using sound working knowledge of installation principles, procedures, techniques, tools and test equipment, according to appropriate codes of practice, standards, safety and legislative requirements.</p> <p>2.2. During installation access for maintenance and mounting connections for power, signal, and process are planned and catered for.</p> <p>2.3. Installed sensors, transmitters and final control elements are diagnosed for correct operation using appropriate test equipment and procedures. Results are assessed against specifications or manufacturers' technical data sheets.</p>
<p>3. Maintain, diagnose correct operation of sensors, transmitters and final control elements</p>	<p>3.1. Using knowledge of device characteristics and principles of operation, preventative maintenance schedules and procedures are applied to maintain sensors, transmitters and final control elements in optimum condition.</p> <p>3.2. Using knowledge of device characteristics and principles of operation, sensing elements are cleaned and serviced to maintain optimum operating condition particularly at the process interface, using correct principles, tools, test equipment, techniques and procedures.</p> <p>3.3. Using appropriate test equipment and procedures, sensors, transmitters and final control elements are diagnosed, within the system or as individual devices, to determine correct operation or malfunction.</p> <p>3.4. Operation of sensors, transmitters and final control</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>elements is monitored and assessed against predetermined specification or manufacturers' technical data.</p> <p>3.5.Using appropriate test equipment/procedures, correct operation of sensors, transmitters and final control elements is checked or fault condition identified, localised and monitored.</p>
<p>4. Complete fault documentation and plan corrective action</p>	<p>4.1.Faults and malfunctions are documented and/or reported according to standard operating procedures.</p> <p>4.2.Corrective action is planned autonomously or in consultation with appropriate personnel and actioned.</p>
<p>5. Analyse control loop and localise faults</p>	<p>5.1.Engineering specifications and technical information, control device, signal transmission and final element specifications are obtained and interpreted. System specifications, including operational data, and historical records and trends are read and interpreted.</p> <p>5.2.Consultation with system operators and other relevant plant personnel is carried out, relevant data is extracted and documented to standard operating procedures.</p> <p>5.3.Operation of the system is observed using sound knowledge of all external control device characteristics, controller modes, signal transmission, final control devices.</p> <p>5.4.Correct and appropriate signal transmission test equipment is set up and applied using appropriate technique.</p> <p>5.5.Circuits and control lines are tested to the level necessary to detect and localise fault.</p>
<p>6. Repair/replace, overhaul sensors, transmitters and final control elements</p>	<p>6.1.Sensors, transmitters and final control elements are examined and verified for replacement, repair or overhaul using correct tools/test equipment and appropriate principles, techniques and procedures.</p> <p>6.2.Replacement items are selected from manufacturers' parts lists or catalogues to meet specifications.</p> <p>6.3.Replacement items are obtained.</p> <p>6.4.Faulty items are repaired or overhauled using correct principles, techniques, tools, test equipment and procedures.</p> <p>6.5.Repaired, overhauled and replacement items are prepared for refitting according to standard</p>

ELEMENT	PERFORMANCE CRITERIA
	workshop procedures. 6.6.Sensors, transmitters and final control elements are refitted using correct principles, tools, test equipment and procedures. 6.7.Refitted sensors, transmitters and final control elements are prepared for testing and calibration.
7. Calibrate and test instrumentation sensors, transmitters and final control elements	7.1.Sensors, transmitters and final control elements are calibrated against appropriate physical standards using correct calibration devices, test equipment, techniques and procedures. 7.2.Zero, span and range tests are performed using correct calibration devices, test equipment, principles, techniques and procedures. 7.3.Zero span and range results are assessed against manufacturers' instructions sheets. 7.4.Zero, span adjustments are applied to align sensors, transmitters and final control elements to manufacturers' instruction sheets using correct calibration equipment, principles, techniques and procedures.
8. Return sensors, transmitters and final control elements and control loops to service	8.1.Sensors, transmitters and final control elements are put into service on conformance to specifications with due regard to process requirements, safety, installation/commissioning procedures and sequence of operation. 8.2.Controller modes and actions are adjusted according to specifications. 8.3.Electrical and pneumatic transmission lines are tested and appropriate action is taken including the use of signal conditioning devices. 8.4.Correct procedures are applied in returning instrumentation to service, including configuring, calibrating, adjusting, tuning and validating system performance. 8.5.System is returned to service in accordance with standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- accessing relevant data sheets, circuit diagrams, engineering drawings, instructions, specifications, information and supplier catalogues and replacement components
- selecting sensors, transmitters and final control elements
- installing and testing sensors, transmitters and final control elements to specification
- obtaining and performing relevant scheduled/preventative maintenance schedules for sensors, transmitters and final control elements
- determining correct function of sensors, transmitters and final control elements
- recording test results
- identifying, localising, monitoring and reporting/recording faults in sensors, transmitters and final control elements
- preparing sequential action plan to correct faults in sensors, transmitters and final control elements
- applying procedures to sequential and loop testing
- checking sensors, transmitters and final control elements and marking for replacement, repair or overhaul
- repairing/overhauling faulty items for fitting and /or refitting
- fitting/ refitting sensors, transmitters and final control elements
- preparing fitted/refitted sensors, transmitters and final control elements for testing and calibration
- configuring, calibrating, testing, adjusting, tuning and validating system performance

Required knowledge

Look for evidence that confirms knowledge of:

- characteristics, specifications and principles of operation of the sensors, transmitters and final control elements to be installed
- criteria for selecting sensors, transmitters and final control elements
- procedures for testing, installing and maintaining sensors, transmitters and final control elements and for reporting/recording and monitoring faults and/or malfunctions in sensors, transmitters and final control elements
- factors that determine the type of test equipment required
- tools, equipment and techniques required to install sensors and transmitters
- relevant codes, standards, safety and legislative requirements
- connections to be made to sensors, transmitters and final control elements
- variations of test results from specifications and probable causes of variations

REQUIRED SKILLS AND KNOWLEDGE

- between test results and specifications
- housekeeping requirements with respect to sensors.
- test equipment and techniques required to determine correct function or malfunction of sensors, transmitters and final control elements
- probable causes of variations between test results and specifications
- the need for systematic and/or sequential testing
- procedures for configuring, calibrating, testing, adjusting, tuning and validating system performance including sensors, transmitters and final control elements
- physical standards against which sensors, transmitters and final control elements are to be calibrated
- devices, equipment and techniques required to calibrate sensors, transmitters and final control elements
- zero, span and range tests to be applied to the sensors, transmitters and final control elements
- procedures for recommissioning sensors, transmitters and final control elements
- safety procedures to be taken when recommissioning sensors, transmitters and final control elements

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to install, maintain and calibrate instrumentation sensors, transmitters and final control elements. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with installing, maintaining and calibrating instrumentation sensors, transmitters and final control elements, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes,</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify and mark conductors/cables	1.1.Cables and conductors are identified using appropriate test equipment and techniques. 1.2.Cables and conductors are labelled in accordance with standard operating procedures, legislative requirements and statutory regulations to specifications.
2. Prepare cable	2.1.Termination requirements and specifications are obtained and understood. 2.2.Cable ends are prepared to specifications, legislative requirements and statutory regulations utilising appropriate tools and techniques.
3. Terminate cables	3.1.Cables are terminated to specifications utilising appropriate tools and techniques. 3.2.Terminations are tested/examined for compliance with specifications, legislative requirements and statutory regulations utilising appropriate test equipment and techniques.
4. Fix/secure cables	4.1.Cables are fixed/secured in accordance with standard operating procedures, specifications, legislative requirements and statutory regulations, utilising appropriate fixing/securing techniques.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE
This section describes the skills and knowledge required for this unit.
Required skills
Look for evidence that confirms skills in: <ul style="list-style-type: none"> • identifying cables and conductors • labelling cables and conductors • obtaining relevant instructions, specifications and data sheets • preparing cable ends for termination • following specifications • testing completed terminations for compliance to specifications • fixing/securing cables

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- legislative requirements and statutory regulations including ACA Technical Standards AS/ACIF008, AS/ACIF009, SAA Communications Cabling Manual (Open), AS/NZS 3000, Telecommunications Act 1997
- the test equipment and techniques to be used to identify cables and conductors
- procedures to be followed when identifying cables and conductors
- labelling requirements of cables and conductors
- procedures for labelling cables and conductors
- termination requirements and specifications
- procedures, tools and techniques for preparing and terminating cables
- procedures for testing cables and terminations
- factors that influence selection of fixing/securing techniques
- safe work practices and procedures

Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Legislative requirements and statutory regulations

- ACA Technical Standards AS/ACIF008, AS/ACIF009
- SAA Communications Cabling Manual (Open)
- AS/NZS 3000
- Telecommunications Act 1997

Types of cables

- Thermocouple/compensator cables including MIMS
- Transmission cables
- Thermoplastic/elastomer insulated/sheathed
- Compensating cables
- Coaxial
- Telephone
- Category 5
- Optical fibre
- Extra low voltage control cables

Terminations

Crimp, wire wrap, (non-insulated and pre-insulated), solder, connectors, multi-terminal plugs and sockets, fibre optics, coaxial, terminal blocks

Fixing and securing

The use of clamps, cable ties, bolting, screwing

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Check instrumentation system components	1.1. System components are identified correctly. 1.2. The characteristics and operational function of each system component are understood. 1.3. The operational function of each component is inspected and tested in accordance with standard operating procedures. 1.4. Operation of each component is assessed against specifications.
2. Identify, repair/replace faulty instrumentation system components	2.1. Faulty system components are localised/isolated and the malfunction is confirmed by inspection and testing using instrumentation principles, procedures and safety requirements. 2.2. Faulty system components are dismantled and repaired according to manufacturers'/site specifications and in accordance with standard operating procedures. 2.3. Replacement parts are selected from manufacturer catalogues and listings to required specifications. 2.4. System components are reassembled and tested for correct operation and assessment against specifications and in accordance with standard operating procedures. 2.5. Correct operation of the instrumentation system is confirmed according to standard operating procedures. 2.6. Appropriate follow-up procedures are adopted according to standard operating procedures. 2.7. Where appropriate, service reports are completed according to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

REQUIRED SKILLS AND KNOWLEDGE

- obtaining relevant data with respect to the operation of the instrumentation systems/equipment
- locating, inspecting and testing a range of instrumentation system components
- isolating instrumentation system/equipment
- obtaining and interpreting all relevant instrumentation circuits, drawings, instructions, manuals and data sheets
- checking the individual components within the instrumentation system for correct operation
- dismantling/repairing/reassembling faulty components
- selecting correct replacement parts from the manufacturer/supplier catalogues
- checking repaired/replaced instrumentation system components for correct operation
- completing service reports
- obtaining error code interpretation documents
- recording/documenting test results
- undertaking zero, span and range checks on instrumentation systems/equipment
- calibrating instrumentation system/equipment

Required knowledge

Look for evidence that confirms knowledge of:

- instrumentation principles such as controlling density, level, flow, temperature, composition of a range of materials
- effects of resistance, capacitance, inductance and impedance (R,L,C) upon electrical circuit
- interpretation requirements of schematic, wiring and block diagrams and circuits
- basic principles of hydraulic/pneumatic/electrical flow
- purpose and operational function of each system component
- procedures and equipment for inspecting and testing instrumentation system components
- instrumentation system component specifications
- deviations from specifications
- procedures for repairing faulty instrumentation system components
- dismantling, reassembly and testing techniques
- correct operation of the instrumentation system
- procedures for recording and completing service reports
- safe work practices and procedures
- relevant hazards and control measures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to maintain instrumentation system components. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with maintaining instrumentation system components, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Components

Include sensors, transmitters, converters, indicators, analysers, controllers, transducers, power supplies, removable circuit boards and sensor units associated with determining/controlling density, level, flow, temperature, composition etc. of a range of materials

Unit Sector(s)

Unit sector

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate fault	<p>1.1. System/equipment functions and principles are determined and understood by reference to equipment manuals, circuit diagrams etc.</p> <p>1.2. Built-in test functions are run, and fault indicators error codes and appropriate maintenance records are checked and reviewed.</p> <p>1.3. Fault symptoms are reproduced where appropriate and verified, using appropriate fault finding techniques.</p> <p>1.4. Where appropriate, faulty equipment is isolated and removed from system using correct and appropriate tools and techniques.</p> <p>1.5. Equipment is checked and tested using correct and appropriate test equipment and fault finding techniques.</p> <p>1.6. Faulty component/s are identified and/or fault cause is isolated.</p>
2. Repair/replace faulty components	<p>2.1. Faulty component is removed where required using correct and appropriate tools and techniques.</p> <p>2.2. Faulty component is repaired/replaced in accordance with manufacturers' recommended procedures or to standard operating procedures.</p> <p>2.3. Repaired/replacement components are fitted in accordance with manufacturers' recommended procedure or to standard operating procedures using correct and appropriate tools and techniques.</p> <p>2.4. Where appropriate, repaired equipment is refitted to system using correct and appropriate tools and techniques.</p> <p>2.5. Systems/equipment is checked and tested for correct operational compliance to specifications utilising correct and appropriate test procedures and equipment.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Look for evidence that confirms skills in:

- obtaining relevant circuit diagrams, manuals, schematics, specifications, maintenance records, supplier catalogues
- locating, reading/recording and diagnosing built-in fault indicators
- obtaining error code interpretation documents
- running test functions and recording faults and/or equipment status indicated by built-in test functions/displays
- checking electronic equipment/sub-assemblies, components, connections and terminations for conformance to specifications
- removing and replacing/repairing faulty components from the electronic equipment
- recording results tests on electronic equipment
- isolating electronic sub-assembly from the power supply
- adjusting/tuning and calibrating electronic equipment/sub-assemblies
- returning to service and testing to specification the repaired electronic equipment/sub-assembly
- reporting/recording return to service
- reproducing fault symptoms in the electronic equipment and verifying faults using appropriate test equipment and fault finding techniques
- refitting repaired/replaced components into the sub-assembly

Required knowledge

Look for evidence that confirms knowledge of:

- analogue and digital electronics including amplifiers, oscillators, power suppliers, filters, transistors, ICs, digital timers, gate arrays, transmitters, converters
- the function(s) of the electronic equipment/sub-assembly
- procedures for running built-in test functions
- errors indicated by built-in devices
- symptoms of the fault in the electronic equipment/sub-assembly
- the purpose of reproducing electronic equipment/sub-assembly fault symptoms
- test equipment and techniques necessary to confirm electronic equipment/sub-assembly faults
- procedures for verifying faults in electronic equipment/sub-assemblies
- procedures for isolating electronic equipment/sub-assemblies
- hazards associated with electronic equipment/sub-assemblies including electro-static discharge (ESD)
- procedures for removing sub-assemblies from electronic equipment
- tools and techniques to be used to remove/refit/repair/replace the faulty sub-assemblies/component from the electronic equipment
- procedures for testing faulty sub-assemblies

REQUIRED SKILLS AND KNOWLEDGE

- operational specifications of the sub-assembly
- equipment and techniques to be used to test the faulty sub-assemblies/component
- probable causes of component failure
- procedures for removing faulty components from electronic equipment
- procedures for repairing/replacing faulty components
- procedures for fitting repaired/replaced components into sub-assemblies
- procedures for fitting repaired sub-assemblies into electronic equipment
- procedures for testing electronic equipment/sub-assembly performance
- operational specifications of the electronic equipment/sub-assembly/component
- test equipment and techniques necessary to check electronic equipment/sub-assembly performance
- safe work practices and procedures

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Equipment

Digital hardware, communication, consumer audio/video, electronic appliances, scanning systems, security/fire systems, power supplies and test equipment, etc.

Fault finding techniques

Signal injection, substitution, monitoring, measurement, heating/cooling, sound, visual, touch, smell and the use of inbuilt software and hardware diagnostics

Test equipment

Continuity testers, ammeters, voltmeters, cathode ray oscilloscopes, frequency counters, signal generators, digital probes etc.

Components

Discrete component assemblies or individual components such as resistors, switching devices, capacitors, transformers, solenoids, tubes, semi-conductors, transistors, ICs, digital timers, gate arrays, transmitters, converters etc.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Locate faults	1.1. Equipment function and principles are determined and understood by reference to schematics, circuit diagrams, flow charts, equipment manuals etc. 1.2. Built-in test functions are run and results are interpreted correctly. 1.3. Fault symptoms are reproduced where appropriate and verified using appropriate fault finding techniques. 1.4. Faulty or defect component/s are identified and/or fault cause is isolated using appropriate test equipment.
2. Replace/repair faulty components	2.1. Faulty component is renewed using/ correct and appropriate tools and techniques. 2.2. Faulty component/s are repaired/replaced in accordance with manufacturers' recommended procedure or standard operating procedure. 2.3. Repaired/replaced component/s are fitted using correct and appropriate tools and techniques. 2.4. Equipment is checked and tested for operational compliance to specifications utilising correct and appropriate test procedures and equipment.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining relevant circuit diagrams, manuals, specifications, schematics, maintenance records, supplier catalogues
- locating, reading/recording and diagnosing built-in fault indicators
- obtaining error code interpretation documents
- running test functions and recording faults and/or equipment status indicated by built-in test functions/displays
- checking microprocessor-based equipment, electronic equipment/sub-assemblies, components, connections and terminations for conformance to specifications

REQUIRED SKILLS AND KNOWLEDGE

- removing and replacing/repairing faulty components and/or microprocessor from the electronic equipment
- recording results tests undertaken on the microprocessor-based equipment
- isolating the microprocessor-based equipment from the power supply
- adjusting/tuning and calibrating the microprocessor-based equipment
- returning to service and testing to specification the repaired microprocessor-based equipment
- reporting/recording return to service
- reproducing fault symptoms in the microprocessor-based equipment and verifying faults using appropriate test equipment and fault finding techniques
- refitting repaired/replaced components into the microprocessor-based equipment

Required knowledge

Look for evidence that confirms knowledge of:

- microprocessor systems, architecture, circuits and dedicated chips
- function(s) of the microprocessor-based equipment
- electronic principles utilised in the operation of the microprocessor-based equipment
- procedures for running built-in test functions
- errors indicated by built-in devices
- symptoms of the fault in the microprocessor-based equipment
- purpose of reproducing fault symptoms
- test equipment and fault finding techniques necessary to confirm microprocessor-based equipment faults
- procedures for verifying faults in microprocessor-based equipment
- procedures for testing faulty microprocessor-based equipment
- hazards associated with microprocessor-based equipment including electro-static discharge (ESD)
- equipment and techniques to be used to test the faulty microprocessor-based equipment
- probable causes of component failure
- procedures, tools and techniques for removing and/or repairing faulty components from microprocessor-based equipment
- reasons for identifying the faulty component for repair or replacement
- procedures, tools and techniques for refitting repaired/ replaced components into the microprocessor-based equipment
- procedures for testing microprocessor-based equipment performance
- operational specifications of the microprocessor-based equipment
- test equipment and fault finding techniques necessary to check the microprocessor-based equipment performance
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine control loop characteristics	1.1.Engineering specifications, technical information and historical process, records and trends are examined for relevant data. 1.2.Consultation with system operators and other relevant plant personnel is carried out, and relevant data is extracted and documented to standard operating procedures. 1.3.Programmed maintenance/service reports are read and relevant data noted. 1.4.Data is analysed and control loop characteristics are ascertained.
2. Record control loop responses	2.1.Using chart recorders and data loggers, control loop responses are recorded in open and closed loop mode. 2.2.Unit is tested for tuning using appropriate diagnostic techniques. 2.3.Diagnostic results are analysed against specifications.
3. Tune control loops	3.1.Using knowledge of control loop device characteristics, controller mode principles and adjustment methods, tuning operations are performed using correct and appropriate techniques, procedures and equipment. 3.2.Recording equipment used for monitoring and adjustment of control loop components during controller tuning operations is corrected and tested. 3.3.Step response - open loop tuning calculations are applied to achieve specified loop characteristics. 3.4.Closed loop tuning methods using ultimate sensitivity and systematic trials are used to achieve specified loop characteristics. 3.5.Correct sequence of tuning is used on multi controllers and/or multi element systems to achieve specified characteristics. 3.6.Control loops are tuned to optimum mode settings utilising correct and appropriate techniques, tools, test equipment and procedures.
4. Complete service reports	4.1.Service reports are completed to standard operating procedures. 4.2.Appropriate follow up procedures are adopted.

ELEMENT	PERFORMANCE CRITERIA
	4.3.Process control loop is recommissioned to specifications.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- calculating control loop characteristics
- obtaining and interpreting relevant engineering specifications, technical information, software data, diagrams and drawings, historical records and documents pertaining to the system components and operational data
- consulting system operators and other relevant plant personnel with respect to the control loop characteristics
- confirming function/malfunction of the system and/or its components
- checking operational characteristics of control devices, signal conversion instruments and final control elements for conformance to specification
- identifying faults/defects in control system components
- locating/reading in-built fault indicators and error codes
- obtaining relevant pneumatic, electrical and electronic circuit diagrams
- determining corrective action and interpreting trends from operational data
- testing/monitoring the control loop for correct operation
- monitoring and recording operational responses of the control system/loop
- using appropriate fault-finding and diagnostic techniques and procedures throughout the monitoring and testing process
- comparing collected data with the operational specifications of the control system
- marking components for repair or replacement
- dismantling/disassembling serviceable items
- setting up appropriate test and calibration equipment
- setting and adjusting the controller modes
- checking the control instrumentation for correct zero, span and range
- adjusting the control system as required
- implementing diagnostic techniques and procedures
- tuning the control loop
- completing all necessary reports including appropriate follow up procedures
- commissioning the control system

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- proportional integral differential (PID) control loops tuning/calibration techniques
- mathematical computations including algebra, exponentials and logarithms, equations, graphs, charts, vectors, complex numbers, Boolean algebra
- relevant data, including information from in-built devices on the control loop characteristics
- specifications of each system component
- control programming
- SCADA systems, programmable logic controller systems (PLC), distributive control systems (DCS) and computer-based systems
- procedures for documenting/reporting information
- signal transmission including the principles of operation of the final control element, procedures for calibrating and adjusting the control system
- correct function of the circuits and components within the control loop
- calibration and adjustment methods for the control loop devices
- configuration of the digital control system software
- operational responses and procedures for monitoring and recording test and operational data
- fault-finding and diagnostic techniques throughout the monitoring and testing process
- deviations/variations from specification
- procedures for documenting control system tests and analysis
- hazards associated with testing circuits
- procedures for isolating and testing the control system and its components
- procedures for verifying apparent faults in circuits and/or control system components
- procedures for marking components for repair or replacement including procedures for dismantling/ disassembling components for repair or replacement
- correct maintenance procedures for serviceable item(s)
- procedures for assembling repaired and/or replacement items
- procedures and equipment necessary for the calibration of control system components
- adjustments which affect the calibration to control system components
- controller modes and actions
- procedures for checking control instruments for zero, span and range
- procedures for making final adjustments to ensure all control system components conform to specification
- reporting/recording requirements associated with the commissioning of the control system

REQUIRED SKILLS AND KNOWLEDGE

- follow-up actions to be undertaken after maintaining/repairing control system instrumentation
- procedures for commissioning the control system
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to tune control loops - multi controller or multi element systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with tuning control loops - multi controller or multi element systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Historical process

SCADA, charts, chart recorders and data loggers, equipment condition monitoring etc.

Control loop

An opened and closed loop system includes final control elements, process measuring devices, converters, controllers, process signals and the like

Test equipment

Pneumatic, analogue and digital electronic test equipment for the monitoring and adjustment of control loop tuning

MEM18069B Maintain, repair instrumentation process control analysers

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers performing preventative maintenance on process control analysers; completing fault documentation; planning corrective action; repairing, replacing, overhauling, calibrating and testing; re-installing and recommissioning process control analysers.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit applies to the use of electrical and electronic test equipment for transmission and signal measurement, and extends to the use of liquid analysis devices for the measurement of pH, selective ions, oxygen and electrolytic conductivity.</p> <p>Included is the use of gas analysis devices operating on the principles of thermal conductivity, thermal reaction, combustion, paramagnetism, chemical absorption, ionisation, infra-red, ultraviolet, emission or absorption and solid electrolytic conductivity.</p> <p>Tasks involve the use of hygrometers, wet and dry bulb and calibration of gas cylinders and gas supply equipment, the use of chemical calibration solutions and the use of special calibration devices specific to chemical detectors. Central to the task is the interpretation of electrical and electronic circuit diagrams and the interpretation of calibration and analysis data and procedures in accordance with manufacturers' data sheets. Safety codes of practice including the identification, handling and appropriate use of high pressure gas cylinders, equipment and chemical solutions are included.</p> <p>Work is undertaken autonomously or in a team environment, using predetermined standards of quality, safety and workshop procedures. Tasks are performed in laboratory, workshop or on-site environments.</p> <p>Unit MEM05002B (Perform high reliability soldering and desoldering) must also be selected if soldering of components is required to advanced or military specifications, where the reliability of electrical connections is critical, or where surface mounted devices are being soldered/de-soldered.</p> <p>If diagnosis and repair of electronic equipment is undertaken to component level Unit MEM18056B</p>
--------------------------------	---

	<p>(Diagnose and repair analog equipment and components) and/or Unit MEM18065B (Diagnose and repair digital equipment and components) should be selected.</p> <p>Band: B</p> <p>Unit Weight: 6</p>

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM05001B	Perform manual soldering/desoldering - electrical/electronic components
	MEM09002B	Interpret technical drawing
	MEM12004B	Perform precision electrical/electronic measurement
	MEM12023A	Perform engineering measurements
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18054B	Fault find, test and calibrate instrumentation systems and equipment
	MEM18055B	Dismantle, replace and assemble engineering components
	MEM18057B	Maintain/service analog/digital electronic equipment
	MEM18062B	Install, maintain and calibrate instrumentation sensors, transmitters and final control

Prerequisite units		
		elements
Path 2	MEM09002B	Interpret technical drawing
	MEM12002B	Perform electrical/electronic measurement
	MEM12023A	Perform engineering measurements
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18054B	Fault find, test and calibrate instrumentation systems and equipment
	MEM18055B	Dismantle, replace and assemble engineering components
	MEM18064B	Maintain instrumentation system components

Employability Skills Information

Employability skills	This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Perform preventative maintenance on process control analysers	<p>1.1. Specification requirements are determined from manufacturers' manuals, maintenance schedules and other relevant documents.</p> <p>1.2. Using knowledge of process control analyser characteristics and principles of operation, specification requirements are interpreted, defined and understood.</p> <p>1.3. Preventative maintenance schedules are performed on process control analysers to service and maintain analysers within defined specifications.</p> <p>1.4. Using appropriate electrical and electronic test equipment, techniques and procedures, specified process control analysers are diagnosed within the system or within the laboratory to determine correct operation or malfunction.</p> <p>1.5. Operation of process control analysers are monitored and assessed against predetermined laboratory data and/or the fault condition is identified, localised and monitored.</p> <p>1.6. Using appropriate test equipment and procedures, correct operation of analysers is tested, and/or the fault condition is identified, localised and monitored.</p> <p>1.7. Correct operation is confirmed.</p> <p>1.8. Faults and malfunctions are identified and confirmed.</p>
2. Complete fault documentation	2.1. Faults and malfunctions are documented or reported according to standard operating procedures.
3. Plan corrective action	3.1. Corrective action is planned autonomously or in consultation with appropriate personnel and actioned.
4. Repair, replace, overhaul process control analysers	<p>4.1. Process control analysers are examined or verified for repair, replacement or overhaul using correct tools/equipment and appropriate principles, techniques and procedures.</p> <p>4.2. Replacement items are selected from manufacturers' parts lists or catalogues according to specifications required.</p> <p>4.3. Faulty items are repaired or overhauled using correct principles, techniques, tools, equipment and procedures.</p> <p>4.4. Repaired, overhauled and replacement items are</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>prepared for refitting according to standard operating procedures.</p> <p>4.5.Process control analysers are refitted using correct principles, tools, equipment and procedures.</p> <p>4.6.Refitted process control analysers are prepared for testing and calibration.</p>
5. Calibrate and test process control analysers	<p>5.1.Process control analysers are calibrated against appropriate physical standards using correct calibration devices, equipment, techniques and procedures.</p> <p>5.2.Calibrated process control analysers are tested using appropriate test equipment.</p> <p>5.3.Calibration and analysis data is collected.</p> <p>5.4.Calibration and analysis data is interpreted.</p> <p>5.5.Calibration and analysis data is assessed in accordance with manufacturers' data sheets, codes of practice and safety procedures.</p>
6. Re-install and recommission process control analysers	<p>6.1.Process control analysers are put into service to specifications with due regard to process requirements, codes of practice, safety, commissioning procedures and techniques.</p> <p>6.2.Service reports are completed to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining and interpreting relevant data sheets, circuit diagrams, engineering drawings, instructions, manufacturers' manuals, maintenance schedules, supplier catalogues, standard workplace procedures and other reference documents
- performing scheduled/preventative maintenance on process control analysers
- determining correct function or the malfunction of process control analysers
- recording test results
- monitoring apparent faults

REQUIRED SKILLS AND KNOWLEDGE

- identifying, monitoring and localising faults in process control analysers using a structured diagnostic approach
- confirming correct action of process control analysers
- recording/reporting faults and malfunctions in process control analysers
- preparing sequential action plan to correct faults in process control analysers
- checking and marking process control analysers for replacement, repair or overhaul
- repairing and overhauling faulty items
- preparing repaired, overhauled and replacement items for fitting/refitting
- fitting/refitting process control analysers
- preparing process control analysers for testing and calibration
- calibrating process control analysers against appropriate physical standards using appropriate calibration devices, equipment and techniques
- testing calibrated process control analysers using appropriate equipment
- obtaining relevant calibration and analysis data with respect to the given process controller
- recommissioning process control analysers
- completing necessary service reports

Required knowledge

Look for evidence that confirms knowledge of:

- specifications for the process control analyser to be installed
- procedures for maintaining process control analysers
- the maintenance to be undertaken and the frequency at which process control analysers are to be maintained
- procedures for determining correct function or the malfunction of process control analysers
- test equipment and diagnostic techniques required to determine correct function or malfunction of process control analysers
- procedures for recording test results and procedures for monitoring apparent faults detected from test results
- probable causes of variations between test results and specifications
- procedures for reporting/recording faults and/or malfunctions in process control analysers
- action to be taken to return the process control analysers to specification and reasons for undertaking the proposed actions
- persons to be consulted in planning the corrective action
- sequence of actions to be taken
- procedures for marking components for repair, replacement or overhaul
- tools, equipment and techniques required to test components and reasons for marking components for repair, replacement and/or overhaul
- specifications for the component(s) to be replaced

REQUIRED SKILLS AND KNOWLEDGE

- procedures, tools, techniques and equipment required to repair/overhaul the faulty items
- preparation requirements of items to be fitted/refitted
- procedures for preparing items for fitting/refitting
- procedures for fitting/refitting process control analysers
- tools, techniques and equipment required to fit/refit process control analysers
- preparation requirements of process control analysers prior to testing and calibration
- procedures for calibrating process control analysers
- physical standards against which process control analysers are to be calibrated
- devices, equipment and techniques required to calibrate process control analysers
- equipment and procedures for testing calibrated process control analysers
- probable causes of any variations/deviations detected
- action to be taken to return the process control analyser to specification and reasons for undertaking the proposed action(s)
- procedures for recommissioning process control analysers
- the safety precautions to be taken when recommissioning process control analysers
- procedures for reporting/recording service undertaken on process control analysers and reasons for recording service undertaken
- appropriate measuring techniques, tools and equipment
- hazards/control measures associated with maintaining, repairing instrumentation process control analysers
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to maintain, repair instrumentation process control analysers. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with maintaining, repairing instrumentation process control analysers, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine system specifications and characteristics	1.1. Complex circuit/system function and characteristics are determined with reference to circuit diagrams, specifications, schematics and/or consultation with technical adviser. 1.2. System specifications and operational data is obtained, read and interpreted. 1.3. Findings are verified using correct and appropriate techniques, procedures, tools and test equipment. 1.4. Results are recorded and analysed to determine appropriate modification.
2. Modify circuits and systems as required	2.1. Modifications are undertaken as determined to standard operating procedures.
3. Test modification	3.1. Modifications are tested and monitored to assess suitability. 3.2. Modifications are documented in accordance with standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- determining appropriate system modifications
- analysing
- facilitating multiple processes
- obtaining and interpreting relevant circuit diagrams, flow charts, specifications, schematics, engineering data sheets, etc.
- recording/reporting
- testing and monitoring electrical circuit/systems
- high level communicating
- undertaking calculations using formulae
- entering routine and familiar information onto proformas and standard workplace forms
- locating, reading and interpreting information on written job instructions,

REQUIRED SKILLS AND KNOWLEDGE

specifications, drawings, charts, lists and other reference documentation

- planning, sequencing operations
- checking and clarifying strategies

Required knowledge

Look for evidence that confirms knowledge of:

- system interrelationship and dynamics
- operation of complex electrical circuit/system
- implications of modifications to system including hazards
- operational specifications of the circuit/system
- common electrical test instruments and their application
- appropriate test equipment and its application to the testing of the modified circuit/system
- the reporting/recording requirements associated with the modification of complex electrical circuits and systems
- any applicable industry standards, national/Australian standards, NOHSC guides, State/Territory regulatory codes of practice/standards
- use and application of personal protective equipment
- safe work practices and procedures
- relevant hazards and control measures related to the competency

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Complex electrical circuits and systems

Industrial control systems, automatic process machines, material transfer systems, distribution systems, complex control panels etc. incorporating a range of circuit protective devices, relays, timers, transformers, sensors etc.

System

A system's circuit is defined as one that interconnects between a number of interdependent apparatus

Test equipment

Continuity testers, ammeters, voltmeters, multimeters, tong testers, wattmeters, cathode ray oscilloscope, etc.

Documented

All modifications recorded or incorporated into drawings, schematics, etc.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Disconnect fluid conveying components and assemblies	1.1.Safety/risk assessment is carried out, potentially hazardous situations/conditions are identified and safety devices are positioned as required. 1.2.Fluid conveying conductor lay out is noted, recorded and labelled to standard operating procedures. 1.3.Faulty component/assembly is identified using specific trouble-shooting procedures, reference documents and fluid power principles. 1.4.Fluid conveying components and assemblies are disconnected and removed using appropriate techniques, procedures, tools and equipment. 1.5.Open system is adequately sealed with standard or special purpose sealing materials.
2. Obtain replacement parts	2.1.Replacement parts are selected from manufacturer catalogues and other relevant reference sources according to international standards and specifications.
3. Test and store components	3.1.Fluid conveying assemblies and individual components are pressure tested according to industry and manufacturer standards and using fluid power principles. 3.2.Condition is assessed and noted according to standard operating procedures. 3.3.Components/assemblies are cleaned, sealed and stored according to industry and manufacturer standards.
4. Connect fluid conveying components and assemblies	4.1.Connections are checked and prepared for reconnection. 4.2.Components and assemblies are connected to equipment to specifications using appropriate techniques. 4.3.Tagged out equipment, signage and safety blocking devices are removed according to standard operating procedures. 4.4.Equipment and fluid conveying systems are checked and tested for correct operation according to manufacturer and industry standards.
5. Report results	5.1.Reporting and certification procedures are followed. 5.2.All relevant information is completed and correct.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying potentially hazardous situations
- tagging, locking off safety/security
- locating faulty component
- neutralising pressures
- removing components/assemblies
- applying safe working practices
- sealing system
- interpreting reference materials to identify required part(s)
- performing pressure testing
- undertaking condition and serviceability assessment
- cleaning, sealing and storing components
- connecting components
- testing components
- completing routine reports

Required knowledge

Look for evidence that confirms knowledge of:

- different sources of stored energy and their applications
- hazardous situations/conditions
- OHS responsibilities of customer and self
- safety/security lock-off devices and signage
- the reasons for installing lock-off devices and signage
- the procedures for installing lock-off devices and signage
- procedures to record and label components
- trouble shooting techniques
- techniques, procedures and safety practices including neutralisation of pressures
- standard and specific sealing materials and techniques
- different fluid conveying parts and their function
- techniques and safety practices for pressure testing
- basic functions of fluid power systems, including: effects of heat/contamination; pressures, flow rates and temperatures; hose strength and size; effect of media on hoses; test, operational and burst pressures

REQUIRED SKILLS AND KNOWLEDGE

- criteria for assessment
- storage methods and requirements
- methods of cleaning, sealing and storing
- criteria for checking connection
- techniques for connection
- procedure for removal
- testing procedures
- safety requirements
- reporting procedures and media for reporting
- required information

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Manufacture fluid conveying system conductors	1.1. Conductor requirements are identified and appropriate materials/fittings are selected to suit application. 1.2. Conductor materials are prepared for assembly. 1.3. Conductors are assembled to specification.
2. Repair faulty conductors and assemblies	2.1. Faulty fluid conveying system conductors are dismantled and repaired to manufacturer/industry standards and specifications.
3. Check/test conductor assemblies	3.1. Operation of fluid conveying components and assemblies is tested against current industry standards and manufacturer specifications using fluid power principles and relevant reference documents. 3.2. Faulty fluid conveying components and assemblies are identified and failure/potential to fail is confirmed by inspection and testing using fluid power conveying principles, procedures, equipment and safety practices. 3.3. Manufactured/repaired components are assembled, cleaned, tested and correct operation verified to ensure compliance with required specifications and standards.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying materials/fittings with reference to circuit drawings, schematics, reference manuals and equipment specifications
- preparing existing conductors
- assembling conductors
- applying safety practices
- following enterprise procedures
- identifying faults/potential faults

REQUIRED SKILLS AND KNOWLEDGE

- inspecting for compliance/non-compliance with specifications

Required knowledge

Look for evidence that confirms knowledge of:

- conductor materials and fittings for a range of applications and media (fluid types)
- methods for preparation of different conductors, including hose and pipe assemblies
- different methods for assembling hose and pipe assemblies, including swaging, crimping, brazing/soldering
- dismantle and repair procedures
- operational function and characteristics of fluid conveying installation and application category types
- industry standards and manufacturer specifications
- procedure to assess operation
- fluid power conveying principles, procedures and safety requirements
- procedures to assemble, clean, test

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Conductor	Hoses, tubes, pipes, fittings, connectors, adaptors and anchors and other associated attachments
Assembled	Hose - skive and measurement tools, crimping and cleaning machines, lathes
Reference documents	Manufacturer product catalogues, tables and charts, schematic diagrams

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Obtain information on mobile plant and equipment performance	1.1. Job related information is accessed and interpreted. 1.2. Information management systems are used to access data on plant and equipment performance. 1.3. Previous records are reviewed. 1.4. Equipment systems operation, testing and adjusting procedure is reviewed and troubleshooting procedure is identified. 1.5. Hazards associated with plant and equipment tests are identified.
2. Identify equipment fault/s	2.1. Data from information management system is interpreted. 2.2. Fault symptoms are determined. 2.3. Equipment operation is visually inspected. 2.4. All test equipment is installed at the correct test point locations. 2.5. Performance tests are conducted as required. 2.6. Information from tests and test equipment is analysed. 2.7. Fault is identified. 2.8. Data is plotted and recorded on performance analysis report forms.
3. Determine cause of fault/s	3.1. Possible causes are identified. 3.2. Diagnostic tests are conducted to confirm cause. 3.3. Test results are analysed. 3.4. Test results are compared with specifications. 3.5. Cause of fault is located and documented.
4. Make recommendations	4.1. Recommendations for repair are made. 4.2. Rectification strategy is implemented.
5. Check and document repairs	5.1. Repairs are checked for completion. 5.2. Equipment is re-tested to ensure correct performance. 5.3. Service report is prepared and completed. 5.4. Required documentation is completed.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking and clarifying task-related information
- problem solving
- checking for conformance to specifications
- using tools and equipment to conduct performance and fault finding tests
- undertaking root cause analysis
- undertaking calculations and numerical operations within the scope of this unit
- using computer
- using information management systems
- making recommendations for rectifying faults
- implementing and reviewing rectification strategy
- documenting findings and outcomes

Required knowledge

Look for evidence that confirms knowledge of:

- hazards and control measures associated with conducting tests and fault finding across equipment, including housekeeping
- safe work practices and procedures
- tests to be conducted to diagnose faults at equipment and component level
- sources of information available to assist in fault finding
- uses and parameters of information management systems
- required rectification for equipment faults
- practices and procedures in root cause analysis
- equipment performance specifications
- documentation requirements

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to undertake advanced equipment testing and diagnostics. Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with advanced equipment testing and diagnostics, or other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Mobile plant and equipment	Hydraulics, engine, power train and electronic systems
Job related information	Personnel accounts/descriptions, log books, job records standard operating procedures, manufacturers' specifications
Accessed	By manual or electronic means
Previous records	Equipment logs and history
Hazards	<ul style="list-style-type: none"> • Ventilation hazards including battery gas leaks and (freon) paint emission • Excessive noise • Fluid spillage • Electrical hazards from generator sets and water • Lifting hazards caused by the removal and replacement of heavy components, e.g. engines and transmissions • Hydraulic hazards such as high oil pressure and temperature • Drive trains hazards such as tail shaft wind up • Fire hazards from the activation of fuel and temperature
Information management systems include	<ul style="list-style-type: none"> • Retrieving test data from the Service Information System (SIS) • Equipment management systems

RANGE STATEMENT	
	<ul style="list-style-type: none"> • Factory passwords • Finding test data through, microfiche and SIS • Obtaining relevant Flash File information • Finding full load settings (FLS) and full torque settings (FTS), SIS or similar • Using the dynamometer and windows performance analysis reporting programs • Producing performance analysis report
Test equipment	Dynamometer, electronic technician, multimeter, flow meter, pressure gauges, communication adaptors, scroll box and stop watch
Performance tests	<ul style="list-style-type: none"> • Rocker checks for oil • Fluid level checks • Fuel and cooling system checks • Emergency shut-down operation checks • Final walk around inspection • Manual and/or electronic tests of equipment and/or components • Cylinder cut out tests • Solenoid tests • Cycle times • Sensor tests • Lubrication pressure checks • Leak checks • Power checks using the dynamometer program, engine performance tools, transmission and hydraulic test equipment • Checks on alignments between components
Rectification strategy	Repair, referral, replacement, dispatch to other personnel

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine the operating conditions of vapour compression systems	<p>1.1. Established procedures are used to determine the actual and specified range of operating conditions from measured and calculated values as they apply to particular vapour compression systems.</p> <p>1.2. Established OHS procedures and risk control measures for carrying out the work are followed.</p> <p>1.3. Operating conditions are established and recorded on commissioning documentation.</p> <p>1.4. Tools, equipment and testing devices needed to determine the basic operating conditions are obtained and checked for correct operation and safety</p> <p>1.5. The system is checked and isolated where necessary, in strict accordance OHS requirements and procedures</p>
2. Recover refrigerants from split air conditioning systems	<p>2.1. Circuits/appliances are isolated where necessary in strict accordance OHS requirements and procedures.</p> <p>2.2. Refrigerants are removed safely into suitably labelled containers in accordance with legislative and industry requirements.</p> <p>2.3. Contaminated refrigerant is dealt with in accordance with legislative and industry requirements.</p>
3. Pressure and leak test split air conditioning systems	<p>3.1. Safety hazards are identified and noted and established risk control measures are implemented.</p> <p>3.2. Industry codes of practice and manufacturer installation instructions are followed.</p> <p>3.3. Precautions are taken to prevent damage to components while pressure testing the system.</p> <p>3.4. Pressure testing is conducted at a pressure compatible with the refrigerant to be used.</p> <p>3.5. Leaks are located, isolated and repaired using methods appropriate to the system type under test and in accordance with industry practices.</p>
4. Evacuate split air	4.1. Safety hazards which have not previously

ELEMENT	PERFORMANCE CRITERIA
conditioning systems	<p>been identified are noted, and established risk control measures are implemented.</p> <p>4.2. The system is evacuated to the required level and cleaned the system of all moisture and other containments in accordance with legislative and industry requirements.</p> <p>4.3. A standing vacuum test is applied in accordance with industry codes of practice and applicable standards.</p>
5. Charge split air conditioning systems	<p>5.1. Correct refrigerant is selected for the system, in accordance with manufacturer requirements and industry practices.</p> <p>5.2. The refrigerant charge is measured by weight in accordance with manufacturer specifications.</p> <p>5.3. The system is charged correctly in accordance with manufacturer requirements and industry practices.</p> <p>5.4. All components are checked and maintained in accordance with manufacturer requirements.</p>
6. Test the operation of split air conditioning systems	<p>6.1. The system is started and operated in accordance with manufacturer instructions</p> <p>6.2. Standard tests are carried out to confirm system performance to manufacturer specifications.</p> <p>6.3. The refrigerant charge is checked and refrigerant added if required.</p> <p>6.4. The system is leak checked in accordance with refrigeration procedures and practices.</p> <p>6.5. Test data is recorded as required.</p>
7. Complete the commissioning/recommissioning of split air conditioning systems	<p>7.1. The worksite is cleaned and left in presentable condition in accordance with original presentation, client requirements, industry standards and organisational requirements.</p> <p>7.2. Final inspections are undertaken to ensure installation conforms with industry, legislative and work order requirements.</p> <p>7.3. The client is instructed on the use of the product in accordance with organisational requirements and manufacturer</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>specifications.</p> <p>7.4. Certificates of compliance and other relevant commissioning documentation are completed and processed in accordance with State regulatory requirements.</p>
8. Decommission split air conditioning systems	<p>8.1. Plug in appliance is electrically disconnected or arrangements made for appropriately licensed person to isolate hard-wired appliances</p> <p>8.2. Refrigerants are recovered, stored and disposed of in accordance with legislative and industry requirements.</p> <p>8.3. Units and components are removed and disposed of safely and in accordance with regulations, industry codes of practice and sustainable environmental practices.</p> <p>8.4. The worksite is cleaned and left in presentable condition, client and organisational requirements, industry standards and sustainable environmental practices.</p> <p>8.5. Decommissioning documentation is completed and processed in accordance with State regulatory requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, catalogues, lists, drawings and other applicable reference documents
- effective communication with appropriate persons
- planning and sequencing operations
- checking and clarifying task related information
- using tools, techniques and equipment necessary to check for correct operation

REQUIRED SKILLS AND KNOWLEDGE

- comparing system and component performance/ operation against specification
- identifying faulty components and non-compliances
- using appropriate test equipment to identify non-compliance
- safely removing, containing and adding refrigerant to relevant Australian Standards or codes and regulations
- making required adjustments to achieve specifications
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- completing relevant commissioning and decommissioning documentation

Required knowledge

Look for evidence that confirms knowledge of:

- applicable legislative and regulatory requirements, standards, codes, licensing requirements and sustainable environmental practices for commissioning and decommissioning systems
- applicable procedures and legislative requirements for storage, handling and treatment of ozone depleting and synthetic greenhouse gas refrigerant
- procedures to determine the actual and specified range of operating conditions from measured and calculated values as they apply to particular vapour compression systems
- typical work environments, demands and considerations
- specifications, operational characteristics and process for identifying system components
- typical problems, contingencies and solutions
- applicable tools, equipment and testing devices and their operation
- procedures for evacuating system
- procedures for leak testing
- procedures for adding refrigerant
- requirements and procedures to isolate circuits/appliances
- procedures for checking air flow
- measuring instruments/equipment, specifications and procedures for checking temperature and system performance
- measuring instruments/equipment, specifications and procedures for checking components
- procedures for reporting non-conformances
- process for identifying refrigerant type
- types of commissioning documentation
- requirements and procedures for completing documentation
- OHS procedures and risk control measures
- hazards and risk control measures associated with commissioning split and domestic air conditioning systems

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to install split air conditioning systems to manufacturer specifications, safely, to relevant Australian Standards, codes and regulations.

Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with commissioning, recommissioning and decommissioning split air conditioning systems or domestic air conditioning and refrigeration appliances and other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Install and remove domestic refrigeration and air conditioning appliances</p>	<p>1.1. Appliance location is identified and sited in accordance with customer requirements, regulations, standards, codes of practice and industry guidelines</p> <p>1.2. Site is prepared for installation of appliance</p> <p>1.3. Appliance is installed and secured in accordance with manufacturer instructions and industry best practice</p> <p>1.4. Operation of the appliance is checked in accordance with manufacturer instructions</p> <p>1.5. Waste materials and products are disposed of in accordance with Commonwealth and State legislation, environmental and industry codes of practice</p>
<p>2. Determine operating condition of domestic refrigeration and air conditioning appliances</p>	<p>2.1. Established procedures and standard electrical tests are carried out to determine actual operating condition</p> <p>2.2. Established OHS risk control measures and procedures are followed to enable the system to be isolated and checked where necessary</p> <p>2.3. Tools, equipment and testing devices needed to determine the basic refrigeration operating conditions are obtained and checked for correct operation and safety</p> <p>2.4. Industry codes of practice and manufacturer service instructions are followed</p>
<p>3. Carry out routine maintenance of domestic refrigeration and air conditioning appliances</p>	<p>3.1. Safety hazards are identified and recorded and established risk control measures implemented</p> <p>3.2. Routine maintenance procedure is performed as per manufacturer and client scheduling</p> <p>3.3. Routine maintenance records are maintained and faults recorded</p>
<p>4. Fault-find and troubleshoot domestic refrigeration and air conditioning appliance faults</p>	<p>4.1. OHS requirements are determined</p> <p>4.2. Equipment and testing devices needed to determine fault are selected</p> <p>4.3. Apply standard test procedures to determine faults against equipment specifications</p> <p>4.4. Test data and faults are recorded as required</p>
<p>5. Replace, repair or service faulty components in</p>	<p>5.1. Plug in appliance is electrically disconnected or arrangements made for appropriately licensed person to isolate hard-wired appliances</p>

ELEMENT	PERFORMANCE CRITERIA
domestic refrigeration and air conditioning appliances	5.2. Electrical components are replaced in accordance with manufacturer recommendation and industry best practice 5.3. Refrigeration system replacement components are selected and prepared 5.4. Refrigerants are recovered, stored and disposed of in accordance with Commonwealth legislation and industry codes of practice 5.5. Refrigeration system components are installed in accordance with industry best practice, standards and codes 5.6. Refrigeration system is returned to operating condition using standard refrigeration return to service procedures
6. Return to service domestic refrigeration and air conditioning appliances	6.1. Standard electrical tests are applied to identify electrical faults before operating 6.2. Appliance is started and operated in accordance with manufacturer standards 6.3. Standard tests are carried out to confirm system performance to manufacturer specifications 6.4. Appliance operating data is recorded as required 6.5. Worksite is cleaned and left in presentable condition in accordance with original presentation, client requirements, industry standards and organisational requirements

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking and clarifying task related information

REQUIRED SKILLS AND KNOWLEDGE

- attaching ancillary devices
- using tools, techniques and equipment necessary to check for correct operation
- comparing system and component performance/ operation against specification
- identifying faulty components and non compliances
- using appropriate test equipment to identify non compliance
- safely remove, contain or add refrigerant to relevant Australian Standards or codes and regulations
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- completing relevant standard, code or local required documentation

Required knowledge

Look for evidence that confirms knowledge of:

- procedures and industry best practice for brazing refrigeration pipework
- procedures for evacuating system
- procedures for pressure and leak testing
- procedures for handling and adding refrigerant
- safety and legislative requirements for handling refrigerants
- procedure for checking air flow
- standard electrical measurements for earth continuity, insulation resistance, circuit resistance, supply voltage and current
- measuring instruments/equipment, specifications and procedures for checking temperature and system performance
- measuring instruments/equipment, specifications and procedures for checking and testing components
- procedures for reporting non-conformances
- specifications, operational characteristics and process for identifying system components
- process for identifying refrigerant type
- procedures complying to all legislative and regulatory requirements for safely removing the refrigerant and charging and evacuating the system
- procedures for completing documentation
- hazards and control measures associated with installing split air conditioning systems, including housekeeping

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to install service and repair domestic refrigerators and air conditioners to manufacturer specifications, safely, to relevant Australian Standards, codes and regulations.

Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

ELEMENT	PERFORMANCE CRITERIA
1. Assess refrigeration system operation	1.1.Refrigeration system operating principles and terminology are applied to assessment activities. 1.2.All <i>relevant information</i> is obtained and correctly interpreted prior to the commencement of work on the refrigeration system. 1.3.Refrigeration system checks are undertaken safely in accordance with standard operating procedures, relevant codes and regulations. 1.4.Appropriate operating procedures are developed as required. 1.5.Pressures and temperatures are correctly determined and recorded. 1.6.Faults are correctly isolated to component level and <i>appropriate corrective action</i> is determined. 1.7.The refrigeration system is checked for leaks. 1.8.The refrigeration system is checked for <i>contamination</i> .
2. Recover refrigerant and evacuate system	2.1.The <i>refrigerant</i> in the system is recovered in accordance with standard operating procedures, codes and regulations. 2.2.The refrigerant recovered from the refrigeration system is contained in accordance with the <i>relevant codes and regulations</i> . 2.3.The refrigeration system is evacuated in accordance with standard operating procedures, codes and regulations.
3. Charge the refrigeration system	3.1.The refrigeration system is charged with the correct refrigerant in accordance with standard operating procedures. 3.2.The appropriate lubricating oil is added to the refrigeration system in accordance with standard operating procedures. 3.3.The refrigeration system is checked for leaks.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- planning and sequencing operations
- developing operating procedures for equipment as required
- selecting correct refrigerant for a given system
- obtaining and interpreting drawings, instructions, specifications, procedures, codes and regulations
- testing and checking refrigeration components and systems including electrical safety checks and tests
- checking for conformance to specifications
- undertaking numerical operations within the scope of this unit
- determining pressures and temperatures
- documenting test results and procedures undertaken
- using equipment and test techniques
- identifying faulty components and system contamination
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- selecting appropriate materials, equipment and solutions for specific refrigeration systems

Required knowledge

Look for evidence that confirms knowledge of:

- operating principles of refrigeration systems
- characteristics, properties and operating specifications of each type of refrigerant
- safety precautions and work practices to be undertaken when handling or working with refrigerants
- methods of identifying stored refrigerants
- methods of identifying the type of refrigerant used in refrigeration systems
- relevant codes and regulations applying to refrigeration systems
- procedures and safety precautions for testing/checking refrigeration systems
- corrective actions for system and component faults including appropriate basic electrical safety checks
- types of leak detection equipment/techniques and their applications
- causes of contamination in refrigeration systems and their effect on refrigeration system performance
- procedures, tools and equipment to be used to clean up contaminated systems
- care and use of vacuum pumps
- tools, techniques and equipment required to carry out recovery procedures

REQUIRED SKILLS AND KNOWLEDGE

- procedures for storing/disposing of recovered refrigerant
- consequences of releasing quantities of refrigerant into the atmosphere
- procedures for charging refrigeration systems
- correct refrigerant for a range of given applications
- tools, techniques and equipment required to charge a refrigeration system with refrigerant
- precautions to be taken when charging by various methods, refrigeration systems with refrigerant
- procedures for checking level and adding lubricating oil
- properties and uses of refrigeration oil
- hazards and control measures associated with handling refrigerants, including housekeeping
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to test, recover, evacuate and charge refrigeration systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the assessment, evacuation and charging of refrigeration systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Relevant information	Manufacturers' technical data, pressure temperature charts, operating manuals
Appropriate operating procedures	In the case where specific equipment does not have standard operating procedures
Appropriate corrective action	Isolation and tagging of faulty components, repair and/or replacement
Contamination	Moisture, non-condensables, solids, acids etc.
Refrigerant	All refrigerants including CFCs, HCFCs, HFCs, natural refrigerants, ammonia, etc.
Relevant codes and regulations	Australian Standards Refrigeration and Air Conditioning codes of practice, relevant ozone and greenhouse substance legislation

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Undertake preventive maintenance checks/adjustment on domestic/light commercial refrigeration/air conditioning</p>	<p>1.1. Visual inspection and testing with appropriate test equipment are carried out according to refrigeration/air conditioning principles, procedures and safety requirements.</p> <p>1.2. Preventative maintenance tasks are performed according to manufacturers' specifications using refrigeration/air conditioning techniques/practices.</p>
<p>2. Undertake fault finding on domestic/light commercial refrigeration/air conditioning equipment</p>	<p>2.1. Equipment components are identified correctly.</p> <p>2.2. The characteristics and operation of each component is understood.</p> <p>2.3. The operational function of each component is inspected and tested.</p> <p>2.4. Correct operation of each component is assessed against specification.</p>
<p>3. Repair/replace faulty domestic/light commercial refrigeration/air conditioning components</p>	<p>3.1. Faulty components are localised and malfunction is confirmed by inspection and testing using refrigeration and air conditioning principles, procedures and safety requirements.</p> <p>3.2. The refrigerant is removed safely from the system and contained in accordance with standard operating procedures and regulatory requirements where appropriate.</p> <p>3.3. Faulty components are dismantled and repaired/replaced to manufacturers' specifications as required.</p> <p>3.4. Replacement parts are selected from manufacturers' catalogues according to required specifications and relevant legislation.</p>
<p>4. Return to service domestic/light commercial refrigeration/air conditioning equipment</p>	<p>4.1. Components are reassembled and tested for correct operation and assessed against specification.</p> <p>4.2. Using domestic refrigeration/air conditioning principles and system application techniques, correct operation of the equipment is verified.</p> <p>4.3. Maintenance records/service reports are completed by appropriate designated means.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check refrigeration/air conditioning system components for correct operation
- obtaining, reading and interpreting specifications
- comparing component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- undertake calculations and numerical operations within the scope of this unit
- recording and reporting service activities

Required knowledge

Look for evidence that confirms knowledge of:

- preventative maintenance requirements
- variations in component identities
- operation and characteristics of range of components
- procedures for checking refrigeration/air conditioning components for correct operation
- procedures for identifying components for repair or replacement
- recovery, containment and storage procedures
- effect of poor repair practices
- processes and resources to select replacement parts
- assembly procedures
- procedures, tools, techniques and equipment for adjusting refrigeration/air conditioning systems for correct operation and to specification
- procedures for obtaining authorisation of adjustments outside of operational specifications
- basic electrical principles, testing and fault identification
- hazards and control measures associated with the service and repair of domestic

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to service and repair domestic and light commercial refrigeration and air conditioning equipment. Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with servicing of domestic and light commercial refrigeration and air conditioning equipment and components or other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes,

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- selecting and using equipment for testing and checking temperature, flow and quality of the conditioned air
- checking task-related information
- identifying faults and non-compliances
- making required adjustments to achieve specifications
- comparing operation of each system component against system specification
- planning and sequencing operations
- entering routine and familiar information onto proformas and standard workplace forms
- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents

Required knowledge

Look for evidence that confirms knowledge of:

- measuring instruments/equipment and specifications for checking air temperatures, air flows, air quality and air properties
- procedures for reporting non-conformances
- air properties controlled by the air conditioning system
- measuring instruments/equipment and specifications required for checking component noise and vibration levels
- procedures and sequence for performing preventative maintenance on air conditioning systems
- specifications and process for identifying system components
- operational characteristics of the system components
- procedures for inspecting and testing system components and operational compliance
- procedures for assessing that the operation of system components meet system specification
- appropriate process for localising and confirming faulty components
- procedures and all legislative and regulatory requirements for safely removing the refrigerant from the system and charging the system
- procedures for dismantling and repairing faulty components and selecting replacement parts
- procedures for reassembling and testing components

REQUIRED SKILLS AND KNOWLEDGE

- procedures for completing maintenance records/service reports
- hazards and control measures associated with maintaining and repairing commercial air conditioning systems and components
- safe work practices and procedures
- selecting and using equipment for testing electrical compliance of equipment
- documenting and reporting
- calculations and numerical operations within the scope of this unit

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Undertake preventive maintenance checks/adjustment on large central air handling systems	1.1.The temperature, humidity, quality, pressure and flow of air delivered to zones by the air handling system are checked for conformance to specification. 1.2.The noise/vibration levels of the air handling sub-systems are checked for conformance to specification. 1.3.Preventative maintenance tasks are performed according to manufacturers' specifications using appropriate refrigeration and air conditioning techniques/practices.
2. Undertake fault finding on large central air handling systems	2.1.Components of sub-systems are correctly identified. 2.2.The characteristics and operation of each sub-system component can be explained. 2.3.The operational function of each sub-system component is inspected and tested. 2.4.Correct operation of each component is assessed against specification.
3. Repair/replace faulty air handling components	3.1.Faulty components are localised and malfunction is confirmed by inspection and testing using air conditioning principles, procedures and safety requirements. 3.2.Faulty components are dismantled and repaired to manufacturer' specifications as required. 3.3.Replacement parts are selected from manufacturers' catalogues according to required specifications.
4. Return to service large central air handling systems	4.1.Components are reassembled and tested for correct operation and assessed against specification. 4.2.Correct operation of the equipment is verified using air handling principles and techniques. 4.3.Maintenance records/service reports are completed by appropriate designated means.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check large central air conditioning system, sub-systems and components for correct operation
- obtaining, reading and interpreting specifications
- comparing system, sub-systems and component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- undertaking calculations and numerical operations within the scope of this unit
- using tools, techniques and equipment necessary to check large central air conditioning system, sub-systems and components for correct operation

Required knowledge

Look for evidence that confirms knowledge of:

- appropriate measuring instruments/equipment and specifications for checking humidity, air temperatures, air flows, air quality and air pressure
- procedures for reporting non-conformances
- measuring instruments/equipment and specifications required for checking sub-system noise and vibration levels
- procedures and sequence for performing preventative maintenance on an air conditioning system
- specifications of and process for identifying primary and secondary refrigerant, or air distribution/reticulation systems
- operational characteristics of each sub-system component
- procedures and specifications for inspecting and testing each sub-system component
- process for localising and confirming faulty components
- procedures for dismantling and repairing faulty components
- procedures for selecting replacement parts
- procedures for completing maintenance records/service reports

REQUIRED SKILLS AND KNOWLEDGE

- hazards and control measures associated with maintaining and repairing large central air handling systems
- safe work practices and procedures
- codes and regulations relevant to the refrigeration/air conditioning industry including environmental and ozone and greenhouse substance legislation

Prerequisite units		
Path 1	MEM05006C	Perform brazing and /or silver soldering
	MEM09002B	Interpret technical drawing
	MEM10002B	Terminate and connect electrical wiring
	MEM10010B	Install pipework and pipework assemblies
	MEM12002B	Perform electrical/electronic measurement
	MEM12023A	Perform engineering measurements
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18049C	Disconnect/reconnect fixed wired equipment up to 1000 volts a.c./1500 volts d.c.
	MEM18055B	Dismantle, replace and assemble engineering components
	MEM18086B	Test, recover, evacuate and charge refrigeration systems

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Undertake preventive maintenance checks/adjustment on industrial refrigeration systems and components	1.1. The temperature and properties of the controlled medium/s are checked for conformance to specification. 1.2. The noise/vibration levels of the industrial refrigeration system components are checked for conformance to specification. 1.3. Preventative maintenance tasks and plant room safety equipment checks are performed according to manufacturers' specifications using refrigeration principles techniques/practices.
2. Undertake fault finding on industrial refrigeration systems and components	2.1. System components are identified correctly. 2.2. The characteristics and operation of each component is understood. 2.3. The operational function of each component is inspected and tested. 2.4. Correct operation of each component is assessed against specification.
3. Repair/replace faulty industrial refrigeration components	3.1. Faulty components are localised and malfunction is confirmed by inspection and testing using industrial refrigeration principles, procedures and safety requirements. 3.2. The refrigerant is removed safely from the system and contained in accordance with standard operating procedures and regulatory requirements where appropriate. 3.3. Faulty components are dismantled and repaired to manufacturers' specifications as required. 3.4. Replacement parts are selected from manufacturers' catalogues according to required specifications.
4. Return to service industrial refrigeration systems and components	4.1. Components are reassembled and tested for correct operation and assessed against specification. 4.2. The system is charged with correct refrigerant safely and in accordance with standard operating procedures and regulatory requirements where appropriate. 4.3. Using industrial refrigeration principles and system application techniques, correct operation of the equipment is verified. 4.4. Maintenance records/service reports are completed by appropriate designated means.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check industrial refrigeration systems and components for correct operation
- comparing system and component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- measuring instruments/equipment, specifications and procedures for checking temperature(s)
- properties of controlled medium(s)
- measuring instruments/equipment, specifications and procedures for checking components noise and vibration levels
- procedures for reporting non-conformances
- procedures and sequence for performing preventative maintenance on air conditioning systems
- specifications, operational characteristics and process for identifying system components
- process for localising and confirming faulty components
- procedures and all legislative and regulatory requirements for safely removing the refrigerant and charging the system
- procedures for dismantling, repairing, reassembling and testing components

REQUIRED SKILLS AND KNOWLEDGE

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to maintain and repair industrial refrigeration systems and components. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the maintenance and repair of industrial refrigeration systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Controlled medium/s

Process chilling, secondary refrigerants e.g. glycol, brine, air, water, ice etc.

Preventative maintenance tasks

Check/adjust fan belts, check/clean filters, check/clean heat exchangers (evaporator and condenser), overhaul of major system components, cleaning of major system components, testing operation of all safety devices

Unit Sector(s)

Competency field	Maintenance and diagnostics
------------------	-----------------------------

MEM18091B Maintain and repair multi stage, cascade and/or ultra-cold industrial refrigeration systems

Modification History

Single band identifier removed to clarify dual status

Unit Descriptor

Unit descriptor	This unit covers maintaining and repairing multi stage, cascade cryogenic and ultra-cold industrial refrigeration systems.
------------------------	--

Application of the Unit

Application of the unit	<p>It includes interpreting drawings and diagrams of complex industrial refrigeration systems; utilising fault finding procedures and test equipment to identify and diagnose faults in systems; isolating faulty components; and rectifying common faults.</p> <p>This unit applies to retrofitting existing multi stage, cascade and/or ultra-cold industrial refrigeration systems; reconditioning components; returning to service and testing systems; and completing service reports for administrative action. The application of this competency must cover a variety of refrigeration equipment and systems.</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C5 (AQF level V).</p> <p>Unit Weight: 4</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check multi stage, cascade and/or ultra-cold industrial refrigeration systems and components for correct operation
- comparing system, sub-systems and component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information

Required knowledge

Look for evidence that confirms knowledge of:

- measuring instruments/equipment and specifications for checking the temperature/s and properties of the controlled medium/s
- procedures for reporting non-conformances
- measuring instruments/equipment and specifications for checking component noise and vibration levels
- procedures and sequence for performing preventative maintenance
- procedures and sequence for performing safety equipment checks
- specifications and process for identifying system components
- operational characteristics of the system components
- procedures and all legislative and regulatory requirements for safely removing the refrigerant from the system
- procedures for dismantling and repairing components, selecting replacement parts, reassembling and testing

	<p>manufacturers' specifications.</p> <p>4.4.Replacement items are selected from manufacturers' catalogues to meet specification.</p> <p>4.5.Control components are reassembled using appropriate principles and procedures according to specification.</p>
<p>5. Check and adjust sequence of refrigeration/air conditioning controls</p>	<p>5.1.Sensors and controllers are identified using circuit diagram and refrigeration/air conditioning system control principles.</p> <p>5.2.Necessary adjustments to sequence control circuit are made to meet operational specification.</p> <p>5.3.Correct operation of control circuit is checked and confirmed against operational specification.</p> <p>5.4.Refrigeration/air conditioning controls are returned to service to specification.</p> <p>5.5.Appropriate follow-up procedures are adopted.</p> <p>5.6.Service/maintenance report is completed to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- using tools, techniques and equipment necessary to check commercial and/or industrial refrigeration and/or air conditioning controls for correct operation
- comparing system, controls and component performance/operation against specifications
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken

REQUIRED SKILLS AND KNOWLEDGE

- documenting results of the adjustments
- planning and sequencing operations
- checking task-related information
- undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- refrigeration/air conditioning system operational requirements and specifications
- application of common system/circuit components and controllers
- the importance of following installation procedures in terms of control operation, safety and reliability
- measuring instruments/equipment and specifications for checking air temperatures, air flows, air quality and air properties
- procedures for reporting non-conformances
- operational sequence of the system
- typical adjustments to correct sequencing variations from specification
- procedures for recording/reporting modifications/alterations/maintenance etc.
- typical causes of component failure
- procedures for rectifying faulty conditions and components
- maintenance requirements
- procedures for returning to service and commissioning refrigeration/air conditioning control systems
- hazards and control measures associated with maintaining and repairing commercial and/or industrial refrigeration and/or air conditioning controls, including housekeeping
- safe workplace practices and procedures
- codes and regulations relevant to the refrigeration / air conditioning industry including environmental and ozone and greenhouse substance legislation

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to maintain and repair commercial and/or industrial refrigeration and/or air conditioning controls. Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the repair/replacement of commercial and/or industrial refrigeration and/or commercial air conditioning controls, or other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes,

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Install/replace refrigeration/air handling system controls	<p>1.1.Refrigeration/air handling control principles and system diagrams are interpreted.</p> <p>1.2.Control system/circuit components are identified and inspected for compliance to specifications.</p> <p>1.3.Sequential installation is undertaken according to manufacturers' specifications and standard operating procedures.</p>
2. Check and adjust refrigeration/air handling system control sequence and operation	<p>2.1.The temperature, quality, pressure and properties of the air delivered by the air handling system is checked for conformance to specification.</p> <p>2.2.Controls and system operation are checked against operational specifications using appropriate test equipment and application of principles/techniques.</p> <p>2.3.Adjustments are performed to sequence system to meet/align to operational requirements and specifications.</p> <p>2.4.Modifications/alterations are recorded and reported in accordance with standard operating procedures.</p> <p>2.5.Controls and system operation are checked and commissioned to specifications.</p>
3. Fault find refrigeration/air handling system control circuits	<p>3.1.Control system/circuit diagrams and data sheets are interpreted.</p> <p>3.2.Control system/circuit components are identified and inspected.</p> <p>3.3.Control system/circuit is traced and action of components is diagnosed to identify and localise faults.</p> <p>3.4.Control system/circuit parts are tested using appropriate test equipment and application principles.</p> <p>3.5.Control system/circuit parts are assessed against operational specification.</p> <p>3.6.Fault condition is localised at the component level.</p> <p>3.7.Faulty condition is evaluated, root cause is analysed and corrective action is planned.</p>
4. Maintain, repair/replace system control components	<p>4.1.Correct maintenance procedures are applied according to standard operating procedures.</p> <p>4.2.Repair procedures are selected and applied using correct and appropriate techniques, tools and equipment.</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>4.3. Faulty items are tested, repaired or replaced using sequential installation procedures according to manufacturers' specifications.</p> <p>4.4. Replacement items are selected from manufacturers' catalogues to meet specifications.</p> <p>4.5. System control components are reassembled using appropriate principles and procedures according to specification.</p>
<p>5. Check and adjust sequence of refrigeration/air handling system controls</p>	<p>5.1. Using circuit diagram and refrigeration/air handling system control principles, circuit sensors and controllers are identified.</p> <p>5.2. Necessary adjustments are made to sequence system control circuit to meet operational specification.</p> <p>5.3. Correct operation of system control circuit is checked and confirmed against operational specification.</p> <p>5.4. Refrigeration/air handling system controls are commissioned to specification.</p> <p>5.5. Appropriate follow-up procedures are adopted.</p> <p>5.6. Service/maintenance report is completed to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check integrated industrial refrigeration and/or large air handling system controls for correct operation
- obtaining, reading and interpreting specifications
- comparing system and component/circuit control performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative

REQUIRED SKILLS AND KNOWLEDGE

- requirements to all work undertaken
- documenting results of the adjustments
 - reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
 - planning and sequencing operations
 - checking task-related information
 - undertaking calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- safe work practices and procedures
- system operational requirements and specifications
- application of common refrigeration/air handling system components and controllers
- importance of following installation procedures in terms of control operation, safety and reliability
- measuring instruments/equipment and specifications for checking air temperatures, air flows, air quality and air properties
- procedures for reporting non-conformances
- refrigeration/air conditioning test equipment and application
- operational sequence of systems
- typical adjustments to correct sequencing variations from specification
- procedures for recording/reporting modifications/alterations
- typical causes of component failure
- procedures for rectifying faulty conditions
- maintenance schedule and procedures
- common adjustments that can be made to control systems and their effect
- procedures for returning to service or commissioning refrigeration/air handling control systems
- maintenance/service recording/reporting requirements
- hazard and control measures associated with maintaining and repairing integrated industrial refrigeration and/or large air handling system controls, including housekeeping

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to maintain and repair integrated industrial refrigeration and/or large air handling system controls. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the repair/replacement of integrated industrial refrigeration and air handling systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes,</p>

EVIDENCE GUIDE	
	standards, manuals and reference materials.
Guidance information for assessment	

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Test equipment	Multimeter, ammeter, megohm meter, cable analyser, pressure gauges
Adjustments	Pressure controls, timers, thermostats
Modifications/alterations	Pressure control settings, timer settings, thermostat settings. Must comply with manufacturers' specifications. Must be documented in site drawings/documents
Maintenance procedures	Testing of all control sequences, testing of all safety devices
Corrective action	Replacement, repair, adjustment

Unit Descriptor

Unit descriptor	This unit covers servicing and repairing commercial and supermarket equipment and components.
------------------------	---

Application of the Unit

Application of the unit	<p>It includes interpreting drawings and diagrams of refrigeration equipment; utilising basic fault finding procedures, service manifolds, and test equipment to identify and diagnose faults in equipment; isolating faulty components including control components; and rectifying common faults.</p> <p>This unit applies to the service and repair of commercial refrigeration systems. This can include supermarket, retail, wholesale and other commercial applications. This would include service and repair work, reconditioning components, returning to service and testing equipment, and completing service reports for administrative action. It may include retrofitting alternative refrigerants in existing equipment.</p> <p>Where any rectification, modification involves electrical disconnection and reconnection, then Unit MEM18049C (Disconnect/reconnect fixed wired equipment up to 1000 volt a.c./1500 volt d.c.) should also be considered.</p> <p>When there is a requirement to remove and replace components by brazing and or silver soldering, Unit MEM05006B (Perform brazing and/or silver soldering) should also be accessed.</p> <p>Where detailed maintenance is carried out on control systems, Unit MEM18057B (Maintain/service analogue/digital electronic equipment) should also be selected.</p> <p>Band: A</p> <p>Unit Weight: 6</p>
--------------------------------	---

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Undertake preventive maintenance checks/adjustment on commercial refrigeration equipment	1.1. Visual inspection and testing with appropriate test equipment is carried out according to refrigeration principles, procedures and safety requirements. 1.2. Preventative maintenance tasks are performed according to manufacturers' specifications using refrigeration techniques and practices.
2. Undertake fault finding on commercial refrigeration equipment	2.1. Equipment components are identified correctly. 2.2. The characteristics and operation of each component is understood. 2.3. The operational function of each component is inspected and tested. 2.4. Correct operation of each component is assessed against specification.
3. Repair/replace commercial refrigeration components	3.1. Faulty components are localised and malfunction is confirmed by inspection and testing using refrigeration principles, procedures and safety requirements. 3.2. The refrigerant is removed safely from the system and contained in accordance with standard operating procedures and regulatory requirements where appropriate. 3.3. Faulty components are dismantled and repaired to manufacturers' specifications as required. 3.4. Replacement parts are selected from manufacturers' catalogues according to required specifications.
4. Return to service commercial refrigeration equipment	4.1. Components are reassembled and tested for correct operation and assessed against specification 4.2. Using refrigeration principles and system application techniques, correct operation of the equipment is verified. 4.3. Maintenance records/service reports are completed by appropriate designated means.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- planning and sequencing operations
- checking task-related information
- using tools, techniques and equipment necessary to check commercial and supermarket equipment and components for correct operation
- comparing system, controls and component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments
- calculations and numerical operations within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- test procedures
- frequency and reason for preventative maintenance
- variations in component identities
- operation and characteristics of range of components
- procedures for checking refrigeration components for correct operation
- tools, techniques and equipment necessary to check refrigeration system components
- procedures for identifying components for repair or replacement
- recovery containment and storage procedures for refrigerants
- refrigeration systems evacuation procedures
- effect of poor repair practices
- process to select replacement parts
- assembly and testing procedures
- procedures, tools, techniques and equipment for adjusting refrigeration systems
- procedures for obtaining authorisation of adjustments outside of operational specifications
- codes and regulations relevant to the refrigeration/air conditioning industry, including environmental and ozone and greenhouse substance legislation
- hazards and controls associated with commercial refrigeration, including

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
<p>1. Undertake preventive maintenance checks</p>	<p>1.1. Legislative requirements are understood. 1.2. System components are identified. 1.3. The operational function of each component is inspected and tested. 1.4. Correct operation of each component is assessed against specification. 1.5. Visual inspection and testing with appropriate test equipment is carried out according to refrigeration principles, procedures and safety requirements. 1.6. Preventative maintenance tasks are performed to manufacturers' specifications using refrigeration techniques and practices.</p>
<p>2. Undertake fault finding on cooling tower/evaporative condenser water systems components</p>	<p>2.1. System components are identified correctly. 2.2. The characteristics and operation of each component is understood. 2.3. The operational function of each component is inspected and tested. 2.4. Correct operation of each component is assessed against specification.</p>
<p>3. Repair/replace cooling tower/evaporative condenser components</p>	<p>3.1. Faulty components are localised and malfunction is confirmed by inspection and testing using refrigeration principles, procedures and safety requirements. 3.2. Faulty components are dismantled and repaired to manufactures' specifications as required. 3.3. Replacement parts are selected from manufacturers' or other catalogues according to required specifications. 3.4. Where required, refrigerant is removed/contained following refrigeration principles and procedures to all relevant standards, codes and safety standards.</p>
<p>4. Return to service cooling tower/evaporative condenser components.</p>	<p>4.1. Components are reassembled and tested for correct operation and assessed against specification. 4.2. Where required, refrigerant is added to system, following refrigeration principles and procedures to all relevant standards, codes and safety standards. 4.3. Using refrigeration principles and system application, correct operation of the equipment is verified. 4.4. Maintenance records/service reports are completed</p>

ELEMENT	PERFORMANCE CRITERIA
	by appropriate designated means.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check cooling tower/evaporative condenser fans, valves, centrifugal pumps and components for correct operation
- obtaining and interpreting specifications
- comparing system and component performance/operation against specification
- identifying faulty components and non-compliances
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- removing and replacing refrigerant
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments

Required knowledge

Look for evidence that confirms knowledge of:

- terminology of cooling towers
- psychometrics
- measuring instruments/equipment, specifications and procedures for checking temperature(s)/humidity/air flow
- operation of centrifugal water pumps
- terminology of centrifugal water pumps
- field testing centrifugal pumps
- operation of water valves including bypass valve either mechanical or electrical operation
- procedures for testing and operation of controls
- procedures for testing of fan motors
- v belts
- measuring instruments/equipment, specifications and procedures for checking

REQUIRED SKILLS AND KNOWLEDGE

- component noise and vibration levels
- procedures for reporting non-conformances
- procedures and sequence for performing preventative maintenance on refrigeration and air conditioning systems
- specifications, operational characteristics and process for identifying system components
- process for localising and confirming faulty components
- procedures and all legislative and regulatory requirements for safely removing the refrigerant and charging the system
- procedures for dismantling, repairing, reassembling and testing components
- procedure for removal/recharging refrigerant
- procedures for selecting replacement parts
- procedures for completing maintenance records/service reports

Evidence Guide

Return to service refrigerant flow control</p>	<p>4.1.System is evacuated and recharged with refrigerant safely, in accordance with refrigeration principles and procedures and relevant standards and codes.</p> <p>4.2.System is leak tested in accordance with refrigeration principles/procedures and relevant standards and codes.</p> <p>4.3.Flow control is adjusted to manufactures' specifications in accordance with refrigeration principles and procedures and relevant standards and codes.</p> <p>4.4.Performance check is undertaken in accordance with refrigeration principles and procedures and relevant standards and codes.</p>

ELEMENT	PERFORMANCE CRITERIA
	4.5.Maintenance records service reports are completed by appropriate designated means.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- using tools, techniques and equipment necessary to check for correct operation
- obtaining and interpreting specifications
- comparing system and component performance/operation against specification
- select replacement controls and/or components
- identifying faulty components and non-compliances
- using appropriate test equipment to identify non-compliance
- safely remove, contain or add refrigerant to relevant Australian standards or codes
- making required adjustments to achieve specifications
- sourcing and using relevant catalogues/lists
- applying safety procedures, standard operating procedures and legislative requirements to all work undertaken
- documenting results of the adjustments

Required knowledge

Look for evidence that confirms knowledge of:

- operation of refrigerant flow controls including:
 - TEV
 - internal equalised
 - external equalised
 - direct operating
 - servo operated
 - pilot operated
- MOP
- cross charged
- gas charged
- capillary tube

REQUIRED SKILLS AND KNOWLEDGE

- thermo electric
- electronic TEV and controllers
- low side floats
- high side floats
- distributors
- reversing valves
- solenoid valves
- non return valves
- EPR
- CPR
- condenser bypass valves
- liquid level controllers
- AX valves
- hand expansion valves
- measuring instruments/equipment, specifications and procedures for checking temperature(s)
- measuring instruments/equipment, specifications and procedures for checking components
- procedures for reporting non-conformances
- procedures and sequence for performing preventative maintenance
- specifications, operational characteristics and process for identifying system components
- process for localising and confirming faulty components
- process for identifying refrigerant type
- procedures and all legislative and regulatory requirements for safely removing the refrigerant and charging the system
- procedures for dismantling, repairing, reassembling and testing components
- procedures for selecting replacement parts
- procedures for completing maintenance records/service reports

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to maintain, adjust, repair or replace refrigerant flow controls, either liquid or vapour, to manufactures' specifications safely to relevant Australian standards codes and regulations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the maintenance, repair/replacement or adjustment of refrigerant flow controls, or other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes,

EVIDENCE GUIDE	
	standards, manuals and reference materials.
Guidance information for assessment	

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Control	Selected from required knowledge list
Parameters	Operational values
Refrigerant control	Could be any selected from list in required knowledge
Characteristics	Operational parameters of the flow control
Associated valves	Check valves, solenoid valves
Test equipment	Refrigeration gauges, thermometers, multimeter, vacuum pump, leak detector, associated hand tools, specialised hand tools
Components	Any part of any flow control selected from list in required knowledge
Performance	Pressures, temperatures and relationships

MEM18097A Manufacture cavity dies

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers preparing to manufacture and manufacturing cavity dies including matching use of hand and hand held power tools, assembly of the tooling components and trialling the tooling.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit includes the skills required to manufacture and trial all types of production tooling.</p> <p>Work is undertaken autonomously or in a team environment.</p> <p>The tooling being produced may include, but is not limited to, the following types:; forging dies, extruding dies, die casting (high and low pressure and gravity feed), plastic moulds (injection, compression, blow and foam) and glass moulds or dies requiring precision manufacture. A normal range of tool room equipment would be used which may include lathes, mills, copy/duplicator, grinders, EDM and wire cut equipment, precision measurement, hand and power tools.</p> <p>Where simple welding or brazing skills are required, see Units MEM05012C (Perform routine manual metal arc welding) and Unit MEM05006B (Perform brazing and/or silver soldering). Where manufacture of press tools and gauges is required, unit MEM18014B (Manufacture press tools and gauges) should be selected.</p> <p>Band: A</p> <p>Unit Weight: 8</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare to manufacture cavity die	<p>1.1.Tooling requirements are determined from customer's components drawings, prints or sample component.</p> <p>1.2.Tooling type and design are conceptualised and planned with reference to customer's specifications (written or verbal) for numbers, finish, quality and material.</p> <p>1.3.Production machine to be used to produce components is assessed and considered in tooling design.</p> <p>1.4.Tool design is interpreted and visualised from tooling drawings, prints or plan and checked against customer requirements.</p> <p>1.5.Selected production machine mounting requirements are determined to ensure any special or additional provisions are incorporated in tooling design.</p>
2. Manufacture tooling	<p>2.1.Appropriate materials are selected and obtained to meet tooling requirements for strength, durability, component finish, heat treatment qualities where necessary and accounting for materials availability.</p> <p>2.2.Selected material is tested for hardness as appropriate to aid selection of machine tools, hand tools and hand held power tools to be used to fashion or shape tooling components.</p> <p>2.3.Plan is developed to sequence and stage manufacturing process, including establishing datum, mark out, rough out (machine or fashion), stress relieve/heat treat, finish size, fashion and fit and assemble componentry.</p>
3. Perform machining operations	<p>3.1.Appropriate machines and machining process are selected from a range of standard tool room machines to shape/produce tooling components to specifications.</p>
4. Use hand and hand held power tools	<p>4.1.A range of hand and hand held power tools are selected and used to fashion/manufacture tooling components to specification.</p> <p>4.2.Where practical, components sample or section is produced for testing.</p>
5. Assemble tooling components	<p>5.1.Using acceptable tool making techniques and procedures, components are checked and fitted/assembled correctly to specifications.</p>

ELEMENT	PERFORMANCE CRITERIA
6. Trial tooling	<p>6.1. First-off component is checked with precision instruments against specification.</p> <p>6.2. Tooling is modified as necessary to produce components to specification.</p> <p>6.3. Modified tooling is re-trialled and component is produced.</p> <p>6.4. Conformance to specification is verified and reported according to standard operating procedures.</p> <p>6.5. Where necessary, all deviations or modifications to original tooling design, prints or plans are recorded and reported according to standard operating procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- obtaining and interpreting relevant drawings, prints and/or sample components, specifications and instructions
- sketching or drawing the tool design
- incorporating mounting requirements into tooling design
- testing tooling materials for hardness
- preparing sequential plan for the manufacture of the required tooling
- shaping/producing tooling components to specifications using appropriate machines and machining processes
- using hand and hand held power tools to fashion/ manufacture tooling components to specification
- assembling and fitting tooling components using acceptable tool making techniques and procedures
- producing first-off component/product
- checking first-off component/product for conformance to specification
- modifying tooling using appropriate tool making techniques and procedures
- checking conformance of the component/product to specifications
- recording/reporting modifications or alterations to original tooling design

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- customers' tooling requirements
- the type of tooling to be manufactured
- the machine(s) in which the tooling is to be used
- the tooling design concept in terms of customer specifications and proposed production machine(s)
- the performance requirements of the tooling
- the method of mounting the tooling in the production machine into which it is to be installed
- the physical properties of a range of tool steels
- the appropriate materials for each component of the tooling to be produced
- the reasons for selecting the chosen materials in terms of: strength, durability, component finish, heat treatment requirements, and availability
- the procedures for hardness testing materials
- the effect of material hardness on machinability of the material
- the appropriate machinery and tools to be used to fashion or shape tooling components
- the reasons for selecting the chosen machinery and tooling
- the reasons for establishing a sequential plan for the manufacture of tooling
- the procedures for documenting plans for the manufacture of tooling
- the hand and hand held power tools to be used to fashion/manufacture the required tooling components
- the reasons for selecting the chosen hand and hand held power tools
- procedures for fitting/assembling the tooling components
- the precautions to be taken when fitting/assembling tooling components
- the appropriate precision instruments for checking the components produced
- the specifications of the finished product
- causes of any non-conformance to specification
- the tool making techniques/procedures to be applied to return the tooling to specification
- procedures for reporting/recording the conformance of the component/product produced by the tooling to specifications
- procedures for recording/reporting modifications and/or alterations to tooling design
- hazards and control measures associated with the manufacture of tools, including housekeeping
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to manufacture cavity dies. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with cavity die manufacture or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. MEM18098A Prepare to perform work associated with fuel system installation and servicing

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to prepare for work associated with fuel system installation and servicing. It complements other relevant general occupational health and safety (OHS) and any required technical units.

Application of the Unit

This unit applies to personnel who install or service fuel systems and equipment. They will typically undertake this in a service station forecourt which may be operational or be shut down for refurbishment or under construction.

Work associated with installation and servicing may be undertaken by a person working autonomously or in a team.

The skills and knowledge needed to undertake the work are covered by relevant technical units of competency.

Band: A

Unit weight: 2

Licensing/Regulatory Information

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|---|--|
| 1 Plan and prepare for installation or servicing task | 1.1 Clarify job requirements, as appropriate
1.2 Clarify variations to work plan and take appropriate action
1.3 Obtain required work permits
1.4 Identify and comply with emergency and safety procedures for worksite |
| 2 Confirm location and nature of key fuel system components | 2.1 Identify and locate above and below ground storage components
2.2 Identify and locate fuel conveying systems
2.3 Identify and locate pumps and pump systems
2.4 Identify and locate dispensing systems
2.5 Confirm location of fuel system components with site plan
2.6 Identify and report any hazards and/or inconsistencies with site plan, equipment drawings and regulatory requirements |
| 3 Assess and manage risks associated with the work | 3.1 Identify fuels and other hazardous materials on site
3.2 Identify other hazards
3.3 Identify and confirm shut-off procedures, details of evacuation plan and location of emergency equipment
3.4 Assess hazards and determine risks
3.5 Determine appropriate control measures to control risks
3.6 Select appropriate tools and equipment to be used on the job
3.7 Identify nature and location of required isolations |

- 3.8 Determine the type of, and appropriate locations for, barriers to prevent unauthorised access to the work location and put them in place before job commencement

Required Skills and Knowledge

Required knowledge includes:

- types of fuels and their associated hazards
- fuel delivery systems and associated hazards:
 - pressure
 - suction
 - flammability
 - explosive potential
 - toxicity
 - static electricity
- dangerous goods classification and labelling
- storage and handling of dangerous goods
- suction/pressure systems
- first stage vapour recovery systems
- second stage vapour recovery systems
- pumps and pumping principles and problems
- fuel dispensing and metering systems
- interpretation of permits, site maps and hazard maps
- regulatory requirements, including licensing, OHS and environmental regulations

Required skills include:

- communicating effectively, including recording, reporting and documenting information
- identifying and complying with appropriate legislation and regulations
- identifying hazards
- assessing hazards and determining risks
- determining appropriate control measures using the hierarchy of control
- identifying support and assistance requirements
- relating to people from a range of social, cultural and ethnic backgrounds and of varying physical and mental abilities
- selecting and using appropriate personal protection equipment
- using relevant computer systems

Evidence Guide

Overview of assessment	
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>A person who demonstrates competency in this unit must be able to provide evidence of the ability to:</p> <ul style="list-style-type: none"> • determine work requirements • identify hazards and risks associated with the worksite • establish appropriate plan for the performance of work • apply any state/territory licensing, OHS and environmental legislation, standards and industry codes of practice.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • The application of competency may be assessed in the workplace or simulated work environment. • Assessment may be conducted before a candidate goes to site using appropriate simulations, scenarios and questioning. • The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • The assessment environment should not disadvantage the candidate. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. • The following resources should be made available: <ul style="list-style-type: none"> • workplace location or simulated workplace • a bank of appropriate scenarios.
Method of assessment	
Guidance information for assessment	<p>Assessment processes and techniques must be culturally appropriate and suitable to the language, literacy and numeracy capacity of the candidate and the competency being assessed. In all cases where practical assessment is used, it should be combined with targeted questioning to assess the underpinning knowledge.</p>

Range Statement

<p>Work permits</p>	<p>Work permits may include, but are not limited to:</p> <ul style="list-style-type: none"> • permits issued by client • permits using the Australian Institute of Petroleum (AIP) form • other work documents required for the job <p>Types of permit may include, but are not limited to:</p> <ul style="list-style-type: none"> • hot work • cold work • confined space • excavation • working at heights
<p>Emergency and safety procedures for worksite</p>	<p>Emergency and safety procedures for worksite may include, but are not limited to:</p> <ul style="list-style-type: none"> • specific procedures for that site • location of emergency shut-off and procedures for re-setting emergency shut-off • dealing with spills or other losses in containment • fire response • other incident response procedures for that site • other site-specific hazards and procedures
<p>Storage components</p>	<p>Storage components may include, but are not limited to:</p> <ul style="list-style-type: none"> • single wall tanks • jacketed steel tanks • double-walled tanks (dry and liquid filled interstitial space) • fibre composite (FRP) tanks • high density polyethylene (HDPE) tanks
<p>Fuel conveying systems</p>	<p>Fuel conveying systems may include, but are not limited to:</p> <ul style="list-style-type: none"> • steel pipes • HDPE pipes • vapour recovery systems and pipes • pipe joining
<p>Pumps and pump systems</p>	<p>Pumps and pump systems may include, but are not limited to:</p> <ul style="list-style-type: none"> • centrifugal pumps • positive displacement pumps • pressure and suction systems • pumping problems • multiproduct pumps

<p>Dispensing systems</p>	<p>Dispensing systems may include, but are not limited to:</p> <ul style="list-style-type: none"> • fuel metering • hoses and nozzles • stage two vapour recovery • flow control valves • discharge control • multiproduct dispensers
<p>Corrosion protection systems and components</p>	<p>Corrosion protection systems and components may be:</p> <ul style="list-style-type: none"> • cathodic protection: <ul style="list-style-type: none"> • impressed current • sacrificial anode • wrapping • coating
<p>Fuels</p>	<p>Fuels may include, but are not limited to:</p> <ul style="list-style-type: none"> • petrol • ethanol blend fuels (of various concentrations) • diesel and biodiesel • liquefied petroleum gas (LPG)
<p>Hazardous materials</p>	<p>Other hazardous materials may include, but are not limited to:</p> <ul style="list-style-type: none"> • ‘solid’ pool chlorine (calcium hypochlorite) • ‘liquid’ pool chlorine (sodium hypochlorite solutions) • lubricants • cleaning agents • gas ‘bottles’ • workshop materials
<p>Appropriate tools</p>	<p>Appropriate tools may include, but are not limited to tools that are:</p> <ul style="list-style-type: none"> • intrinsically safe • ergonomically appropriate to the job • safe and in good condition
<p>Required isolations</p>	<p>Required isolations may include, but are not limited to:</p> <ul style="list-style-type: none"> • lock out/tag out • double block and bleed • use of blanks, blinds and goggles • removal of spool piece • removal of mechanical drives

Barriers	Barriers are methods of excluding unauthorised access from the worksite and may include, but are not limited to: <ul style="list-style-type: none">• temporary fencing• bollards• witches hats• tapes• signage
Problems	Typical problems may include, but are not limited to: <ul style="list-style-type: none">• variations to the work schedule• variations to the work scope• issues with the public or site personnel• failure of equipment• inappropriate/incomplete permit or work instructions

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare metals for casting	1.1. Metals and alloys are selected in appropriate proportions. 1.2. Metals and alloys are weighed out correctly and in correct wax-to-metal ratios. 1.3. Relevant data is recorded.
2. Conduct pre-casting operations	2.1. Equipment is prepared according to standard operation procedures. 2.2. Inert gas supply/delivery and vacuum systems are checked, if applicable. 2.3. Preheating/glazing is carried out, if applicable. 2.4. Temperature of invested flask is maintained.
3. Melt jewellery metal	3.1. Protective coating is applied to jewellery metal as appropriate. 3.2. Jewellery metal is heated. 3.3. Jewellery metal casting temperature is achieved.
4. Cast metals	4.1. Burn-out flask is positioned correctly. 4.2. Molten metal is tapped. 4.3. Allowance is made for adequate solidification time. 4.4. Furnace is operated in accordance with work site procedures.
5. Perform post-casting operations	5.1. Casting flask is removed and stored in a safe manner. 5.2. Casting materials/consumables are cleaned/stored/disposed as appropriate.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying metals and their alloys
- weighing metals and their alloys
- setting up, checking and operating equipment

REQUIRED SKILLS AND KNOWLEDGE

- maintaining furnace temperatures
- heating metals and alloys
- applying safe casting procedures
- working within heating timeframe constraints
- housekeeping
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings

Required knowledge

Look for evidence that confirms knowledge of:

- hazards related to casting
- safety clothing/apparatus for casting
- identification of precious metals and alloys
- calculations for proportions/quantities of alloys
- data recording procedures
- consequences of poor work practices
- equipment preparation and operating procedures
- burn-out cycles and testing of heat register/control device
- procedures for checking and maintaining inert gas supply/delivery seals and vacuum systems
- melting points of various metals/alloys
- furnace start-up and shut-down procedures
- housekeeping and equipment cleaning procedures
- safe work practices and procedures
- properties of jewellery metals in relation to casting

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify drawing specifications	1.1. Specifications are identified from appropriate sources. 1.2. Required data is identified and collected. 1.3. Appropriate equipment is selected.
2. Prepare or modify drawing	2.1. Illustrations are consistent with enterprise standard operating procedures. 2.2. Illustration is rendered, if applicable. 2.3. Illustration and accompanying documentation are approved in accordance with standard operating procedures.
3. File/store of illustration	3.1. Working and reference drawings/illustrations are used/stored/filed/copied/issued in accordance with standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying and collecting data necessary to produce the illustration
- selecting equipment appropriate to the illustrating method and requirements
- using colour, contour, shadow/highlight techniques for emphasis to display jewellery design concept
- interpreting and clarifying illustration requirements
- drawing and rendering
- modifying drawings

Required knowledge

Look for evidence that confirms knowledge of:

- common documentation, storage and retrieval
- isometric and orthographic drawing perspectives
- drawing equipment and applications, storage and maintenance
- drawing methods

REQUIRED SKILLS AND KNOWLEDGE

- rendering applications and techniques and tools for the creation of illustration effects
- jewellery designs - e.g. shanks, settings styles, shoulders, decorative finishes
- working properties of jewellery metals used in practical manufacturing applications

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

A person who demonstrates competency in this unit must be able to prepare jewellery illustrations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Context of and specific resources for assessment

This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.

This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with preparing jewellery illustrations or other units requiring the exercise of the skills and knowledge covered by this unit.

Method of assessment

Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.

EVIDENCE GUIDE

Guidance information for assessment

MEM19003B Handle gem materials

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers handling and examining gem materials during jewellery manufacture, repair or alteration to minimise the risk of damage to gem materials (including diamonds).
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to handling of gem materials to minimise risk of damage, through familiarity and understanding of the physical and chemical properties of natural, composite, synthetic, imitation and treated gem materials that may affect handling requirements.</p> <p>Emphasis is placed on knowledge of the principles of gemology, gemstone and diamond nomenclature, gemstone processing enhancement and repair, and appreciation of gemstone qualities.</p> <p>This unit applies to an individual working autonomously in a jewellery manufacturing environment and guided by strict rules of procedure.</p> <p>Equipment would include 10x loupe, tweezers and thermal probes.</p> <p>The range of gem materials would include all natural, synthetic, treated, composite and imitation gem materials that may reasonably be expected to be encountered in the workplace.</p> <p>Note: The competencies covered by this unit do not include the requirement to perform accurate and positive gemstone identifications.</p> <p>Band: A</p> <p>Unit Weight: 6</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare equipment for gemstone examination	1.1.Examination methods and <i>equipment</i> are selected appropriate to the gem material and examination requirements. 1.2.Equipment and specimen/s are prepared.
2. Perform gemstone examinations	2.1.The physical and optical properties of gem materials are observed. 2.2.Examination results are recorded and verified.
3. Handle gem materials	3.1.Handling measures appropriate to gem material are identified. 3.2.Gem materials are handled to minimise risk of damage.
4. Investigate and report examination results	4.1.Examination results are prepared and recorded.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard work procedures, charts, lists, illustrations and other applicable reference documents
- checking and clarifying task-related information
- entering task-related information onto proformas and workplace documents
- selecting procedures and equipment for examination of gem materials
- preparing, pre-setting, balancing, calibrating, and levelling equipment
- cleaning specimens
- using equipment according to manuals and standard operating procedures
- identifying relevant physical and optical properties of gemstones
- recording results and comparing results with known control items/charts/lists/graphs/diagrams and resource materials
- reading valuation documents and making comparisons
- verifying outcomes

REQUIRED SKILLS AND KNOWLEDGE

- selecting and applying handling measures and precautions in relation to given gem materials, work processes and tools/equipment
- preparing format/documentation of results according to standard operating procedures.
- interpreting results
- obtaining sufficient evidence to support conclusions
- undertaking numerical operations and calculations/formulae within the scope of this unit
- following verbal instructions

Required knowledge

Look for evidence that confirms knowledge of:

- examination methods for gem materials in relation to the properties and features that may affect specific materials during jewellery manufacture, repair or alteration
- equipment required for examination and the function of each
- limitations of the selected equipment/methods
- standard operating procedures and supplier/manufacture specifications
- the procedures for correct use of selected equipment
- definitions of processes and features
- physical and optical properties of relevant gemstones
- the process for verifying results
- resource materials
- handling measures and precautions for specific gem materials during jewellery manufacture, repair or alteration
- specific handling measures and precautions used during given jobs
- evidence used in support of conclusions
- terminology and definitions
- limitations/errors in process/methods
- sources of independent verification
- hazards and control measures associated with handling gem materials, including housekeeping
- the effects of inadequate housekeeping and workplace procedures
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to handle and examine gemstone materials. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with handling and examining gemstone materials or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Equipment

- Refractometer
- UV light
- Microscope
- 10 X loupe
- Tweezers

Investigate

- Assess need for further examination
- Cross reference other records
- Cross reference valuation documents

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine item requirements	1.1.Item production information is identified. 1.2.Process/technique is selected for production of item. 1.3.Item material/s is selected. 1.4.Appropriate tools, equipment and processes are selected.
2. Produce one-off design/item	2.1.Construction plan is developed to meet specifications/stages of process. 2.2.Item components are prepared using appropriate techniques/procedures. 2.3.Design/item is produced/assembled.
3. Finish and inspect work	3.1.Item is checked for compliance with specifications. 3.2.Product data is recorded using appropriate documentation. 3.3.Final finish and storage procedures are applied.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting design specifications and following instructions (oral or written)
- interpreting drawings
- weighing and measuring
- selecting appropriate tools and equipment
- selecting appropriate materials and manufacturing techniques
- applying appropriate fabrication and finishing procedures, which may include electroplating
- identifying alternative metals/materials
- meeting compliance specifications
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings
- entering routine and familiar information onto proformas and standard workplace forms

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- reasons for selecting particular metals, construction methods, manufacturing and finishing techniques
- tools and equipment matched to processes
- planning/process stages
- working properties of precious and non-precious metals
- fine detail manufacturing processes
- knowledge of workplace hazards and emergency procedures
- various components of jewellery items
- appropriate measuring devices and recording methods
- procedures for final treatment/safe handling and storage of items
- occupational health and safety procedures
- use and application of personal protective equipment
- safe work practices and procedures
- relevant hazards and control measures related to the competency

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to produce three-dimensional jewellery items. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. MEM19006B Replace watch batteries

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers selecting and replacing digital/analogue watch power cells.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to the selection and replacement of digital/analogue watch power cells whilst operating in a jewellery/watch workshop environment with access to the appropriate equipment.</p> <p>Some knowledge of watch glasses and seals is required, however specific replacement functions for these are not covered by this unit. Testing functions relate only to the measurement of voltage, consumption and resistance.</p> <p>This competency does not apply to diver and other water-resistant watch types. Water resistance and pressure testing is not covered by this unit, however identification of watches requiring testing as well as procedures for arranging testing are a requirement of this unit.</p> <p>Where power cell replacements in these two categories are of common practice with associated testing, and/or identification/cleaning/supply/fitting of waterproofing/water resistance components, the appropriate horological units should be selected.</p> <p>Band: A</p> <p>Unit Weight: 1</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify watch case construction	1.1. Case material and construction is identified. 1.2. Case types and their functions are identified. 1.3. Associated parts and consumables are identified.
2. Open and close watches	2.1. Workshop tools and equipment are selected and used appropriately. 2.2. Watch cases are opened and closed correctly. 2.3. Parts are inspected and results are reported and/or recorded.
3. Select power cells	3.1. Appropriate batteries/power cells are selected.
4. Replace power cells	4.1. General inspection of surface/contact areas is performed. 4.2. Appropriate batteries/power cells are selected and installed. 4.3. Voltage, consumption and resistance are measured. 4.4. Power cells are handled and stored correctly.
5. Arrange water resistance and pressure testing	5.1. Watches requiring water resistance and/or pressure testing are identified. 5.2. Water resistance and pressure testing is arranged.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- handling case, movement and other watch parts
- cleaning case and watch parts
- opening/closing watch cases
- inspecting for obvious damage/wear and/or moisture intrusion.
- inserting and removing batteries
- interpreting charts and information sheets
- measuring voltage/ resistance/consumption
- reading and interpreting routine information on written job instructions,

REQUIRED SKILLS AND KNOWLEDGE

specifications and standard operating procedures. May include drawings

Required knowledge

Look for evidence that confirms knowledge of:

- applicable horological terminology
- design of case types and their functions
- types of batteries/power cells and their functions
- battery cell construction
- cases including water resistant, dustproof and diver's
- analog, digital, multi-function and mechanical watch functions
- wear and the possible effects on glass and adjustors
- the watch-specific tools and equipment
- manufacturers' information/specifications/procedures
- location and cause of moisture and corrosion effects
- handling/cleaning/adjustment procedures
- OH&S issues for mercury and lithium batteries
- appropriate symbols and other identifying relevant standards information and their location
- relevant internal and/or external water resistance and pressure testing bodies/personnel
- arrangements/procedures for dispatch and receipt of watches
- battery features and identification codes
- parts associated with power cell function
- location and cause of moisture and corrosion effects
- watch functions
- procedures to confirm power cell status

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify setting requirements	1.1. Setting requirements are identified. 1.2. Gemstone status is assessed. 1.3. Setting metal is identified.
2. Prepare materials and equipment for setting	2.1. Tools are selected for use in achieving the desired outcome. 2.2. Tools are prepared and maintained to produce required specifications. 2.3. Metal is prepared for setting.
3. Perform gemstone setting	3.1. Gemstones are secured correctly. 3.2. Setting metal is finished/burnished to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- selecting and preparing tools
- identifying metals
- identifying gemstone features
- adjusting, sharpening and maintaining tools
- preparing metals
- securing gemstones
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings

Required knowledge

Look for evidence that confirms knowledge of:

- setting processes and terminology
- gemstone features and handling procedures
- suitability of metal for carving and setting
- maintenance of tools
- setting techniques, processes and procedures

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to perform basic gemstone setting. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with gemstone setting or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

assessment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Tools

Various holding and securing devices, pliers, burrs, scaupers, burnishers, emery, beadars

Setting requirements

Type of setting, specific product handling measures

Unit Sector(s)

Unit sector

Co-requisite units

Co-requisite units

Competency field

Competency field	Jewellery and horological
------------------	---------------------------

MEM19008B Prepare jewellery designs

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers preparing jewellery designs and associated documentation with a view to producing the designed item/s.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit applies to jewellery designs developed with view to producing the designed item/s using current commercial procedures, including traditional hand-fabrication techniques and/or in combination with a range of manufacturing technologies.</p> <p>Procedures may include CNC and mass finishing activities. Preparation of designs may include 2D and 3D CAD applications.</p> <p>Where CAD is used, the appropriate units should also be selected. Where jewellery illustrations only are prepared, Unit MEM19002B (Prepare jewellery illustrations) should be selected.</p> <p>Band: A</p> <p>Unit Weight: 6</p>
--------------------------------	---

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM13003B	Work safely with industrial chemicals and materials
	MEM13004B	Work safely with molten metals/glass
	MEM16006A	Organise and communicate information
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18003C	Use tools for precision work
	MEM19002B	Prepare jewellery illustrations
Path 2	MEM08010B	Manually finish/polish materials
	MEM13004B	Work safely with molten metals/glass
	MEM16006A	Organise and communicate information
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM19001B	Prepare jewellery metal casting
	MEM19002B	Prepare jewellery illustrations
Path 3	MEM16006A	Organise and communicate information
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM18003C	Use tools for precision work

Prerequisite units		
	MEM19003B	Handle gem materials
	MEM19007B	Perform gemstone setting
	MEM19014B	Perform hand engraving

Employability Skills Information

Employability skills	This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify design requirements	1.1.Design requirements, purpose and needs are determined from a variety of applicable sources and reference documents. 1.2.Where necessary, further research/idea development is undertaken. 1.3.Information is consolidated and analysed. 1.4.Where applicable, customer is advised on design considerations and limitations and further clarification is gained as necessary.
2. Develop design concept	2.1.Concept is developed, employing design principles. 2.2.Design process is documented. 2.3.Basic forms and proportions are established. 2.4.Where applicable, decorative aesthetics are applied. 2.5.Design concept is confirmed as necessary.
3. Produce drawings for item manufacture	3.1.Appropriate manufacturing technologies are selected. 3.2.Working technical and finished drawings are developed. 3.3.Production requirements/instructions are specified and communicated to appropriate persons.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading and interpreting information on specifications, design documentation, illustrations, design drawings and other applicable source documents
- identifying purpose and needs, including design restraints, budget considerations, item end-use, proportions and desired features, available materials
- checking and clarifying information
- developing research/idea to sufficient level in order to determine customer expectations and/or design outcomes
- evaluating abstract and applied concepts/data for use in a commercial environment

REQUIRED SKILLS AND KNOWLEDGE

- interpreting design concepts/drafts as appropriate for client/industry technician
- collecting and collating data relevant to design
- communicating concepts in terms suitable to relevant customer or other contacts e.g. engineer, master pattern maker
- documenting and maintaining design process, features and design development notes
- producing basic form drawings that accurately reflect design concept
- using balance, proportion, highlights, shadowing, texturing effects appropriately
- selecting technologies suitable for manufacture of item(s)
- undertake numerical operations, geometry and calculations within the scope of the unit

Required knowledge

Look for evidence that confirms knowledge of:

- design resources and where to locate them
- research techniques and available resources
- social trends, cultural/environmental/social context
- relevant industry literature
- existing designs, ethical and competitive considerations
- applicable industry standards or regulations
- brainstorming techniques for research/idea development
- design principles including form, function, harmony, line definition (interpretive/actual)
- drawing media and their functions/applications including paper, watercolour, pastel/ink/pencil
- drawing tools and their functions/applications including stencils, rubbers etc.
- design documentation
- form drawing development
- geometric forms and drawing techniques e.g. cones, cylinders, cube, rectangle, sphere etc. 3D concept, axis lines, conversion of 2D to 3D concepts, depth, perspective and scale (1,2,3 point)
- enhancement techniques
- available manufacturing technologies and their suitability for jewellery manufacture
- types of working drawings and their uses
- the inter-relation between technical and design drawings
- industry requirements and availability of industry expertise
- hazard and control measures associated with preparing jewellery designs
- safe work practices

Evidence Guide

Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Design requirements

- Materials
- Stone specifications
- Special requirements
- Size restrictions
- Budgetary range

Design principles

- Correct construction techniques employed
- Construction limitations of materials
- Drawing to scale for designs
- Form, function, harmony, line definition (interpretive/actual)

Decorative aesthetics

Surface finishing such as sandblasting, polishing, electroplating

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare investment materials	1.1. Sprue/tree materials are prepared/built, if necessary. 1.2. Assembled tree/materials are checked, if necessary. 1.3. Casting methods and equipment are selected appropriate to task. 1.4. Associated tools and equipment are prepared.
2. Invest flask	2.1. Flask is assembled for casting. 2.2. Investment is mixed correctly. 2.3. Curing stage is prepared.
3. Operate 'lost wax' sequence	3.1. 'Low melt' wax is evacuated by steam process, if necessary. 3.2. Investment flask is positioned/stored correctly. 3.3. 'Burn-out' procedure is selected and applied.
4. Decontaminate/clean site	4.1. Tools, equipment and site area are cleaned correctly.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading and following routine task-related information
- checking pre-assembled wax for security, size, and weight
- selecting/checking/cleaning sprue and investment materials
- selecting appropriate components
- recording weights
- selecting and assembling appropriate flask size
- calculating and weighing out proportions of investment material and water
- performing mixing, vibrating and vacuum procedures
- operating steamer and process
- inspecting flasks for residue prior to burn-out
- selecting appropriate burn-out procedure/equipment

REQUIRED SKILLS AND KNOWLEDGE

- positioning/storing flask
- inspecting and adjusting oven/kiln cavity
- cleaning working area, and all tools and investing equipment of investment residue
- disposing of residue and materials

Required knowledge

Look for evidence that confirms knowledge of:

- procedures for checking built wax
- casting methods and equipment and processes
- sprue/investment/tools/equipment/materials
- techniques for sprue/tree styles and selection/application of the processes
- selection of flask and components for specific casting processes
- procedures and computations for mixing proportions, time calculations, volume and weights, etc.
- appropriate gloss off/set time allowance prior to base removal
- occupational health and safety requirements/issues
- requirements for curing/set stage
- sequence and values for time, temperature, and/or cam settings
- steamer process
- suitability of flask/investment for burn-out
- sequence, procedures, adjustments for variables
- procedures for storage and positioning
- procedures for cleaning, storage and/or removal of materials
- the reasons for appropriate/approved housekeeping functions
- recording procedures
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare and pack mould frame/systems	1.1.Appropriate mould frame/moulding system is selected for given job. 1.2.Appropriate rubber is selected for style of master. 1.3.Rubber is prepared and packed correctly.
2. Vulcanise/cure rubber	2.1.Appropriate curing system is selected. 2.2.Assembled mould is cured, cooled, removed.
3. Release mould	3.1.Appropriate tools and procedure for the release of master pattern are selected. 3.2.Master pattern is released correctly.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- following work procedures
- selecting appropriate frame/system to suit master requirements
- preparing/packing master, frame/system
- selecting variables of time, temperature, and pressure
- cutting rubber
- selecting and using tools/methods for release of master
- safely releasing master without damage
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings
- using measurement skills needed to meet the requirements of this unit
- entering routine and familiar information onto proformas and standard workplace forms
- planning, sequencing operations

Required knowledge

Look for evidence that confirms knowledge of:

- work procedures
- procedures for assessing frame/system

REQUIRED SKILLS AND KNOWLEDGE

- the specific master requirements
- procedures for assessing rubber/ master suitability/compatibility
- working limitations of rubber
- procedures for correct packing technique
- packing variations for a range of situations
- methods for establishing the appropriate time, temperature and pressure settings for the selected process
- the stages in the process for mould curing, removal and cooling
- correct selection of tools/procedures
- sequence of procedures for release of master
- the placement of mould/vent lines
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Perform wax injection of moulds	1.1.Appropriate wax material is selected for given task. 1.2.Injection equipment/tools are prepared. 1.3.Moulds are prepared correctly. 1.4.Wax injection procedures are carried out correctly.
2. Remove and inspect patterns	2.1.Wax pattern is removed without damage. 2.2.Wax pattern is inspected and stored as required. 2.3.Work area is secured and cleaned.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- following work procedures
- selecting wax type according to wax/model/cavity specifications
- preparing moulds
- rectifying inappropriate mould features
- completing injection
- removing duplicated wax pattern
- checking duplicate for compliance with master/specifications and irregularities
- reporting/recording irregularities
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings
- using measurement skills needed to meet the requirements of this unit
- entering routine and familiar information onto proformas and standard workplace forms
- planning, sequencing operations

Required knowledge

Look for evidence that confirms knowledge of:

- wax types and characteristics
- procedures for wax injection equipment/processes for the given values of time, temperature, pressure

REQUIRED SKILLS AND KNOWLEDGE

- mould conditions
- injection procedures
- minor variations and adjustments to processes/ equipment situations
- undamaged wax duplicate removal techniques for a range of situations
- procedures for wax duplicate inspection
- common irregularities
- causes of imperfections
- remedies for imperfections
- safe storage procedures
- procedures for safe cleaning, disposal, and storage
- hazards and control measures associated with working with hot wax, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine master requirements	1.1.Customer specifications are identified.
2. Prepare materials for production of wax model	2.1.Appropriate waxes are selected. 2.2.Stock materials are cut to appropriate length. 2.3.Appropriate tools are selected and used.
3. Produce wax models	3.1.Material use and production time are optimised. 3.2.Wax is sculpted to specifications.
4. Finish wax models	4.1.Imperfections in final wax model are minimised. 4.2.Surface finishes are applied.
5. Assess suitability of final wax product	5.1.Product is inspected for compliance with specifications. 5.2.Final product is modified as necessary.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- clarifying customer specifications
- selecting appropriate method for construction of wax model for the supplied specifications
- selecting wax to suit construction method and required finish
- roughing out shapes with minimal wastage, effort/time in final finishing
- fusing joints to achieve optimum strength and quality
- applying texture finishing, high polishes, etc.
- using protective safety equipment
- inspecting product for correct tolerances, allowance for casting shrinkage and finishing processes
- modifying original product to meet required tolerances and finishes
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings
- using measurement skills needed to meet the requirements of this unit
- entering routine and familiar information onto proformas and standard workplace

REQUIRED SKILLS AND KNOWLEDGE

forms

- planning, sequencing operations

Required knowledge

Look for evidence that confirms knowledge of:

- factors affecting construction of wax model, including type of wax, hand tools, method of construction, final finish, weight of finished product
- variations in end product and the relationship with wax types
- methods to be used to produce the outcome requirements/specifications and minimise waste
- tools for preparing and producing wax for specific wax types and constructions
- importance of minimising material wastage and time taken during roughing/finishing
- appropriate key features/datum points
- purpose/requirements for selected surface finish
- evaluation of product by weight formulation
- effects of toxic fumes of melting wax
- effects of casting shrinkage and finishing processes
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to produce a jewellery wax model. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with producing a jewellery wax model or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Materials

Materials	Materials may include those of different colours/hardness/properties
Tools	Electric and hand held tools, e.g. heat irons, wax guns, saws, carving tools, wax files, flaming torch
Surface finishes	Fine emery, Shellite

Tools**Surface finishes****Unit Sector(s)**

Competency field

Competency field	Jewellery and horological
------------------	---------------------------

MEM19013B Produce jewellery metal masters

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers the manufacturing jewellery master pattern(s) for jewellery reproduction, mainly by hand held application of processes. It requires the application of precision measurement and hand-making/machine skills to a greater level than that required in Unit MEM19005B (Produce three-dimensional precision items).
------------------------	---

Application of the Unit

Application of the unit	<p>This unit applies to the manufacture of jewellery master pattern(s) for jewellery reproduction, mainly by the hand held application of processes. Work would be mainly autonomous in a jewellery manufacturing environment.</p> <p>Understanding the principles of casting/moulding/shrinkage and wax injection is required. General production processes used to finish the reproductions must be understood. Competency in this unit cannot be fully met without appropriate comparison to the finished production item.</p> <p>Where machining is required as a major component of this manufacturing concept, then unit MEM07005C (Perform general machining) should be selected. The equipment used may include hand and power tools, lathes and non-CNC machines.</p> <p>Where component(s) require preparation or manufacture by NC/CNC/CAD/CAM as an integral part of this process by the person working autonomously, the relevant competencies should be accessed.</p> <p>If electro-deposition and/or electro-forming of metal is required, MEM07024B (Operate and monitor machine/process) or Unit MEM08003C (Perform electroplating operations) should also be selected.</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C5 (AQF level V).</p> <p>Band: A</p> <p>Unit Weight: 4</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine master pattern requirements	1.1. Specifications and drawings are interpreted for required pattern information. 1.2. Technique/process to achieve suitable quality finish for masters are selected. 1.3. Materials to produce given item are selected. 1.4. Tools, equipment and processes appropriate to task are selected.
2. Produce master	2.1. Materials are marked out and/or construction plan developed to meet specifications/stages of process. 2.2. Pattern material(s) are prepared. 2.3. Master is produced.
3. Finish and inspect work	3.1. Item is checked for compliance with specifications. 3.2. Weights and measurements are recorded. 3.3. Sprue material is fitted if necessary. 3.4. Final finish is applied, where appropriate, and item is stored. 3.5. Master is evaluated and compared to production sample.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- following procedures
- planning and sequencing operations
- checking and clarifying task-related information
- entering information onto proformas and other workplace forms
- checking for conformance to specifications
- using precision measurement equipment

REQUIRED SKILLS AND KNOWLEDGE

- measuring items to specified tolerances
- undertaking numerical operations and calculations/formulae within the scope of this unit
- following verbal instructions
- orally reporting information
- collecting and assessing data for practical applications
- selecting methods, materials and tools/equipment
- selecting and using tools/equipment/processes
- applying a working knowledge of metals and materials
- pre-forming/producing item/components to size and shape
- checking product for compliance to specifications and design outcomes
- matching product to original design concept/drawings/ specifications
- inspecting surface condition for pre-treatment/plating process
- making allowance for sequential processes
- recording statistical evidence
- positioning/securing sprue section
- undertake final treatments according to standard operating procedures and OH&S
- handling and storing products
- comparing/calculating design specifications

Required knowledge

Look for evidence that confirms knowledge of:

- understanding of the principles of casting, moulding, shrinkage, and wax injection
- location of information/specifications
- clarification approval processes
- collective information/drawings/specification/product development plans
- wrought, forge, machine and cast techniques and applications
- the appropriate properties/function of materials
- prerequisite working specifications/abilities/limitations of selected materials
- stored data on specifications and processes
- planning/process stages
- the difference between master and finished item specifications
- fine detail work processes
- levels of acceptable performance and productivity outcomes
- finishing processes
- sequential processes required for design outcomes
- inspection and compliance checks
- surface/parts/areas appropriate for post production processes for setting/electroplating/enamelling, and for the subsequent processes of moulding and waxing

REQUIRED SKILLS AND KNOWLEDGE

- reasons for the recording of specifications
- appropriate measuring devices and recording methods
- handling and design needs associated with sprue placement
- appropriate knowledge of wax injection, moulding, casting, molten metal flow/solidification
- procedures for final treatment/safe handling/storage of item
- relevancy of calculations/specifications
- appropriate techniques, tools and equipment to measure machined components
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures
- reasons tools, equipment, resources and reference material are stored in accordance with OH&S and standard operating procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify engraving requirements	1.1. Engraving requirements are identified from applicable documents. 1.2. Sequence of procedures is correctly identified.
2. Select and maintain engraving equipment and accessories	2.1. Appropriate equipment is selected for use. 2.2. Gravers are prepared to industry standards.
3. Perform hand engraving	3.1. Item is measured and marked out for engraving as required. 3.2. Work piece is positioned and held/clamped effectively and without damage to the work piece. 3.3. Work is undertaken according to standard work procedures and workplace/industry standards.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- identifying the engraving sequence
- selecting and using gravers, scorpers and other applicable tools
- controlling engraving tools
- machining and sharpening graver shape and cutting angles
- using datum lines/points
- handling and securing work pieces
- maintaining points/cutting edges/polished faces

Required knowledge

Look for evidence that confirms knowledge of:

- engraving terminology
- sources of task-related information

REQUIRED SKILLS AND KNOWLEDGE

- securing methods and limitations
- different gravers, scorpers and other tools and their applications
- techniques for producing and maintaining cutting edges
- equipment used for maintaining gravers
- required industry standards
- tool maintenance
- basic hand engraving techniques
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify enamelling requirements	<p>1.1. Enamelling requirements are identified from workplace documentation and customer requirements.</p> <p>1.2. Item materials and construction are assessed for enamelling suitability.</p> <p>1.3. Appropriate enamelling technique and materials are selected for the required outcome.</p>
2. Prepare items and materials for enamelling	<p>2.1. Enamels are prepared for enamelling operation.</p> <p>2.2. Metal surfaces are prepared for enamelling.</p> <p>2.3. Additional processing of item is carried out prior to enamelling.</p>
3. Enamel jewellery items	<p>3.1. Equipment and items are set up for firing.</p> <p>3.2. Items are enamelled to specification.</p> <p>3.3. Items are fired correctly.</p>
4. Finish and inspect work	<p>4.1. Final finishes are applied.</p> <p>4.2. Product is checked for compliance to specifications.</p> <p>4.3. Faults are rectified.</p> <p>4.4. Relevant job information is recorded.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting instructions and job requirements from job packets, verbal or written instructions/diagrams
- checking and clarifying task-related information
- analysing item features/properties/construction for enamelling suitability
- selecting colour appropriate to job specification/design
- selecting enamelling technique/materials to suit job specification/design, item properties and construction
- washing and/or grinding enamels
- cleaning, polishing/burnishing and pre-treating and pickling metals by hand

REQUIRED SKILLS AND KNOWLEDGE

- performing additional processing requirements
- applying enamel to achieve desired outcome
- setting equipment to correct temperature
- positioning items for firing using appropriate work holding devices
- monitoring and gauging stages
- removing from heat source at appropriate time to avoid over/under firing
- applying different firing techniques and final treatments/finishes
- masking out
- final firing polishing
- checking for conformance to specifications/ design requirements
- identifying causes of non-conformances
- rectifying faults
- entering information onto proformas and other workplace forms

Required knowledge

Look for evidence that confirms knowledge of:

- enamels, base metals and properties relating to enamelling, enamelling techniques, firing techniques and work holding devices, faults and common rectification methods
- factors for determining suitability for enamelling including available enamelling compositions, firing temperatures, metal type and properties, item construction
- different enamelling techniques and terms
- enamelling compositions and techniques and related to specific item properties and factors such as metal type/properties, item construction, firing temperature
- enamels and forms of availability for purchase including leaded/unleaded, opaque/transparent
- terms applied to various enamelling techniques
- use of enamel colour chart to determine suitable colours
- correct working procedures during the preparation of enamel powder
- techniques for washing and grinding enamels, when required, and reasons for doing so
- preparation of metal surfaces by hand cleaning, polishing/burnishing, chemical pre-treatment by acid, surface depletion methods and application to different metals
- hazards and safety measures relating to pre-treatment of metals and preparation of enamels/metals
- additional processing, including stamping, engraving, saw piercing, chasing, oxidising, roller pressing
- tools and equipment for processing and their uses
- methods of applying enamels including wet packing, dry dusting
- melting temperatures of metals and enamels

REQUIRED SKILLS AND KNOWLEDGE

- work-holding devices
- visual appearance of enamel at different stages of firing process
- counter-enamelling techniques and reasons for doing so
- cleaning and lapping processes between firing
- different finishes and methods for achieving specific effects
- masking out methods
- final firing and polishing methods
- features and factors for compliance from original specifications and/or job requirements
- common enamelling faults/incorrect outcomes and their causes, including oxidation, staining, under/over firing
- actions to rectify faults using standard techniques/methods
- job data to be recorded
- procedures to record data
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify pattern and component/item requirements	1.1. Component/item specifications are identified from work instruction. 1.2. Design requirements are identified from work instruction. 1.3. Forming, joining and finishing requirements are identified from work instruction.
2. Transfer designs to templates and work pieces	2.1. Work pieces are prepared as required for drawing transfer. 2.2. Accurate representations component specifications are transferred onto templates or work pieces. 2.3. Material wastage is minimised.
3. Produce 2D patterns/blanks	3.1. Patterns/blanks are produced to specification.
4. Form and finish components/items	4.1. The formed item conforms to design requirements. 4.2. Appropriate tools and equipment are selected for forming, joining and finishing. 4.3. Components/formed items are joined as required. 4.4. Components/items are finished to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying component type, design, material type and specifications from verbal/written instructions, jewellery illustrations and samples
- identifying transfer method from work instruction
- selecting transfer materials, tools and equipment
- identifying required techniques/methods and steps
- selecting and using tools and equipment for forming, joining and finishing
- cutting, rolling and shaping to correct size/thickness
- transcribing markings clearly and accurately onto work piece or template
- adhering templates to work pieces

REQUIRED SKILLS AND KNOWLEDGE

- transferring design to optimise use of material
- minimising filing and finishing requirements
- following design markings
- filing, emery finishing pattern/blank
- folding, bending, curving, dapping etc. as required
- achieving correct symmetry, angle, shape
- correctly aligning joins
- removing excess materials by filing, emery etc.
- undertaking re-forming adjustments if necessary to achieve specifications
- removing scratches, scribe marks and other markings by file, emery etc. to a fine emery finish
- polishing item according to standard operating procedure

Required knowledge

Look for evidence that confirms knowledge of:

- metal types, applications and properties
- jewellery items and components
- methods and tools for transferring designs
- selection of blades, drills and files
- techniques and methods for forming and finishing components/single piece
- tools and equipment for forming and finishing
- polishing techniques
- safe operation of equipment
- use and application of personal protective equipment
- safe work practices and procedures
- relevant hazards and control measures related to the competency

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to construct jewellery components or single-piece items of basic design. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with constructing jewellery components or items or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

assessment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Components/items	Components or single-piece items of basic design
Design requirements	Instructions from supervisor/management, job packet
Forming methods	Cutting, folding, bending, curving, dapping
Joining methods	Primarily by brazing/silver soldering but may include other methods such as riveting
Finishing processes	Filing, emery finishing, basic polishing
Transfer design	Transfer direct to work piece using permanent pen, scribe, freehand and/or by compass, dividers, chinagraph pencil, carbon paper tracing or drawn/copied to template and adhered to work piece
Tools and equipment	Compass, dividers, rules, squares, spring gauges, vernier calipers, piercing saw, files, drill press/pedestal drill, polishing equipment and compounds, ultrasonic cleaner

Prerequisite unit MEM05006B updated to MEM05006C

Unit Descriptor

Unit descriptor	This unit covers constructing jewellery components, single and multiple-piece items involving a range of fabrication processes and techniques.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to the construction of jewellery components, single-piece and multiple-piece items involving a range of fabrication processes and techniques.</p> <p>It requires the ability to use jewellery tools and equipment and safe and efficient work practices to identify fabrication requirements, prepare materials/manufacture components for fabrication and fabricate and finish items.</p> <p>If electroplating skills are required, Unit MEM08003C (Perform electroplating operations) should also be selected.</p> <p>Band: A</p> <p>Unit Weight: 6</p>
--------------------------------	--

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM05006C	Perform brazing and/or silver soldering
	MEM06007B	Perform basic incidental heat/quenching, tempering and annealing
	MEM12023A	Perform engineering measurements
	MEM18001C	Use hand tools

Employability Skills Information

Employability skills	This unit contains employability skills.
----------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify fabrication requirements	<p>1.1.Item design characteristics, dimensions, construction, composition and finish are established from predetermined specifications in accordance with organisational and client requirements.</p> <p>1.2.Fabrication and finish specifications and required outcomes are confirmed and clarified as necessary with appropriate person(s) and in accordance with organisational requirements.</p> <p>1.3.Appropriate preparation and fabrication techniques are established in accordance with item construction, verbal and written specifications, organisational requirements and personal abilities.</p> <p>1.4.Fabrication and finishing activities are prioritised in accordance with designated timeframes, organisational and specific fabrication requirements.</p>
2. Prepare materials for fabrication	<p>2.1.Components, materials and consumables are selected/obtained in accordance with organisational requirements and in consultation with appropriate person(s).</p> <p>2.2.Metals are alloyed to specified quality, as required.</p> <p>2.3.Metals are rolled/drawn down/cut to required dimensions.</p> <p>2.4.Tools and equipment are selected and used appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications and organisational procedures.</p> <p>2.5.Material preparation is conducted using safe operating practices and protective equipment, in accordance with OHS and organisational requirements.</p>
3. Fabricate jewellery item	<p>3.1.Tools and equipment for fabrication are selected and used appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications and organisational procedures.</p> <p>3.2.Applicable fabrication activities are performed using safe operating practices and protective equipment, and in accordance with OHS, organisational and industry accepted methods.</p> <p>3.3.Item is checked to ensure construction conforms</p>

ELEMENT	PERFORMANCE CRITERIA
	with required specifications, quality, organisational and applicable industry standards.
4. Finish jewellery items	<p>4.1.The appropriate surface finish is produced to required specifications in accordance with organisational requirements.</p> <p>4.2.Tools and equipment for embellishing and polishing are selected and used appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications and organisational procedures.</p>
5. Complete fabrication	<p>5.1.Finished item is packaged/presented and stored safely in accordance with organisational requirements.</p> <p>5.2.Documentation is accurately completed and processed in accordance with organisational requirements and standards.</p> <p>5.3.Notification of work completion is made to appropriate person(s) in accordance with organisational procedures.</p> <p>5.4.Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements.</p> <p>5.5.Unused/excess materials are collected and stored/reclaimed in accordance with organisational requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting design specifications and follow instructions (oral or written)
- interpreting drawings
- weighing and measuring
- selecting appropriate tools and equipment
- selecting appropriate materials and manufacturing techniques

REQUIRED SKILLS AND KNOWLEDGE

- applying appropriate fabrication and finishing procedures
- applying safe working skills
- identifying alternative metals

Required knowledge

Look for evidence that confirms knowledge of:

- metals and materials for fabricating a range of jewellery items/designs
- common jewellery design features, constructions and finishes
- metal preparation and fabrication techniques to suit different design requirements
- factors affecting the selection of preparation and fabrication methods
- organisational requirements for fabrication activities
- relevant materials and consumables for given jewellery fabrication jobs
- properties and characteristics of applicable metals
- ratios to create required grade/quality/composition of metals
- melting temperatures and preparation methods for melting applicable metals
- types of ingot moulds and their characteristics/applications
- methods, applications, equipment types and operational requirements for rolling and drawing metals
- process for annealing metals to prevent work hardening
- procedures for checking serviceability of applicable tools and equipment
- safe operating procedure for applicable tools and equipment
- applicable fabrication techniques and processes
- organisation of customer service, quality and work standards
- accepted industry standards of quality
- tools, techniques and materials for embellishing and polishing
- organisation procedures for storage and packaging/presentation of finished items
- security measures for protection of jewellery items
- safe work practices and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to fabricate jewellery items. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with the fabrication of fine jewellery or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate person(s)	Supervisor, client, colleague
Appropriate preparation and fabrication techniques	<ul style="list-style-type: none"> Cutting, folding, bending, curving, dapping, drawing, rolling, doming, annealing, melting, granulation Primarily by brazing/silver soldering but may include other methods such as riveting
Finishing activities	Filing, emery finishing, high and satin polish, various embellishment finishes (sandblasting, brushed, burring, reticulation, burnishing etc.)
Components	Components, single-piece and multiple-piece items involving a range of fabrication processes and techniques, for example various clips, catches and pins
Materials	Precious and non-precious metals
Consumables	Solders and fluxes, drills and blades, polishing compounds, cleaning and finishing materials
Tools and equipment	All hand and power tools appropriate to fabrication of jewellery items and personal protective equipment
Documentation	Job packet, work instructions and procedures, parts and components reference material, materials and consumables used, time and record

RANGE STATEMENT	
	sheets

MEM19018B Repair jewellery items

Modification History

Prerequisite unit MEM05006B updated to MEM05006C

Editorial correction to unit application to include missing notes relating to dual status.

Single band identifier removed to clarify dual status.

Unit Descriptor

Unit descriptor	This unit covers making common repairs to a range of jewellery items. It requires the application of skills and knowledge in jewellery manufacturing and finishing techniques.
------------------------	--

Application of the Unit

Application of the unit	<p>The unit applies to a range of repair work carried out in a jewellery manufacture/repair environment. It requires the ability to use safe and efficient work practices to identify the condition of the item, establish repair requirements and complete and finalise the repair work.</p> <p>If an estimate or quotation for repair is produced, then Unit PRSTS317A (Provide estimate and quote) should also be selected.</p> <p>If jewellery setting is required, then Unit MEM19007B (Perform gemstone setting) should also be selected.</p> <p>If replacement components need to be manufactured for the repair, then the appropriate units should also be selected.</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C5 (AQF level V).</p> <p>Unit Weight: 6</p>
--------------------------------	---

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM05006C	Perform brazing and/or silver soldering
	MEM12023A	Perform engineering measurements
	MEM13003B	Work safely with industrial chemicals and materials
	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM19001B	Perform jewellery metal casting
	MEM19003B	Handle gem materials
	MEM19016B	Construct jewellery components
	MEM19017B	Fabricate jewellery items

Employability Skills Information

Employability skills	This unit contains employability skills.
----------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess item condition	<p>1.1.Item characteristics, construction and composition are identified from specifications in accordance with organisational requirements.</p> <p>1.2.Personal limitations in assessing item condition are identified and assistance is sought from appropriate sources in accordance with organisational procedures.</p> <p>1.3.Condition of item and nature/extent of damage is verified in accordance with organisational procedures, established inspection techniques and original specifications.</p>
2. Establish repair requirements and materials	<p>2.1.Repair requirements, options and recommended actions are established in accordance with organisational requirements and factors impacting on feasibility of repair.</p> <p>2.2.Recommended repairs and options are conveyed to client and required repair is work confirmed in accordance with organisational requirements.</p> <p>2.3.Appropriate repair techniques are selected in accordance with item construction/condition and identified repair requirements.</p> <p>2.4.Replacement components are obtained and/or manufactured in accordance with organisational requirements and in consultation with appropriate person(s).</p>
3. Carry out repairs	<p>3.1.Unforeseen conditions/effects of the repair work are identified and appropriate actions are taken in accordance with organisational requirements.</p> <p>3.2.Tools, equipment, materials and consumables are selected and used appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications and organisational procedures.</p> <p>3.3.All work is conducted using safe operating practices and protective equipment in accordance with OHS and organisational requirements.</p> <p>3.4.Evidence of the repair/repair area is minimised.</p> <p>3.5.Repaired item conforms with original specifications and/or identified customer requirements.</p>
4. Finalise repair	<p>4.1.Finished item is packaged/presented and stored safely in accordance with organisational</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>requirements.</p> <p>4.2.Repair work is documented and confirmed with appropriate person(s) in accordance with organisational procedures.</p> <p>4.3.Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements.</p> <p>4.4.Unused/excess materials are collected and stored/reclaimed in accordance with organisational and requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting design requirements and following instructions (oral or written)
- interpreting drawings
- weighing and measuring
- selecting appropriate tools and equipment
- selecting appropriate materials and repair/manufacturing techniques
- applying appropriate fabrication and finishing procedures
- working safely
- identifying alternative metals
- reading and interpreting routine information on written job instructions, specifications and standard operating procedures. May include drawings
- entering routine and familiar information onto proforma and standard workplace forms

Required knowledge

Look for evidence that confirms knowledge of:

- reasons for selecting particular metals, construction methods, repair/manufacturing and finishing techniques
- knowledge of workplace hazards and emergency procedures
- use and application of personal protective equipment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Factors impacting on feasibility of repair

Cost, time, feasibility, value

Repair techniques

- Retipping
- Reshank
- Restoration
- New collets
- Chain repairs
- Fastening mechanism repairs

Appropriate person(s)

Supervisors, managers, suppliers, technical experts, colleagues

Unforeseen conditions/effects

Effects which could be caused by previous construction and repair techniques

Effects of the repair process on stones or other components

Tools, equipment

All hand and power tools appropriate to construction and repair of jewellery items and personal protective equipment

Materials

Precious and non-precious metals

Consumables

Solders and fluxes, drills and blades, polishing compounds, cleaning and finishing materials, adhesives

RANGE STATEMENT

Documentation	Job packet, work instructions and procedures, parts and components reference material, materials and consumables used, time and record sheets

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Dismantle micro-mechanism components	1.1.Micromechanism components are dismantled for inspection using techniques and principles appropriate to the task.
2. Verify condition and operation of components	2.1.Overall condition of micro-mechanism is assessed. 2.2.Physical condition and operational functioning of components inspected and verified, if necessary, with appropriate persons. 2.3.Faults are identified using tools, equipment and techniques appropriate to the task.
3. Carry out maintenance	3.1.Maintenance requirements are confirmed, if necessary, with appropriate persons. 3.2.Components are lubricated to specification. 3.3.Components are cleaned/replaced and installed as required.
4. Assemble components	4.1.Components are assembled to specification.
5. Check and adjust components	5.1.Components are checked for correct operation. 5.2.Components are adjusted to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- dismantling/removing components using appropriate hand tools and techniques
- removing power from the spring
- removing and dismantling movement
- removing and dismantling balance assembly
- removing/dismantling bridges, mainspring, barrel, winding mechanism
- applying procedures to avoid damage to components during disassembly/assembly
- noting position/assembly of components for re-assembly
- checking timepiece for overall condition, damage to case etc.
- cleaning and preparing components for inspection, including movement

REQUIRED SKILLS AND KNOWLEDGE

- checking components for evidence of toxic contamination, pollution, chemical waste and other contaminants
- checking operation/function of components using appropriate tools and techniques
- identifying defective, damaged or non-serviceable components
- following standard/routine procedures to locate/identify common faults and maintenance requirement
- applying lubricants using appropriate techniques
- cleaning/replacing components in correct sequence, using appropriate tools and techniques
- following OHS procedures
- handling components
- assembling components to specification, including, barrel and mainspring, mechanism (movement), canon pinion, drive train, balance assembly, shock resist system, calendar, winding system and other mechanisms
- verifying operation of components and assemblies, including barrel, mainspring, cannon pinion, endshake, sideshake, power reserve, drive train, calendar, winding system, power source
- adjusting components, assemblies/mechanisms to ensure operation/function to manufacturer specification using appropriate electronic timing and other diagnostic equipment and tools
- operational adjustments and verification including regulation, beat error, balance amplitude, rate, power supply

Required knowledge

Look for evidence that confirms knowledge of:

- component parts, including mainspring, barrel, winding mechanism, electronic circuit, bridges, bearing surfaces, balance assembly, calendar, power source
- techniques and procedures for dismantling/removing components
- common/typical faults and maintenance requirements for common timepieces
- verification processes for condition/function of components of movement including balance assembly, escapement, endshakes, sideshakes, bridges, bearing surfaces, mainspring, barrel, winding mechanism, electronic circuit, freedom of wheel train
- fault-finding procedures
- typical faults caused by wear, blockages and other damage and their effects
- typical contaminants and their effects on operation/functioning of components, including contaminants and foreign objects
- lubricants and lubrication techniques
- cleaning requirements for ensuring correct operation
- OHS procedures for cleaning and maintenance
- techniques/tools for handling and installing components
- tools and techniques for assembling components

REQUIRED SKILLS AND KNOWLEDGE

- safe work practices and safety measures
- required checks and procedures for verifying correct operation/function of components
- procedures/techniques for adjusting components
- operational specification for components and assemblies
- tools and equipment (mechanical and electronic) and their use/application

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify performance requirements for servicing	1.1.Features and performance characteristics of micro-mechanism are identified. 1.2.Performance problems common to make and model are identified. 1.3.Performance requirements for given task are identified and clarified with appropriate persons.
2. Diagnose faults and servicing requirements	2.1.Overall condition of micro-mechanism is assessed. 2.2.Physical condition and operational functioning of components inspected and verified, if necessary, with appropriate persons. 2.3.Servicing requirements are established with appropriate persons. 2.4.Performance problems are diagnosed and verified, if necessary, with appropriate persons. 2.5.Replacement parts are sourced according to enterprise procedures.
3. Service micro-mechanisms	3.1.Components are dismantled and cleaned to specification. 3.2.Requirements for new components are identified. 3.3.Components are refinished/replaced as required. 3.4.Components are assembled and lubricated to specification. 3.5.Components finished and adjusted to specification.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying features and performance characteristics by critical observation of materials/design/finish
- identifying movement type
- identifying typical performance problems and special servicing requirements for given mechanism

REQUIRED SKILLS AND KNOWLEDGE

- identifying missing/damaged components
- determining remedial action
- assessing casing components for wear/damage or missing parts
- using parts and movement catalogues
- determining sequence required for servicing, with reference to available parts, design of product, nature of servicing requirement
- repair costing, including provision for replacement parts
- standard checks of assemblies and subassemblies, balance assembly, escapement, wheel train, motion work, power source (mainspring), calendar, winding and setting mechanisms
- checks for tensioning, functioning, cleanliness, clearances/tolerances, wear and damage
- verifying functioning of additional mechanisms e.g. auto-winding, generating systems, calendar mechanisms
- identifying faults affecting performance
- cleaning and refinishing components e.g. pivots
- selecting and applying correct lubricant based on materials used and torque requirements
- building assemblies and subassemblies
- fitting appearance parts
- evaluating water resistance of completed watch
- adjusting timekeeping to tolerance

Required knowledge

Look for evidence that confirms knowledge of:

- methods/media for identifying performance characteristics
- reasons for specific performance problems/faults e.g. wear, broken parts, fatigue, knocking
- faults in design or materials and special servicing requirements
- general condition features such as obvious damage, contaminants, rust etc.
- interchangeability of parts for specific timepiece
- factors affecting sequence/process for servicing
- techniques, tools and diagnostic equipment for diagnosing and identifying performance problems
- techniques for dismantling assemblies and subassemblies
- operation of equipment for refinishing pivots/bearing replacement
- techniques and procedures for assembling components, assemblies and subassemblies
- applications and use of different lubricants
- correct alignment of hands relating to date change mechanism and dial graduations
- adjusting timekeeping

Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Micro-mechanisms

Mechanical and electric watches and clocks of recent manufacture, or restoration pieces. May include day/date, automatic winding or generating systems. Clock mechanisms may include alarm, striking and chiming mechanisms

Components

Power source, wheel trains, mechanical oscillating systems, motion work and calendar systems

Inspection

Observations of clearances, fits and adjustments, functioning. Operation of systems and performance analysis

Appropriate persons

Customers, supervisors/managers/suppliers, technical experts, colleagues

Specifications

Manufacturer specifications. Recognition of components of product and how quality of component and materials will affect performance

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Adjust timing of precision micro-mechanisms	1.1.Data for precision timing of micro-mechanisms is analysed and interpreted. 1.2.Compensation/adjustment is made to achieve a constant rate.
2. Diagnose precision micro-mechanisms	2.1.Detailed inspection techniques are applied to diagnose and identify performance faults, condition and repair/servicing requirements. 2.2.High tolerance/precision tools and equipment are handled and used correctly.
3. Carry out precision micro-mechanism servicing	3.1.Precision components are replaced as appropriate. 3.2.Components are adjusted to precision tolerances and specifications.
4. Repair and adjust chronograph mechanisms	4.1.Functional elements are adjusted and tested. 4.2.Chronograph components are examined and re-finished as required.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- eliminating/minimising effects of internal external/external influences
- judging adequacy of accuracy
- making timing adjustments include balance spring, dynamic poising, static poising, truing balance (flat and round)
- making detailed observations using high-magnification optics
- testing functioning of components to high tolerances including the functioning of escapement and oscillating system
- removing and replacing assembly and subassembly components including balance staff, pallet staff, pallet jewels and other precision components
- adjusting pallet jewels, safety action of escapement, poise of balance, manipulation of balance spring to minimise error in performance
- tensioning chronograph wheel and minute wheel
- observing and adjusting depth of engagement and operating sequence of

REQUIRED SKILLS AND KNOWLEDGE

- functioning elements
- applying lubrication
 - alignment of hands with dial
 - re-finishing and matching components to existing components to ensure correct functioning
 - fitting and adjusting new and repaired components to function within existing system

Required knowledge

Look for evidence that confirms knowledge of:

- physical limitations and condition of system and control factors influencing isochronism
- inherent influences in design, internal and external influences on rating variation
- adjustment procedures/techniques
- detailed inspection and analysis techniques for diagnosing precision micro-mechanisms
- acceptable tolerances, clearances and limits for precision components
- components suitable for precision outcomes
- effects of adjustment on performance and operation
- criteria for correct adjustment of balance spring and regulating system
- types of chronograph mechanisms and their functioning
- adjustment procedures for chronograph operation, including minute and hour recording systems

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to perform precision micro-mechanism diagnosis and servicing. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with preparing precision micro-mechanism diagnosis and servicing or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning should not require language, literacy and numeracy skills beyond those required in this unit. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Micro-mechanisms

Mechanical and electric precision watches and clocks of recent manufacture, or restoration pieces. Includes chronometer timepieces. May include day/date, automatic winding or generating systems. Clock mechanisms may include alarm, striking and chiming mechanisms

Repair/servicing requirements

- Repairs and timing adjustments include balance spring, dynamic poising, static poising, truing balance (flat and round)
- Repair and adjustment of chronograph mechanisms to ensure correct operation of seconds, minute and hour recording systems

Tools and equipment

Range of precision mechanical/electronic tools and high-tolerance testing equipment for detailed observation diagnosis and servicing. Includes specialist service tools for adjusting oscillating systems and chronograph mechanisms

Precision components

- Timekeeping elements, including balance staff, pallet staff, pallet jewels, wheel trains and other precision components
- Power source, mechanical oscillating systems, motion work, calendar systems

Specifications

- Precision adjustment performed to detailed manufacturer specifications and tolerances
- Account made of inherent influences in design, internal and external influences on

-------------------------	---------------------------

MEM19023A Apply drawing and rendering techniques to jewellery or object design

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to use various drawing techniques in the jewellery or object design creative process. The unit covers conventions, language and forms of drawings and the role of drawings in communicating the tactile, visual and spatial features of a design.

Application of the Unit

This unit applies to jewellery and object designers who are using drawings to develop and explore concepts as part of developing a jewellery or object design. The unit applies to both early and late stages of the design process and covers the role of drawing as a research, idea generation, interpretation and problem-solving tool. It also includes the use of drawing and drawing techniques as a means of representing and communicating the essential features of a design before finalisation and production.

The unit does not cover the production technical drawings intended to guide the manufacture of jewellery or objects by either the designer or others. Where this skill is required see MEM19031A Produce renderings and technical drawings for jewellery and object design construction. The unit also does not cover life drawing and the production of 3D computer-aided design (CAD) based models.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|--|---|
| 1 Use drawing and rendering techniques to explore design options | 1.1 Demonstrate an understanding of the language and forms of drawing and rendering |
| | 1.2 Investigate the range of analytical, observational and imaginative drawing techniques for communication of design features and intent |
| | 1.3 Explore design options through expressive and gestural drawing |
| | 1.4 Explore and sample marks, mark making and surface qualities in drawing |
| 2 Explore tactile and visual qualities of drawing subject | 2.1 Develop body, hand and eye coordination in relation to the act of drawing from observation |
| | 2.2 Complete a linear analysis of jewellery or object |
| | 2.3 Investigate shape, plane and volume in respect to jewellery or object |
| | 2.4 Interpret the effect of light on a form |
| | 2.5 Consider the picture plane and composition |
| | 2.6 Explore real and implied texture |
| 3 Manipulate black and white and coloured drawing media in a creative and sensitive manner | 3.1 Explore and use a range of black and white media to develop design options |
| | 3.2 Explore and use a range of coloured media appropriate to develop design options |
| | 3.3 Use a range of papers and surfaces appropriate to development of design options |

- 4 Use principles of perspective to illustrate spatial illusion
 - 4.1 Use principles of perspective to enhance the spatial illusion of jewellery or objects in space
 - 4.2 Complete freehand perspective drawings showing evidence of an understanding of single, two and three point perspective
 - 4.3 Illustrate views and projections appropriate to design

Required Skills and Knowledge

Required knowledge includes:

- types and characteristics of media, materials and drawing surfaces
- drawing equipment and applications, storage and maintenance
- role of shape, plane and volume in drawing and rendering
- elements and principles of design
- mathematical procedures for estimation and measurement
- 2D and 3D drawing techniques
- occupational health and safety (OHS) requirements

Required skills include:

- exploring, selecting and manipulating a range of media, materials and drawings
- exploring marks and mark making
- drawing from observation
- using perspective in drawing
- applying a range of drawing techniques, such as line drawing, contour drawing and gesture drawing
- drawing to create spatial illusion
- using shape, plane and volume in drawing and rendering
- creating texture in drawing (real and implied)
- applying black and white and coloured rendering techniques
- applying composition techniques
- applying rendering applications and techniques and tools for the creation of illustration effects
- expressing self through intuitive and expressive drawing

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to apply a range of drawing techniques to illustrate perspectives and features of jewellery or object designs.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • demonstrate analytical, observational and imaginative drawing techniques to demonstrate features of jewellery or object designs • produce drawings of jewellery or object designs from single, two and three point perspectives • use drawing tools, materials and techniques to communicate the

	design features.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed assessment guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Elements and Performance Criteria

- | | |
|--|---|
| 1 Determine project requirements | 1.1 Ensure applicable occupational health and safety (OHS), legislative and organisational requirements relevant to CAD applications are verified and complied with |
| | 1.2 Review jewellery or object design brief and parameters to determine drawing and documentation requirements |
| | 1.3 Examine sketches, drawings and other information and confirm calculations and measurements |
| | 1.4 Select and prepare computing equipment and suitable software for jewellery or object designs |
| 2 Use CAD applications to produce 3D model and documentation | 2.1 Set up a 3D environment on the screen to allow multiple viewing |
| | 2.2 Use editing tools to create features and dimensions of jewellery or object |
| | 2.3 Manipulate drawing planes and shapes to create 3D view of jewellery or object |
| | 2.4 Produce isometric, perspective and orthographic projections |
| | 2.5 Extract mass and area properties of jewellery or object model |
| | 2.6 Use principles of perspective to enhance the spatial illusion of jewellery or objects in space |
| | 2.7 Apply basic rendering techniques to 3D model of jewellery or object |
| | 2.8 Apply drawing protocols to refine and document drawing features |
| 3 Save and back up files | 3.1 Determine appropriate presentation for jewellery or object drawings |
| | 3.2 Save and file drawings to allow easy access according to workplace documentation system |

Required Skills and Knowledge

Required knowledge includes:

- state or territory OHS legislation, regulations, standards and codes of practice relevant to the full range of processes for using CAD applications
- elements and principles of design
- terminology and symbols used in drawings and CAD software
- types of CAD equipment and procedures for their safe use, operation and maintenance
- computer programs and CAD applications
- drafting and drawing codes and practices relevant to jewellery and object design
- 2D and 3D drawing techniques
- appropriate mathematical procedures for estimation and measurement
- documentation control procedures
- problem identification and resolution techniques
- jewellery and object design and construction techniques
- rendering applications and techniques and tools for the creation of illustration effects
- region modelling techniques
- solid modelling techniques
- development of sectioned models
- use of cutting plane
- use of cross hatching
- use of pre-drawn library files and primitives to produce 3D models
- use of third level software to produce 3D models
- how to extract mass and area properties
- how to extract area properties from region models
- application of basic rendering techniques to a 3D model

Required skills include:

- communicating ideas and information to enable confirmation of work requirements and specifications
- reading and interpreting workplace documents, including working drawings
- using mathematical ideas and techniques to correctly complete measurements, calculate area and volume, and estimate other material requirements
- attending to detail
- planning own work within the given task parameters
- using workplace technology, including calculators, measuring and recording devices, and computing equipment

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Prepare for design process
 - 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the work and for the work area
 - 1.2 Confirm design brief and parameters with client or relevant personnel
 - 1.3 Analyse jewellery or object design brief to determine implications for design process
 - 1.4 Develop work plan of activities which identifies and prioritises tasks
 - 1.5 Identify and collect required data
 - 1.6 Select and prepare appropriate media and equipment
- 2 Apply design processes to develop concepts
 - 2.1 Conduct research to inform generation of ideas and design concepts for jewellery or object
 - 2.2 Complete drawings to develop ideas and gain perspectives and views for jewellery or object
 - 2.3 Develop design concepts with consideration to elements and principles of design
 - 2.4 Consider a range of specialist jewellery and object production techniques and apply to design concepts
 - 2.5 Apply knowledge of jewellery or object materials for the development of design concepts and determine most suitable options
 - 2.6 Apply creative processes to develop and refine jewellery or object design concepts
 - Establish basic forms and proportions
- 3 Revise and refine design solution
 - 3.1 Assess concepts for viability and adherence to design brief
 - 3.2 Discuss concepts with client or relevant personnel and integrate feedback
 - 3.3 Select and refine design solution
 - 3.4 Develop work plan of activities and design specifications
 - 3.5 Document design process

- 4 Document and present design solution
 - 4.1 Prepare documentation and drawings of design solution to clearly demonstrate features and specifications
 - 4.2 Present design solution to client or relevant personnel and seek feedback
 - 4.3 Evaluate design process and outcomes to determine success in meeting design brief

Required Skills and Knowledge

Required knowledge includes:

- research resources and techniques for investigating design information
- elements and principles of design as they relate to design of jewellery and objects
- working properties of jewellery materials
- methods of production for jewellery and objects
- design resources
- brainstorming and other idea generation techniques for research/idea development
- drawing media and their functions/applications, including paper, watercolours and pastels/inks/pencils
- computer drawing/design software (e.g. Photoshop, Illustrator and Indesign)
- form drawing development
- options available for drawing presentation
- enhancement techniques
- types of working drawings and their uses
- the interrelation between technical and design drawings
- hazard and control measures associated with preparing jewellery designs
- safe work practices

Required skills include:

- interpreting and clarifying a design brief
- identifying and collecting information necessary to create design concepts
- drawing
- developing and refining ideas
- applying principles and elements of design
- reading and interpreting information on specifications, design documentation, illustrations, design drawings and other applicable source documents
- identifying purpose and needs, including design considerations, item end use, proportions and desired features, and available materials
- checking and clarifying information
- developing research/idea to sufficient level in order to determine client expectations and/or design outcomes
- evaluating abstract and applied concepts/data
- collecting and collating data relevant to design
- communicating concepts in terms suitable to clients
- documenting and maintaining design process, features and design development notes
- producing basic form drawings that accurately reflect design concept
- using drawing and/or rendering techniques appropriately
- undertaking numerical operations, geometry and calculations within the scope of the unit

- carrying out work according to OHS practices

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to apply a range of creative processes to develop and refine design concepts and present a design solution which meets the parameters of a design brief.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices • analyse a design brief and determine key parameters • apply creative processes to develop and refine design concepts • apply knowledge of materials and production processes to jewellery and object design • prepare and present design concepts to appeal to the specific needs of the intended audience • evaluate success of design in meeting design brief.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process.

	<ul style="list-style-type: none"> • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

MEM19026A Investigate quality and application of jewellery materials

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to investigate the quality of materials used in jewellery construction and their applications in order to inform design and production. It includes conducting research into materials and selecting materials according to construction and design requirements.

Application of the Unit

This unit applies to those involved in jewellery construction as makers and/or designers who require a working knowledge of the benefits and limitations of materials used. It includes recognition of quality assessment processes and industry standardisation in order to identify quality of materials. Materials may also be used in construction of decorative objects.

Band A

Unit Weight 2

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Research jewellery materials
 - 1.1 Identify materials typically used in jewellery construction and their range of uses
 - 1.2 Identify information sources and specialist expertise available to confirm uses and quality of materials
 - 1.3 Identify source/origin of materials and processes involved in extraction or development and known environmental impacts
 - 1.4 Identify recovery and recycling opportunities for materials used in jewellery
 - 1.5 Assess risk factors in using materials for various jewellery applications
 - 1.6 Select materials for construction of jewellery according to design, work and quality requirements
- 2 Apply knowledge of metals to jewellery construction
 - 2.1 Describe the qualities, features, limitations and working characteristics of different metals used in jewellery
 - 2.2 Describe industry standards of purity for precious metals and the marking system used to identify grade of quality
 - 2.3 Describe the process of making metal alloys and impact of mix on final properties
 - 2.4 Conduct basic tests to assess purity of metal
 - 2.5 Determine costing implications of using metals of various purity in jewellery
 - 2.6 Select metals for construction of jewellery according to design, work and quality requirements
- 3 Apply knowledge of gemstones to jewellery construction
 - 3.1 Identify types of gemstones and their key characteristics
 - 3.2 Identify processes used to determine quality of gemstones and interpret industry standards
 - 3.3 Identify range of facet cuts used on gems and range of applications in jewellery design
 - 3.4 Identify techniques used to enhance lower quality gemstones
 - 3.5 Determine costing implications of using various

gemstones in jewellery

- 3.6 Identify requirements for handling and cleaning gemstones
- 3.7 Select gems for construction of jewellery according to design, work and quality requirements
- 4 Apply safe work practices in handling materials
 - 4.1 Conduct risk assessment for materials and processes to be used in construction
 - 4.2 Identify characteristics of chemicals and hazardous materials used in construction and ensure workplace safety procedures are applied
 - 4.3 Access, interpret and apply material safety data sheets (MSDS) and labelling information
 - 4.4 Use protective equipment required for handling and manipulating materials

Required Skills and Knowledge

Required knowledge includes:

- melting points of various metals/alloys
- properties of jewellery metals
- nomenclature used in describing and identifying jewellery materials
- physical and optical properties of gem materials
- uses and characteristics of less common materials used in jewellery
- industry standards for quality of materials
- safe work practices

Required skills include:

- identifying metals and their alloys
- measuring and handling gemstones
- recognising the range of materials used in jewellery
- interpreting industry technical information
- conducting research and accessing information to inform work
- applying quality standards to work
- undertaking numerical operations, geometry and calculations within the scope of the unit
- carrying out work according to occupational health and safety (OHS) practices

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to identify the features of materials used in jewellery construction and the processes used to confirm quality, and apply this knowledge in the selection and use of materials in the construction of jewellery items.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • analyse and apply industry standards and information on material quality and grades • select materials to meet the needs of work outcomes • apply knowledge of metals and gemstones to work processes.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.

Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

MEM19027A Produce life drawings for presenting jewellery and object designs

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skill and knowledge required to produce drawings which present jewellery and object designs on the human figure in a manner which demonstrates design features.

Application of the Unit

This unit applies to jewellery and object designers who are using drawings to explore and demonstrate the relationship of jewellery and objects with the human figure. It includes application of a range of drawing techniques and media and production of hand drawn representations from a life model.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM19023A Apply drawing and rendering techniques to jewellery or object design

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|---|--|
| 1 Prepare for drawing | 1.1 Select and prepare drawing tools for drawing and establish drawing position for desired perspective |
| | 1.2 Prepare life model to achieve desired lighting, angle and position |
| | 1.3 Examine model to assess features, such as shape, shading, dimension and perspective |
| | 1.4 Assess the total figure in regard to totality of figure and consider gesture, flowing lines, proportion and structure |
| 2 Draw the human figure from life model | 2.1 Apply drawing techniques to draw expressive human figure |
| | 2.2 Apply elements of design to show gesture, rhythm and movement |
| | 2.3 Apply drawing techniques to achieve structure, proportion and balance |
| | 2.4 Represent head, hands and feet in illustration with focus on detail |
| 3 Explore relationship of jewellery and objects with human form | 3.1 Experiment with a variety of media, materials and techniques to represent jewellery and objects on the human form |
| | 3.2 Analyse the effects of different representations and their strengths and limitations in presenting jewellery and objects |
| | 3.3 Analyse the relationship of jewellery and objects to the human form and demonstrate relationship through drawings |
| 4 Present jewellery or objects on the human form | 4.1 Select media, materials and techniques for presenting specific pieces of jewellery or object |
| | 4.2 Complete life drawing with jewellery or object |
| | 4.3 Present drawing and identify key features and elements demonstrated |
| | 4.4 Seek and integrate feedback on drawing |

Required Skills and Knowledge

Required knowledge includes:

- types and characteristics of media, materials and drawing surfaces
- drawing equipment and applications, storage and maintenance
- role of shape, plane and volume in drawing and rendering
- elements and principles of design
- features and effects of materials and forms used in jewellery and object designs
- mathematical procedures for estimation and measurement
- 2D and 3D drawing techniques
- occupational health and safety (OHS) requirements

Required skills include:

- applying a range of hand drawing techniques, such as line drawing, gesture drawing and contour drawing
- interpreting and representing
- exploring, selecting and manipulating of a range of media, materials and drawing styles
- using shape, plane and volume in drawing and rendering
- creating texture in drawing (real and implied)
- applying black and white and coloured rendering techniques
- applying composition techniques
- using rendering applications and techniques and tools for the creation of illustration effects
- expressing self through intuitive and expressive drawing

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to apply a range of drawing techniques to illustrate perspectives and features of jewellery or object designs in relationship with the human form.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • demonstrate analytical, observational and imaginative drawing techniques to represent features of jewellery or object designs on the human figure • produce expressive figure drawings from life model • use drawing tools, materials and techniques to communicate relationship of jewellery and objects to the human form.
Context of and specific	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Select materials for jewellery or object applications
 - 1.1 Identify properties, features and typical applications of metals and metal alloys used in jewellery or objects
 - 1.2 Identify properties, features and typical applications of alternative materials used in jewellery or objects
 - 1.3 Evaluate materials for suitability and compatibility against jewellery or object design requirements, product descriptions and/or drawings
 - 1.4 Consider benefits and limitations of working with or adding alternate materials against the design brief
 - 1.5 Identify and compare alternative options and, if necessary, consult with appropriate persons
 - 1.6 Select final materials based on design requirements, design considerations, drawings, product description, principal material properties and processing requirements
 - 1.7 Confirm selection of materials with appropriate persons
- 2 Select manufacturing technologies and processes for jewellery or object applications
 - 2.1 Identify jewellery or object manufacturing technologies and processes suitable to jewellery and 3D object production
 - 2.2 Identify manufacturing technologies and processes suited to specific jewellery and 3D object applications and materials
 - 2.3 Consider capabilities and limitations of different technologies and processes against design brief and other design considerations
 - 2.4 Identify and compare alternative technologies and processes and, if necessary, consult with appropriate persons
 - 2.5 Select manufacturing technologies and processes based on design requirements, design considerations, drawings, product description and appropriateness to selected materials
 - 2.6 Confirm selection of jewellery or object manufacturing technologies and processes with appropriate personnel

- 3 Finalise drawing for presentation
 - 3.1 Select drawing presentation and production technique to enhance impact of jewellery or object design features and to appeal to the intended audience
 - 3.2 Use/store/file/copy/issue working and reference drawings/illustrations in accordance with standard operating procedures
 - 3.3 Prepare supporting information to accompany drawing, as required

Required Skills and Knowledge

Required knowledge includes:

- properties and features and typical applications of precious metals and alloys, base and refractory metals
- types of alternative materials
- advantages and drawbacks of particular materials
- properties and features and typical applications of alternative materials
- manufacturing technologies and processes suitable to jewellery and 3D object production
- advantages and drawbacks of different technologies and processes

Required skills include:

- identifying design requirements and design considerations
- matching materials and technologies to design requirements and design considerations
- comparing and evaluating various materials and technologies

Evidence Guide

Elements and Performance Criteria

- | | |
|---------------------------------|--|
| 1 Develop design folio concepts | 1.1 Establish the purpose and objectives of a design folio |
| | 1.2 Research concepts or presentation styles and select ideas/concepts appropriate for the purpose and function of the jewellery or object |

- presentation material
- 1.3 Document ideas and concept development using a range of media
 - 1.4 Identify constraints and limitations in presenting jewellery or objects in various formats on and off the body, and determine implications for folio concept
 - 1.5 Select folio concept based on practical considerations and appropriateness to function, purpose and objectives of jewellery or objects to be displayed
- 2 Collect and prepare source materials
 - 2.1 Collect and prepare drawings, sketches, jewellery, objects and works for photographing/illustrating or other processing
 - 2.2 Select images that present works on and off the body to portray key features of the item
 - 2.3 Select display formats for individual items/folio elements to emphasise message and meaning
 - 2.4 Obtain resources for producing design folio
 - 2.5 Produce design documentation, as required, using appropriate media and formats
- 3 Compile design folio
 - 3.1 Arrange and sequence folio elements for required visual effect
 - 3.2 Confirm that the completed folio is consistent with aims and objectives
 - 3.3 Check the completed folio for accuracy of content and consistency of arrangement, layout and style
 - 3.4 Ensure adherence to protocols, conventions and industry standards

Required Skills and Knowledge

Required knowledge includes:

- purpose and applications of design folios
- techniques for idea/concept development
- research techniques
- arranging and sequencing elements for effect
- protocols, conventions and industry standards
- techniques/manufacturing methods for jewellery/3D object production

Required skills include:

- experimenting with media, designs, layout and presentation styles
- applying idea generation and concept development techniques
- researching information
- preparing design documentation

Evidence Guide

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|---|--|
| 1 Explain basic concepts relating to environmental conservation, resources utilisation and sustainable design | 1.1 Describe the basic principles of environmental conservation |
| | 1.2 Identify and analyse a product that makes efficient use of resources |
| | 1.3 Describe the basic principles of |

sustainable design

- 2 Develop and utilise product design processes that promote positive environmental outcomes
 - 2.1 Develop criteria to select materials and processes that promote environmental conservation
 - 2.2 Document the manufacturing and materials processes used in the production of a simple product
 - 2.3 Identify substitute materials and manufacturing processes that would make more efficient use of resources
 - 2.4 Recommend materials and processes that minimise materials and energy usage
- 3 Recommend appropriate materials and processes to minimise the impact on the environment
 - 3.1 Define the main benefits of using sustainable materials and processes
 - 3.2 Qualify the main benefits
 - 3.3 Document research sources fully

Required Skills and Knowledge

Required knowledge includes:

- environmental conservation
- resource utilisation
- sustainability
- design processes
- simple material selection processes
- basic product design production processes
- creation and utilisation of appropriate criteria for materials and manufacturing process selection
- common features of design specifications
- commonly used research methodologies
- report writing
- management of time and resources
- effective workplace communication strategies and techniques
- workplace occupational health and safety (OHS) principles and processes

Required skills include:

- conducting research
- communicating research findings
- evaluating sustainability credentials of relevant source materials and completing design documentation
- planning and organising
- interpreting and responding to design criteria
- solving problems sufficiently to identify, rank and recommend appropriate solutions

Evidence Guide

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to conduct research into issues of sustainability for jewellery and object design and analyse findings to inform work decisions.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • apply sustainable design principles and practices • comply with the design brief requirements • create and utilise appropriate criteria • undertake relevant research and document findings and application of sustainability principles.

MEM19031A Produce renderings and technical drawings for jewellery and object design construction

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required by a designer to produce renderings and technical drawings to enable construction of their design.

Application of the Unit

This unit applies to designers who must produce renderings and technical drawings of their design to facilitate construction by themselves or others. The unit presumes that the design is finalised. The drawings and renderings would typically be used by the designer to develop production concepts, for marketing, or to record details necessary for construction by self or others.

Where the production of jewellery illustrations is required for practical application or trade work, such as manufacturing, modifying or repairing jewellery items, see MEM19002B Prepare jewellery illustrations.

Elements and Performance Criteria

- | | |
|-------------------------------------|---|
| 1 Identify drawing requirements | 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the work and for the work area |
| | 1.2 Analyse jewellery or object design to determine types of drawings, views and specifications required |
| | 1.3 Identify and collect required data |
| | 1.4 Select appropriate media and equipment |
| 2 Produce drawing or render | 2.1 Adhere to OHS requirements for carrying out the work |
| | 2.2 Plan the stages, materials, tools and equipment for drawing or render |
| | 2.3 Produce drawing or render in a manner that maximises jewellery or object design features while conveying technical details necessary for construction |
| | 2.4 Apply drawing protocols as required to specify construction details and dimensions |
| | 2.5 Check and confirm illustration and accompanying documentation are consistent with design |
| 3 Finalise drawing for presentation | 3.1 Select drawing presentation and production technique to enhance impact of jewellery or object design features and to appeal to the intended audience |
| | 3.2 Use/store/file/copy/issue working and reference drawings/illustrations in accordance with standard operating procedures |
| | 3.3 Prepare supporting information to accompany drawing, as required |

Required Skills and Knowledge

Required knowledge includes:

- common documentation, storage and retrieval
- isometric and orthographic drawing perspectives
- drawing equipment and applications, storage and maintenance
- drawing methods, protocols and symbols used in technical drawings for jewellery manufacture
- rendering applications and techniques and tools for the creation of illustration effects
- jewellery and object design features and decorative finishes
- properties of jewellery metals used in practical manufacturing applications
- options available for drawing presentation

Required skills include:

- identifying and collecting data necessary to produce the illustration
- selecting equipment appropriate to the illustrating method and requirements
- using colour, contour, shadow/highlight techniques for emphasis to display jewellery design concept
- interpreting and clarifying illustration requirements
- drawing and rendering
- modifying drawings
- using workplace technology, including calculators, measuring and recording devices, and computing equipment

MEM19032A Design and implement mechanisms in jewellery items

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to design and manufacture a range of common jewellery mechanisms. It includes development of design specifications and application of required fabrication techniques.

Application of the Unit

This unit applies to enterprises where one-off, single and multi-component jewellery/3D objects are produced.

Applications of this unit include manufacturing mechanisms for brooches, either existing or new.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Determine mechanism design requirements
 - 1.1 Establish design requirements for mechanism from source documentation, items/samples and appropriate persons, as required
 - 1.2 Identify factors and conditions affecting the design and conduct further research/design development, as required
 - 1.3 Select components and materials to meet design requirements
 - 1.4 Determine various options and select the most appropriate option to suit client requirements
- 2 Design mechanism
 - 2.1 Determine specifications for manufacturing the mechanism
 - 2.2 Produce illustrations and/or renderings, if necessary
 - 2.3 Confirm final design with appropriate persons, if required
 - 2.4 Complete documentation of mechanism design and production specifications
- 3 Manufacture mechanism
 - 3.1 Establish and adhere to occupational health and safety (OHS) and environmental requirements for carrying out work
 - 3.2 Plan steps/stages for manufacture of the mechanism
 - 3.3 Select and use tools and equipment in accordance with safe working practices
 - 3.4 Produce components using appropriate fabrication techniques
 - 3.5 Minimise waste and ensure environmental requirements are adhered to in work practice
 - 3.6 Ensure components conform to design specifications and are produced to correct tolerances
 - 3.7 Ensure all moving parts operate in a smooth, straight manner without jamming or excess play

Required Skills and Knowledge

Required knowledge includes:

- types and applications of mechanisms
- components of mechanisms
- materials and factors affecting selection of materials
- techniques for manufacturing a range of pins, joints and catches
- tools and equipment used for manufacturing mechanisms
- OHS and environmental requirements
- safety equipment and safe working practices

Required skills include:

- communicating effectively
- selecting components and materials
- producing designs
- planning steps/stages of manufacture
- using tools and equipment
- fabricating mechanism components to specification

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to design and implement mechanisms in jewellery.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • determine mechanism requirements and develop design and production specifications • manufacture mechanisms according to specifications.

Elements and Performance Criteria

- | | |
|---|---|
| 1 Draw wire for chain making to size required | 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area |
| | 1.2 Establish item requirements and specifications from source documentation and/or appropriate personnel, as required |

- 1.3 Establish and organise stages, materials and tools/equipment for the fabrication process
 - 1.4 Calculate required material
 - 1.5 Cut materials and draw wire to the required size
 - 1.6 Anneal materials, as necessary, to relieve stress/work hardening
 - 1.7 Draw materials to specified tolerance using appropriate equipment
 - 1.8 Obtain and check resources and equipment for the task are fit for purpose
- 2 Fabricate jewellery chains
- 2.1 Follow OHS requirements for carrying out the work
 - 2.2 Produce spit jig suitable for specified chain
 - 2.3 Produce links to the correct size and specification
 - 2.4 Solder links free from pit holes and flooding
 - 2.5 Construct chain links accurately and sequentially
 - 2.6 Conduct quality assurance during construction to maintain link consistency and meet requirements
- 3 Finish jewellery chains
- 3.1 Follow OHS requirements for completing the work
 - 3.2 Polish and finish chains to a blemish-free high lustre
 - 3.3 Clean up and maintain production environment, including polishing machines/tumblers, according to enterprise procedures

Required Skills and Knowledge

Required knowledge includes:

- uses of wire and chain
- safety requirements for drawing wire
- use of rolling equipment and techniques for rolling
- calculations and measurements
- procedures to anneal material and reasons for stress relieving metal
- equipment and techniques for wire drawing
- use of cleaning solution and safe practices with chemicals
- procedure to make a split jig
- techniques for coiling and cutting link wire
- procedures to fit and solder chain links
- safe use of polishing lathe and polishing tumbler
- selection and use of buffs and compounds
- selection, use and maintenance of steel polishing shot

Required skills include:

- calculating required material size
- cutting materials
- rolling materials to size and thickness
- annealing materials
- drawing materials to size
- soldering materials/items
- cleaning materials/items
- filing and finishing items
- polishing jewellery chains

MEM19035A Plan and apply casting techniques for jewellery and object designs

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to plan and apply casting techniques for constructing jewellery and object designs. It includes use of wax models and moulds and application of metal casting skills.

Application of the Unit

This unit applies to jewellery and object designers who make items according to design specifications, where casting and associated techniques are required for the production of jewellery and 3D objects.

Band A

Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Examine design brief and prepare for work
 - 1.1 Review design brief and all documentation to confirm specifications
 - 1.2 Determine type of casting techniques and resources appropriate for design
 - 1.3 Develop work plan for production
 - 1.4 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area
- 2 Produce wax models
 - 2.1 Determine process requirements for production of wax model
 - 2.2 Identify required equipment and prepare for use
 - 2.3 Cut materials to required dimensions using appropriate tools
 - 2.4 Sculpt wax model to specifications and minimise imperfections
 - 2.5 Apply surface finishes as required
- 3 Produce moulds
 - 3.1 Select appropriate moulding material for style of master, and prepare, pack, dry and burn out correctly
 - 3.2 Carry out wax injection of moulds using appropriate tools, materials and processes, if required
 - 3.3 Vulcanise/cure rubber correctly, if appropriate
 - 3.4 Release master pattern correctly using appropriate tools
- 4 Cast metals for jewellery and object designs
 - 4.1 Establish casting requirements from source documentation and/or appropriate personnel, as required
 - 4.2 Select metals and alloys in appropriate proportions and weigh correctly and in correct wax-to-metal ratios
 - 4.3 Prepare casting equipment according to established enterprise procedures
 - 4.4 Carry out pre-heating/glazing, if applicable
 - 4.5 Cast jewellery item or object using correct procedures with respect to maintaining temperature, applying protective coating, if required, and handling of hot molten metal
 - 4.6 Allow for adequate solidification time

4.7 Clean up work area and equipment and dispose of waste according to environmental requirements

Required Skills and Knowledge

Required knowledge includes:

- design casting process
- properties of metals and alloys
- making the master model
- moulding
- making the wax pattern
- investment
- burn out
- melting
- casting
- removing investment
- cutting
- finishing
- workshop procedures
- casting defects
- minimising casting defects

Required skills include:

- selecting appropriate quality materials for the production of wax model
- producing wax models to given specifications and minimising imperfections
- performing wax injection of mould, where applicable
- correctly vulcanising and curing rubber moulds where applicable
- using molten metal safely
- casting jewellery and objects using different techniques and materials
- applying appropriate finishing techniques to cast object

MEM19036A Use specialised techniques to produce jewellery and objects

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to apply a range of specialised or complex techniques to produce jewellery and/or object designs.

Application of the Unit

This unit applies to enterprises where jewellery is designed and made according to design specifications. Metal working skills described by this unit are not performed to trade level outcomes, rather to allow the production of one-off custom jewellery and object designs. Application of this unit requires use of a range of hand and power tools used in the construction of jewellery and objects.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|---|---|
| 1 Prepare for applying specialised production | 1.1 Establish work area and prepare for work |
| | 1.2 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and |

- techniques for the work area
- 1.3 Analyse design specifications and related information for jewellery or object and determine production requirements from documentation and discussion with appropriate persons
 - 1.4 Develop a production plan, identifying the multiple steps and operations for manufacture, required components, soldering plan, fitting of pieces, required materials, tools, equipment and processes/techniques
 - 1.5 Identify potential manufacturing difficulties for jewellery or object and develop solutions based on understanding of materials, their limitations and workability, as well as knowledge of processes and techniques
 - 1.6 Select and prepare materials and equipment required
- 2 Apply specialised techniques
- 2.1 Implement OHS and environmental requirements
 - 2.2 Determine and apply calculations and formulae, as necessary, to determine material quantities, dimensions and sizing
 - 2.3 Produce jewellery or object features using specialised techniques
 - 2.4 Identify faults and problems and take corrective action
 - 2.5 Confirm work meets design specifications
 - 2.6 Finish work according to requirements of technique used
- 3 Present and evaluate finished piece
- 3.1 Confirm finished piece meets design specifications
 - 3.2 Prepare piece for presentation
 - 3.3 Evaluate result and identify and make any final improvements

Required Skills and Knowledge

Required knowledge includes:

- range and uses of specialised techniques
- calculations and measurements
- reasons for selecting particular metals, construction methods, manufacturing and finishing techniques
- tools and equipment matched to processes
- planning and process stages
- working properties of precious and non-precious metals and/or other materials
- fine detail manufacturing processes
- knowledge of workplace hazards and emergency procedures
- various components of jewellery items
- appropriate measuring devices and recording methods
- procedures for final treatment
- safe handling and storage of items
- use and application of personal protective equipment
- safe work practices and procedures
- relevant hazards and control measures

Required skills include:

- calculating required material size
- using tools and equipment for jewellery and object construction
- interpreting design specifications and following instructions
- interpreting drawings
- measuring
- selecting appropriate materials and manufacturing techniques
- applying appropriate production and finishing procedures
- identifying alternative metals/materials
- meeting design specifications
- cleaning materials/items
- filing and finishing items
- communicating design and construction information

Evidence Guide

Overview of assessment	<p>A person who demonstrates competency in this unit must be able to apply a minimum of four (4) specialised techniques to produce jewellery and object designs according to specification.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • apply a minimum of four specialised techniques to produce jewellery and object designs on more than one occasion and in different contexts. This includes: <ul style="list-style-type: none"> • determining manufacturing requirements • developing a production plan • using a combination of techniques, materials and processes • finishing and inspecting work.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related

MEM19037A Plan and implement chenier fabrication process

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to fabricate chenier items and basic hinges.

Application of the Unit

This unit applies to enterprises where jewellery and objects are designed, made or repaired.

Band A

Unit Weight 2

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|-----------------------------|---|
| 1 Plan and prepare for work | 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area |
| | 1.2 Establish resource requirements and specifications from source documentation and/or appropriate persons, as required |

- 1.3 Establish, plan and organise stages, materials and tools/equipment for the fabrication process
 - 1.4 Calculate required material
- 2 Draw chenier materials to size
 - 2.1 Cut materials, establishing wall thickness and diameter, swage or form, if applicable, to required size
 - 2.2 Anneal materials to relieve stress
 - 2.3 Draw materials to specified tolerance using appropriate equipment
 - 2.4 Carry out finishing processes, such as soldering, to specification
- 3 Produce items from cheniers
 - 3.1 Follow OHS requirements for carrying out the work
 - 3.2 Solder seams free from pin holes, inclusions and excess flooding
 - 3.3 Ensure cheniers have a smooth, blemish-free surface
 - 3.4 Conduct quality assurance during construction to maintain finish consistency and ensure items are produced to all specified dimensions
- 4 Fabricate hinges
 - 4.1 Follow OHS requirements for carrying out the work
 - 4.2 Produce knuckles and bearer wires or sheets
 - 4.3 Ensure items are gapped to size and specification
 - 4.4 Ensure knuckles are cut, filed and placed according to item requirement
 - 4.5 Ensure solder is flushed and drawn under knuckles
 - 4.6 Ensure pin fits comfortably through knuckles of adjoining sides

Required Skills and Knowledge

Required knowledge includes:

- uses of cheniers
- safety requirements for drawing of cheniers
- use of rolling equipment and techniques for rolling
- calculations and measurements
- procedure to anneal material and reasons why this is needed
- equipment and techniques for drawing chenier
- procedure to swage, draw and solder chenier
- use of pickling solution and safe use of solution
- procedure to fit and solder knuckles
- safe use of polishing machine
- selection and use of mops, wheels and compounds

Required skills include:

- calculating required material size
- cutting materials
- rolling materials to size and thickness
- annealing materials
- drawing materials to size
- swaging or forming materials
- soldering materials/items
- pickling, filing and finishing items
- polishing jewellery items

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to apply techniques to fabricate chenier and basic hinge according to specification.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • draw chenier materials to size • produce items using chenier • fabricate sample cheniers and hinges to specification.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. MEM19038A Apply traditional techniques to jewellery and 3D object production

Modification History

Release 2 - Band A and 4 points allocated to unit for use in Certificate IV

Unit Descriptor

This unit of competency covers the skills and knowledge required to produce jewellery items using traditional techniques. It includes conducting research to assess the suitability of traditional techniques for achieving desired outcomes and identifying and addressing problems which may arise in reproduction.

Application of the Unit

This unit is applied to jewellery production using traditional techniques and incorporating them into contemporary jewellery manufacture.

Band A
Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|---|--|
| 1 Identify item requirements employing traditional techniques | 1.1 Identify and research features and applications of a given traditional jewellery or object production technique |
| | 1.2 Establish requirements for applying a given technique to a specified item from source documentation and/or appropriate persons |
| | 1.3 Assess the suitability of the required technique to specific jewellery or object item, identify potential problems and difficulties and consider alternatives in consultation with appropriate persons |
| 2 Select and source materials and equipment | 2.1 Identify and source materials appropriate to the production of selected technique |
| | 2.2 Obtain and/or produce tools and equipment appropriate to the technique |
| 3 Apply traditional techniques to produce item | 3.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the work and for the work area |
| | 3.2 Identify and plan stages, materials and tools/equipment involved in producing the technique |
| | 3.3 Identify and use other information and conditions relevant to successfully applying the technique |
| | 3.4 Reproduce traditional jewellery or object production technique according to industry standards and client expectations |

Required Skills and Knowledge

Required knowledge includes:

- features, applications and traditional development of traditional techniques
- problems and difficulties in applying techniques
- guidelines/principles/conditions for successful application of given technique
- stages and steps involved in producing given technique
- tools and equipment for applying given technique

Required skills include:

- researching particular techniques
- questioning and clarifying information
- planning the steps in a process
- operating/using relevant hand tools and equipment
- applying a given traditional technique

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to replicate traditional techniques in the production of jewellery and 3D objects.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • identify features and applications of a given traditional technique • identify conditions for successful application of given technique • apply a given technique to selected items.

Elements and Performance Criteria

- | | |
|--|---|
| 1 Identify exhibition's or program's purpose, aims and rationale | 1.1 Clarify and confirm the exhibition's aims, objectives and purpose and assess feasibility within existing technical and spatial constraints, resource estimates and timeframes |
| | 1.2 Engage all relevant personnel and stakeholders and gain input and consensus on the overall message, subject |

- matter, style and intended target audience's experience
- 1.3 Confirm that the agreed purpose, aims and objectives are philosophically and culturally acceptable and complementary to other organisational objectives
 - 1.4 Determine range of jewellery or object items to be included and selection criteria
- 2 Confirm type of exhibition or program and develop plan
- 2.1 Determine suitable options for jewellery or object exhibition or program in consultation with relevant personnel
 - 2.2 Assess options against existing constraints and financial resources and select most appropriate format
 - 2.3 Present selection and rationale to stakeholders to gain approval
 - 2.4 Develop plans detailing the nature and scope of the program, its intended outcome, resources required and timeframe
 - 2.5 Identify opportunities for related activities, public relations and advertising
 - 2.6 Detail the operational requirements for the exhibition or program based on consultation with relevant parties
 - 2.7 Identify and document funds and other resources required
 - 2.8 Identify and document safety hazards and determine risk control measures to be implemented
- 3 Prepare to hold the exhibition or program
- 3.1 Establish and confirm the financial and physical resources, appropriate personnel and organisational structures required
 - 3.2 Identify staff responsibilities and conduct briefings with all relevant parties
 - 3.3 Determine and source jewellery or objects to be included and ensure compatibility with exhibition or program objectives
 - 3.4 Evaluate the contribution of jewellery or object pieces to the overall impact and objectives of exhibition or program
 - 3.5 Establish and action promotional and public relations activities and other ways of reaching the audience

- 3.6 Confirm evaluation mechanisms through consultation and negotiation
 - 3.7 Ensure occupational health and safety (OHS) requirements and risk control measures and procedures are established
 - 3.8 Assess the environmental implications of the exhibition or program and determine ways to minimise impacts
- 4 Manage implementation
- 4.1 Follow agreed plans and procedures and coordinate the program or exhibition as intended
 - 4.2 Ensure transportation and placement of jewellery or objects is conducted to ensure items are not damaged
 - 4.3 Deploy and coordinate personnel as required
 - 4.4 Make variations, adjustments and changes to plan, as required, without compromising the activity
 - 4.5 Obtain and monitor audience feedback and other performance information
 - 4.6 Monitor safety and environmental impacts and make adjustments, as required, to improve outcomes
- 5 Evaluate effectiveness of exhibition
- 5.1 Determine evaluation questions, sources of evaluation data and methods of collecting data
 - 5.2 Develop and implement suitable and valid methods for collecting data
 - 5.3 Collate, analyse and report evaluation data
 - 5.4 Document exhibition/program outcomes and identify benefits and areas for improvement
 - 5.5 Present findings to relevant stakeholders

Required Skills and Knowledge

Required knowledge includes:

- specialised knowledge of subject areas
- the institution's policies and priorities for exhibitions and public programs
- legal, ethical and financial requirements for exhibitions and public programs
- insurance and indemnity requirements
- cultural protocols and applying cross-cultural sensitivity and effective communication techniques to all communications
- Indigenous culture and issues
- intellectual and copyright issues
- safe work and manual handling procedures
- the institution's users and their needs
- sources of expert advice
- security and protection of the collection
- conservation methods and principles
- evaluation techniques
- effective customer service
- proposal development
- exhibition presentation techniques
- audience development

Required skills include:

- applying lateral thinking skills and solving difficult or unusual problems
- applying a wide range of highly specialised technical, creative or conceptual skills
- managing functions of others
- managing projects
- planning projects, funding and management
- developing and delivery programs
- listening, questioning and clarifying
- writing business letters, proposals, project plans and reports
- reading detailed planning documents
- speaking clearly, concisely and in a friendly manner
- planning, implementing, monitoring and evaluating projects
- working collaboratively in a team
- leading a team
- networking within the community
- managing human, financial and technical resources
- preparing budgets and resource estimates
- planning marketing

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to plan and implement a jewellery and object exhibition according to organisational objectives and requirements.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • develop a plan for a jewellery and object exhibition which details all aspects of the activity, including use of resources, marketing and operational plans • coordinate the implementation of a jewellery and object exhibition • assess the impacts of the exhibition.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. MEM19040A Create and manufacture jewellery or object design prototypes for the mass market

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to apply creative and technical processes to develop jewellery or object designs for the mass market. It includes the development and testing of a prototype and evaluation of product viability.

Application of the Unit

This unit applies to designers who are responsible for creating and manufacturing jewellery or object design prototypes.

The unit applies to the analysis of commercial market opportunities and development of a design and production brief leading to development of one-off, limited edition, series and mass produced jewellery or objects.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|--|--|
| 1 Define and evaluate mass market opportunities | 1.1 Define difference between one-off, limited edition, series and mass produced products and the benefits and opportunities for jewellery and object designs |
| | 1.2 Identify commercial and design objectives of the client or workplace |
| | 1.3 Analyse commercial jewellery and object markets and current and emerging product trends and technologies |
| | 1.4 Conduct market research to inform development of design directions |
| 2 Determine suitable jewellery or object manufacturing processes | 2.1 Identify in-house manufacturing capabilities available for producing designs and determine the strengths and weaknesses of this form of jewellery or object production |
| | 2.2 Identify external manufacturing resources and suppliers available for producing designs and determine their strengths and weaknesses |
| | 2.3 Estimate costing impacts of internal and external production suppliers on the overall design costs |
| 3 Develop jewellery or object design concepts | 3.1 Apply information from market and production analysis to development of commercial product ideas |
| | 3.2 Consult with appropriate personnel to analyse and refine ideas and develop a design brief |
| | 3.3 Test design brief with appropriate personnel and confirm specifications for product development |
| | 3.4 Develop jewellery or object design concepts and solutions in accordance with design brief and determine required manufacturing processes |
| 4 Specify design production requirements | 4.1 Document design and production specifications |
| | 4.2 Identify target audience, market position and objectives for jewellery or object |
| | 4.3 Prepare costing estimates |
| | 4.4 Develop and present product proposal to test viability and confirm design specifications |
| | 4.5 Develop work plan for design production |

- 5 Prepare design prototype
 - 5.1 Plan for the production of jewellery or object design prototype
 - 5.2 Prepare materials and equipment for development
 - 5.3 Produce jewellery or object design prototype in accordance with design specifications
 - 5.4 Evaluate production and design results against design brief, costings, marketing objectives and specifications
 - 5.5 Make adjustments to concept, specifications or production processes to improve result
 - 5.6 Finalise design and production specifications
- 6 Document and present design solution
 - 6.1 Prepare documentation and drawings of design solution to clearly demonstrate jewellery or object features and specifications
 - 6.2 Present design solution prototype to relevant personnel and seek feedback
 - 6.3 Evaluate design process and outcomes to determine success in meeting design objectives

Required Skills and Knowledge

Required knowledge includes:

- supply chain management
- outsourcing arrangements
- cost-benefit analysis methods
- research resources and techniques for investigating design information
- elements and principles of design as they relate to design of jewellery and objects
- jewellery designs (e.g. shanks, settings styles, shoulders and decorative finishes)
- working properties of jewellery materials
- methods of production for jewellery and objects
- design resources
- brainstorming and other idea generation techniques for research/idea development
- elements and principles of design, including form, harmony and line
- design considerations
- drawing media and their functions/applications, including paper, watercolours and pastels/inks/pencils
- drawing tools and their functions/applications, including stencils and rubbers
- design documentation
- form drawing development
- options available for drawing presentation
- enhancement techniques
- types of working drawings and their uses
- the interrelation between technical and design drawings
- hazard and control measures associated with preparing jewellery designs
- safe work practices

Required skills include:

- interpreting and clarifying a design brief
- identifying and collecting information necessary to create design concepts
- drawing
- conducting market research
- identifying features and benefits of design solutions
- selecting production processes
- developing and refining ideas
- applying principles and elements of design
- reading and interpreting information on specifications, design documentation, illustrations, design drawings and other applicable source documents
- identifying purpose and needs, including design considerations, item end use, proportions and desired features, and available materials
- checking and clarifying information
- documenting and maintaining design process, features and design development notes
- producing basic form drawings that accurately reflect design concept

- using drawing and/or rendering techniques appropriately
- undertaking numerical operations, geometry and calculations within the scope of the unit
- carrying out work according to occupational health and safety (OHS) practices

Evidence Guide

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to apply a range of creative processes to develop and refine design concepts that meet commercial objectives.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices • analyse jewellery and object markets to identify commercial opportunities • develop a design brief and determine key parameters • apply creative processes to develop, refine and test design concepts • apply knowledge of materials and production processes to jewellery and object design • produce design prototypes • prepare and present design concepts to appeal to the specific needs of the intended audience • evaluate success of design in meeting design brief and commercial objectives.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. - | | |
|---|--|
| 1 Conduct research into jewellery and object design | 1.1 Confirm objectives and parameters for design process |
| | 1.2 Access and analyse local and international information on jewellery and object design, materials and production trends |

- 1.3 Identify trends in local and international market conditions
- 1.4 Determine impact of sustainability considerations on jewellery and object design
- 1.5 Identify opportunities for jewellery or object design
- 1.6 Determine funding opportunities for design development
- 1.7 Identify occupational health and safety (OHS) considerations for design
- 2 Apply creative process to develop design concepts
 - 2.1 Examine possible future directions for jewellery and object design
 - 2.2 Scope future directions to guide concept development
 - 2.3 Use creative design tools and techniques to develop concepts for jewellery or object designs
 - 2.4 Experiment with materials to further develop design concept
 - 2.5 Experiment with jewellery or object construction techniques to further develop design concept
 - 2.6 Apply knowledge of design elements and principles to design concepts
 - 2.7 Document processes and outcomes of experimentation
 - 2.8 Select design concepts for testing
- 3 Assess design concepts
 - 3.1 Test design concepts with selected personnel, obtain feedback and integrate as appropriate
 - 3.2 Determine production processes and requirements for concepts and assess viability of design concepts
 - 3.3 Develop preliminary costings
 - 3.4 Conduct tests to assess quality of design
 - 3.5 Assess design concepts against project objectives and parameters
 - 3.6 Determine viability of jewellery or object designs in current market and assess expected response of intended audience

- 3.7 Select concept for development
- 4 Confirm and document design proposal
 - 4.1 Review and rework design concept
 - 4.2 Determine and document design specifications and production plan
 - 4.3 Produce proposal for jewellery or object design, including supporting information and documentation

Required Skills and Knowledge

Required knowledge includes:

- range and uses of jewellery and object production techniques
- calculations and measurements
- reasons for selecting particular materials, construction methods, manufacturing and finishing techniques
- creative design tools and processes
- principles and elements of design
- planning and process stages
- working properties of precious and non-precious metals and/or other materials
- fine detail manufacturing processes
- workplace hazards and emergency procedures
- various components of jewellery items
- appropriate measuring devices and recording methods

Required skills include:

- developing designs
- production skills in order to experiment with design concepts
- selecting appropriate materials and manufacturing techniques
- identifying alternative metals/materials
- determining design specifications
- applying creative processes
- documenting design specifications
- conducting research
- assessing and testing design concepts
- communicating design and construction information
- working with others to develop designs

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to experiment with a range of materials and processes to develop and select a design concept.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • apply skill and knowledge in materials and construction processes to experiment with and develop design concepts • test and assess the viability of design concepts • use and produce design documentation.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred

	<p>to other circumstances.</p> <ul style="list-style-type: none">• Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

Objectives for design process	<p>Objectives for design process may include:</p> <ul style="list-style-type: none"> • exhibition • sale • presentation or display • creative expression • commercial production • custom production • demonstrate ability or for portfolio • develop design skills • innovate new design concepts • marketing or promotion
Parameters for design process	<p>Parameters for design process may include:</p> <ul style="list-style-type: none"> • availability of materials and equipment • budget • timelines • required criteria • design brief
Market conditions	<p>Market conditions may include:</p> <ul style="list-style-type: none"> • fashion trends • price and availability of materials and other resources • disposable income of target market • purchasing preferences
Sustainability considerations	<p>Sustainability considerations may include:</p> <ul style="list-style-type: none"> • impact on environment (e.g. generation of waste and by-products resulting from production or end use, and use of precious or rare materials) • impact on greater society (e.g. health risks to those obtaining materials or providing resources, and community values with regard to design features) • impact on economy (e.g. contribution to financial wellbeing of community)
Future directions for jewellery and object designs	<p>Future directions for jewellery and object design may include:</p> <ul style="list-style-type: none"> • new uses and applications • new materials • new technologies and equipment • new markets or market conditions • changes to pricing, distribution or other marketing

	variables
Elements and principles of design	<p>Design elements include:</p> <ul style="list-style-type: none"> • colour • direction • form • light • line • mass • point • shape • size • space • texture • time • tone • value <p>Design principles include:</p> <ul style="list-style-type: none"> • balance • contrast • dominance • emphasis • harmony • movement • pattern • proportion • rhythm • unity
Creative design tools and techniques	<p>Creative design tools and techniques may include use of:</p> <ul style="list-style-type: none"> • colour wheels • collage • materials board • mind mapping • drawings (hand drawings and electronic) • pictures, photographs and images • discussions with others • models • exhibitions • examination of jewellery and objects
Design tests	<p>Design tests may include, but are not limited to:</p>

	<ul style="list-style-type: none"> • market feedback • testing strength of components and whole piece • development and testing of prototypes or models • colour fastness • testing of fixing mechanisms, glues and finishes • protection of precious components • transportability
Design documentation	<p>Design documentation may include:</p> <ul style="list-style-type: none"> • drawings and illustrations • photographs • specifications • production plan
OHS considerations	<p>OHS considerations may include:</p> <ul style="list-style-type: none"> • legislation • protective equipment • material safety management systems • hazardous substances and dangerous goods code • local safe operation procedures • award provisions

Elements and Performance Criteria

- | | |
|----------------------------------|---|
| 1 Analyse rendering requirements | 1.1 Explain the features of rendering software packages used in the design industry |
| | 1.2 Analyse the design brief or other reference sources to plan and determine rendering |

- requirements
- 2 Select a suitable rendering application to achieve desired appearance
 - 2.1 Select rendering software with capability to achieve the desired effects within timeframe and budget
 - 2.2 Confirm selection is in accordance with design brief, system limitations and requirements
 - 3 Prepare rendering application for desired outcome
 - 3.1 Select and apply appropriate image resolutions
 - 3.2 Select and apply appropriate image aspect ratio
 - 3.3 Select and apply appropriate pixel ratio
 - 3.4 Adjust renderer attributes to obtain desired anti-aliasing
 - 3.5 Adjust renderer attributes to obtain other desired visual effects
 - 4 Check render integrity and quality
 - 4.1 Test and refine render integrity
 - 4.2 Test and re-link any missing images and textures
 - 4.3 Test render times for optimising process
 - 4.3 Test alpha channels and opacity matts
 - 4.4 Test render layers and passes
 - 5 Optimise images for render processes
 - 5.1 Complete all relevant pre-rendering optimisations tasks
 - 5.2 Adjust and refine renderer attributes to optimise render times
 - 5.3 Select appropriate file format for output in accordance with the brief
 - 5.4 Select appropriate file names and output destinations
 - 6 Render images and save files appropriately
 - 6.1 Undertake final rendering processes
 - 6.2 Store/archive files
 - 6.3 Review completed render to ensure compliance with system and brief

Required Skills and Knowledge

Required knowledge includes:

- 3D modelling
- 3D animation
- lighting
- shading
- texturing
- rendering principles
- appropriate file sizes and file formats

Required skills include:

- using advanced computer graphics applications
- managing time and resources
- producing original and brief responsive renderings
- communicating effectively with colleagues and clients
- scheduling of production components
- using computer networks for rendering
- interpreting design briefs

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to produce rendered images which illustrate features of designs.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • adhere to design brief requirements • design and comprehend rendering tasks • use and refine render components for best performance • adhere to systems requirements in relation to file sizes and formats • store rendered components in an organised manner for any further use.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities. • Assessment requires access to relevant computer hardware and 3D software, as well as models and/or scenes to be rendered. These may include: <ul style="list-style-type: none"> • computer workstation • 3D animation software • storyboard/script • rendering software • input device (e.g. stylus tablet, keyboard and mouse) • output device (e.g. monitor, TV, printer and speakers) • style shots • rendering briefs/specifications and schedules.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment

	<p>Guidelines of the MEM05 Metal and Engineering Training Package.</p> <ul style="list-style-type: none">• Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge.• Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application.• Assessment may be applied under project-related conditions (real or simulated) and require evidence of process.• Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances.• Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

Planning tasks	<p>Planning tasks may include:</p> <ul style="list-style-type: none"> • research • production planning • production management • team discussions • lighting • texturing • shading • networking
Pre-rendering optimisation tasks	<p>Pre-rendering optimisation tasks may include:</p> <ul style="list-style-type: none"> • selection of most appropriate renderers for specific outcomes • assessing options with key personnel • deleting any unnecessary geometry and components • preparing renderers attributes • preparing layer/pass control • preparing opacity mattes and alpha channels • testing and diagnosing rendering issues • optimising and refining for best render performance • rendering • organisation of output
Equipment and media	<p>Equipment and media may include:</p> <ul style="list-style-type: none"> • computer workstation • ergonomic furniture • 3D animation software • rendering software • render network distribution software • hub/s • switches • input device (e.g. stylist tablet, keyboard and mouse) • output device (e.g. monitor, TV, printer and speakers) • render farm

MEM19043A *Oversee jewellery or object design production*

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers the skills and knowledge required to manage the production of jewellery or objects to ensure they comply with design specifications and quality standards.

Application of the Unit

This unit applies to designers who are responsible for producing jewellery and object designs. This unit covers the management of the production process and the implementation of a prototype. It includes working with other specialists and industry suppliers to ensure that design specifications and intent are achieved in the final product. Production may be of one-off or mass produced items and be manufactured in-house or using external resources. This unit requires extensive skills and knowledge in jewellery and object design, materials and construction techniques. High level judgement is required in planning and selecting appropriate processes or procedures.

Licensing/Regulatory Information

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Select production processes
 - 1.1 Examine design brief and specifications to determine required production expertise and services for jewellery or object
 - 1.2 Establish quality and service criteria for production processes
 - 1.3 Research possible jewellery or object suppliers or manufacturers and select most suitable resources
 - 1.4 Confirm that production process meets organisational objectives and performance systems
 - 1.5 Document production brief and plan
- 2 Brief production personnel
 - 2.1 Negotiate production arrangements and establish performance targets with key production personnel
 - 2.2 Assign tasks according to available expertise and production requirements
 - 2.3 Provide and explain jewellery or object design specifications, drawings, and all relevant information to production personnel
 - 2.4 Establish relevant technical, monitoring and reporting procedures
- 3 Monitor production
 - 3.1 Maintain ongoing communication with personnel to ensure obligations, quality, timelines, budget and technical constraints are met
 - 3.2 Address problems and make production modification decisions as required
 - 3.3 Ensure production changes are documented and reflected in design documentation
 - 3.4 Monitor production activities to ensure compliance with occupational health and safety (OHS) practices
- 4 Evaluate final product
 - 4.1 Collate and evaluate information on development process
 - 4.2 Assess jewellery or object outcome against specifications
 - 4.3 Assess production outcomes with personnel to review strengths and weaknesses of process
 - 4.4 Assess actual costs against projected costs and identify reasons for discrepancies
 - 4.5 Complete all production and design documentation to inform

reproduction

Required Skills and Knowledge

Required knowledge includes:

- supply chain management
- outsourcing arrangements
- cost-benefit analysis methods
- research resources and techniques for investigating design information
- elements and principles of design as they relate to design of jewellery and objects
- jewellery designs (e.g. shanks, settings styles, shoulders and decorative finishes)
- working properties of jewellery materials
- methods of production for jewellery and objects
- design resources
- brainstorming and other idea generation techniques for research/idea development
- elements and principles of design, including form, harmony and line
- design considerations
- drawing media and their functions/applications, including paper, watercolours, pastels/inks/pencils
- drawing tools and their functions/applications, including stencils and rubbers
- design documentation
- form drawing development
- options available for drawing presentation
- enhancement techniques
- types of working drawings and their uses
- the interrelation between technical and design drawings
- hazard and control measures associated with preparing jewellery designs
- safe work practices

Required skills include:

- providing a design brief
- selecting production processes
- making decisions
- solving problems
- prioritising
- communicating effectively with personnel
- selecting, interpreting and applying procedures or processes
- preparing and presenting documentation and information
- sequencing operations
- meeting specifications
- clarifying and checking task-related information
- determining and assessing OHS practices for work
- reading and interpreting information on specifications, design documentation, illustrations, design drawings and other applicable source documents
- documenting and maintaining design process, features and design development notes

Evidence Guide

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to oversee the production of a range of jewellery or objects to design specifications and according to production criteria.</p>

MEM19044A Repair and restore antique jewellery

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to use jewellery repair techniques in the repair and restoration of antique or traditional jewellery items.

Application of the Unit

This unit applies to restoration and repair work conducted on antique, traditional or period jewellery where the finish must be consistent with the characteristics of the item.

Work includes use of jewellery equipment.

Band A

Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | |
|---|-------------------------------------|---|
| 1 | Determine work requirements | 1.1 Clarify client requirements for work |
| | | 1.2 Identify the era and design characteristics of the jewellery item and the materials and construction techniques used |
| | | 1.3 Conduct research into the item characteristics, as required, to inform work |
| | | 1.4 Examine the item to determine condition and extent of work requirements and determine feasibility of completing work to standard required |
| | | 1.5 Determine storage and handling requirements for item to ensure protection from damage |
| 2 | Plan repair or restoration work | 2.1 Determine requirements for jewellery item repair or restoration and develop work plan |
| | | 2.2 Estimate costs and confirm viability against client requirements and budget |
| | | 2.3 Determine requirement for manufacture of new componentry or sourcing of specialist expertise |
| | | 2.4 Confirm feasibility of repair work to achieve quality outcome |
| | | 2.5 Source materials, equipment, components and specialist expertise required to complete work |
| 3 | Conduct repair and restoration work | 3.1 Select and use tools, equipment, materials and consumables appropriate to job requirements in accordance with manufacturer specifications and organisational procedures |
| | | 3.2 Apply repair and restoration techniques to jewellery item in accordance with the style of the item |
| | | 3.3 Identify and address unforeseen consequences of work |
| | | 3.4 Observe occupational health and safety (OHS) requirements and safely operate all workshop equipment used |

- 3.5 Perform work in a manner that minimises waste and complies with environmental requirements

- 4 Finish work
 - 4.1 Check work meets client requirements and quality standards
 - 4.2 Determine safe cleaning techniques for antique item to ensure features are protected from damage
 - 4.3 Clean item and prepare for presentation to client
 - 4.4 Complete documentation on work undertaken
 - 4.5 Clean up work area

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- reading and interpreting routine information on written job instructions, specifications, standard operating procedures and drawings
- interpreting client requirements
- analysing characteristics of antique jewellery
- costing work
- completing work by hand according to job requirements
- interpreting drawings
- weighing and measuring
- selecting appropriate tools and equipment
- selecting appropriate materials and repair/manufacturing techniques
- applying appropriate fabrication and finishing procedures
- working safely
- identifying alternative metals

Required knowledge

Required knowledge includes:

- information sources on antique jewellery
- range of techniques used in antique jewellery construction
- characteristics and responses of metals and common materials used in antique jewellery
- reasons for selecting particular metals, construction methods, repair/manufacturing and finishing techniques
- workplace hazards and emergency procedures
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to repair and restore a range of antique jewellery items in a manner which is consistent with the style and era of the item.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures to safely and effectively use jewellery repair and construction equipment and processes • determine the requirements for repair or restoration • source and apply information on antique jewellery • conduct a range of repair and restoration techniques to ensure quality standards and client requirements are met.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application.

	<ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Materials	<p>Materials may include:</p> <ul style="list-style-type: none"> • gold, silver and platinum • precious or semi-precious stones • coral, shells, leather, copper and copper alloys, enamel, glass, ceramic, feathers, insect cases, bone and ivory, hair and paper
Repair or restoration work	<p>Repair or restoration work may relate to:</p> <ul style="list-style-type: none"> • wear and tear • chipped stones or enamel • broken or weak clasps or componentry • scratched surfaces • tarnished or dirty metals • encrusting of components with foreign objects • deterioration • light damage • stains
Repair and restoration techniques	<p>Repair and restoration techniques may include:</p> <ul style="list-style-type: none"> • retipping • reshank

	<ul style="list-style-type: none"> • restoration • new collets • chain repairs • fastening mechanism repairs • replacement or reconstruction of componentry • refinishing • cleaning
OHS requirements	<p>OHS requirements may include:</p> <ul style="list-style-type: none"> • wearing personal protective equipment in the jewellery workshop • aprons • protective foot wear • eye protection while operating rotary equipment
Environmental requirements	<p>Environmental requirements may relate to:</p> <ul style="list-style-type: none"> • liquid waste • solid waste • gas, fume, vapour, smoke emissions, including fugitive emissions, and dust • excessive energy and water use • excessive noise

MEM19045A Set gems in channel style settings

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to prepare, seat and set gems into channel style settings.

Application of the Unit

This unit applies to pre-manufactured jewellery items and must include application of both tapered and parallel channel setting techniques. Gem materials include round brilliant and baguette shaped stones.

Work includes use of gem setting equipment and cleaning and inspection of the work produced.

Band A
Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | |
|---|----------------------------|---|
| 1 | Prepare for gem setting | <p>1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area</p> <p>1.2 Plan gem setting procedure</p> <p>1.3 Obtain and prepare equipment for the task and make modifications as required for work</p> <p>1.4 Identify materials used in channel settings and their essential characteristics</p> <p>1.5 Handle gem in a manner which ensures damage is prevented</p> <p>1.6 Determine the characteristics and purpose of channel in setting gem material</p> |
| 2 | Construct channel settings | <p>2.1 Secure the item to be set in a manner which negates damage to the jewellery piece during the setting process</p> <p>2.2 Check the thickness, width and length of the channel construction in regard to the gem dimension to be set</p> <p>2.3 Prepare, lay out and cut the appropriate channel to suit the gem shape and number to be set</p> <p>2.4 Cut the bearing by hand or with a burr and seat the gem in accordance with industry standards</p> <p>2.5 Form the channel edge by hand or with an automatic hammer handpiece to secure the gem in the setting, including executing a bright cut on the inside edge of the channel</p> |

- 3 Finish work
 - 3.1 Remove any securing compound and clean the jewellery piece for inspection
 - 3.2 Ensure that jewellery piece meets quality standards
 - 3.3 Complete workplace documentation
 - 3.4 Clean up and maintain production environment and equipment according to enterprise procedures

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- selecting and preparing tools
- identifying metals
- identifying gem features
- adjusting, sharpening and maintaining tools
- preparing metals
- securing gems
- calculating required material size
- securing the jewellery item to be set without inflicting damage
- selecting the appropriate depth and spacing at which to cut the bearing on the inside of the channel wall
- seating the gem level and straight in the channel that has been prepared
- securing the gem by forming the channel wall over the gem
- finishing the top of the channel to reflect industry standard
- applying techniques for handling gem safely and minimising stress during setting processes
- reading and interpreting routine information on written job instructions, specifications, standard operating procedures and drawings

Required knowledge

Required knowledge includes:

- setting terminology
- gem features and handling procedures
- maintenance of tools
- setting techniques, processes and procedures
- working properties of gems
- suitability of metal for carving and setting
- essential characteristics of various styles of channel settings
- various securing techniques for jewellery items to be set
- safe operation all workshop equipment used

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to prepare, seat and set gems into channel style settings.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures • produce a channel setting reflective of industry standard • use the safety equipment provided appropriately • demonstrate safe working operations at all times • applying techniques for handling gems safely and minimising stress during setting processes.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related

	<p>conditions (real or simulated) and require evidence of process.</p> <ul style="list-style-type: none"> • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

OHS requirements	<p>OHS requirements may include:</p> <ul style="list-style-type: none"> • legislation • personal protective equipment • material safety management systems • hazardous substances and dangerous goods code • local safe operation procedures • awards provisions
Materials used in channel settings	<p>Materials may include:</p> <ul style="list-style-type: none"> • gemstones • natural stones • modified and synthetic gems • gold • silver • platinum • cast and handmade alloys • faceted and cabochon cut gems in either calibrated or freeform shapes
Gem setting tools and equipment	<p>Gem setting tools and equipment may include:</p> <ul style="list-style-type: none"> • gravers

	<ul style="list-style-type: none"> • grinders • micro-motors • polishing machines • sharpening stones • setters wax/cement • jewellers burrs/drills • 10X loupe or head set • emery paper • flat and half pliers • needle files • pocket knife • oil • workbench • blocks or dowels covered with setters cement • bench mate setters clamp • engravers vice • bench vice • hand held setters clamp
<p>Environmental requirements</p>	<p>Environmental requirements may relate to:</p> <ul style="list-style-type: none"> • liquid waste • solid waste • gas, fume, vapour, smoke emissions, including fugitive emissions, and dust • excessive energy and water use • excessive noise
<p>Enterprise procedures</p>	<p>Enterprise procedures may include:</p> <ul style="list-style-type: none"> • the use of tools and equipment • instructions, including job sheets, cutting lists, plans, drawings and designs • reporting and communication • manufacturer specifications • operational procedures

MEM19046A Apply grain setting techniques

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to apply grain setting techniques to set gem setting.

Application of the Unit

This unit applies to pre-manufactured jewellery items and must include application of pave', thread and grain, and single stone bead set techniques to produce a variety of completed settings.

Work includes use of gem setting equipment and cleaning and inspection of the work produced.

Band A
Unit Weight 4

Licensing/Regulatory Information

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | |
|---|---------------------------|--|
| 1 | Prepare for grain setting | <ul style="list-style-type: none"> 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area 1.2 Define the characteristics and purpose of grain in a setting 1.3 Define the characteristics of pave', thread and grain, and single stone bead set 1.4 Plan grain setting procedure 1.5 Obtain and prepare equipment for the task and make modifications as required for work 1.6 Identify materials used and their essential characteristics 1.7 Handle gems in a manner which ensures damage is prevented |
| 2 | Prepare grain setting | <ul style="list-style-type: none"> 2.1 Secure the item to be set in a manner which negates damage to the jewellery piece during the setting process 2.2 Drill and countersink the item producing a bearing to suit gem diameter 2.3 Seat the gem in the bearing opening checking the gem is at the correct height, straight and level 2.4 Raise the grains using various shaped gravers and bead the grains over to secure the gem 2.5 Form the grains into beads using a beading tool to secure the gem |

- 2.6 Perform the final bright cutting using either a flat or onglette graver
 - 2.7 Conduct work in accordance with environmental considerations
- 3 Finish work
 - 3.1 Remove any securing compound and clean the jewellery piece for inspection
 - 3.2 Apply techniques for inspection and quality control of the setting work produced through a 10X magnification
 - 3.3 Ensure that jewellery piece meets quality standards
 - 3.4 Complete workplace documentation
 - 3.5 Clean up and maintain production environment and equipment according to enterprise procedures

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- selecting and preparing tools
- identifying metals
- identifying gem features
- adjusting, sharpening and maintaining tools
- preparing metals
- securing gems
- calculating required material size
- securing the jewellery item to be set without inflicting damage
- marking out and drilling the layout for the gem to be grain set
- selecting the appropriate depth at which to countersink and form a bearing reflective of the gem height
- seating the gem material level and straight in the bearing
- securing the gem by raising two or more grains over the gem
- using gravers to remove excess metal from around the gem to highlight the reflective properties of the gem
- choosing the correct size beading tool and form the grains into beads over the gem
- bright cutting the edges of the setting area using gravers to finish the setting work in accordance with industry standards
- applying techniques for handling gems safely and minimising stress during setting processes

Required knowledge

Required knowledge includes:

- setting terminology
- gem features and handling procedures
- maintenance of tools
- setting techniques, processes and procedures
- working properties of gems
- suitability of metal for carving and setting
- essential characteristics of various styles of grain settings
- various securing techniques for jewellery items to be set

- spacing and layout techniques for pave' setting
- safe operation all workshop equipment used

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to produce a variety of pave', thread and grain, and single stone bead settings.

Elements and Performance Criteria

- | | | |
|---|--|---|
| 1 | Prepare for gem setting | <p>1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the tasks and for the work area</p> <p>1.2 Define the characteristics of bezels, including full and part bezels, along with bezel construction types</p> <p>1.3 Plan gem setting procedure</p> <p>1.4 Obtain and prepare equipment for the task and make modifications as required for work</p> <p>1.5 Identify materials used in bezel and claw settings and their essential characteristics</p> <p>1.6 Handle gem material in a manner which ensures damage is prevented</p> |
| 2 | Prepare various shapes and types of bezels for setting | <p>2.1 Secure the item to be set, in a manner which negates damage to the jewellery piece during the setting process</p> <p>2.2 Adjust the height of the bezel in accordance to the depth of the gem</p> <p>2.3 Cut the bearing by hand or with a burr and seat and secure gem in accordance with industry standards</p> <p>2.4 Shape the top of the bezel wall and bright cut the inner edge as required by the shape</p> <p>2.5 Conduct work in accordance with environmental considerations</p> |

- 3 Prepare claw settings
 - 3.1 Describe advantages and disadvantages of 2,4,6,8,12 wire settings and 'V' wire claw settings
 - 3.2 Prepare claw for setting and select the height and depth of the bearing to be cut
 - 3.3 Cut the bearing by hand or with a burr and seat the gem in accordance with industry standards.
 - 3.4 Form the claw to secure the gem in the setting, including finishing the top of the claw to a predetermined shape without damaging the gem

- 4 Finish work
 - 4.1 Remove any securing compound and clean the jewellery piece for inspection
 - 4.2 Ensure that jewellery piece meets quality standards
 - 4.3 Complete workplace documentation
 - 4.4 Clean up and maintain production environment and equipment according to enterprise procedures

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- selecting and preparing tools
- identifying metals
- identifying gem features
- adjusting, sharpening and maintaining tools
- preparing metals
- securing gems
- calculating required material size
- securing the jewellery item to be set without inflicting damage
- selecting the appropriate height and depth at which to cut the bearing on the wire of the claw setting
- seating the gem level and straight in the claw setting
- securing the gem by pushing the claw wire over the gem
- finishing the top of the claw to desired shape
- selecting the appropriate height and depth at which to cut the bearing on the inside of the bezel wall
- seating the gem level and straight in the bezel setting
- securing the gem by pushing the bezel wall over the gem
- finishing the top of the bezel to desired shape
- applying techniques for handling gems safely and minimising stress during setting processes

Required knowledge

Required knowledge includes:

- setting terminology
- gem features and handling procedures
- maintenance of tools
- setting techniques, processes and procedures
- working properties of materials
- types of gems and their key characteristics
- range of facet cuts used on gems
- qualities, features, limitations and working characteristics of different metals used in

jewellery

- suitability of metal for carving and setting
- essential characteristics of wire claw settings
- essential characteristics of various styles of bezel settings
- various securing techniques for jewellery items to be set
- safe operation all workshop equipment used

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

1	Plan complex borders and ornate decorations for engraving	1.1	Identify and list elements of various border designs and decorative drawing styles for engraving
		1.2	Determine client requirements for border designs and decoration
2	Develop designs to meet client requirements	2.1	Develop complex designs for borders and decorations to predetermined dimensions and client requirements
		2.2	Use computer-based tools to explore and develop complex borders and decorative designs to predetermined dimensions and client requirements
3	Mark out border and decorative layouts on metal surface	3.1	Identify techniques to reduce or enlarge designs to predetermined dimensions according to client requirements
		3.2	Accurately mark out lettering and/or monogram and cipher layouts on metal surfaces to be engraved using predetermined reference/datum points
4	Perform hand engraving	4.1	Perform engraving of complex and ornate style borders to a commercial industry standard
		4.2	Perform engraving of complex and ornate decorative layouts to a commercial industry standard
		4.3	Perform work in a manner that minimises waste and complies with environmental requirements
		4.4	Observe occupational health and safety (OHS) requirements and safely operate all workshop equipment

used

- 5 Finish work
 - 5.1 Check engraving meets client requirements and quality standards
 - 5.2 Clean item and prepare for presentation to client
 - 5.3 Clean up work area

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- interpreting client requirements
- identifying the engraving sequence
- using drawing tools
- selecting and using gravers, scorpers and other applicable tools
- controlling engraving tools
- drawing decorative borders and other design work to required dimensions
- using datum lines/points
- skilfully laying out and transferring designs for lettering, monograms and ciphers onto metal surfaces
- machining and sharpening graver shape and cutting angles
- handling and securing work pieces
- maintaining points/cutting edges/polished faces
- completing fine engraving work by hand

Required knowledge

Required knowledge includes:

- engraving terminology
- sources of task-related information
- historic and cultural sources for complex borders and decorative design styles
- design research techniques
- elements and principles of design as applied to border and surface decoration design
- characteristics and responses of metals for engraving purposes
- securing methods and limitations
- different gravers, scorpers and other tools and their applications
- techniques for producing and maintaining cutting edges
- equipment used for maintaining gravers
- required industry standards
- tool maintenance
- basic hand engraving techniques
- hazards and control measures, including housekeeping
- use and application of personal protective equipment

- safe work practices and procedures

Evidence Guide

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

1	Research heraldic designs and identify requirements for engraving	1.1	Research heraldic designs for hand engraving
		1.2	Determine client requirements for application of the heraldic design onto the metal surface
2	Develop heraldic designs	2.1	Plan the layout for the heraldic design according to predetermined dimensions and client requirements
		2.2	Use computer-based tools to explore and develop heraldic designs for hand engraving
3	Mark out layout of heraldic designs to be engraved	3.1	Identify techniques to reduce or enlarge designs to predetermined dimensions according to client requirements
		3.2	Accurately mark out heraldic layouts on metal surfaces to be engraved using predetermined reference/datum points
4	Perform hand engraving of heraldic designs	4.1	Perform heraldic crest hand engraving to predetermined stipulations/dimensions
		4.2	Perform engraving of ornate style heraldic crests to a commercial industry standard
		4.3	Perform engraving of heraldic shields
		4.4	Perform engraving of heraldic helmets
		4.5	Perform work in a manner that minimises waste and

- complies with environmental requirements
- 4.6 Observe occupational health and safety (OHS) requirements and safely operate all workshop equipment used
- 5 Finish work
 - 5.1 Check engraving meets client requirements and quality standards
 - 5.2 Clean item and prepare for presentation to client
 - 5.3 Clean up work area

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- interpreting client requirements
- identifying the engraving sequence
- using drawing tools
- using datum lines/points
- drawing decorative borders and other design work to required dimensions
- applying block/script lettering and carving techniques to achieve patterns in relief or intaglio
- skilfully laying out and transferring heraldic designs onto metal surfaces
- selecting and using gravers, scorpers and other applicable tools
- controlling engraving tools
- machining and sharpening graver shape and cutting angles
- handling and securing work pieces
- maintaining points/cutting edges/polished faces
- completing fine engraving work by hand

Required knowledge

Required knowledge includes:

- historic and cultural sources of heraldic designs
- design research techniques
- elements and principles of design as applied to applications of hand engraved designs to a range of metal surfaces
- characteristics and responses of metals for engraving purposes
- engraving terminology
- sources of task-related information
- securing methods and limitations
- different gravers, scorpers and other tools and their applications
- techniques for producing and maintaining cutting edges
- equipment used for maintaining gravers

- required industry standards
- tool maintenance
- hand engraving techniques
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to engrave a variety of heraldic designs on a range of metal surfaces.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures to safely and effectively use engraving equipment and processes • source heraldic designs to meet customer requirements • appropriately position and transfer heraldic design onto the object to be engraved • represent fine line detail and shading • design work that meets with client approval and is consistent with commercial standards.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application.

	<ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Heraldic designs	<p>Heraldic designs may include:</p> <ul style="list-style-type: none"> • College of Arms as a repository of information for historical and cultural sources • crests • coats of arms • flag designs
Metal surfaces	<p>Metal surfaces may include, but are not limited to:</p> <ul style="list-style-type: none"> • gold • silver • platinum • alloys
Computer-based tools	<p>Computer-based tools may include, but are not limited to:</p> <ul style="list-style-type: none"> • computer-generated fonts • word processing applications • vector based and bitmap drawing applications • desktop publishing applications • printers

Elements and principles of design	<p>Elements and principles of design may include:</p> <ul style="list-style-type: none"> • line and direction • shape and size • texture, colour and value • harmony • contrast • dominance • repetition • gradation and radiation • unity • proportion • alternation • balance
OHS requirements	<p>OHS requirements may include:</p> <ul style="list-style-type: none"> • wearing personal protective equipment in the jewellery workshop • aprons • protective foot wear • eye protection while operating rotary equipment
Environmental requirements	<p>Environmental requirements may relate to:</p> <ul style="list-style-type: none"> • liquid waste • solid waste • gas, fume, vapour, smoke emissions, including fugitive emissions, and dust • excessive energy and water use • excessive noise

MEM19050A Hand carve engraving work

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to engrave/carve in relief onto a variety of jewellery or object surfaces.

Application of the Unit

This unit applies to engraving work, which includes seal carving and relief carving, on both concave and convex surfaces and carving half hoop rings. Work is conducted according to design specification and includes transferring design drawing onto surface for carving. Carving must be conducted on a range of metals surfaces and may also include alternative materials, such as coral, shells, enamel, glass and ceramic, where they are used in the jewellery or object design.

Work includes use of jewellery making equipment.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | | |
|---|------------------------------|-----|---|
| 1 | Confirm work requirements | 1.1 | Analyse specifications or design drawing to determine carving requirements |
| | | 1.2 | Determine requirements for drawing modification or resizing in order to fit metal surface |
| | | 1.3 | Confirm metal surface will respond to carving technique |
| 2 | Transfer and mark out design | 2.1 | Apply techniques to reduce or enlarge the design to a given size |
| | | 2.2 | Transfer drawing detail onto metal surface |
| | | 2.3 | Mark out various carving layouts and patterns using predetermined reference/datum points |
| 3 | Apply carving techniques | 3.1 | Select and use tools, equipment, materials and consumables appropriate to job requirements in accordance with manufacturer specifications and organisational procedures |
| | | 3.2 | Determine need for specialist carving tools and design and produce tools, as required, to complete work |
| | | 3.3 | Perform engraving carving in accordance with design stipulations |
| | | 3.4 | Observe occupational health and safety (OHS) requirements and safely operate all workshop equipment used |
| | | 3.5 | Perform work in a manner that minimises waste and complies with environmental requirements |

- 4 Finish work
 - 4.1 Check work meets client requirements and quality standards
 - 4.2 Clean item and prepare for presentation to client
 - 4.3 Complete documentation on work undertaken
 - 4.4 Clean up work area

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- reading, interpreting and following information on written job instructions, specifications, standard operating procedures, charts, lists, drawings and other applicable reference documents
- interpreting client requirements
- identifying the engraving sequence
- determining suitability of item and materials for carving work
- using datum lines/points and marking out design
- selecting and using gravers, scorpers and other applicable tools
- controlling engraving tools
- machining and sharpening graver shape and cutting angles
- handling and securing work pieces
- maintaining points/cutting edges/polished faces
- completing work by hand according to job requirements

Required knowledge

Required knowledge includes:

- range of techniques used for carving
- characteristics and responses of metals and common materials used in jewellery
- engraving terminology
- sources of task-related information
- securing methods and limitations
- different gravers, scorpers and other tools and their applications
- techniques for producing and maintaining cutting edges
- equipment used for maintaining gravers
- required industry standards
- tool maintenance
- hand engraving techniques
- hazards and control measures, including housekeeping
- use and application of personal protective equipment
- safe work practices and procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to perform seal carving and relief carving on both concave and convex metals surfaces.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • transfer design onto metal surfaces for carving • implement OHS workplace procedures to safely and effectively carve relief and seal designs on a range of metal surfaces • perform carving to industry standard • determine the requirements for repair or restoration.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process.

MEM19051A Construct multiple stone settings

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to apply a range of jewellery making skills in the construction of jewellery that incorporates multiple stone settings.

Application of the Unit

This unit applies to construction of jewellery that features multiple stone settings and clusters and may be applied to rings, brooches, pendants, and so on. It will involve the application of a range of jewellery construction techniques, such as bezel, shank, claw and eternity rings.

Work includes use of jewellery making equipment.

Band B
Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM19047A Set gems in claw and bezel style settings

MEM19045A Set gems in channel style settings

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

1	Confirm work requirements	1.1	Clarify requirements for work
		1.2	Analyse specifications or design documentation to determine construction requirements
		1.3	Conduct research into design features, as required, to inform work
		1.4	Develop construction plan
		1.5	Estimate costs and confirm viability
2	Research multiple setting styles	2.1	Conduct research into traditional and contemporary applications of multiple stone settings
		2.2	Research jewellery styles that contain multiple stone settings used in rings, pendants, brooches and earrings
		2.3	Document findings covering trends and methods of construction
3	Construct stone setting	3.1	Source materials, equipment and components required to complete work
		3.2	Select and arrange stones or stone sizes in a manner which displays features and works in accordance with their shape and size
		3.3	Construct top plate and/or settings, layers and levels to position stones
		3.4	Mark out stones according to design requirements
		3.5	Conduct cutting, annealing, soldering, drilling and other

- construction techniques to accurately and neatly position stones in cluster setting
- 3.6 Observe occupational health and safety (OHS) requirements and safely operate all workshop equipment used
 - 3.7 Perform work in a manner that minimises waste and complies with environmental requirements
- 4 Finish work
- 4.1 Check work meets client requirements and quality standards
 - 4.2 Determine safe cleaning techniques for item to ensure features are protected from damage
 - 4.3 Clean item and prepare for presentation to client
 - 4.4 Complete documentation on work undertaken
 - 4.5 Clean up work area

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- interpreting client requirements
- measuring and marking out stones
- analysing characteristics of jewellery design
- costing work
- using jewellery manufacturing tools
- completing work by hand according to job requirements

Required knowledge

Required knowledge includes:

- range of techniques used in antique jewellery construction
- OHS principles and practices
- characteristics and responses of metals and gems used in jewellery

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to construct an item of jewellery that includes a multiple stone setting and is finished according to industry quality standards.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures to safely and effectively use jewellery construction equipment and processes • plan the design and construction of stone settings • apply a range of jewellery construction techniques to complete multiple stone items of jewellery.

MEM19052A Produce complex objects using silversmithing techniques

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to design and create complex objects using a range of silversmithing techniques.

It includes assessing the application of the design brief in the final outcome.

Application of the Unit

This unit requires application of silversmithing techniques in the production of objects where consistency of outcomes is required across multiple items. For example, a cutlery set where a standard of quality and finish must be repeated across many pieces. It also applies to the production of complex pieces, such as tea or coffee sets or trophies, which require extensive soldering operations and complex finishing procedures.

The unit would typically apply to post-trade study or to jewellers specialising in large silver work.

Band A
Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM19033A Create silversmithing objects

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | |
|---|--|---|
| 1 | Design a complex object for silversmithing | <ul style="list-style-type: none"> 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the work and for the work area 1.2 Determine requirements from the design brief, research and discussions with appropriate personnel, if required 1.3 Evaluate relevant research information, references and resources to the design process 1.4 Record concept development through a range of drawings, notations and design options 1.5 Prepare production plans for selected design solution and refine design, as appropriate 1.6 Produce a model or maquette of the selected design 1.7 Determine and obtain resources and equipment to undertake the task |
| 2 | Apply silversmithing techniques | <ul style="list-style-type: none"> 2.1 Implement OHS requirements for carrying out the work 2.2 Determine appropriate silversmithing techniques and equipment through testing and experimenting, if required 2.3 Select and apply a range of silversmithing techniques and processes to produce the objects 2.4 Determine and apply the appropriate soldering operations for complex items that require a large number of joins to be undertaken 2.5 Produce objects to design specifications and ensure |

- consistency across items, as relevant
- 2.6 Apply knowledge to reduce the production of fire-scale during heating operations
- 2.7 Apply materials and process knowledge to identify and address production problems or inconsistencies
- 2.8 Apply relevant surface finishing techniques to the objects
- 3 Evaluate objects for meeting the design brief
 - 3.1 Implement OHS requirements for finishing the work
 - 3.2 Test objects for function against the design brief, if required
 - 3.3 Assess consistency of outcome quality in multiple objects and complex design features
 - 3.4 Evaluate and document design processes
 - 3.5 Clean up and maintain production environment
 - 3.6 Apply appropriate control measures to hazardous substances according to environmental requirements

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- researching information
- sketching and interpreting drawings
- generating ideas and concepts
- working with a wide range of materials and techniques
- using relevant tools and equipment for producing objects
- preparing and maintaining silversmithing tools and equipment (e.g. hammers, stakes, files and vices)
- applying a range of silversmithing techniques to high standard
- producing work where fire-scale is controlled during production and applying a high standard of finishing skills
- achieving consistency in standards across multiple pieces
- working effectively with others
- communicating effectively

Required knowledge

Required knowledge includes:

- concept development techniques
- purpose, function and maintenance of silversmithing equipment
- techniques/manufacturing methods for silversmithing production
- soldering techniques for silversmithing
- control measures for fire-scale
- binding and locating techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to apply a range of silversmithing techniques to the design and creation of complex or multiple objects.

MEM19054A Fabricate platinum jewellery items

Modification History

New unit

Unit Descriptor

This unit of competency covers the skills and knowledge required to design and create platinum jewellery objects applying a range of jewellery techniques. It includes assessing the application of the design brief in the final outcome.

Application of the Unit

This unit applies to work conducted in enterprises which produce platinum jewellery items. It requires the application of production processes, such as fusing and soldering, use of OHS equipment and practices, and emery and finishing operations, in a manner that addresses the specialised needs and conditions relevant to working with platinum.

Band A

Unit Weight 4

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | |
|---|--|---|
| 1 | Design and develop a concept from a design brief | <ul style="list-style-type: none"> 1.1 Identify and implement occupational health and safety (OHS) and environmental requirements for carrying out the work and for the work area 1.2 Determine requirements from the design brief, research and discussions with appropriate personnel, if required 1.3 Evaluate relevant research information, references and resources to the design process are evaluated 1.4 Record concept development through a range of drawings, notations and design options 1.5 Prepare production plans for selected design solution and refine design, as appropriate 1.6 Determine and obtain resources and equipment to undertake the task |
| 2 | Join platinum items using fusing techniques | <ul style="list-style-type: none"> 2.1 Implement OHS requirements for carrying out the work 2.2 Determine appropriate jewellery techniques and equipment through testing and experimenting, if required 2.3 Identify properties, visual and working characteristics, and safety considerations of platinum 2.4 Determine suitability of using platinum in a range of jewellery items 2.5 Select and apply fusing techniques and processes to commence production of a platinum item |

- | | | | |
|---|--|------|--|
| 3 | Apply soldering techniques | 3.1 | Determine the soldering sequence that is required for production |
| | | 3.2 | Select and apply the appropriate solders to produce the platinum item |
| | | 3.10 | |
| 4 | Construct and finish platinum items | 4.1 | Select and apply suitable jewellery techniques in constructing the item |
| | | 4.2 | Apply emery operations and surface finishing techniques which are specific to platinum items |
| | | 4.3 | Apply materials and process knowledge to identify and address production problems or inconsistencies |
| 5 | Evaluate object for meeting the design brief | 5.1 | Implement OHS requirements for finishing the work |
| | | 5.2 | Test object for function against the design brief, if required |
| | | 5.3 | Evaluate and document design processes |
| | | 5.4 | Clean up and maintain production environment |
| | | 5.5 | Apply appropriate control measures to hazardous substances according to environmental requirements |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- researching information
- sketching and interpreting drawings
- generating ideas and concepts
- working with platinum as a major component material
- applying OHS requirements for working with platinum
- applying fusing and soldering techniques for platinum
- using relevant tools and equipment for producing objects
- preparing and maintaining jewellery tools and equipment (e.g. hammers, stakes, files and vices)
- working effectively with others
- communicating effectively

Required knowledge

Required knowledge includes:

- concept development techniques
- purpose, function and maintenance of jewellery equipment
- characteristics and chemical properties of platinum
- OHS considerations and requirements when working with platinum
- emery requirements for platinum
- pre-polish and finishing options suitable for platinum items
- acids used in platinum work
- chemical and visual differences of platinum with other commonly used metals
- contamination risks for platinum
- heating and cooling techniques for platinum
- techniques/manufacturing methods and tools for platinum production
- fusing and soldering techniques for platinum jewellery
- surface finishing aspects specific to platinum jewellery production
- binding and locating techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to apply specific safety requirements for working with platinum and apply jewellery production and surface techniques relevant to this material.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • implement OHS workplace procedures and practices, including the use of risk control measures specific to platinum production • demonstrate the creation and production of platinum jewellery items on more than one occasion and in different contexts. This includes: <ul style="list-style-type: none"> • development of a sketchbook of drawings and notations that record: <ul style="list-style-type: none"> • ideas and design options generated • concept development • relevant research • plans for production solutions • production of tests and experiments, where appropriate • fusing and soldering techniques for platinum.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package.

	<ul style="list-style-type: none"> • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate personnel	<p>Appropriate personnel may include:</p> <ul style="list-style-type: none"> • supervisor • manager • trainer • mentor • teacher • team member • client
Jewellery production	<p>Production may include:</p> <ul style="list-style-type: none"> • soldering • fusing • crimping

	<ul style="list-style-type: none"> • folding • forging • hinge making • fabricating • forming
Surface finishing techniques	<p>Surface finishing techniques may include:</p> <ul style="list-style-type: none"> • electroplating • emery finishes • planishing • polishing • burnishing
OHS requirements	<p>OHS requirements may include:</p> <ul style="list-style-type: none"> • legislation • personal protective equipment • material safety management systems • hazardous substances and dangerous goods code • local safe operation procedures • awards provisions • use of welding goggles • safe use of chemicals
Environmental requirements	<p>Environmental requirements may relate to:</p> <ul style="list-style-type: none"> • liquid waste • solid waste • gas, fume, vapour, smoke emissions, including fugitive emissions, and dust • excessive energy and water use • excessive noise
Enterprise procedures	<p>Enterprise procedures may include:</p> <ul style="list-style-type: none"> • the use of tools and equipment • instructions, including job sheets, cutting lists, plans, drawings and designs • reporting and communication • manufacturer specifications • operational procedures

MEM20001A Produce keys

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers producing and duplicating keys for mechanical locking devices and systems - by hand, code and duplicating machine, computer code machines and read/write transponder programming.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to production and duplication of keys in a store/workshop, mobile workshop or on-site. It applies to the production of keys across a range of locksmithing areas, including automotive, domestic, commercial, security containers and ancillaries.</p> <p>Key tasks are identifying blank type, obtaining blank, selecting cutting method, preparing tools and equipment, cutting/duplicating keys, checking finished product.</p> <p>If electronically stored data is accessed and recorded (where program knowledge and judgement is not required), Unit MEM16006A (Organise and communicate information) should also be selected.</p> <p>This unit applies to identification of transponder keys and programming read/write transponder keys only. Where other programming of high-security transponders is required, Unit MEM20013A (Service automotive transponder systems) should be selected.</p> <p>Band: A</p> <p>Unit Weight: 4</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify requirements for key production	1.1. Appropriate method for cutting/duplicating is selected according to key type and system, and other applicable factors. 1.2. Requirements for key production are identified from instructions, documentation and existing samples. 1.3. Signatories are confirmed.
2. Prepare materials and equipment	2.1. Appropriate tools and equipment are selected. 2.2. Correct key blank is selected for the given application. 2.3. Equipment and accessories are set up correctly for cutting/duplicating.
3. Produce and duplicate keys	3.1. Key correctly fits and operates lock. 3.2. Key dimensions meet manufacturer specifications. 3.3. Hand tools and equipment are used safely and correctly. 3.4. Key is finished according to standard operating procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- selecting appropriate cutting/duplicating method
- using and interpreting conversion charts, reference books, and samples to identify blank requirements
- accessing and using computer and book code programs
- measuring key dimensions
- identifying key types and features
- identifying faults in samples
- selecting tools and equipment
- setting up and safely using cutting and duplicating equipment
- testing and adjusting key operation

REQUIRED SKILLS AND KNOWLEDGE

- checking calibration
- key finishing

Required knowledge

Look for evidence that confirms knowledge of:

- different techniques for cutting and duplicating
- tools and equipment for hand and machine cutting
- key systems and blanks
- spacings, depths, angles, shapes and other measurements relevant to cutting keys
- terminology for key production
- workplace method for confirming signatory to key order
- tools, equipment and accessories for cutting keys by hand and machine
- key blank storage and classification systems
- housekeeping procedures
- safe operation of equipment and safe work practices
- identification marking procedures
- key storage and packaging procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to produce and duplicate various keys across a range of locksmithing areas.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with producing keys, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>
Guidance information for assessment	

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Appropriate method for cutting/duplicating	Hand, machine, computer and book code equipment, programming of read/write transponders
Key types	Inline pin tumbler, single and double sided wafer, 2 and 4 track, lever (pin, pipe, mortice, flat steel, double bitted), warded, pre-cut, rotating pin, rotating disc, axial pin (dimple), tubular, cruciform
Key systems	Restricted, semi-restricted and non-restricted system numbers, manufacturer restricted, factory restricted, locksmith restricted/managed, association restricted
Requirements for key production	Specific client requirements and quantities, completion times and dates, job requirements and tasks, signature authorities, OHS requirements, company requirements, compliance with relevant manufacturer requirements, warranties and service information
Documentation	Materials used, identified faults, warranties and recommendations, costs
Tools and equipment	<ul style="list-style-type: none"> • Manual and computerised code machines, milling machines, tubular machines, duplicating machines, crimpers, hand files, bridge support. • Measuring equipment includes standard gauges and vernier callipers
Safely and correctly	<ul style="list-style-type: none"> • OHS policies and procedures include hazardous and risk assessment mechanisms, implementation of safety regulations, safety

RANGE STATEMENT

	<p>training, safety, systems incorporating use of protective equipment, use of codes of practice, emergency procedures, first aid</p> <ul style="list-style-type: none"> • Safety and personal protective equipment includes safety glasses, support devices and rests, guarding

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify key mechanism features and assembly requirements	1.1. Assembly specifications are identified from instructions and documentation. 1.2. Appropriate authorisations are obtained, signatures checked and order confirmed. 1.3. Appropriate assembly sequence/method is planned in accordance with instructions and manufacturer documentation.
2. Prepare to assemble lock mechanisms	2.1. Lock mechanisms are disassembled, if necessary. 2.2. Components and parts are compiled in accordance with assembly specifications. 2.3. Tools, equipment and materials are selected to suit job requirements. 2.4. Work area is prepared and components are arranged in accordance with organisational procedures and selected assembly technique. 2.5. Defective or faulty parts are identified and processed according to organisational procedures.
3. Assemble lock mechanisms	3.1. Locksmithing techniques and principles are applied appropriate to assembly activity. 3.2. Records/data are maintained or processed in accordance with organisational requirements. 3.3. Component parts are fitted to ensure correct positioning and conformance with specifications. 3.4. Locking mechanism is correctly marked/ tagged/ identified as appropriate in accordance with organisational procedure. 3.5. Components and/or assembly are handled and stored in a manner least likely to cause damage and in accordance with organisational procedure.
4. Identify the combination of an assembled mechanism	4.1. The lock mechanism and construction is correctly identified using appropriate method. 4.2. Lock mechanism is decoded (internal locking components).
5. Check finished products	5.1. Operation of the lock mechanism and key is checked for conformance to specifications. 5.2. Faults in lock mechanism or key operation are identified and rectified.
6. Mark, package and label products	6.1. Products are stamped with correct door and key reference information in accordance with

ELEMENT	PERFORMANCE CRITERIA
	organisational procedures. 6.2. Stamping equipment is selected and used correctly. 6.3. Products are grouped, packaged and labelled for installation in accordance with organisational procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- checking components/parts against key schedule/job sheet, assembly list or equivalent instructions
- planning assembly sequence
- decoding key mechanisms

Required knowledge

Look for evidence that confirms knowledge of:

- types of mechanical locking devices
- information on handwritten and computer generated pinning charts, key and door schedules, hardware chart, mechanical locking devices, mechanisms and components
- the importance of obtaining authorisations
- the difference between levers and key blanks
- fitting requirements and sequence of assembly
- tools, equipment and materials for assembling lock mechanisms
- door and key reference information and stamping methods

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish installation and upgrade requirements	<p>1.1. Customer requirements and work order/instructions are identified and clarified with appropriate person/s as required in accordance with organisational requirements.</p> <p>1.2. Customer is advised of products, product options and possible upgrade options in accordance with organisational and customer requirements.</p> <p>1.3. Installation procedure is established in accordance with work order and with minimal disruption to customer, services or normal work routines.</p>
2. Organise and prepare installation	<p>2.1. Appropriate and serviceable tools, equipment, and materials are selected and obtained in accordance with organisational requirements, procedures and fitting instructions.</p> <p>2.2. A safe work site is established and maintained in accordance with OHS, legislative and organisational requirements.</p> <p>2.3. Suitable safety and personal protective equipment is selected and used in accordance with OHS, legislative and organisational requirements.</p> <p>2.4. Access to site and specific site requirements are established, and appropriate arrangements made in accordance with client and organisational requirements.</p>
3. Install and upgrade locks and hardware	<p>3.1. Installation location is prepared, measured and marked out as appropriate.</p> <p>3.2. Locks and hardware are fitted in accordance with manufacturer specifications and organisational requirements.</p> <p>3.3. Lock and hardware function is checked for correct functioning and operational problems are rectified.</p> <p>3.4. Work is carried out using safe work procedures and practices and in accordance with applicable legislation, codes, regulations and standards.</p> <p>3.5. Problems affecting the installation are identified and variations to installation are discussed and resolved with appropriate persons.</p>
4. Complete the installation	<p>4.1. Work site is cleaned and left in presentable condition in accordance with original presentation, client requirements, industry standards and organisational requirements.</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>4.2. Final inspections are undertaken to ensure installation conforms with industry, legislative and order requirements.</p> <p>4.3. Client is notified of job completion and client acceptance is obtained in accordance with organisational procedures.</p> <p>4.4. Client is instructed on use of product in accordance with organisational requirements and manufacturer specifications.</p> <p>4.5. Relevant documentation is accurately completed and processed in accordance with industry, legislative and organisational requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- measuring and marking out with tape measures, rules, squares and templates
- identify existing fixtures and fittings (if any) including type and quality of construction
- establishing customer requirements such as location, product type/colour/function, compatibility with existing hardware
- communicating product information
- interpreting fitting instructions/templates/terminology
- planning stages/steps for installation or upgrade and suitable timeframe for installation
- checking tools for serviceability
- selecting appropriate tools for the type of products, materials and conditions
- identifying and assessing hazards
- using safety and personal protective equipment
- safely using tools and equipment
- drilling, filing, fixing
- applying safe work practices
- assessing the potential for unforeseen problems and incidents to affect the installation

REQUIRED SKILLS AND KNOWLEDGE

- testing and confirming function of locks and hardware
- completing and processing documentation

Required knowledge

Look for evidence that confirms knowledge of:

- utility and application of locks/hardware/accessories
- fixtures (doors, frames, windows etc.) and their type of construction, such as foam fill, hollow, clad, steel, aluminium and other materials
- types and functions of locks, hardware and accessories to suit different fixtures and materials
- factors for determining customer requirements
- factors affecting suitable options including intended use, cost, compatibility with existing hardware
- installation procedures for locks/hardware/accessories
- terminology relating to lock products and installation
- tools and equipment for installing locks, hardware and lock furniture
- use of specialised tools, such as morticers, routers, jigs, cherry centre
- materials, parts and components for installation of locks and lock furniture
- hazards and risks to installer, client and public
- applicable legislation, local regulations
- safety and emergency measures and safe work practices to avoid or minimise potential and actual hazards
- individual responsibilities and duty of care
- types and uses of personal protective equipment
- access and installation factors, such as site safety issues, night access, disruption to client work routines, installation environment, building codes
- procedures for measuring and marking lock and lock furniture positions
- installation procedures for locks and lock furniture
- effects of incorrect installation
- common installation problems
- troubleshooting and lock testing methods
- potential installation problems and incidents, including breakdowns, environmental, physical, time and cost restrictions, product supply problems
- strategies for resolving problems and incidents
- procedures and industry standards for site clean-up
- organisational requirements for final inspection
- organisational requirements for client acceptance
- manufacturer specifications, uses, limitations and warranties for relevant product/s
- procedures to complete and process relevant documentation, including installation details, costings, materials used, records of faults and damage, installation problems and factors, testing and inspection results

REQUIRED SKILLS AND KNOWLEDGE

- | |
|--|
| <ul style="list-style-type: none">• environmentally safe disposal procedures for packaging and other waste• procedures for client notification and acceptance of job completion |

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Customer requirements

May relate to product type, function and capabilities, access issues, installation locations and positions, upgrade information, service and maintenance requirements, product operation and warranty information, costings

Work order/instructions

Schedules, timeframes, access and site information, products, installation and upgrade requirements, specific client requests, materials, costings, warranties and service information, legislation, codes and regulatory requirements, OHS factors and requirements

Organisational requirements

Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training

Tools, equipment and other materials

Hand tools, power tools and accessories, fixing tools, special-purpose equipment, lubricants, adhesives and sealants, cleaning materials, wire and cable, vacuum, door&window and frame materials e.g. aluminium, timber, MDF

Safety and personal protective equipment

Night hats, signs, barriers, masks/goggles/safety glasses, earmuffs/plugs, vests, hard hats, gloves, knee pads, safety boots, warning signs and tapes,

RANGE STATEMENT	
	fire extinguisher, first aid kit
Locks and hardware	Cylinder nightlatches and deadlocks, lever and cylinder mortice locks, tubular deadbolts, key in knob, key in lever, tie bolts, door control devices, exit devices, lockable bolts, peep holes, window locks
Safe work procedures and practices	Risk identification and assessment, non compliance with building codes and regulations, safety practices and regulations, safe use of tools and equipment, individual responsibilities and obligations, safety training and procedures, emergency and first aid procedures, working in confined spaces, use of personal protective equipment, industry standards and codes of practice, dust and fibres in relation to MDF and possible asbestos
Legislation, codes, regulations and standards	Industry licensing, industry codes of practice, privacy laws, Australian standards, building codes and those of other regulatory bodies, quality assurance, organisational standards and practices, awards and enterprise agreements, competition, trade and consumer protection laws

MEM20004A Gain entry

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers gaining entry and straightforward return to service of general types of mechanical locks.
------------------------	--

Application of the Unit

Application of the unit	<p>The unit applies to gaining entry into commercial and domestic locks. The basis for entry includes lockout (keys inside), lost keys (rekeys) and malfunction. Applications include locks for doors and windows.</p> <p>It requires an ability to safely gain straightforward entry to mechanical locking devices, taking into account factors that ensure conformance to specifications and operational performance.</p> <p>These include locksmithing principles, ethics, techniques, procedures and safe work practices.</p> <p>Where specialised skills are required to gain entry and to reinstate both mechanical and electronic locking systems in automotive or fire and security containers, the appropriate units should be selected.</p> <p>Band: A</p> <p>Unit Weight: 4</p>
--------------------------------	--

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
Path 1	MEM18001C	Use hand tools
	MEM18002B	Use power tools/hand held operations
	MEM20001A	Produce keys
	MEM20002A	Assemble and test lock mechanisms
	MEM20003A	Install and upgrade locks and hardware

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish entry requirements, authorisation and ownership	1.1.Reason for entry, nature and urgency of problem is established. 1.2.Evidence relating to ownership and/or legal possession and authenticity of request is verified. 1.3.Own representation and authorisation is given. 1.4.Construction and mechanism information, including lock type, manufacturer, model, date, restrictions and limitations is identified. 1.5.Entry requirements and process are confirmed with customer.
2. Gain entry to mechanical locking system	2.1.Appropriate tools, equipment and entry methods are selected for the given mechanism, problem, conditions, customer and organisational requirements. 2.2.A safe and secure working environment is established according to industry, organisational and legislative requirements. 2.3.Selected tools are used to gain entry with minimal damage using appropriate industry practices. 2.4.Limitations and problems are identified and advice/assistance is sought as appropriate. 2.5.Locks and components are replaced, if necessary. 2.6.Keys are manufactured as required.
3. Finalise and document entry process	3.1.Functioning of locking system is checked and adjusted as necessary for correct operation. 3.2.Operational problems are identified for further service or repair. 3.3.Temporary or replacement lock is fitted, if necessary. 3.4.Job details and recommendations for any further action are given to customer according to organisational procedures. 3.5.Customer is instructed on use of new components, if necessary. 3.6.Completed documentation is accurate and is processed in accordance with legislative, industry and organisational requirements.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- handpicking
- impressioning
- diagnosing problems
- relating to customers
- questioning
- manipulating locks/latches (bypassing cylinder)

Required knowledge

Look for evidence that confirms knowledge of:

- products
- product identification
- methods of gaining access to mechanical locks
- tools and equipment for gaining access to mechanical locks
- operation and assembly of mechanical locks
- using catalogues and resources
- reading assembly drawings
- procedures to establish legal possession
- legal obligations and ethical requirements
- procedures to deal with fraudulent requests
- requirements and procedures for fitting temporary locks
- workplace hazards and risk minimisation

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to gain entry to a range of mechanical locks across a range of applications. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with gaining entry or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Evidence for legal possession	Photo identification, letters of authority, proof of ownership papers
Lock type	Pin tumbler (4.5.6.7 pin), wafer - E.G. L + F, lever, mechanical digital, exposed wheel combination, tubular locks
Tools and equipment	Specialised files, impression tools, pick gun, hand tools relating to gaining access Picks: curved, rake, hooks, tension wrenches (turning), lever lock picks, custom tools, tubular lock picks, scope
Entry methods	Pick, impressioning, reading, bypass, manipulation, drilling
Keys	Blank recognition, keys to code, keys to sample, use of key machines, use of computer and book code programs
Documentation	Disclaimer documents, receipt/invoice, job sheets

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for installation and service	<p>1.1. Work order is reviewed and clarified with appropriate person(s) as required in accordance with organisational requirements.</p> <p>1.2. Tools, equipment and materials are selected appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications.</p> <p>1.3. Faulty or unsafe tools are identified and segregated for repair or replacement in accordance with organisational procedures.</p> <p>1.4. Potential and existing risks and hazards associated with maintenance activities are identified and controlled in accordance with OHS policies and procedures and organisational requirements.</p> <p>1.5. Suitable personal protective equipment is selected and maintained in accordance with OHS and organisational requirements.</p>
2. Install door control devices/systems	<p>2.1. All work is conducted using safe operating practices in accordance with OHS and organisational requirements.</p> <p>2.2. The appropriate door control device/systems are selected for the given door type and specifications.</p> <p>2.3. Door control devices/systems are installed in accordance with manufacturers' specifications, work order and OHS requirements legislative and organisational requirements.</p> <p>2.4. Door control devices/systems are checked for correct operation and adjusted as necessary.</p>
3. Service door control device	<p>3.1. Checks are conducted on door control devices/systems and/or components to identify any damage, friction or sticking in accordance with manufacturers' specifications.</p> <p>3.2. Assessment of viability for continued operation or replacement of door control device.</p> <p>3.3. Door control devices/systems and/or components are adjusted in accordance with manufacturers' specifications, work order and OHS requirements legislative and organisational requirements.</p>
4. Complete installation or service	<p>4.1. Notification of work completion is made to appropriate person(s) in accordance with organisational procedures.</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>4.2. Documentation is promptly and accurately completed and processed in accordance with industry, legislative and organisational requirements.</p> <p>4.3. Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements.</p> <p>4.4. Malfunctions, faults, wear or damage to tools is reported for repair or replacement in accordance with organisational policy and procedures.</p> <p>4.5. Waste from service and repair activities is collected, treated and disposed or recycled in accordance with organisational and environmental requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- communicating in a clear and concise manner
- using appropriate tools and equipment
- lubricating mechanical locks and locking systems
- demonstrating basic logic and lateral thinking processes
- disassembling/reassembling mechanical locks/locking systems
- identifying faults
- reading and interpreting specifications, charts and diagrams
- methodically organising and prioritising work tasks
- solving routine problems
- working in confined spaces
- accurately estimating materials, tools and equipment requirements
- applying safe and environmentally aware workplace practices

Required knowledge

Look for evidence that confirms knowledge of:

- types, functions and specifications of door control devices/systems
- correct selection of door control devices

REQUIRED SKILLS AND KNOWLEDGE

- operational principles of door control devices/systems
- common door control devices/systems faults
- maintenance requirements of door control devices/systems
- tests to confirm door control devices/systems operation
- procedures to disassemble/reassemble
- technical terminology
- types of doors and windows and mechanical system applications
- maintenance risks and hazards
- working in confined space procedures
- duty of care

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Work order

Work schedules, completion dates, job requirements and tasks, specific client requirements, access to site and specific site requirements, resource requirements, OHS requirements, compliance with relevant legislation, budget allocations, warranties and service information

Appropriate person(s)

Installer, sub contractor, technician, supervisor, manager, director, client

Organisational requirements

Legal and organisational operational policies and procedures, operations manuals, induction and training materials, insurance policy agreements, client and organisational confidentiality requirements, organisational goals/objectives/plans/systems/ processes, employer and employee rights and responsibilities, own role, responsibility and delegation, quality and continuous improvement processes and standards, client service standards, defined resource parameters, OHS policies/procedures/programs, emergency and evacuation procedures, duty of care, code of conduct, code of ethics, access and equity policy, principles and practice, records and information systems and processes, communication channels and reporting procedures

RANGE STATEMENT	
Tools and equipment	Hand tools, fixing tools, strippers, router, file, drill, power saw, spirit level, soldering iron, welder, ladder, hoist, drop sheet, batteries, master key plans, personal protective equipment, communications equipment
Materials	Solder, insulation tape, springs, pins, graphite powder, oil, silicon, dry lube, grease, lockease, glue, paint, patch materials, electronic components, cleaning compounds, key blanks
Risks and hazards	Non-compliance with building codes and regulations, exposed electrical wiring, manual handling, exposure to asbestos, dust, noise, live power, vermin, water, glass fibre, building debris, natural and other gas build-up
Maintenance	Cleaning, inspection, lubrication, routine repairs, identification of worn parts, confirming operation, adjustments, key cutting, replacement of worn parts
OHS policies and procedures	Hazardous and risk assessment mechanisms, implementation of safety regulations, safety training, safety systems incorporating - work clearance procedures, isolation procedures, gas and vapour, monitoring/testing procedures, use of protective equipment and clothing, use of codes of practice
Personal protective clothing and equipment	Masks, safety glasses, head protection, ear muffs, safety boots, knee pads, gloves, warning signs and tapes, first aid kit
Door control devices/systems	Surface mounted door closers, semi concealed door closers, concealed closers, semi automatic/automatic door control devices, exit devices
Safe operating practices	Working safely around electrical wiring, cables and overhead power lines, working safely around tools and equipment, hazard recognition, emergency procedures, awareness of electrical hazards, following confined spaces procedures, administering first aid

RANGE STATEMENT	
Applicable legislation, codes and national standards	Compliance with Australian building codes and regulations, compliance with Australian Communications Authority (ACA) cabling standards, EPA noise control regulations, relevant Commonwealth/State/Territory legislation which affect organisational operation - OHS and safe work practices, environmental issues, equal employment opportunity, industrial relations, anti-discrimination and diversity, licensing arrangements, Australian standards, quality assurance and certification requirements, relevant industry codes of practice, trade practices, award and enterprise agreements, privacy requirements and privacy related legislation
Documentation	Completion of work log, mechanical lock/locking system problems/faults, warranty conditions and allowances, recommendation for repairs, operational checks and maintenance conducted, testing and commissioning results, parts and components replaced, materials used, recommendations for future operation and maintenance, costings

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for maintenance	<p>1.1. Work order is reviewed and clarified with appropriate person(s) as required in accordance with organisational requirements.</p> <p>1.2. Mechanical locks/locking systems to be inspected, serviced and/or repaired are identified and confirmed in accordance with work order.</p> <p>1.3. Tools, equipment and materials are selected appropriate to job requirements and checked for operational effectiveness in accordance with manufacturers' specifications.</p> <p>1.4. Faulty or unsafe tools are identified and segregated for repair or replacement in accordance with organisational procedures.</p> <p>1.5. Potential and existing risks and hazards associated with maintenance activities are identified and controlled in accordance with OHS policies and procedures and organisational requirements.</p> <p>1.6. Suitable personal protective equipment is selected and maintained in accordance with OHS and organisational requirements.</p>
2. Maintain mechanical lock/locking system	<p>2.1. All work is conducted using safe operating practices in accordance with OHS and organisational requirements.</p> <p>2.2. Mechanical locks/locking systems identified for maintenance are accessed with minimal disruption to client, services or normal work routines.</p> <p>2.3. Checks are conducted on mechanical locks/locking systems and/or components to identify any damage, friction or sticking in accordance with manufacturers' specifications.</p> <p>2.4. Mechanical locks/locking systems and/or components are serviced and repaired in accordance with manufacturers' specifications, work order and OHS requirements.</p> <p>2.5. Worn keys are identified and replaced as required to ensure effective operational capability in accordance with work order, legislative and organisational requirements.</p> <p>2.6. Complex faults or repair requirements outside area of responsibility or competence are reported to appropriate person(s) for specialist advice in</p>

ELEMENT	PERFORMANCE CRITERIA
	accordance with organisational procedures.
3. Complete maintenance	<p>3.1. Serviced and/or repaired mechanical locks/locking systems are reassembled and checked for correct operation and serviceability in accordance with manufacturers' specifications and OHS requirements.</p> <p>3.2. Notification of work completion is made to appropriate person(s) in accordance with organisational procedures.</p> <p>3.3. Documentation is promptly and accurately completed and processed in accordance with industry, legislative and organisational requirements.</p> <p>3.4. Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements.</p> <p>3.5. Malfunctions, faults, wear or damage to tools are reported for repair or replacement in accordance with organisational policy and procedures.</p> <p>3.6. Waste from service and repair activities is collected, treated and disposed or recycled in accordance with organisational and environmental requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- communicating in a clear and concise manner
- using appropriate tools and equipment
- lubricating mechanical locks and locking systems
- demonstrating basic logic and lateral thinking processes
- disassembling/reassembling mechanical locks/locking systems
- identifying faults
- reading and interpreting specifications, charts and diagrams
- methodically organising and prioritising work tasks
- solving routine problems
- working in confined spaces

REQUIRED SKILLS AND KNOWLEDGE

- accurately estimating materials, tools and equipment requirements
- applying safe and environmentally aware workplace practices

Required knowledge

Look for evidence that confirms knowledge of:

- types, functions and specifications of mechanical locks/locking systems
- operational principles of mechanical locks and locking systems
- common mechanical locking faults
- maintenance requirements of mechanical locks and locking
- common mechanical lock and locking system faults
- tests to confirm lock operation
- procedures to disassemble/reassemble mechanical locks
- technical terminology
- types of doors and windows and mechanical locking system applications
- maintenance risks and hazards
- working in confined space procedures
- duty of care

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to maintain and service mechanical locking devices across a range of locksmithing areas. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both. Where assessment occurs off the job, i.e. the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with maintaining and servicing mechanical locking devices, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Work order

Work schedules, completion dates, job requirements and tasks, specific client requirements, access to site and specific site requirements, resource requirements, OHS requirements, compliance with relevant legislation, budget allocations, warranties and service information

Appropriate person(s)

Installer, sub contractor, technician, supervisor, manager, director, client

Organisational requirements

Legal and organisational operational policies and procedures, operations manuals, induction and training materials, insurance policy agreements, client and organisational confidentiality requirements, organisational goals/objectives/plans/systems/ processes, employer and employee rights and responsibilities, own role, responsibility and delegation, quality and continuous improvement processes and standards, client service standards, defined resource parameters, OHS policies/procedures/programs, emergency and evacuation procedures, duty of care, code of conduct, code of ethics, access and equity policy, principles and practice, records and information systems and processes, communication channels and reporting procedures

Mechanical locks/locking

Nightlatches, deadlocks, lever and cylinder mortice

RANGE STATEMENT	
systems	locks, tubular deadbolts, key in knob, key in lever, tie bolts, exit devices, door control devices, lockable bolts, window locks, high security cylinders for commercial applications, exposed wheel combination locks (e.g. briefcases), mechanical digital (e.g. simplex), lockwood digital, tubular locks
Tools and equipment	Hand tools, fixing tools, strippers, router, file, drill, power saw, lockpick, pick gun, spirit level, soldering iron, welder, ladder, hoist, drop sheet, batteries, master key plans, personal protective equipment, communications equipment
Materials	Solder, insulation tape, springs, pins, graphite powder, oil, silicon, dry lube, grease, lockease, glue, paint, patch materials, electronic components, cleaning compounds, key blanks
Risks and hazards	Non-compliance with building codes and regulations, exposed electrical wiring, manual handling, exposure to asbestos, dust, noise, live power, vermin, water, glass fibre, building debris, natural and other gas build-up
OHS policies and procedures	Hazardous and risk assessment mechanisms, implementation of safety regulations, safety training, safety systems incorporating - work clearance procedures, isolation procedures, gas and vapour, monitoring/testing procedures, use of protective equipment and clothing, use of codes of practice
Personal protective clothing and equipment	Masks, safety glasses, head protection, ear muffs, safety boots, knee pads, gloves, warning signs and tapes, first aid kit
Safe operating practices	Working safely around electrical wiring, cables and overhead power lines, working safely around tools and equipment, hazard recognition, emergency procedures, awareness of electrical hazards, following confined spaces procedures, administering first aid
Maintenance	Cleaning, inspection, lubrication, routine repairs, identification of worn parts, confirming operation,

RANGE STATEMENT	
	adjustments, key cutting, replacement of worn parts
Access	Disassembly, use of access code, disablement of system, removal of housing, access token, keys, phone line access
Disruptions	Security, time, access, noise, use of communications equipment, business operations
Applicable legislation, codes and national standards	Compliance with Australian building codes and regulations, compliance with Australian Communications Authority (ACA) cabling standards, EPA noise control regulations, relevant Commonwealth/State/Territory legislation which affect organisational operation - OHS and safe work practices, environmental issues, equal employment opportunity, industrial relations, anti-discrimination and diversity, licensing arrangements, Australian standards, quality assurance and certification requirements, relevant industry codes of practice, trade practices, award and enterprise agreements, privacy requirements and privacy related legislation
Documentation	Completion of work log, mechanical lock/locking system problems/faults, warranty conditions and allowances, recommendation for repairs, operational checks and maintenance conducted, testing/commissioning results, parts/components replaced, materials used, future operation and maintenance recommendations, costings

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess customer requirements	<p>1.1. Customer needs are discussed and clarified according to organisational procedures.</p> <p>1.2. Appropriate levels of security/access are reviewed with respect to customer assets, activities and existing security arrangements.</p> <p>1.3. Door and lock schedules and other appropriate documentation are prepared according to organisational procedures.</p> <p>1.4. Customer requirements are matched to the mechanical possibilities and limitations of masterkey systems.</p> <p>1.5. Options are identified and customer is advised on options and alternatives.</p> <p>1.6. Personal limitations in assessing requirements for key systems and masterkey systems are identified and assistance is sought from appropriate person(s) in accordance with organisational procedures.</p>
2. Design masterkey system	<p>2.1. Keying matrix is developed to customer requirements, allowing for future system expansion and mechanical capabilities of system.</p> <p>2.2. Key codes (progression chart) are produced from mathematical permutations and calculations as per customer requirements.</p> <p>2.3. Key codes are selected from progression chart that maximise system security.</p> <p>2.4. Key cutting and cylinder loading charts are accurately developed.</p> <p>2.5. Incidental masterkeys are identified within progression charts.</p> <p>2.6. Principles of masterkeying are applied in accordance with industry practice and organisational requirements.</p>
3. Finalise system design	<p>3.1. Final system design and keying requirements are reviewed and confirmed with appropriate person(s) in accordance with organisational requirements.</p> <p>3.2. Documentation is accurately prepared and processed and stored in accordance with client, legislative and organisational requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- listening and questioning
- reading architectural plans, floor plans and charts
- applying calculations and formulae within the scope of this unit
- recording information on a floor plan
- developing key matrix
- developing and reading progression charts
- selecting codes from a progression chart that maximise system security
- checking own and others' codes for interchange
- identifying incidental masters in a key system
- selecting groups of codes to form a maisonned cylinder
- creating saving and storing information/documentation related
- using key system

Required knowledge

Look for evidence that confirms knowledge of:

- record keeping and management
- manufacturers'/Australian/building standards
- product knowledge/limitations
- key matrixes and schedules
- allowances for expansion
- operation and limitations of masterkey systems
- levels of systems (KD, KA, MK, GMK, GGMK)
- door handing
- cylinder types
- criteria for key code selection
- strategies for checking key systems for interchange
- strategies for checking key systems for incidental masters
- principles of maison keying
- strategies for code selection

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to survey and prepare a masterkey system to in-line GMK level. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with surveying and preparing masterkey systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Reviewed	Physically and/or off the plan
Customer requirements	Specific client requirements and quantities, completion times and dates, job requirements and tasks, signature authorities, OHS requirements, company requirements, compliance with relevant manufacturer requirements, warranties and service information.
Key systems	Restricted, semi-restricted and non-restricted system numbers, manufacturer restricted, factory restricted, locksmith restricted/managed, association restricted. Levels including (KD, KA, MK,GMK,GGMK)
Masterkey system	A generic term to describe a group of cylinders operated by more than one key
System expansion	Creation of excess codes to allow for lost keys, unusable codes and future customer requirements, multibroaching
Calculations	Mathematical patterns
Documentation	Materials used, identified faults, warranties and recommendations, costs.

Co-requisite units

Co-requisite units		

Competency field

Competency field	Locksmithing
-------------------------	--------------

MEM20008A Develop and implement a masterkey system

Modification History

Single band identifier removed to clarify dual status

Unit Descriptor

Unit descriptor	This unit covers creating new commercial masterkey systems and expanding existing keying systems using even cut and rotating constant progression methods. Emphasis is on cross keying, submasterkeying, selective masterkeying, construction keying, maisonning and hierarchical systems up to and including a GGMK system.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to writing masterkey systems for high security cylinders, primarily for commercial operations. Systems are written manually and using a computer masterkeying package.</p> <p>All relevant legislative requirements, policies and procedures and codes of practice are adhered to including hazardous and risk assessment, use of codes of practice, ergonomics.</p> <p>If a security survey/site assessment is required, then Unit MEM20014A (Perform a site security survey) should also be selected.</p> <p>For standard hierarchical keying, refer to Unit MEM20007A (Plan and prepare a masterkey system).</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C5 (AQF level V).</p> <p>Unit Weight: 6</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Assess customer requirements	1.1. Physical characteristics of existing locks and other security devices are considered and requirement for additional site inspection is determined. 1.2. Customer access and task requirements are discussed and clarified according to organisational procedures. 1.3. Customer requirements are evaluated with respect to current capacity, and recommendations are made for the design of new/expanded system. 1.4. Personal limitations in assessing requirements for masterkey system are identified and assistance is sought from appropriate person(s) in accordance with organisational procedures.
2. Design masterkey system and system modifications	2.1. Commercial masterkey system is designed to meet customer complex access requirements. 2.2. System is checked for interchange. 2.3. Principles and processes of masterkeying are applied in accordance with industry practice and organisational requirements.
3. Finalise system design	3.1. Final system design and keying requirements are reviewed and confirmed with appropriate person(s) in accordance with organisational requirements. 3.2. Documentation is prepared to allow for future interpretation and design requirements. 3.3. Documentation is accurately prepared and processed and stored in accordance with client, legislative and organisational requirements.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- listening and questioning
- reading architectural plans, floor plans and charts

REQUIRED SKILLS AND KNOWLEDGE

- evaluating system and expansion requirements
- determining the required structure of a keying system based on customer requirements
- developing key matrix
- developing and reading progression charts for in-line key systems using even cut and rotating constant methods
- developing and reading progression charts for rotating disc, radial pin and pin sidebar key systems
- selecting codes from progression chart that maximise system security
- checking own and others' codes for interchange
- identifying incidental masters in a key system and using them to achieve complex access requirements
- selecting groups of codes to form a maisonned cylinder
- determining the structure of the design of an existing system and the maximum number of codes that can be produced
- identifying any unused codes in an existing system
- expanding an existing key system by using multibroached plugs/barrels
- expanding an existing key system by converting the progression from even cut to rotating constant
- creating/saving and storing information/documentation
- applying calculations and formulae within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- record keeping and management
- manufacturers'/Australian/building standards
- product knowledge/limitations
- key matrixes and schedules
- allowances for expansion
- operation and limitations of masterkey systems
- levels of systems (KD, KA, MK, GMK, GGMK)
- door handing
- cylinder types
- principles of construction keying, submaster keying, cross keying, selective keying, maison keying
- criteria for key code selection
- strategies for checking key systems for interchange
- strategies for checking key systems for incidental masters
- strategies for using incidental masters to create submaster keys, cross keys and selective keys
- strategies for selecting groups of codes to form a maisonned cylinder

MEM20009A Gain entry and reinstate fire and security containers

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers gaining entry to fire and security containers fitted with mechanical and electronic locking systems. It also covers straightforward reinstatement of the locking system by removal and replacement of component parts.
------------------------	---

Application of the Unit

Application of the unit	<p>The unit may be applied to fire and security containers for commercial and domestic use. The focus is on both mechanical and electronic safe locking systems.</p> <p>Basis for entry includes lockout (keys inside), lost keys (rekeys), malfunction, and damage caused by burglary or user.</p> <p>It requires an ability to safely remove, replace and reinstate original and replacement components and locking systems.</p> <p>Appropriate factors that ensure conformance to specifications, operational performance, quality and safety must be applied. These include locksmithing principles, ethics, techniques, procedures and safe workshop practices.</p> <p>If welding skills are required, then the appropriate units should be selected.</p> <p>Where manual handling for removal of safe is required, Unit MEM11011B (Undertake manual handling) should also be selected.</p> <p>Where repairs to fire and security containers are required, unit MEM20011A (Service and repair fire and security containers) should also be selected.</p> <p>Band: A</p> <p>Unit Weight: 4</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish entry requirements, authorisations and ownership	<p>1.1.Safe ownership, contents and ownership of contents are established and verified in accordance with organisational and industry procedures.</p> <p>1.2.Safe type, locking mechanism and other relevant information is established from appropriate sources and in accordance with organisational and customer requirements.</p> <p>1.3.Nature of problem and circumstances of prior operation are established in accordance with organisational procedures, inspection/diagnostic techniques and original specifications.</p> <p>1.4.Appropriate entry method is selected in accordance with specific circumstances, customer requirements and organisational procedures.</p> <p>1.5.Appropriate location of work is determined and removal of safe is arranged, if necessary.</p>
2. Gain entry to fire and security containers	<p>2.1.Site access requirements are identified and appropriate arrangements are made.</p> <p>2.2.Potential and existing risks and hazards are identified and managed, area is made secure, and privacy/security of environment are ensured in accordance with organisational and legislative requirements.</p> <p>2.3.Safe work practices are observed to minimise risk of injury to self or others in accordance with OHS policies and procedures and organisational requirements.</p> <p>2.4.Suitable personal protective equipment is selected, used and maintained in accordance with OHS and organisational requirements.</p> <p>2.5.Tools, equipment, materials and consumables are selected appropriate to entry requirements and checked for serviceability in accordance with manufacturers' specifications and organisational procedures.</p> <p>2.6.Entry is gained in accordance with applicable legislation, codes, regulations and standards.</p>
3. Reinstat fire and security container	<p>3.1.Where applicable, replacement and/or repaired parts are selected as appropriate for reassembly.</p> <p>3.2.Lock assemblies and components are dismantled/removed using appropriate organisational</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>procedures, industry practices, tools and equipment.</p> <p>3.3. Sub-assemblies are inspected, tested and adjusted for compliance to original factory assembly and function.</p> <p>3.4. Components are prepared, assembled and adjusted using fastening equipment and methods that ensure conformance to specifications, correct functioning, quality and safety of the completed assembly.</p> <p>3.5. Lubrication, packing, sealing materials are selected and applied correctly in accordance with job specifications.</p> <p>3.6. Locking system is inspected, tested and adjusted as necessary for compliance to original factory assembly and functioning.</p>
4. Finalise entry and reinstatement process	<p>4.1. Documentation is completed and processed in accordance with legislative and organisational requirements.</p> <p>4.2. Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements.</p> <p>4.3. Safe is cleaned and returned to serviceable condition.</p> <p>4.4. Customer is advised of work undertaken, further recommended actions and any other relevant information.</p> <p>4.5. Customer is instructed, as necessary, in accordance with organisational procedure and manufacturer recommendations.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting specifications, charts, manuals, diagrams and related information specific to gaining entry
- questioning, confirming and clarifying information

REQUIRED SKILLS AND KNOWLEDGE

- identifying safe locking components and associated equipment
- checking functioning of safe locking systems
- tracing faults
- selecting and using appropriate tools and equipment, materials and consumables
- applying safe work practices
- identifying and acting on actual and potential hazards
- identifying alternative servicing and repair options
- disassembling and assembling components
- documenting information
- housekeeping
- undertaking calculations and measurement within the scope of this unit

Required knowledge

Look for evidence that confirms knowledge of:

- sources of specifications and other relevant information for safe locking systems
- types and classes of safes and locks
- barrier materials used
- tools and equipment to suit entry to specific safes
- components of safe locking systems
- principles of safe systems and component function
- technical terminology relating to safes
- operation of specific locks
- common safe design problems and servicing issues,
- faults arising from vandalism, misuse, wear etc.
- checks and tests to confirm service requirements
- organisational procedures for establishing service requirements
- procedures to establish and verify safe and contents ownership
- obligations, responsibilities, disclaimers and reasons for verifying ownership
- environmental, physical and behavioural hazards in relation to safe and surrounds
- operating principles of safes
- personal liability for safety and duty of care
- personal protective clothing, equipment and safe working procedures
- factors impacting on feasibility of repair or replacement
- dismantling and assembly procedures for a range of safe locks
- documentation and recording procedures
- procedures for replacing worn and damaged parts, removing foreign objects and lubricating, packing and sealing components
- organisational requirements for cleaning and storage
- key blanks to suit model and mechanical/electronic part of lock
- programming and operating procedures for electronic locks

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Safe type	Plate safes, fire, data, cash and/or jewellery, under-floor, wall, bank safes and vaults
Appropriate sources	Catalogues, manufacturer manuals, drawings, detailed/technical sketches and associated data sheets
Organisational requirements	Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training
Customer requirements	Function and capabilities, access issues, service and maintenance requirements, product operation and warranty information, costings
Entry method	Mechanical drilling and cutting, safe lever lock - impressioning reading, picking, manipulation of mechanical combination locks, alternative methods
Risks and hazards	Safe construction, chemical, environmental and material hazards, lifting and handling, use of mechanical and fuel gas cutting equipment
OHS policies, procedures and practices	Assessment of actual and potential risk, identification of hazards, safety practices and

RANGE STATEMENT	
	regulations, safe use of tools and equipment, individual responsibilities and obligations, safety training and procedures, emergency and first aid procedures, working in confined spaces, use of personal protective equipment, industry standards and codes of practice
Personal protective equipment	Safety glasses, earmuffs/plugs, safety vests, hard hats, gloves, knee pads, safety boots, warning signs and tapes, fire extinguisher, first aid kit
Tools and equipment	<ul style="list-style-type: none"> Hand and power tools and accessories specific to gaining entry - hardened drill bits, special-purpose equipment e.g. borescope, combination lock automatic dialler (soft drill), listening devices, flexilight, fibre optical scope, vacuum cleaner, magnetic based drills, lever rigs Measuring equipment includes vernier callipers, rules, squares and templates, gauges
Legislation, codes, regulations and standards	ASIO regulations, industry licensing, industry codes of practice, privacy laws, Australian standards, building codes and those of other regulatory bodies, quality assurance, organisational standards and practices, awards and enterprise agreements, competition, trade and consumer protection laws
Materials and consumables	Lubricants, adhesives and sealants, cleaning materials, wire and cable, replacement parts
Lock assemblies and components	Keylocks, keyless combination locks, electronic digital, electronic and mechanical time delay
Documentation	Historical records, procedures and measurements for opening specific safes, job sheets, invoices, warranties

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish entry requirements to auto locking system	1.1. The reason for entry is established. 1.2. Authenticity of request is verified in accordance with organisational and industry procedures. 1.3. Nature of problem and circumstances of prior operation are established in accordance with organisational procedures, inspection/diagnostic techniques and original specifications. 1.4. Vehicle, locking system and other relevant information is identified from appropriate sources and in accordance with organisational and customer requirements. 1.5. Specifications for components are obtained from appropriate source and are interpreted correctly.
2. Gain entry to vehicle	2.1. Appropriate entry method is selected in accordance with specific circumstances, customer requirements and organisational procedures. 2.2. Tools, equipment, materials and consumables are selected appropriate to entry requirements and checked for serviceability in accordance with manufacturers' specifications and organisational procedures. 2.3. Selected tools are used correctly to gain entry using appropriate industry practices. 2.4. Entry is gained in accordance with applicable legislation, codes, regulations and standards.
3. Re-instate automotive locking components and system	3.1. Where applicable, replacement and/or repaired parts are selected for reassembly. 3.2. Lock assemblies and components are dismantled/removed using appropriate organisational procedures, industry practices, tools and equipment. 3.3. Sub-assemblies are inspected, tested and adjusted as necessary for compliance to original factory assembly and functioning. 3.4. Appropriate techniques are applied in the preparation, assembly and adjustment of components parts using fastening equipment and methods which ensure conformance to specifications, operational performance, quality and safety of the completed assembly. 3.5. Correct lubrication, packing, sealing materials are selected and applied correctly in conformance to job

ELEMENT	PERFORMANCE CRITERIA
	specifications. 3.6.Locking system is inspected, tested and adjusted as necessary for compliance to original factory assembly and functioning.
4. Finalise entry and reinstatement process	4.1.Documentation is completed and processed in accordance with legislative and organisational requirements. 4.2.Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements. 4.3.Vehicle is cleaned and returned to serviceable condition. 4.4.Customer is advised of work undertaken, further recommended actions and any other relevant information. 4.5.Customer is instructed, as necessary, in accordance with organisational procedure and manufacturer recommendations.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting specifications, charts, manuals, diagrams and related information specific to gaining entry
- confirming and clarifying information
- identifying automotive locking components and associated equipment
- checking functioning of locking systems
- tracing faults
- selecting and using appropriate tools and equipment, materials and consumables
- applying safe work practices
- identifying and acting on actual and potential hazards
- disassembling and assembling components
- documenting information
- housekeeping

REQUIRED SKILLS AND KNOWLEDGE**Required knowledge**

Look for evidence that confirms knowledge of:

- types of vehicle locking systems - mechanical and electronic
- attachment methods for window winders, internal handles, snibs, trims, cylinders, locks and external handles
- release positions of ignition lock
- release positions of air bag, front and side and appropriate safety procedures
- break-off bolts, removal and replacement
- window winders and door trims
- door lock retainers
- central locking
- linkages and springs
- use and application of personal protective equipment
- safe work practices and procedures
- hazards and control measures associated with gaining entry to automotive locking systems

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to gain entry to and reinstating automotive locking systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with gaining entry to and reinstating automotive locking systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

EVIDENCE GUIDE

Guidance information for assessment	
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate sources	Catalogues, manufacturer manuals, drawings, detailed/technical sketches and associated data sheets
Organisational requirements	Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training
Customer requirements	Function and capabilities, access issues, service and maintenance requirements, product operation and warranty information, costings
Entry method	Pick, impressioning, reading, manipulate linkages, alternative methods
Tools and equipment	Hand and power tools specific to gaining entry, power tools and accessories, diagnostic specialist equipment, fixing tools, special-purpose equipment, vacuum cleaner
Materials and consumables	Lubricants, adhesives and sealants, cleaning materials, wire and cable
Legislation, codes, regulations and standards	Industry licensing, industry codes of practice, privacy laws, Australian standards, building codes and those of other regulatory bodies, quality

RANGE STATEMENT	
	assurance, organisational standards and practices, awards and enterprise agreements, competition, trade and consumer protection laws
Documentation	Historical records, procedures and measurements for opening specific vehicles, job sheets, invoices, warranties

MEM20011A Service and repair fire and security containers

Modification History

Single band identifier removed to clarify dual status

Unit Descriptor

Unit descriptor	This unit covers dismantling, inspecting, repairing, replacing, servicing and assembling fire and security containers and their components.
------------------------	---

Application of the Unit

Application of the unit	<p>The unit applies to service and repair work on commercial and domestic fire and security containers. It may apply to regular servicing or call-out work and may be required after entry has been gained.</p> <p>Appropriate factors that ensure conformance to specifications, operational performance, quality and safety must be applied. These include locksmithing principles, ethics, techniques, procedures and safe workshop practices.</p> <p>Where interpretation of detailed, complex manufacturer information and specifications is required, Unit MEM16012A (Interpret technical specifications and manuals) should also be considered.</p> <p>Where gaining entry and re-instatement by straightforward replacement of existing or replacement parts is required, Unit MEM20009A (Gain entry and reinstate fire and security containers) should be selected.</p> <p>If welding skills are required, then appropriate units should be selected.</p> <p>Band:</p> <p>This unit has dual status and is to be regarded as both a Specialisation band A unit and Specialisation band B unit for progression to C5 (AQF level V).</p> <p>Unit Weight: 6</p>
--------------------------------	---

Licensing/Regulatory Information

	MEM20002A	Assemble and test lock mechanisms

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify service requirements	<p>1.1. Ownership of safe/container and contents is established and verified in accordance with organisational, legal and industry procedures.</p> <p>1.2. Type of safe and lock mechanism specifications are obtained from appropriate sources and in accordance with organisational and customer requirements.</p> <p>1.3. Nature of any damage or malfunction to exterior, interior and lock components is established in accordance with organisational procedures, established inspection/diagnostic techniques and original specifications.</p> <p>1.4. Service and repair requirements and other information relevant to task are established in accordance with customer needs, organisational and manufacturer specifications and legislation, codes, regulations and standards.</p> <p>1.5. Appropriate location of work is determined and removal of safe is arranged, if necessary.</p>
2. Repair, replace and service safe components	<p>2.1. Risks and hazards are identified and area is made secure.</p> <p>2.2. Safe/container locking components are inspected and further specific repair/service requirements, options and recommended actions are established in accordance with organisational requirements and factors impacting on feasibility of repair.</p> <p>2.3. Lock assemblies and components are dismantled using appropriate organisational procedures, industry practices, tools and equipment.</p> <p>2.4. Components are repaired/replaced/serviced as required, necessary and practicable.</p> <p>2.5. Appropriate lubrication and sealing materials are selected and applied in conformance to standard locksmithing procedures.</p> <p>2.6. Boltwork and internal lock components are inspected, tested and adjusted as necessary for compliance to original factory assembly and functioning.</p>
3. Finalise servicing/repair process	<p>3.1. Function of specific components and entire locking system is tested for compliance with operational specifications and adjusted as necessary.</p> <p>3.2. Documentation is completed and processed in</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>accordance with legislative, assignment and organisational requirements.</p> <p>3.3. Work area, tools and equipment are cleaned and stored in accordance with occupational health and safety policies, procedures and practices and organisational requirements.</p> <p>3.4. Safe/container is cleaned and returned to service according to organisational and customer requirements.</p> <p>3.5. Customer is instructed, as necessary, in accordance with organisational procedure and manufacturer recommendations.</p> <p>3.6. Work is confirmed with appropriate person(s) in accordance with organisational procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting specifications, charts, manuals, diagrams and related information specific to servicing and repair of fire and security containers
- confirming and clarifying information
- identifying safe locking components and associated equipment
- checking functioning of safe locking systems
- tracing faults
- selecting and using appropriate tools and equipment, materials and consumables
- applying safe work practices
- identifying and acting on actual and potential hazards
- identifying alternative servicing and repair options
- disassembling and assembling components
- documenting information
- housekeeping

Required knowledge

REQUIRED SKILLS AND KNOWLEDGE

Look for evidence that confirms knowledge of:

- sources of specifications and other relevant information for safe locking systems
- components of safe locking systems
- principles of system and component function
- technical terminology relating to safes
- rating system (e.g. underwriters laboratories)
- manipulation-proof ratings (classes)
- operation of specific locks
- common safe design problems and servicing issues
- faults arising from vandalism, misuse, wear etc.
- checks and tests to confirm service requirements
- procedures for establishing service requirements
- procedures to establish and verify safe and contents ownership
- obligations, responsibilities, disclaimers and reasons for verifying ownership
- environmental, physical and behavioural hazards in relation to safe and surrounds
- operating principles of safes
- personal liability for safety and duty of care
- personal protective equipment
- safe work practices and procedures
- factors impacting on feasibility of repair/replacement
- dismantling and assembly procedures for a range of safe locks
- documentation and recording procedures
- procedures for replacing worn and damaged parts, removing foreign objects and lubricating (non-dry/non grease), packing and sealing components
- organisational requirements for cleaning and storage
- key blanks to suit model and mechanical/electronic part of lock
- programming and operating procedures for electronic locks
- reasons for care and precision

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service, repair, test and return to service fire and security containers. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with servicing and repair of fire and security containers, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Types of safe

Plate safes, fire, data, cash and/or jewellery, under-floor, wall, bank safes and vaults

Lock mechanism

Keylocks, keyless combination locks, electronic digital, electronic and mechanical time delay

Appropriate sources of information

Catalogues, manufacturer manuals, drawings, detailed/technical sketches and associated data sheets, colleagues/specialists, internet

Organisational requirements

Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training

Customer requirements

Function and capabilities, access issues, service and maintenance requirements, product operation and warranty information, costings, maintaining security

Service and repair requirements

Checking components for serviceability and integrity. Removal, repair, service and replacement of lock components. Removing boltwork and re-lockers, dismantling locks, inspecting wheel packs for wear and damage, servicing and repairing/replacing combination locks/lever locks, hinges and internal locking

RANGE STATEMENT	
	compartments
Other information	Schedules, timeframes, access and site information, products, installation and upgrade requirements, specific client requests, materials, costings, warranties and service information, legislation, codes and regulatory requirements, OHS requirements
Legislation, codes, regulations and standards	ASIO regulations, industry licensing, industry codes of practice, privacy laws, Australian standards, building codes and those of other regulatory bodies, quality assurance, organisational standards and practices, awards and enterprise agreements, competition, trade and consumer protection laws
Risks and hazards	Safe construction, chemical and material hazards, lifting and handling, use of mechanical and fuel cutting equipment
Tools and equipment	Hand tools relating to safe service and repair, power tools and accessories, various change keys to suit the safe
Materials and consumables	Appropriate lubricants, adhesives and sealants, cleaning materials, seals
Documentation	Historical records, procedures and measurements for opening specific safes, job sheets, invoices, warranties
OHS policies, procedures and practices	<ul style="list-style-type: none"> • Relevant OHS policies, procedures include assessment of actual and potential risk, identification of hazards, safety practices and regulations, safe use of tools and equipment, individual responsibilities and obligations, safety training and procedures, emergency and first aid procedures, working in confined spaces, use of personal protective equipment, industry standards and codes of practice • Personal protective equipment may include safety glasses, earmuffs/plugs, safety vests, hard hats, gloves, knee pads, safety boots, warning signs and tapes, fire extinguisher, first aid kit

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify service and repair requirements	<p>1.1. Ownership is established and verified in accordance with organisational and industry procedures.</p> <p>1.2. System and component specifications and other relevant information is obtained from appropriate sources and in accordance with organisational and customer requirements.</p> <p>1.3. Nature of damage is established in accordance with organisational procedures, established inspection/diagnostic techniques and original specifications.</p> <p>1.4. Service and repair requirements and other information relevant to task are established in accordance with customer needs, organisational and manufacturer specifications and legislation, codes, regulations and standards.</p>
2. Repair, replace and service automotive locking system	<p>2.1. Risks and hazards are identified and area is made secure.</p> <p>2.2. Specific isolation and/or safety measures are applied with special regard to associated equipment.</p> <p>2.3. OHS policies procedures and practices are applied according to organisational and legislative requirements.</p> <p>2.4. Lock assemblies and components are inspected and repaired/replaced and serviced as appropriate and practicable, in accordance with organisational requirements, industry practices and factors impacting on feasibility of repair.</p> <p>2.5. Tools, equipment, materials and consumables are selected, checked for serviceability and used in accordance with manufacturers' specifications and organisational procedures.</p> <p>2.6. Sub-assemblies and assemblies are inspected, tested and adjusted as necessary for compliance to original factory assembly and functioning.</p>
3. Finalise servicing process	<p>3.1. Function of entire locking system is checked for compliance with operational specifications and is adjusted as necessary.</p> <p>3.2. Documentation is completed and processed in accordance with legislative, assignment and organisational requirements.</p> <p>3.3. Work area, tools and equipment are cleaned and</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>stored in accordance with OHS and organisational requirements.</p> <p>3.4. Vehicle is cleaned and returned to serviceable condition according to customer and organisational requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting specifications, charts, manuals, diagrams and related information specific to service and repair of mechanical automotive locking systems
- confirming and clarifying information
- identifying mechanical automotive locking components and associated equipment
- checking functioning of locking systems
- tracing faults
- selecting and using appropriate tools and equipment, materials and consumables
- applying safe work practices
- identifying and acting on actual and potential hazards
- identifying alternative servicing and repair options
- disassembling and assembling components
- documenting information
- housekeeping

Required knowledge

Look for evidence that confirms knowledge of:

- attachment methods for window winders, internal handles, snibs, trims, cylinders, locks and external handles
- system and component specifications
- sources of specifications and other relevant information for mechanical automotive locking systems
- components of locking system
- principles of system and component function
- technical terminology

REQUIRED SKILLS AND KNOWLEDGE

- operation of specific locks
- common design problems
- faults arising from vandalism, misuse, wear etc.
- checks and tests to confirm service requirements
- organisational procedures for establishing service requirements
- procedures to establish and verify vehicle ownership
- reasons for verifying ownership
- operating principles, release positions and isolation techniques for air bags
- personal liability for safety and duty of care
- applicable legislation, codes, regulations and standards
- OHS policies, procedures and practices
- personal protective clothing, equipment
- safe working practices
- environmental, physical and behavioural hazards in relation to vehicle and surrounds
- factors impacting on feasibility of repair or replacement
- dismantling procedures for a range of automotive locks
- documentation and recording procedures
- procedures for replacing worn and damaged parts, removing foreign objects and lubricating, packing and sealing components
- organisational requirements for cleaning and storage
- reasons for care and precision

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate sources of information

Catalogues, manufacturer manuals, drawings, detailed/technical sketches and associated data sheets

Organisational requirements

Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training

Customer requirements

Function and capabilities, access issues, service and maintenance requirements, product operation and warranty information, costings

Repair/service requirements

Removal, repair, service and replacement of automotive lock components

Other information

Schedules, timeframes, access and site information, products, installation and upgrade requirements, specific client requests, materials, costings, warranties and service information, legislation, codes and regulatory requirements, OHS requirements

Legislation, codes, regulations and standards

Industry licensing, industry codes of practice, privacy laws, Australian standards, quality assurance, organisational standards and practices, awards and enterprise agreements, competition,

RANGE STATEMENT	
	trade and consumer protection laws
Risks and hazards	Supplemental restraint systems (SRS) systems (air bags) are disabled to prevent accidental triggering. Unique dangers arising from working on the roadside. Non-compliance with manufacturer recommendations, materials handling, chemical, environmental and physical hazards
Associated equipment	SRS, steering locking and anti-theft devices
OHS policies, procedures and practices	<ul style="list-style-type: none"> Assessment of actual and potential risk, identification of hazards, safety practices and regulations, safe use of tools and equipment, individual responsibilities and obligations, safety training and procedures, emergency and first aid procedures, working in confined spaces, industry standards and codes of practice Use of personal protective equipment such as safety glasses, earmuffs/plugs, safety vests, hard hats, gloves, knee pads, safety boots, warning signs and tapes, fire extinguisher, first aid kit
Lock assemblies and components	Inline, single and double sided, 2 and 4 track, tibbe (rotating disc), dimple, sidebar, split wafer, new and other mechanisms
Tools and equipment	Tools, power tools and accessories, specialist equipment, fixing tools, special-purpose equipment, vacuum cleaner
Materials and consumables	Lubricants, adhesives and sealants, cleaning materials, wire and cable
Documentation	Historical records, procedures and measurements for opening specific vehicles, job sheets, invoices, warranties

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify service and repair requirements	1.1. Ownership is established and verified in accordance with organisational and industry procedures. 1.2. System and component specifications and other relevant information is obtained from appropriate sources and in accordance with organisational and customer requirements. 1.3. Nature of damage is established in accordance with organisational procedures, established inspection / diagnostic techniques and original specifications. 1.4. Service requirements and other information relevant to task are established in accordance with customer needs, organisational and manufacturer specifications and legislation, codes, regulations and standards.
2. Service automotive transponder system	2.1. Risks and hazards are identified and area is made secure. 2.2. Specific isolation and/or safety measures are applied with special regard to associated equipment. 2.3. OHS policies procedures and practices are applied according to organisational and legislative requirements. 2.4. Tools, equipment, materials and consumables are selected, checked for serviceability and used in accordance with manufacturers' specifications and organisational procedures.
3. Program transponder keys	3.1. Personal limitations in programming are identified and assistance is sought from appropriate sources in accordance with organisational procedures. 3.2. Programming requirements are established in accordance with organisational and supplier requirements. 3.3. Keys are programmed to correct specification. 3.4. System function is tested to ensure correct operation.
4. Finalise servicing process	4.1. Documentation is completed and processed in accordance with legislative, assignment and organisational requirements. 4.2. Work area, tools and equipment are cleaned and stored in accordance with OHS and organisational requirements. 4.3. Vehicle is cleaned and returned to serviceable condition according to customer and organisational

ELEMENT	PERFORMANCE CRITERIA
	requirements.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- interpreting specifications, charts, manuals, diagrams and related information specific to service of automotive transponder systems
- encoding and re-encoding transponder systems
- confirming and clarifying information
- identifying automotive locking components and associated equipment
- checking functioning of locking systems
- tracing faults
- selecting and using appropriate tools and equipment, materials and consumables
- applying safe work practices
- identifying/acting on actual and potential hazards
- identifying alternative servicing and repair options
- disassembling and assembling components
- documenting information
- housekeeping

Required knowledge

Look for evidence that confirms knowledge of:

- system and component specifications
- sources of specifications and other relevant information for automotive transponder systems
- principles of system and component function
- types of transponders
- technical terminology
- common design problems
- faults arising from vandalism, misuse, wear etc.
- checks and tests to confirm service requirements
- organisational procedures for establishing service requirements
- procedures to establish and verify vehicle ownership

REQUIRED SKILLS AND KNOWLEDGE

- reasons for verifying ownership
- operating principles, release positions and isolation techniques for air bags
- operation and function of transponder and engine immobiliser systems
- personal liability for safety and duty of care
- applicable legislation, codes, regulations and standards
- OHS policies, procedures and practices
- personal protective clothing, equipment
- safe working practices
- environmental, physical and behavioural hazards in relation to vehicle and surrounds
- factors impacting on feasibility of repair or replacement
- dismantling procedures for a range of automotive locks
- documentation and recording procedures
- procedures for replacing worn and damaged parts, removing foreign objects and lubricating, packing and sealing components
- organisational requirements for cleaning and storage
- key blanks to suit model and mechanical/electronic part of lock
- different types of transponder technologies
- programming and operating procedures for encoder/ diagnostic machine
- reasons for care and precision

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to identify, analyse, encode and re-encode automotive transponder security systems. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and to be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with servicing of automotive transponder systems, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and to be capable of applying the competency in new and different situations and contexts. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate will</p>

Organisational requirements	Quality assurance standards and procedures, service standards, safety and OHS practices and obligations, resource storage and use, organisational processes and procedures, documentation processes, product and process training
Customer requirements	Function and capabilities, access issues, service and maintenance requirements, product operation and warranty information, costings
Service requirements	Identifying, analysing, encoding and re-encoding automotive transponder security systems
Other information	Schedules, timeframes, access and site information, products, installation and upgrade requirements, specific client requests, materials, costings, warranties and service information, legislation, codes and regulatory requirements,

RANGE STATEMENT	
	OHS requirements
Legislation, codes, regulations and standards	Industry licensing, industry codes of practice, privacy laws, Australian standards, quality assurance, organisational standards and practices, awards and enterprise agreements, competition, trade and consumer protection laws
Risks and hazards	Supplemental restraint systems (SRS) systems (air bags) are disabled to prevent accidental triggering. Unique dangers arising from working on the roadside. Non-compliance with manufacturer recommendations, materials handling, chemical, environmental and physical hazards
Associated equipment	SRS, electronic immobilisers, steering locking and anti-theft devices
OHS policies, procedures and practices	<ul style="list-style-type: none"> Assessment of actual and potential risk, identification of hazards, safety practices and regulations, safe use of tools and equipment, individual responsibilities and obligations, safety training and procedures, emergency and first aid procedures, working in confined spaces, industry standards and codes of practice Use of personal protective equipment such as safety glasses, earmuffs/plugs, safety vests, hard hats, gloves, knee pads, safety boots, warning signs and tapes, fire extinguisher, first aid kit
Tools and equipment	Hand tools, specialist diagnostic and encoding equipment
Documentation	Historical records, procedures and measurements for opening specific vehicles, job sheets, invoices, warranties

MEM20014A Perform a site security survey

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit covers examining and assessing security requirements across commercial, industrial and domestic applications. This unit has been modified from Unit PRSTS301 Identify technical security requirements in the (PRS03) Asset Security Training Package endorsed 19/03/2003.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit requires the ability to source relevant information, establish security risk and use appropriate assessment methods to ensure an accurate determination of security equipment/system options to meet client needs.</p> <p>Where estimates and quotes are required, Unit PRSTS317 (Provide estimate and quote) should also be selected.</p> <p>Band: A</p> <p>Unit Weight: 2</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare to assess security requirements	<p>1.1. Job requirements are reviewed and clarified with appropriate person(s) in accordance with organisational requirements.</p> <p>1.2. Discussions with customer are conducted to establish actual and potential security risks and clarify scope of work.</p> <p>1.3. Effective interpersonal techniques are applied when interacting.</p> <p>1.4. Site access and specific site requirements are identified and appropriate arrangements are made as required in accordance with client and organisational requirements.</p> <p>1.5. Personal limitations in assessing security requirements are identified and assistance is sought from appropriate person(s), in accordance with organisational procedures.</p>
2. Assess security requirements	<p>2.1. Site restrictions, regulations and requirements are identified and complied with in accordance with legislative, client and organisational requirements.</p> <p>2.2. Information is gathered from identified sources and is relevant to assignment requirements in accordance with legislative, client and organisational requirements.</p> <p>2.3. A site assessment is carried out where possible to facilitate an accurate determination of security requirements.</p> <p>2.4. Client assets, activities and existing security arrangements are reviewed to assess the level and range of security risk to client operations.</p> <p>2.5. Weak points, risk areas and environmental factors affecting the security risk of the site are identified and assessed in accordance with organisational procedures.</p>
3. Document security assessment	<p>3.1. Information is recorded and stored in accordance with manufacturer specifications and organisational procedures.</p> <p>3.2. A comprehensive assessment of client security requirements is completed within designated timeframes and presented for review to appropriate person(s).</p> <p>3.3. A security survey is prepared in accordance with</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>industry and organisational standards of style, format and accuracy.</p> <p>3.4.Recommendations for security equipment/systems and alternative options are made in accordance with organisational requirements.</p> <p>3.5.Documentation is processed in accordance with legislative, assignment and organisational requirements.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- identifying security threats to people, property and premises
- observing and assessing technical security requirements
- reading and interpreting plans, designs and specifications
- applying basic numeracy techniques
- applying safe and efficient work practices
- communicating in a clear and concise manner
- relating to people from different social and cultural backgrounds
- presenting a professional image
- preparing documentation
- planning and sequencing work tasks
- entering data using basic keyboarding skills

Required knowledge

Look for evidence that confirms knowledge of:

- risk assessment methods and procedures
- available security equipment/system options and basic requirements for installation
- types and functions of security equipment and systems
- building construction methods and types
- organisational and client confidentiality requirements
- basic problem solving strategies
- operational principles of information technology

REQUIRED SKILLS AND KNOWLEDGE

- | |
|--|
| <ul style="list-style-type: none">• principles of effective communication• documentation requirements and processes |
|--|

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to examine and assess technical security requirements.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with assessing technical security requirements, or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
Method of assessment	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>
Guidance information for	

EVIDENCE GUIDE	
assessment	

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Job requirements	Instructions from supervisor/management, work schedules and completion dates, specific client requirements, site requirements, security clearance and access requirements, reporting and documentation requirements, budget allocations, associated legislation BCA, fire regulations
Appropriate person(s)	Clients, site managers, project managers, engineers and technicians, technical experts, line managers/supervisors, colleagues, regulatory personnel, security consultants
Organisational requirements	Legal and organisational operational policies and procedures, operations manuals, induction and training materials, insurance policy agreements, client and organisational confidentiality requirements, organisational goals/objectives/plans/systems/ processes, employer and employee rights and responsibilities, own role, responsibility and delegation, quality and continuous improvement processes and standards, client service standards, defined resource parameters, OHS policies/procedures/programs, emergency and evacuation procedures, duty of care, code of conduct, code of ethics, access and equity policy, principles and practice, records and information systems and processes, communication channels and reporting procedures
Customer	Owner, property/other agent, tenant, building

RANGE STATEMENT	
	supervisor, manager, project manager, government and legal instruments/agencies
Scope of work	Personal protection, access requirements, property or assets, conformance with insurance, legislative or other requirements
Interpersonal techniques	Verbal or non-verbal language, two-way interaction, constructive feedback, active listening, questioning to clarify and confirm understanding, interpreting non-verbal and verbal messages, observation techniques, use of positive, confident and co-operative language, control of tone of voice and body language, use of language and concepts appropriate to cultural differences, use of clear presentations of options and consequences, demonstrating flexibility and willingness to compromise
Site access and specific site requirements	May relate to access and egress points, time of access, access codes, keys, passes, security clearances, union requirements, OHS requirements, building codes and regulations, heritage listings, noise control
Assessment may involve	Discussions with client, visual inspections, review of client floor plans and supporting documentation, questioning police/insurance companies/other bodies
Applicable legislation, codes and national standards	Relevant Commonwealth/State/Territory legislation which affect organisational operation: occupational health and safety, environmental issues, equal employment opportunity, industrial relations, anti-discrimination and diversity, licensing arrangements, Australian standards, quality assurance and certification requirements, relevant industry codes of practice, trade practices, award and enterprise agreements, privacy related legislation
Information	Value or importance of assets, insurance policy agreements, special rooms or areas requiring higher level of protection, current/proposed operating environments, assets and systems, activities and functions, existing security systems/equipment, existing management strategies, business and

RANGE STATEMENT	
	operational plans, incident history
Site assessment	Type and condition of building structures, identification of risk areas/weak points, site restrictions, regulations and requirements, access and egress patterns, floor plan, existing security equipment/systems
Security risks	Vandalism, sabotage, trespass, break-in, burglary, assault or harm, unauthorised access, theft, pilferage, deliberate/accidental damage
Weak points and risk areas	Unsecured windows, entry points screened from public view, external doors without deadlocks or with hinges opening outward, flimsy building materials, client habits (e.g. doors left unlocked)
Environmental factors	Adequacy of street lighting, traffic flow, neighbourhood crime rating, proximity of other buildings
Security equipment and systems	Detection devices, audible/visual warning devices, cameras, monitors and control equipment, control panels, intercoms, wireless equipment, car alarms, electronic readers, electronic recognition controls, locks and locking systems, grills, lighting, boom gates, turnstiles, bank pop-up screens, smoke detection devices, electric/mechanical fire safety and fire locking systems, power supplies, batteries, security doors and door controls
Security systems	Electronic, mechanical, computerised, procedural
Documentation	Checklists, reports, floor plans, client briefs, specifications, schedules, site survey

MEM21001A Replace watch batteries, capacitors and bands

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers identifying with customers the battery or capacitor replacement need and/or the repair or replacement of bands. This unit also includes conducting any required water-resistance testing.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit of competency applies to the selection and replacement of electronic watch power sources and bands whilst operating in a watch service and repair workshop or jewellery store offering watch service and repair with access to the appropriate equipment. Applications may also be found in kiosks offering jewellery, key cutting, watch service and repair services.</p> <p>Some knowledge of watch glasses, gasket and other component removal procedures is required. However, this unit does not cover specific replacement procedures.</p> <p>Testing functions relate only to the measurement of voltage, consumption and resistance, and checking for case integrity. For example, when power cells are replaced, it is necessary to establish circuit performance by electrical testing and case integrity by water-resistance testing.</p> <p>To perform additional servicing of watch cases <i>MEM21003A Perform watch case servicing, repair and refurbishment</i> should be selected.</p> <p>Band: A</p> <p>Unit weight: 2 points</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Inspect watch condition and type and discuss performance concerns with customer 1.2. Verify and agree on servicing requirements with customer 1.3. Carry out pre-repair tests to verify water-resistance 1.4. Prepare watch for handover 1.5. Record and document repair process
2. Open and close watch cases	2.1. Select and use workshop tools and equipment appropriately 2.2. Identify watch and band construction and components 2.3. Open and close watch cases correctly 2.4. Inspect parts and report and record results 2.5. Verify gasket condition and replace, as required 2.6. Clean cases and bands, as required, during and after repair
3. Select and replace power sources	3.1. Remove power sources using appropriate tools and equipment 3.2. Inspect watch for battery leakage damage and clean or refer for further service, as appropriate 3.3. Assess physical condition of existing cell and its operation under load 3.4. Select, replace and secure appropriate replacement power sources 3.5. Perform integrated circuit resetting or all clear operations as required 3.6. Handle, store and dispose of power sources correctly and in accordance with environmental guidelines
4. Perform electrical testing	4.1. Set up and use multimeters correctly 4.2. Test cell terminal voltage under load using correct methods and equipment 4.3. Test watch circuitry for current consumption using correct methods and equipment 4.4. Confirm results against manufacturer specifications
5. Select and replace bands	5.1. Identify band attachment and removal method 5.2. Remove and replace bands and components, as necessary, using appropriate methods, tools and equipment

ELEMENT	PERFORMANCE CRITERIA
	5.3.Determine dimensions and type of replacement bands/ components required
6. Conduct water-resistance testing	6.1. Identify watches requiring water-resistance and/or pressure testing 6.2. Select appropriate water-resistance testing methods and equipment according to watch type 6.3. Set up and use equipment to verify results

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying, handling and storing power cells, batteries and capacitors
- handling basic watch repairers' tools (e.g. tweezers, screwdrivers and eyeglasses)
- confirming correct selection of replacement cells by size, capacity and function
- using measuring tools (e.g. vernier callipers and band width gauges)
- setting up and using multimeters and interpreting readings
- conducting water-resistance testing
- communicating with customers

Required knowledge

Required knowledge includes:

- watch construction:
 - mechanical, electronic, digital, analog, duo, kinetic and auto quartz
 - function/features/design (e.g. basic operating principle for electronic watches)
- band construction, materials and components:
 - clasps, styles, materials and attachment methods
 - links, end pieces, clasps, buckles, chains, pins and spring bars
- operating principles of power cells, batteries, capacitors and voltages (1.55 V - 3 V)
- how to confirm battery capacity
- handling, storage and disposal procedures for watch power sources
- environmental guidelines and regulations relevant to the disposal of watch power

REQUIRED SKILLS AND KNOWLEDGE

sources

- multimeter types and how to set up, use and record values
- Australian standards for water-resistant watches
- methods of water-resistance testing for watches and advantages and disadvantages of each method
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to replace quartz or electronic watch power sources and bands to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • open and close watches without causing damage to watch or movement • confirm watch movement's performance • select correct replacement power sources for watch type and functions • confirm watch case condition and water-resistance.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and

EVIDENCE GUIDE	
	<p>application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Preparing watch for handover	<p>Preparing watch for handover may include:</p> <ul style="list-style-type: none"> • confirm watch keeping on time • function checking (e.g. calendar, light, chronograph and alarm) • display setting (e.g. time, calendar and other multi-functions)
Electronic watch	<p>Electronic watch includes watches with:</p> <ul style="list-style-type: none"> • quartz crystal • kinetic mechanism • tunic fork • electronic balance
Record and document repair	<p>Record and document repair may include:</p> <ul style="list-style-type: none"> • date and extent of repairs completed

RANGE STATEMENT	
	<ul style="list-style-type: none"> • cost of components replaced or used • time spent on procedure • marking the date of fitting for replacement cell/code • electrical testing results (e.g. current consumption/ running time calculated) • water-resistance test results
Workshop tools and equipment	<p>Workshop tools and equipment may include:</p> <ul style="list-style-type: none"> • hand tools appropriate to watch case construction and repair of watches • personal protective equipment • non-conductive tweezers, case opening and closing tools, glass and case press, plastic sheet protection, cleaning brushes and rodico
Watch and band construction and components	<p>Watch and band construction and components may include:</p> <ul style="list-style-type: none"> • mechanical, electronic, digital, analog, duo, kinetic and auto quartz • bracelets, bands, clasps, styles, straps and material construction
Power sources	<p>Power sources may include:</p> <ul style="list-style-type: none"> • primary and secondary cells • silver oxide cells, including high, low and multi-drain types • capacitors • lithium
Band attachment and removal	<p>Band attachment and removal may include:</p> <ul style="list-style-type: none"> • springlug, tapered pin, cotter pin and screwed
Multimeters	<p>Multimeters may include:</p> <ul style="list-style-type: none"> • analog • digital • external power supplies • ampere • volts • Ohms
Water-resistance testing methods	<p>Water-resistance testing methods may include:</p> <ul style="list-style-type: none"> • Australian standard for watches and

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Verify watch condition and performance concerns with customer 1.2. Prepare written and verbal quotations 1.3. Agree with customer on recommended service procedures to remedy faults 1.4. Record and document repair process
2. Open and close watch cases	2.1. Verify and agree on servicing requirements 2.2. Select and use workshop tools and equipment appropriately 2.3. Open and close watch cases correctly 2.4. Verify condition of case back/gaskets and replace, as required 2.5. Clean case components, as required
3. Remove and replace watch movements	3.1. Establish appropriate working environment 3.2. Identify and follow correct sequence for removal and replacement of watch movements 3.3. Remove and replace crown, stem and case fixings without damaging 3.4. Determine condition of crown, stem, pendant and pushbuttons, and perform custom replacement, as required 3.5. Remove and replace movements without damaging, marking or leaving fingerprints 3.6. Verify correct replacement movement is selected
4. Remove and replace hands and dials	4.1. Identify release mechanism for watch dials 4.2. Remove and replace hands and dials without marking or damaging components 4.3. Check and service hands and dials as required 4.4. Fit hands to correctly synchronise with each other, dial batons and calendar 4.5. Use correct workshop tools and equipment taking precautions for removal and replacement 4.6. Check hands and dial clearances
5. Conduct final inspections	5.1. Inspect watch for cleanliness and rectify imperfections and faults 5.2. Check functionality of crown, stems and pushbuttons 5.3. Confirm watch performance, hand alignment and

ELEMENT	PERFORMANCE CRITERIA
	calendar function and synchronisation 5.4.Record and document repair

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying repair cost
- completing documentation
- cleaning watch components (e.g. watch cases, bands, dials and hands)
- selecting replacement movement or components
- using hand tools and equipment
- measuring and visual alignment of components
- maintaining a clean environment
- identifying and using specific hand tools for dial and hand/pendant/pushbutton removal/ fitting

Required knowledge

Required knowledge includes:

- types of watch construction
- types of stems and crowns
- hand tools (e.g. files and pin vices)
- stem position for removal
- various watch case components (e.g. types, styles and materials)
- various types, styles and materials of dials and hands
- various watch crown types, styles and materials
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	<p>A person who demonstrates competency in this unit must be able to perform watch movement exchange to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • replace watch movements for both quartz and mechanical watches • remove and replace watch movements without damaging or marking • correctly select and fit replacement case parts, crown and stems • correctly remove and replace hands and dials without damaging or marking • ensure correct dial and hand alignment, clearances and calendar synchronisation • ensure cleanliness of the operation is achieved.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with

EVIDENCE GUIDE	
	<p>application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>

MEM21003A Perform watch case servicing, repair and refurbishment

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers servicing and repair techniques for watch cases, including replacement techniques for watch glasses, pendants, pushbuttons and correctors, bezels, case backs, gaskets, crowns and bands, straps or bracelets. Also covered is refurbishment techniques for watch case or band by polishing and graining. Additionally, this unit includes standards for water-resistance testing methods and procedures for water-resistant and divers watches.
------------------------	---

Application of the Unit

Application of the unit	This unit applies to cases for all types of watches, including non-water and water-resistant watches and all types of case materials. Servicing, repair and refurbishment would normally be carried out in watch service and repair centres and watchmaking stores where repair services are offered. Band: A Unit weight: 4 points

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify watch case type, functions, construction and components 1.2. Carry out pre-repair tests to verify water-resistance, as required 1.3. Prepare written quotation and inform customer of watch case condition and outline recommended service procedures 1.4. Verify and agree on servicing requirements with customer 1.5. Prepare watch for handover 1.6. Record and document repair process
2. Disassemble watch case and components for servicing	2.1. Establish appropriate working environment 2.2. Open and close watch cases correctly 2.3. Remove watch case, sub-assemblies and components in correct sequence without damaging, marking or leaving fingerprints 2.4. Verify condition of case gaskets and replace, as required
3. Repair and refurbish watch case, sub-assemblies and components	3.1. Inspect condition of watch case including case sub-assemblies and components 3.2. Replace faulty or damaged or worn watch case, sub-assemblies and components 3.3. Select appropriate media for polishing and graining case and band components 3.4. Set up and operate machines and equipment safely for polishing and graining 3.5. Select appropriate case and band cleaning methods 3.6. Inspect watch case for condition and cleanliness and rectify imperfections and faults
4. Reassemble watch case and band components	4.1. Reassemble and fit watch case and band components according to manufacturer specifications 4.2. Lubricate watch case including case sub-assemblies and components and sub-assemblies according to manufacturer specifications 4.3. Verify security, functioning, and operation of watch case and band including sub-assemblies and components 4.4. Apply watch case assembly inspections and

ELEMENT	PERFORMANCE CRITERIA
	precautions
5. Perform water-resistance testing for watch cases	5.1. Verify and confirm water-resistance rating of watch case 5.2. Identify, set up and operate equipment for water-resistance testing and interpret readings 5.3. Verify watch case performance and repair or replace components and gaskets, as required, to industry standards
6. Apply industry workshop standards to perform work	6.1. Use hand tools and equipment safely and correctly 6.2. Handle components without damaging or marking 6.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying various watch case construction materials
- opening and closing watch cases
- selecting watch case and band polishing and graining media
- selecting, removing and replacing various types of watch glasses
- selecting and replacing crowns
- selecting, replacing and lubricating gaskets
- servicing, dismantling and replacing pushbuttons
- selecting and using tools and equipment for servicing watch cases and components
- dismantling/reassembling techniques of watch case and components according to procedures and manufacture guidelines
- conducting water-resistance testing on watch cases
- watch case cleaning
- selecting, removing and replacing various types of watch band construction
- selecting and ordering replacement watch case component parts

Required knowledge

Required knowledge includes:

REQUIRED SKILLS AND KNOWLEDGE

- types of construction of watch cases by style, design, material and quality
- types of watch glass materials, construction and fitting procedures including use of adhesives as required
- types of crown construction by style, design, material and quality
- types of case gasket materials and construction fitting procedures
- types of crown styles, materials and construction
- types of pushbutton construction
- function and operating principles for water-resistance testing
- tools and equipment for servicing watch cases and components
- watch case cleaning methods
- types of band construction, components and materials
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to perform watch case servicing, repair and refurbishment to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • service, inspect, repair and/or replace watch case components (e.g. glass, crown, pendants and pushbuttons) to manufacturer specifications • select and use appropriate workshop tools, equipment and media for watch case servicing, polishing and graining • determine and conduct appropriate tests for water-resistant watches • safely clean watch cases and bands (e.g. by machine/hand).
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with

EVIDENCE GUIDE	
	<p>application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Watch case type, function, construction and components	<p>Watch case type, function, construction and components may include:</p> <ul style="list-style-type: none"> • pocket watch, wrist watch, ring watch, necklace and specialist watches • non water-resistant (e.g. two and three piece case) • water-resistant (e.g. two piece case) • monocoque (e.g. one piece case) • materials (e.g. precious metals, stainless steel, ceramic, titanium and others) • case body, bezel glass, case back, pushbutton, case ring and gaskets

RANGE STATEMENT	
Watch case/band condition	Watch case/band condition may include: <ul style="list-style-type: none"> • completeness • scratches, dents and worn plating • general wear and tear • water-resistance performance
Recommended service procedures	Recommended service procedures may include: <ul style="list-style-type: none"> • replace worn or damaged components • repair or refurbish • case refurbishment to customer requirements
Record and document repair	Record and document repair may include: <ul style="list-style-type: none"> • extent and date of repair • cost of replacement parts • time spent on procedure
Appropriate working environment	Appropriate working environment may include: <ul style="list-style-type: none"> • clean bench and working area • adequate lighting and ventilation • tools and equipment organised and in good condition • ergonomic seating • dust extraction
Case components and movement sub-assemblies	Case components and movement sub-assemblies may include: <ul style="list-style-type: none"> • glass, spring fit, armoured, mineral and sapphire • bezel (e.g. rotating) • case back and gaskets • crown • pendant (e.g. friction fit or screwed) • gaskets
Inspect condition	Inspect condition may include: <ul style="list-style-type: none"> • originality of components • cleanliness • wear • damage • corrosion
Watch case assembly inspections	Watch case assembly inspections and precautions

RANGE STATEMENT	
and precautions	<p>may include:</p> <ul style="list-style-type: none"> • use plastic protection whilst opening and closing • alignment of components (e.g. case back, bezel and glass) • security of pendants (e.g. friction and threaded) • pushbutton operation • screw crowns and stem length • damage to stem when securing crown • cleanliness
Water-resistance rating	<p>Water-resistance rating may include:</p> <ul style="list-style-type: none"> • minimum standard of 20 metres, or additionally to 30 metres and 50 metres) • minimum standards for divers watch of 100 metres or up to 3000 metres
Equipment for water-resistance testing	<p>Equipment for water-resistance testing may include:</p> <ul style="list-style-type: none"> • vacuum • over pressure • combined test • water immersion method • air leak method • condensation test
Hand tools and equipment	<p>Hand tools and equipment may include:</p> <ul style="list-style-type: none"> • pin vices and case holders • case opening and closing tools • glass press and vigor tool • adhesives • polishing machines and various grades of buff wheels • polishing and graining (e.g. 3M media in various grades)
Clean and safe work environment	<p>Clean and safe work environment may be specified through:</p> <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine,

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Apply principles of occupational health and safety (OHS) to cleaning activities	1.1. Select and use appropriate personal protective equipment correctly based on information in relevant material safety data sheet (MSDS) 1.2. Identify hazards associated with cleaning equipment and media 1.3. Follow safe work practices and apply hazard control measures, as required 1.4. Follow emergency response procedures
2. Select and prepare appropriate methods, equipment and solutions	2.1. Select cleaning methods, processes and equipment according to type and size of mechanisms, components and cases 2.2. Select cleaning solutions appropriate to component, finish, surface coating and material 2.3. Decant, mix and prepare solutions for use 2.4. Dispose of chemicals according to manufacturer guidelines, legislation and regulations
3. Prepare parts and components for cleaning	3.1. Dismantle watch or clock and component parts to optimise cleaning 3.2. Pre-clean components, as required, for inspection 3.3. Arrange components during machine cleaning to prevent damage 3.4. Arrange and sequence parts and components for cleaning to assist subsequent identification, reassembly and to optimise cleaning
4. Perform cleaning operations	4.1. Set up and operate cleaning equipment correctly, using safe work practices 4.2. Monitor and control exposure of components to solutions during cleaning process 4.3. Remove residues, dry and handle cleaned components, as appropriate 4.4. Arrange storage of cleaned components to maintain finish and cleanliness
5. Assess outcomes of cleaning process	5.1. Verify condition of cleaned components and identify remaining residues and contaminants, damage to surface coatings and other component damage 5.2. Account for all components

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- handling cleaned components
- handling chemicals safely
- operating cleaning machines
- mixing chemicals and solutions
- handling cleaned components to prevent contamination
- storing cleaned components to maintain finish

Required knowledge

Required knowledge includes:

- cleaning solutions and uses
- cleaning procedures for different components and finishes
- watch case cleaning methods (ultrasonic, vibratory)
- cleaning machine types, uses, function and operation
- potential for damage to components by chemicals or cleaning operations
- chemical storage and disposal
- OHS regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to clean watch and clock components to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • prepare solutions and equipment • work safely with chemicals and equipment • sort and track components during process • clean components without damage • verify components as effectively cleaned.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related

EVIDENCE GUIDE	
	<p>conditions (real or simulated) and require evidence of process.</p> <ul style="list-style-type: none"> • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.

MEM21005A Diagnose faults in quartz watches

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers testing and diagnosing faults in electronic quartz watches.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit applies to work in watch service centres, jewellery and watchmaking stores and kiosks offering watch service and repair.</p> <p>The unit covers the skills required to diagnose faults where the power cell performance has already been tested and its condition is assessed as good or the correct terminal voltage under load but the watch continues to indicate faults or is stopped. Appropriate diagnostic testing procedures are required to identify or determine the faults in a quartz watch and the extent of servicing required.</p> <p>For repair of mechanical faults refer to the appropriate mechanical watch service units.</p> <p>Band: A</p> <p>Unit weight: 2 points</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Verify watch condition and performance concerns with customer 1.2. Prepare written and verbal quotations 1.3. Agree with customer on recommended service procedures to remedy faults 1.4. Record and document repair process
2. Open and close watch cases	2.1. Determine need to open case for further testing 2.2. Select and use workshop tools and equipment appropriately 2.3. Open and close watch cases correctly 2.4. Inspect parts and report and record results 2.5. Verify gasket condition and replace as required 2.6. Clean cases and bands as required during and after repair
3. Perform tests	3.1. Select appropriate tests for the type of quartz watch 3.2. Select and use appropriate workshop testing equipment 3.3. Test quartz watch output signals using industry-specific equipment 3.4. Assess mechanical condition including freedom of gear train, where applicable 3.5. Maintain testing equipment 3.6. Record test results
4. Analyse results and determine faults	4.1. Interpret test results correctly 4.2. Carry out further testing, as required, to locate faulty components 4.3. Confirm results against manufacturer specifications 4.4. Identify faults from test information 4.5. Evaluate, record and communicate recommended servicing requirements

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Required skills include:

- using testing equipment (e.g. multimeter and quartz timing machines)
- analysing test results for current consumption and voltage
- solving problems
- replacing cells
- accessing and interpreting manufacturer service or technical guides
- communicating with relevant personnel
- replacing watch bands, straps or bracelets

Required knowledge

Required knowledge includes:

- types of quartz watch construction and components
- function/operating principles of electronic quartz watches
- types of cells, power sources, capacitors and electronic storage units
- observation and inspection techniques
- occupational health and safety (OHS) regulations and procedures

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine servicing requirements and liaise with customer	1.1. Identify watch functions and features 1.2. Prepare written quotation and inform customer of watch condition and performance concerns 1.3. Outline recommended service procedures to be undertaken to remedy identified faults 1.4. Verify and agree servicing requirements with customer 1.5. Prepare watch for handover 1.6. Record and document repair process
2. Disassemble watch case and movement components for servicing	2.1. Establish appropriate working environment 2.2. Select and use workshop tools and equipment appropriately 2.3. Open and close watch cases correctly 2.4. Remove case movement and components without damaging or marking 2.5. Verify gasket condition and replace if required 2.6. Clean cases and bands, as required
3. Service watch case and movement components	3.1. Inspect condition of watch case and movement components 3.2. Confirm servicing requirements 3.3. Replace faulty or worn component parts 3.4. Clean components and parts 3.5. Inspect watch case and movement components for cleanliness and rectify imperfections/faults 3.6. Use correct tools and equipment for handling and servicing
4. Reassemble and test watch case and movement components	4.1. Reassemble watch case and movement components according to manufacturer specifications 4.2. Confirm correct assembly of gear train and other components 4.3. Use correct types and amounts of lubricant according to manufacturer specifications 4.4. Use tools and equipment appropriately taking precautions for correct reassembly 4.5. Verify/confirm watch functioning according to manufacturer specifications 4.6. Verify watch performance including rate testing and adjust, as required, according to manufacturer

ELEMENT	PERFORMANCE CRITERIA
	specifications

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- diagnosing and fault-finding quartz analog and digital watches
- dismantling and assembling quartz watch digital modules, movements, gear trains and sub-assemblies
- applying correct type and amount of lubrication
- using quartz timing and testing equipment
- communicating effectively
- interpreting manufacturer technical guides

Required knowledge

Required knowledge includes:

- quartz watch construction and components (i.e. analog, digital and duo displays)
- quartz watch operating principles (e.g. analog and digital)
- quartz watch lubrication techniques
- watch case and band construction and components
- client liaison techniques
- power sources
- power cells, batteries, capacitors and electronic storage units
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify watch functions and features 1.2. Prepare written quotation and inform customer of watch condition and performance concerns 1.3. Outline recommended service procedures to be undertaken to remedy identified faults 1.4. Verify and agree on servicing requirements with customer 1.5. Prepare watch for handover 1.6. Record and document repair process
2. Disassemble complex quartz watch cases, movements and components	2.1. Establish appropriate working environment 2.2. Select and use workshop tools and equipment appropriately 2.3. Open watch cases correctly 2.4. Remove case components and movement without damaging or marking 2.5. Verify gasket condition and replace, as required 2.6. Clean cases and bands, as required
3. Service complex quartz watch case and movement components	3.1. Inspect condition of movement and case components 3.2. Confirm servicing requirements 3.3. Replace faulty or worn component parts 3.4. Clean and inspect watch case and components for cleanliness and rectify imperfections and faults
4. Reassemble and test complex quartz watches	4.1. Reassemble multiple step motors, perpetual calendar mechanisms, watch movement and case components 4.2. Perform work according to manufacturer guidelines and specifications 4.3. Confirm correct assembly and operation of gear train and perpetual calendar driving system 4.4. Use correct types and amounts of lubricant 4.5. Use specialist service tools, jigs and testing equipment 4.6. Verify watch functioning of calendar and chronograph mechanisms 4.7. Verify and adjust watch performance and rate testing 4.8. Perform resetting and zeroing and synchronising of chronograph and perpetual calendar displays

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- dismantling and reassembling complex quartz watches, chronographs and perpetual calendars
- servicing, fault-finding and performance testing multiple quartz step motors
- re-programming or resetting integrated circuits and synchronising analog displays for quartz chronographs and perpetual calendars

Required knowledge

Required knowledge includes:

- quartz watch construction, components and operating principles, including calendars and motor drive systems
- service procedures for complex analog and digital quartz watches
- client liaison techniques
- fault-finding techniques for quartz watches
- performance testing equipment/procedures
- types of calendar displays
- service procedures to program and reset chronograph and perpetual calendar circuits
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service complex quartz watches to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • service multiple step motors in quartz chronograph and perpetual calendar watches • fault-find complex quartz watches • performance test complex quartz watches • re-programming and resetting integrated circuits and synchronising analog displays for quartz chronographs and perpetual calendars.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and

EVIDENCE GUIDE	
	<p>application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Complex quartz watch functions and features	<p>Complex quartz watch functions and features may include:</p> <ul style="list-style-type: none"> • chronograph • perpetual calendar • repeater • perpetual calendar with multiple step motors • ultrasonic step motor calendar driving systems
Record and document repair process	<p>Record and document repair process may include:</p> <ul style="list-style-type: none"> • extent and date of repair • cost of replacement part • time spent on procedure
Appropriate working environment	<p>Appropriate working environment may include:</p> <ul style="list-style-type: none"> • suitable watchmakers' bench

RANGE STATEMENT	
	<ul style="list-style-type: none"> • clean and orderly work area (precautions taken to minimise dust) • suitable lighting and adequate ventilation • ergonomic chair with adjustable height
Workshop tools and equipment	<p>Workshop tools and equipment may include:</p> <ul style="list-style-type: none"> • timing machine • multimeter • pulse generator • watch repair and construction hand tools • case opening and closing tools • cleaning media • cleaning machines • lubricants • personal protective equipment
Case components	<p>Case components may include:</p> <ul style="list-style-type: none"> • watch glasses • case back • bezel (e.g. rotating) • crown (e.g. screwed) • pendant • pushbuttons (e.g. arbors and circlips) • gaskets
Watch performance/rate testing	<p>Watch performance/rate testing may include:</p> <ul style="list-style-type: none"> • current consumption (e.g. manufacture specifications) • pulse generation • lower working limit test • gear train freedom • types of quartz regulating systems (capacitive, inhibition and thermo-compensation) • adjust rate for various types of quartz watch (e.g. +0.25 - 0.3 seconds/day)

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify watch type, functions, construction and components 1.2. Carry out pre-repair tests to verify water-resistance, as required 1.3. Prepare written quotation and inform customer of watch condition, completeness and performance concerns 1.4. Outline recommended service procedures to be undertaken to remedy identified faults 1.5. Verify and agree on servicing requirements with customer 1.6. Prepare watch for handover 1.7. Record and document repair process
2. Disassemble watch, case and movement components for servicing	2.1. Establish appropriate working environment 2.2. Open and close watch cases correctly 2.3. Remove case components and movement sub-assemblies in correct sequence without damaging or marking 2.4. Verify condition of case gaskets and replace, as required 2.5. Clean watch case and band, as required
3. Service watch case, movement, sub-assemblies and components	3.1. Inspect condition of movement, sub-assemblies and case components 3.2. Confirm servicing requirements 3.3. Replace faulty or worn component parts/movement, sub-assemblies or case 3.4. Select appropriate cleaning methods and clean components 3.5. Inspect watch case and components for cleanliness and rectify imperfections and faults
4. Reassemble watch, movement and case components	4.1. Reassemble watch movement and case components according to manufacturer specifications 4.2. Assemble motion work and verify and adjust hand setting tension 4.3. Check and adjust component operation and watch functioning 4.4. Lubricate components and sub-assemblies according to manufacturer specification 4.5. Apply watch assembly inspections and precautions

ELEMENT	PERFORMANCE CRITERIA
5. Test and adjust watch function and performance	5.1. Verify function of watch movement and sub-assemblies 5.2. Correctly set up and operate mechanical watch timing machine and interpret readings 5.3. Verify watch performance and rate testing and adjust as required according to manufacturer specifications
6. Apply industry workshop standards to perform work	6.1. Use hand tools and equipment safely and correctly 6.2. Handle components without damaging or marking 6.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying various mechanical watches by function, escapement and quality
- dismantling and reassembling watch assemblies and movements
- applying correct amount and type of lubrication
- using service equipment (e.g. timing machine, cleaning machines)
- selecting and ordering replacement watch parts

Required knowledge

Required knowledge includes:

- types of mechanical watches by function, escapement and quality
- function and operating principles of mechanical watches, including:
 - shock resistance system (e.g. Incabloc and Kif)
 - regulating systems (e.g. conventional, free sprung and Etachron)
 - mainsprings as generators of power motive force
 - gear train to transmit power
 - escapement to release power
 - oscillator to control the speed of release of power
 - winding and setting to wind watch and set hands to time
- dismantling/reassembling techniques of watch movements according to procedures

REQUIRED SKILLS AND KNOWLEDGE

and manufacturer guidelines

- watch cleaning methods
- band construction and components
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service mechanical watches to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • use correct dismantling and reassembling techniques (e.g. correct sequence for observations and fault diagnosis) • undertake function and performance testing (e.g. adjustment of rate, in-beat and amplitude) • use lubrication techniques (e.g. correct type, amount, application, cleanliness and without spilling) • safely clean watch movements and cases by machine and hand
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in a simulated working environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning

EVIDENCE GUIDE	
	<p>knowledge to ensure its correct interpretation and application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Watch type, function, construction and components	<p>Watch type, function, construction and components may include:</p> <ul style="list-style-type: none"> • manual wound • shock-resistance system (e.g. Incabloc and Kif) • regulating system (e.g. conventional, free sprung and Etachron) • power reserve indicator • mainspring • gear train • escapement • oscillator • winding and setting

RANGE STATEMENT	
Record and document repair	Record and document repair may include: <ul style="list-style-type: none"> • extent and date of repair • cost of replacement part • time spent on procedure
Appropriate working environment	Appropriate working environment may include: <ul style="list-style-type: none"> • clean bench and working area • adequate lighting and ventilation • tools and equipment are organised and in good condition • ergonomic seating • ventilation
Case components and movement sub-assemblies	Case components and movement sub-assemblies may include: <ul style="list-style-type: none"> • glass and bezel (e.g. rotating) • case back and gaskets • crown, pendant, gaskets • balance and cock assembly • pallet, escapement components • barrel and mainspring assembly • gear train • winding and setting mechanisms
Inspect condition	Inspect condition may include: <ul style="list-style-type: none"> • originality of components • corrosion • cleanliness • wear
Cleaning methods	Cleaning methods may include: <ul style="list-style-type: none"> • conventional • ultrasonic • vibrational • hand cleaning • types of watch cleaning solutions used • precautions for handling and disposing cleaning solutions
Verify and adjust hand setting tension	Verify and adjust hand setting tension may include: <ul style="list-style-type: none"> • test for correct friction (e.g. second hand or

RANGE STATEMENT	
	train not reversing) <ul style="list-style-type: none"> • conventional cannon pinions • friction driving wheel • short off centre
Watch assembly inspections and precautions	Watch assembly inspections and precautions may include assessing: <ul style="list-style-type: none"> • winding and setting engagement, operation and lubrication • gear train end shake, backlash and lubrication • mainspring engagement, hooking, tension and lubrication • escapement action, operation e.g. pallet jump and lubrication • oscillator end shake, balance spring condition and correct amount lubrication
Mechanical watch timing machine	Mechanical watch timing machine may include: <ul style="list-style-type: none"> • Witschi watch expert or equivalent giving an indication of rate in seconds a day, beat error and amplitude
Watch performance and rate testing	Watch performance/rate testing may include: <ul style="list-style-type: none"> • in-beat under 0.5 milliseconds • rate adjustment +/- 10 seconds per day • amplitude minimum 220 - 270 degrees fully wound
Hand tools and equipment	Hand tools and equipment may include: <ul style="list-style-type: none"> • timing machine • case opening/closing tools • oilers and oil pots • hand cleaning (e.g. pith, peg wood, rodico and solvents jar)
Clean and safe work environment	Clean and safe work environment may be specified through: <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine, standardise, sustain)

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements	1.1. Identify watch construction, function and characteristics 1.2. Source manufacturer technical guidance information to determine correct tolerances and specifications 1.3. Prepare watch for handover 1.4. Record and document repair process
2. Inspect mechanical watches	2.1. Undertake inspections of watch movements in accordance with manufacturer tolerances and procedures 2.2. Make accurate observations of the condition and function of components and sub-assemblies 2.3. Remove and replace components and sub-assemblies in a sequence designed to accurately assess condition and faults during the process of dismantling and assembling 2.4. Inspect lubrication quantity and condition
3. Diagnose faults in mechanical watches	3.1. Evaluate observations and watch performance characteristics to determine appropriate repair procedure 3.2. Analyse timekeeping performance using appropriate techniques and equipment 3.3. Make alterations in a logical sequence to diagnose faults
4. Repair and adjust mechanical watches	4.1. Select and use appropriate hand tools 4.2. Undertake dismantling and reassembling of watch movements according to industry standard procedures and manufacturer guidelines 4.3. Make precise corrections to sub-assemblies 4.4. Remove, dismantle, replace and reassemble sub-assemblies and components in correct order without damaging or marking 4.5. Select appropriate replacement components
5. Test and adjust watch function and performance	5.1. Verify and confirm function of watch movement and sub-assemblies 5.2. Verify watch performance and rate testing 5.3. Adjust, as required, according to manufacturer specifications 5.4. Repeat testing, as required, to confirm performance

ELEMENT	PERFORMANCE CRITERIA
6. Apply industry workshop standards to perform work	6.1. Use hand tools and equipment safely and correctly 6.2. Handle components without damaging or marking 6.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- good manual dexterity
- assembling and dismantling in accordance with procedures and manufacturer guidelines of mechanical watches including movements
- undertaking inspection and adjustment of watch mechanisms and sub-assemblies, including:
 - escapement end shake and freedom checks
 - observation of gear train backlash
 - wear checks
- performing timekeeping analysis and adjustment techniques

Required knowledge

Required knowledge includes:

- function and operating principles of mechanical watches:
 - mainspring
 - gear train
 - escapement
 - oscillator
 - winding and setting mechanisms
- procedures for fault-finding and inspection of watch mechanisms and sub-assemblies
- manufacturer specifications and tolerances for performance and timekeeping

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to inspect and evaluate the condition and performance of mechanical watches, diagnose faults and make repairs and adjustments to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • apply dextrous hand skills to manipulate components and sub-assemblies • select and use appropriate bench tools when adjusting • interpret readings and make accurate observations to recognise faults • determine appropriate sequence to accurately assess condition and faults during the process of dismantling and assembly.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in a simulated working environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Inspect watch condition and performance concerns 1.2. Prepare written and verbal quotations 1.3. Agree with customer on recommended service procedures to remedy faults 1.4. Identify mechanical self-winding or quartz generating system type 1.5. Prepare watch for handover 1.6. Record and document repair process
2. Disassemble and reassemble self-winding or quartz generating mechanisms	2.1. Open and close self-winding or quartz generating watch cases correctly 2.2. Remove and replace case components, dial and hands, movements and sub-assemblies in correct sequence without damaging or marking 2.3. Verify condition of case pushbuttons, gaskets and replace, as required 2.4. Clean cases and bands, as required 2.5. Apply dismantling and assembly precautions
3. Service and adjust self-winding or quartz generating watch mechanisms	3.1. Inspect condition of self-winding or quartz generating watch mechanisms 3.2. Lubricate components and sub-assemblies according to manufacturer specification 3.3. Replace faulty or worn component parts 3.4. Clean self-winding or quartz generating watch mechanism components 3.5. Inspect self-winding or quartz generating mechanism for cleanliness and rectify imperfections or faults 3.6. Adjust self-winding or quartz generating mechanism components for correct operation, end shake and clearances
4. Test and adjust self-winding or quartz generating mechanism function and performance	4.1. Perform pre-service inspection and fault-finding of self-winding or quartz generating mechanism action, function and wrist sensitivity 4.2. Verify watch performance/rate testing and amplitude 4.3. Perform simulated wear and power generation tests, as appropriate
5. Apply industry workshop standards	5.1. Use hand tools and equipment safely and correctly 5.2. Handle components without damaging or marking

ELEMENT	PERFORMANCE CRITERIA
to perform work	5.3.Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- inspecting and fault-finding of self-winding or quartz generating mechanisms (e.g. wear, function and actions)
- dismantling and reassembling of self-winding or quartz generating mechanisms
- dismantling and reassembling of watch movements according to procedures and manufacturer guidelines
- applying lubrication to self-winding or quartz generating mechanisms (e.g. correct application, type and amount)
- servicing of the barrel and mainspring slipping device
- running time performance testing of self-winding or quartz generating mechanisms (e.g. using automatic winding machine)

Required knowledge

Required knowledge includes:

- types of self-winding or quartz generating watch
- identify and name the components of a self-winding or quartz generating mechanism
- inspection and fault-finding procedures of self-winding or quartz generating mechanisms (e.g. wear, function and actions)
- lubrication techniques of self-winding or quartz generating mechanisms (e.g. correct application, type, amount and cleanliness)
- function of the barrel and mainspring slipping device
- performance testing of self-winding or quartz generating mechanisms (e.g. using automatic winding machine - cyclomat)
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service mechanical self-winding (automatic) watches and quartz watch power generating systems to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • dismantle and assemble self-winding or quartz generating mechanisms using correct techniques and precautions • inspect, fault-find and adjust self-winding or quartz generating mechanisms • conduct wear, performance and power generation testing • clean components and apply lubricants correctly.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in a simulated working environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning

EVIDENCE GUIDE	
	<p>knowledge to ensure its correct interpretation and application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
System type and construction	<p>System type and construction may include:</p> <ul style="list-style-type: none"> • mechanical self-winding • quartz watch power generation (e.g. kinetic and auto quartz) • types of construction (e.g. rotor, buffer, pedometer and case winding) • features of construction (e.g. single and two way winding) • performance characteristics (e.g. constant motive force)
Record and document repair process	<p>Record and document repair process may include:</p> <ul style="list-style-type: none"> • extent and date of repair • cost of replacement part

RANGE STATEMENT	
	<ul style="list-style-type: none"> time spent on procedure
Dismantling and assembly precautions	<p>Dismantling and assembly precautions may include:</p> <ul style="list-style-type: none"> sequence of inspection and adjustment of self-winding or quartz generating mechanism verification of correct operation of oscillating weight, reversing wheel and mainspring slipping device correct selection, application and amount of lubrication for self-winding or quartz generating mechanism
Faulty or worn component parts	<p>Faulty or worn component parts may include:</p> <ul style="list-style-type: none"> oscillating weight ball bearings rotor posts reversing wheel pivots clicks slipping bridle driving gear friction clutch generating rotor
Self-winding or quartz generating components	<p>Self-winding or quartz generating components may include:</p> <ul style="list-style-type: none"> oscillating weights and rotor transmissions, reverser wheels and wig wag mainspring and barrel slipping devices
Watch performance/rate testing	<p>Watch performance and rate testing may include:</p> <ul style="list-style-type: none"> beat error diagnosis and adjustment rate adjustment amplitude
Wear and power generation tests	<p>Wear and power generation tests may include:</p> <ul style="list-style-type: none"> machine simulation wear test (e.g. rotational machine) testing by wrist wearing kinetic voltage test
Hand tools and equipment	<p>Hand tools and equipment may include:</p> <ul style="list-style-type: none"> timing machine

RANGE STATEMENT	
	<ul style="list-style-type: none"> • mainspring winders • cyclomat • case opening and closing tools
Appropriate working environment	<p>Appropriate working environment may include:</p> <ul style="list-style-type: none"> • clean bench and working area • adequate lighting and ventilation • organised tools and equipment • ergonomic seating
Clean and safe work environment	<p>Clean and safe work environment may be specified through:</p> <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine, standardise, sustain)

MEM21011A Service calendar and other dial indication mechanisms for watches

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers servicing techniques for watches with different types or combinations of calendar and other dial indications, including date, day, month, year, moonphase, annual calendar, perpetual calendar, retrograde and power reserve indicators.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit of competency applies to dial indication servicing work undertaken by a watch repair tradesperson. This work is often performed in conjunction with major servicing on both mechanical and quartz watches received for repair. This work would normally be undertaken in watch service and repair centres and jewellery stores where service and repairs are offered.</p> <p>This unit has been developed for watch service and repair apprenticeship training and the recognition of trade-level skills in watch servicing and repair.</p> <p>Band: A</p> <p>Unit weight: 4 points</p>
--------------------------------	--

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
	MEM21010A	Service watch power generating systems
	MEM21009A	Inspect, diagnose, adjust and repair mechanical watches
	MEM21008A	Service mechanical watches
	MEM18001C	Use hand tools

Employability Skills Information

Employability skills	This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements	1.1. Identify watch type, calendar construction and dial indicator components 1.2. Inspect condition and functions of calendar operation/dial indicator mechanisms 1.3. Prepare watch for handover 1.4. Record and document repair requirements
2. Dismantle and reassemble calendar and dial indication mechanisms	2.1. Select and use workshop tools and equipment appropriately 2.2. Open and close watch cases correctly 2.3. Dismantle and reassemble calendar and dial indication mechanisms according to design and construction constraints
3. Service calendar and dial indication mechanisms	3.1. Identify calendar and dial indications drive mechanism 3.2. Identify faults and repair or replace, worn or damaged component parts 3.3. Clean components using appropriate methods 3.4. Inspect correct fitting and function of all components 3.5. Verify sequencing and alignment of components during reassembly, including dial and hand fitting 3.6. Lubricate components according to manufacturer specifications
4. Verify calendar and dial indication mechanism operations	4.1. Test calendar and dial indications will not impact on watch performance, amplitude or timekeeping

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

REQUIRED SKILLS AND KNOWLEDGE

- dismantling and reassembling calendar and dial indication mechanism
- inspecting and diagnosing faults in calendar and dial indication mechanism
- applying correct type and amount of lubrication
- testing calendar and dial indication mechanisms, operation and synchronisation

Required knowledge

Required knowledge includes:

- types of calendar watches
- types of calendar drive mechanism operation
- power reserve indicator construction and operation
- calendar/dial indications component part names
- lubrication techniques for calendar and dial indication mechanisms
- fault-finding and inspection techniques of calendar and dial indication mechanisms
- occupational health and safety (OHS) regulations and practices

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service calendar and dial indication mechanisms to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • dismantle, reassemble and lubricate calendar mechanisms • service and fault-find calendar watches • perform inspection and adjustment of calendar change mechanism • synchronise dial indications with calendar change mechanism.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify oscillator types	1.1. Identify oscillating construction types and components 1.2. Establish the performance characteristics of the watch oscillating system 1.3. Record and document repair requirements
2. Diagnose oscillator condition	2.1. Select and use workshop tools and equipment appropriately 2.2. Inspect oscillator components for condition, function, end shake and performance 2.3. Record and report wear and damage to component parts 2.4. Determine appropriate repair process to rectify faults
3. Repair, replace and adjust oscillator components	3.1. Remove and reassemble balance complete and oscillator components using appropriate tools, equipment and techniques 3.2. Determine type and method of balance staff removal and replacement 3.3. Test security of replacement balance staff and oscillator components 3.4. Inspect condition and adjust balance wheel and oscillator components for correct operation 3.5. Determine type of roller and roller jewel and the method of removal and replacement procedures 3.6. Inspect, diagnose and adjust balance spring to achieve optimum performance and timekeeping 3.7. Inspect, service and replace components for shock protection devices fitted to mechanical oscillators
4. Test and adjust oscillator	4.1. Verify and confirm function of watch movement 4.2. Correctly set up and operate mechanical watch timing machine and interpret readings 4.3. Verify watch performance and timekeeping 4.4. Adjust in-beat and rate, as required, according to performance and design characteristics

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying types and grades of mechanical watch balance complete
- removing and replacing balance staffs and rollers
- truing balance wheels
- poising balance wheels (static)
- inspecting, diagnosing and adjusting balance springs
- adjusting in-beat and rate
- setting up and operating mechanical watch timing machine

Required knowledge

Required knowledge includes:

- types and grades of balance wheel construction
- types of balance staffs construction
- types of balance spring construction
- types of rollers and roller jewels construction
- balance staff replacement techniques and workshop procedures
- performance characteristics of balance wheel completes
- balance spring adjusting techniques
- watch servicing procedures and techniques
- occupational health and safety (OHS) regulations and procedures

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Inspect watch escapement condition	1.1. Identify escapement type and construction 1.2. Inspect escapement components and condition 1.3. Observe escapement action for faults 1.4. Perform and confirm safety test action 1.5. Record and document repair process
2. Repair, replace and adjust watch escapement components	2.1. Adjust or replace components, as necessary 2.2. Adjust pallet stones for optimum performance 2.3. Adjust banking pins for optimum performance 2.4. Reconfirm safety test action
3. Test and adjust escapement function and performance	3.1. Verify and confirm escapement function and lubrication 3.2. Confirm escapement performance by assessing oscillator amplitude to manufacturer specifications 3.3. Reconfirm safety test action 3.4. Assess watch in various states of winding and position 3.5. Make adjustments, as necessary, to achieve performance within specification
4. Apply industry workshop standards to perform work	4.1. Use hand tools and equipment safely and correctly 4.2. Handle components without damaging or marking 4.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- performing inspections, diagnosing faults and adjusting lever escapements
- replacing and adjusting pallet stones
- assessing watch escapement performance and timekeeping

Required knowledge

REQUIRED SKILLS AND KNOWLEDGE

Required knowledge includes:

- watch construction
- historic development and common types of escapements
- lever escapement function, operation, action, inspection and adjustment
- conduct escapement safety tests
- techniques for replacement/adjustment of pallet stones
- techniques for assessing watch escapement performance/timekeeping
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to inspect, adjust and repair watch escapements to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • identify faults in escapement condition and action • rectify escapement action by replacement and adjustment • correctly service/lubricate escapement • performance test escapements.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related

EVIDENCE GUIDE	
	<p>conditions (real or simulated) and require evidence of process.</p> <ul style="list-style-type: none"> • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify type of chronograph watch mechanisms and components 1.2. Prepare written quotation and inform customer of watch condition and performance concerns, outlining recommended service procedures to be undertaken to remedy identified faults 1.3. Verify and agree on servicing requirements with customer 1.4. Prepare watch for handover 1.5. Establish appropriate working environment 1.6. Record and document repair process
2. Disassemble and reassemble chronograph watches	2.1. Open and close chronograph watch cases correctly 2.2. Remove and replace case components, dials and hands, movements and sub-assemblies in correct sequence without damaging or marking 2.3. Verify condition of case pushbuttons, operation and gaskets and replace, as required 2.4. Clean cases and bands, as required 2.5. Apply dismantling and assembly precautions
3. Service and adjust chronograph mechanisms	3.1. Inspect condition of chronograph components 3.2. Lubricate chronograph mechanism with correct type and amount according to manufacturer specifications 3.3. Replace faulty or worn components 3.4. Clean chronograph components 3.5. Inspect chronograph watch for cleanliness and rectify imperfections and faults 3.6. Adjust chronograph components for correct end shake, clearances and penetrations
4. Test and adjust chronograph watch function and performance	4.1. Perform pre-service inspection and fault-finding of chronograph action, function and depthings 4.2. Verify and confirm dial and hand fitting, and casing up of chronograph 4.3. Verify watch performance and rate testing 4.4. Perform final adjustment and correction of recording and zeroing mechanism
5. Apply industry workshop standards to perform work	5.1. Use hand tools and equipment safely and correctly 5.2. Handle components without damaging or marking

ELEMENT	PERFORMANCE CRITERIA
	5.3. Establish a clean and appropriate work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- diagnosing faults in complex mechanical watches
- dismantling/reassembling mechanical watch movements in accordance with procedures and manufacturer guidelines
- inspecting and adjusting chronograph watch mechanisms and sub-assemblies
- fault-finding and inspecting watch mechanisms and sub-assemblies
- performing timekeeping analysis and adjustment techniques
- selecting and applying correct amount of lubrication for chronograph mechanisms

Required knowledge

Required knowledge includes:

- basic functions and operations of the chronograph or stop watch (e.g. start, stop and reset)
- identification of the component parts of a chronograph watch mechanism
- inspections and adjustments techniques of mechanical chronograph mechanisms
- dismantling/reassembling techniques for mechanical chronograph watches in accordance with procedures and manufacturer guidelines
- manufacturer specification and tolerances for lubrication, performance and timekeeping
- chronograph watch case construction, and pushbuttons and pendants servicing
- band construction and components
- occupational health and safety (OHS) regulations and procedures)

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service mechanical chronograph watches to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • dismantle, assemble and clean chronograph watches using correct techniques and precautions • inspect, fault-find and adjust chronograph mechanisms • perform function and performance testing • perform chronograph dial and hand fitting • select and apply lubricants correctly.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and

EVIDENCE GUIDE	
	<p>application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Types of chronograph watch mechanisms	<p>Types of chronograph watch mechanisms may include:</p> <ul style="list-style-type: none"> • types (e.g. application of dial scale indications - tachymeter and telemeter) • chronograph operating systems (e.g. pillar wheel actuated or cam controlled) • features (e.g. minute record, hour record, automatic and split second) • performance characteristics of chronograph watches
Appropriate working environment	<p>Appropriate working environment may include:</p> <ul style="list-style-type: none"> • adequate lighting and ventilation • clean bench and working area • tools and equipment organised and in good condition

RANGE STATEMENT	
	<ul style="list-style-type: none"> ergonomic seating
Record and document repair	<p>Record and document repair may include:</p> <ul style="list-style-type: none"> date and extent of repair cost of replacement part time spent on procedure
Dismantling and assembly precautions	<p>Dismantling and assembly precautions may include:</p> <ul style="list-style-type: none"> inspection of condition and adjustments of chronograph assembly functions verification of correct recording system operation (e.g. engagement, depthing, end shake, penetration) correct selection, application and amount of lubrication for chronograph mechanisms adjustment of timekeeping performance and balance amplitude during chronograph function
Chronograph components	<p>Chronograph components may include:</p> <ul style="list-style-type: none"> operating mechanism (e.g. single and double pusher action) clutch system for chronograph engagement transmission (e.g. minute and hour record) flyback and zeroing
Chronograph action	<p>Chronograph action may include:</p> <ul style="list-style-type: none"> start, stop, reset to zero hand zeroing indexing minute and hour record
Dial and hand fitting	<p>Dial and hand fitting may include:</p> <ul style="list-style-type: none"> hand fitting tools and supports alignments and synchronisation
Watch performance and rate testing	<p>Watch performance and rate testing may include:</p> <ul style="list-style-type: none"> beat error diagnosis and adjustment rate adjustment/positional errors amplitude (e.g. chronograph start - maximum variation <math>\leq 40</math> degrees)
Hand tools and equipment	<p>Hand tools and equipment may include:</p> <ul style="list-style-type: none"> movement holders for operating chronograph

RANGE STATEMENT	
	functions <ul style="list-style-type: none"> • timing machine • rose cutters • tools for removing chronograph driving wheel • hand staking and fitting tools and supports • case opening and closing tools
Clean and safe work environment	Safe and clean work environment may be specified through: <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine, standardise, sustain)

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify high-grade mechanical watch characteristics 1.2. Prepare written quotation and inform customer of watch condition and performance concerns, outlining recommended service procedures to be undertaken to remedy identified faults and timekeeping accuracy 1.3. Verify and agree on servicing requirements with customer 1.4. Prepare watch for handover 1.5. Record and document repair process
2. Analyse watch performance	2.1. Assess condition and ability of watch to achieve chronometer performance 2.2. Conduct performance analysis of mechanical watch 2.3. Adapt servicing techniques to meet manufacturer performance specifications (chronometer certified rating) 2.4. Assess oscillator and balance spring condition 2.5. Analyse positional errors in mechanical watch
3. Adjust mechanical watch performance	3.1. Adjust mechanical watch to minimise positional errors 3.2. Adjust mechanical watch to minimise variations in balance amplitude/performance/rate 3.3. Adjust oscillator and balance spring to minimise positional errors and perform dynamic poising 3.4. Repeat and confirm all adjustments
4. Test mechanical watch function and performance	4.1. Verify instantaneous watch performance and rate testing 4.2. Perform longitudinal testing to confirm watch performance 4.3. Determine intermittent timing faults and adjustments
5. Apply industry workshop standards to perform work	5.1. Use hand tools and equipment safely and correctly 5.2. Handle components without damaging or marking 5.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skill

Required skills include:

- setting up, using and interpreting readings of a mechanical watch timing machine
- conducting performance testing analysis for mechanical watches
- performing fine dexterous adjustments to oscillator components
- using tweezers to manipulate and adjust balance springs for optimum performance
- conducting dynamic poising adjustment of balance wheel complete

Required knowledge

Required knowledge includes:

- types of high-grade mechanical watches by brand and complications
- characteristics of high-grade mechanical watch movements/components
- timekeeping accuracy for chronometers
- watch construction and components
- oscillator pivot friction and end shake adjustment
- influence of out-of-poised balance wheel
- influence of the escapement on timekeeping
- influence of the balance spring design/characteristics on timekeeping
- balance spring inspection and adjustment techniques
- performance testing procedures for mechanical watches
- factors affecting isochronism
- workshop procedures for conducting dynamic poising
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to adjust high-grade mechanical watches to achieve chronometer timekeeping to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • service high-grade mechanical watches to achieve original manufacturer timekeeping standards and specifications • conduct watch performance testing (e.g. chronometer rating) • analyse and interpret results of watch performance testing • adjust and rectify errors in watch oscillating system to achieve precision timing and chronometer performance +/- 4 to 5 seconds per/day.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with

EVIDENCE GUIDE	
	<p>application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
High-grade mechanical watch characteristics	<p>High-grade mechanical watch characteristics may include:</p> <ul style="list-style-type: none"> • finish of components (e.g. bevelling, graining or level of polish) • type of materials used for movement and case construction (e.g. non-magnetic alloys and precious metals) • quality of components used (e.g. balance spring, escapement and balance wheel) • certification chronometer • brand name • number of jewels

RANGE STATEMENT	
Record and document repair	Record and document repair may include: <ul style="list-style-type: none"> • date and extent of repair • cost of replacement part • time spent on procedure
Performance analysis	Performance analysis may include: <ul style="list-style-type: none"> • watch subjected to various testing positions (e.g. dial up, dial down, crown up, crown down, crown right and left) • states of winding (e.g. partly wound, half wound and fully wound) • temperature variation • factors affecting isochronism (e.g. equal time of vibration)
Oscillator and balance spring condition	Oscillator and balance spring condition may include: <ul style="list-style-type: none"> • static poise of balance wheel • balance spring condition (e.g. concentric, flatness and beating evenly between curb pins)
Dynamic poising	Dynamic poising may include: <ul style="list-style-type: none"> • set up and determine out-of-poise/balance wheel using a timing machine (e.g. amplitude <180 degrees) • identify and locate point of adjustment • methods of adjustment (e.g. cutters and milling tools)
Confirm all adjustments	Confirm all adjustments may include: <ul style="list-style-type: none"> • ensure required accuracy is obtained and timekeeping is in accordance with manufacturer specifications (e.g. chronometer certified rating +/- 4 to 5 seconds per day)
Watch performance and rate testing	Watch performance and rate testing may include: <ul style="list-style-type: none"> • in-beat • rate adjustment • amplitude • effect or influence of escapement • temperature • effect of positional errors (e.g. isochronism) • effect of balance wheel poise

RANGE STATEMENT	
	<ul style="list-style-type: none"> • effect of balance spring • states of winding
Longitudinal testing	Longitudinal testing may include: <ul style="list-style-type: none"> • testing over extended time period by wearing or simulator machine (e.g. cyclomat)
Hand tools and equipment	Hand tools and equipment may include: <ul style="list-style-type: none"> • mechanical watch timing machine • poising tools • balance wheel cutters • case opening and closing tools
Working environment	Working environment may include: <ul style="list-style-type: none"> • clean bench and working area • adequate lighting and ventilation • tools and equipment organised and in good condition • ergonomic seating
Clean and safe work environment	Clean and safe work environment may be specified through: <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine, standardise, sustain)

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Handle clocks, shipment and delivery	1.1. Verify and agree clock location requirements (environmental and architectural) with customer 1.2. Prepare the clock for shipment/transport 1.3. Arrange delivery, as required 1.4. Pack parts to avoid damage in transit 1.5. Complete clock handover with customer
2. Assemble and install clocks	2.1. Select and use tools and equipment appropriately 2.2. Unpack components and verify completeness 2.3. Install and stabilise clock case using appropriate methods and fixings 2.4. Assemble clock 2.5. Verify clock functions
3. Determine in-beat and adjust pendulum oscillating systems	3.1. Conduct in-beat assessment 3.2. Identify in-beat adjustment method 3.3. Perform in-beat adjustment 3.4. Evaluate pendulum amplitude and action
4. Verify additional clock functions	4.1. Test and confirm correct striking and chiming sequence 4.2. Adjust, as required, to ensure correct tone and harmony 4.3. Set clock to time and confirm correct functioning of calendar and automatic night shut-off
5. Conduct basic clock regulation techniques	5.1. Set up and use timing equipment correctly 5.2. Verify pendulum rate correctly 5.3. Perform rate adjustments to achieve accurate timekeeping

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

REQUIRED SKILLS AND KNOWLEDGE

- packaging components
- handling and moving clock components and cases
- setting up and levelling clock cases
- using timing equipment
- adjusting the sound of the striking and chiming mechanisms
- interpreting timing test results
- making adjustments to achieve accurate timing and performance

Required knowledge

Required knowledge includes:

- types of clocks
- implications for correct set-up (e.g. wall, shelf, floor and specialty)
- wall and floor fixing methods
- tools and equipment for installation
- packaging methods and materials
- techniques to prevent transit damage
- types of power sources used in clocks
- precautions when handling clock cases
- major sections of mechanical clocks
- components and function of clocks
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to install and set up clocks to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify clock origin and case and movement construction and function 1.2. Verify clock condition and performance concerns with customer 1.3. Prepare written and verbal quotations 1.4. Agree with customer on recommended service procedures 1.5. Prepare clock for handover 1.6. Record and document repair process 1.7. Source replacement parts from industry suppliers
2. Disassemble clock, case and movement components for servicing	2.1. Establish appropriate working environment 2.2. Remove clock movements in sequence considering case design and construction 2.3. Select and correctly use appropriate hand and bench tools 2.4. Verify condition and completeness of clock case 2.5. Perform power release safely 2.6. Dismantle clock movement in correct sequence
3. Service and repair movement, sub-assemblies and components	3.1. Inspect movement, sub-assemblies and components, and identify condition and faults 3.2. Confirm servicing and repair requirements 3.3. Replace or repair faulty or worn component parts, movement or sub-assemblies 3.4. Use hand tools and equipment correctly for servicing and repair 3.5. Clean clock components at appropriate stages using cleaning and finishing methods 3.6. Verify condition of components after cleaning
4. Service clock cases	4.1. Verify completeness of clock case 4.2. Repair and replace missing or damaged components 4.3. Clean internals and refinish/refurbish exterior with appropriate materials and techniques
5. Reassemble clock movement and case components	5.1. Reassemble clock movement and case components 5.2. Assemble motion work and verify and adjust hand setting tension 5.3. Check and adjust component operations and clock functioning 5.4. Select and apply lubricants according to component

ELEMENT	PERFORMANCE CRITERIA
	design and estimated frictional load 5.5. Apply clock assembly inspections and precautions 5.6. Install and secure movement in case
6. Bench test and adjust clock functions	6.1. Verify/confirm function of clock movement 6.2. Set up, operate mechanical clock timing machine and interpret readings correctly 6.3. Verify clock performance and rate testing 6.4. Adjust rate according to performance and design characteristics
7. Apply industry workshop standards to perform work	7.1. Use hand tools and equipment safely and correctly 7.2. Handle components without damaging or marking 7.3. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying country of origin
- identifying various mechanical clocks by features, escapement and oscillator
- dismantling and reassembling clock assemblies and movements
- identifying and rectifying wear and faults in escapement, bearings, arbors, wheels and pinions
- replacing or repairing broken or damaged components
- safe handling of clock mainsprings, including using mainspring handling equipment
- correct lubrication including amount, type, cleanliness and point of application
- using service equipment (e.g. timing machine, cleaning machine, bushing tool, lathe)
- determining and calculating train counts, such as vibrations per hour (VPH)

Required knowledge

Required knowledge includes:

- types of mechanical clocks by country of origin, function, escapement, quality

REQUIRED SKILLS AND KNOWLEDGE

- function and operating principles of mechanical clocks
- dismantling and reassembling techniques of clock movements according to procedures and manufacturer guidelines
- clock cleaning methods
- procurement of replacement clock parts
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service and repair clock timepieces to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • dismantle and reassemble clock movement and components • safely remove and replace clock mainsprings • repair and re-finish worn arbor pivots • re-centre and replace worn bearings (re-bushing) • safely clean clock components using appropriate methods and media • apply lubrication techniques (e.g. correct type and amount) • perform function and performance testing (e.g. adjust escapements, beat error and rate).
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in a simulated working environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge.

EVIDENCE GUIDE	
	<ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Clock origin, case and movement construction and function	<p>Clock origin, case and movement construction and function may include:</p> <ul style="list-style-type: none"> • clocks from all countries of manufacture • clocks manufactured during the 19th and 20th Centuries • clock cases made from timber, metal, natural stone and composite materials • movement components made from brass and steel • pendulum or balance oscillating systems • timepiece only mechanisms • motive force (e.g. mainspring or weight driven)

RANGE STATEMENT	
	<ul style="list-style-type: none"> • gear train for transmitting of power • escapement for release power • oscillator for controlling the speed of release of power • winding (e.g. by key) • time setting (e.g. by key or direct movement of hands)
Clock handover	<p>Clock handover may include:</p> <ul style="list-style-type: none"> • informing customer of features and characteristics of clock • demonstrating winding and setting procedures for clock • inform customer of operation and switching of any automatic night silent, or shut-off for chiming or striking mechanism • warranty information • date of installation
Record and document repair process	<p>Record and document repair process may include:</p> <ul style="list-style-type: none"> • extent and date of repair recorded • tracking of subcontractors • cost of replacement parts • time spent on procedure
Appropriate working environment	<p>Appropriate working environment may include:</p> <ul style="list-style-type: none"> • clean bench and working area • adequate lighting and ventilation • tools and equipment organised and in good condition • ergonomic seating, including bench height
Condition and faults	<p>Condition and faults may include:</p> <ul style="list-style-type: none"> • originality of components • corrosion • cleanliness • wear • damaged or failed components
Faulty or worn components	<p>Faulty or worn components may include:</p> <ul style="list-style-type: none"> • barrel and mainspring (e.g. hooking, teeth and bearings) • gear trains (e.g. bearings, pivots and pinions)

RANGE STATEMENT	
	<ul style="list-style-type: none"> • pendulum escapements (e.g. pallets and escape wheels engagement drop, locking and impulse) • oscillators pendulum type (e.g. rod, crutch engagement, suspension spring fittings and bob security) • oscillators balance type (e.g. balance spring, balance staff and roller) • winding mechanisms(e.g. key fitting, click, ratchet wheel and click spring) • setting hand tension or centre wheel friction
Hand tools and equipment	<p>Hand tools and equipment may include:</p> <ul style="list-style-type: none"> • clock repairers' hand tools (e.g. tweezers, screwdrivers and eyeglasses) • clock mainspring winder • clock re-bushing tool • reamers and smoothing broaches • lathe • oilstones and burnishers • movement supports for clock movements • oilers and oil pots • cleaning brushes, peg wood, solutions and rinses e.g. solvents • clock timing machine (this includes any type of machine that provides frequency count or indication of daily rate)
Cleaning and finishing	<p>Cleaning and finishing may include:</p> <ul style="list-style-type: none"> • hand cleaning • conventional machine (rotational) • ultrasonic • vibrational finishing and polishing • types of clock cleaning solutions • precautions for handling and disposing cleaning solutions • safe practices for the use of polishing equipment
Verify and adjust hand setting tension	<p>Verify and adjust hand setting tension may include:</p> <ul style="list-style-type: none"> • test for correct friction (e.g. power to escape wheel)

RANGE STATEMENT	
	<ul style="list-style-type: none"> • adjustment of motion work friction
Select and apply lubricants	<p>Select and apply lubricants may include:</p> <ul style="list-style-type: none"> • correct lubricants for escapements, bearings, barrels and mainsprings • techniques for lubricating
Clock assembly inspections and precautions	<p>Clock assembly inspections and precautions may include:</p> <ul style="list-style-type: none"> • gear train end shake, backlash, lubrication • mainspring engagement, hooking, tension, lubrication • escapement operation, depthing, lubrication • pendulum oscillator (e.g. amplitude, crutch engagement and suspension function) • balance oscillators (e.g. end shake and balance spring condition, correct lubrication)
Performance and design characteristics	<p>Performance and design characteristics may include:</p> <ul style="list-style-type: none"> • source of motive force • escapement type • oscillator and pendulum construction
Clean and safe work environment	<p>Clean and safe work environment may be specified through:</p> <ul style="list-style-type: none"> • relevant legislation and regulations • enterprise operating procedures • 5S housekeeping related principles and procedures (e.g. sort, straighten, shine, standardise, sustain)

MEM21018A Service clock escapements and oscillating systems

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers servicing techniques for inspecting, diagnosing faults and adjusting common clock escapements (e.g. deadbeat, recoil, cylinder and verge). It also covers techniques for servicing and replacement of different types of oscillating systems, including compound and compensating pendulums, torsional pendulum (e.g. 400 day and Atmos clocks) and platform escapement and floating balances.
------------------------	---

Application of the Unit

Application of the unit	<p>This unit of competency applies to servicing work on clock escapements and oscillating systems undertaken in clock service and repair workshops.</p> <p>This unit has been developed for watch and clock service and repair apprenticeship training and the recognition of trade-level skills in watch and clock servicing and repair.</p> <p>Band: A</p> <p>Unit weight: 4 points</p>
--------------------------------	---

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
	MEM21017A	Service and repair clock timepieces
	MEM21013A	Service, test and adjust watch escapements
	MEM21012A	Service and repair watch oscillating systems
	MEM21009A	Inspect, diagnose, adjust and repair mechanical watches
	MEM21008A	Service mechanical watches
	MEM18001C	Use hand tools

Employability Skills Information

Employability skills	
	This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify escapement and oscillator type	1.1. Identify clock escapements/oscillating systems and applications 1.2. Establish the performance characteristics of the clock according to escapement and oscillating system 1.3. Record and document repair requirements
2. Diagnose clock escapements and oscillators	2.1. Select and use workshop tools and equipment appropriately 2.2. Inspect clock escapement and oscillators for correct function, engagement and performance 2.3. Record and report wear and damage to parts 2.4. Determine appropriate repair process to rectify faults
3. Repair and adjust clock escapements and oscillators	3.1. Remove and reassemble escapement/oscillators using appropriate tools, equipment and techniques 3.2. Determine theoretical length of replacement pendulum 3.3. Repair or replace escapement and oscillator components 3.4. Adjust escapement and oscillator components for correct operation
4. Service and adjust torsional pendulums	4.1. Remove and reassemble torsional pendulums and oscillator components using appropriate tools, equipment and techniques 4.2. Inspect torsional pendulum components and identify condition and wear 4.3. Repair and replace torsional pendulum 4.4. Adjust torsional pendulum for correct operation (in-beat)
5. Service and set up platform escapements	5.1. Remove and reassemble platform escapement using appropriate tools, equipment and techniques 5.2. Inspect platform escapement and identify condition/wear 5.3. Repair and replace platform escapement 5.4. Adjust platform escapement and correct depthing with contrate wheel
6. Test and adjust rate	6.1. Verify/confirm function of clock movement 6.2. Correctly set up and operate mechanical clock timing machine and interpret readings 6.3. Verify clock performance and rate testing

ELEMENT	PERFORMANCE CRITERIA
	6.4. Adjust rate, as required, according to performance and design characteristics

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying clock escapements and oscillators
- adjusting escapement function
- diagnosing faults
- adjusting rate
- setting up and operating timing machine

Required knowledge

Required knowledge includes:

- clock escapement types
- oscillator types
- performance characteristics of escapements and oscillators
- escapement adjusting techniques
- clock servicing procedures and techniques
- calculations and formulas for length of pendulum and geometry of escapements
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service, inspect and adjust clock escapement and oscillating system to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • identify different types of clock escapements • diagnose faults in clock escapement action • repair faults in worn escapements • set up and adjust clock escapements for optimum performance • fault-find oscillating systems • calculate length of replacement pendulum • adjust rate of timepiece.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of

EVIDENCE GUIDE	
	<p>tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify function and type of striking mechanism 1.2. Verify clock condition and performance concerns with customer 1.3. Prepare written and verbal quotations 1.4. Agree with customer on recommended service procedures 1.5. Prepare clock for handover 1.6. Record and document repair process 1.7. Source replacement parts from industry suppliers
2. Service and repair strike mechanisms	2.1. Remove and replace movement from case, considering case design and strike mechanism employed 2.2. Confirm operation of strike mechanism 2.3. Dismantle and reassemble strike components in correct sequence 2.4. Verify orientation of gear trains and strike detents 2.5. Inspect strike release, activation and sound generation, and identify wear, condition and faults 2.6. Confirm servicing and repair requirements 2.7. Repair and rectify faults in strike components 2.8. Clean and reassemble mechanism and verify correct set-up, operation and performance 2.9. Select and apply lubricants to strike components
3. Bench test and adjust striking mechanism	3.1. Verify correct operation and function of striking mechanism 3.2. Verify clock operation over 24 hour period 3.3. Determine and rectify striking faults
4. Apply industry workshop standards to perform work	4.1. Use hand, bench tools and equipment safely and correctly 4.2. Establish appropriate working environment 4.3. Handle components without damaging or marking 4.4. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying country of origin with respect to count wheel striking
- identifying various mechanical striking clocks by features (e.g. count wheel or rack)
- dismantling and reassembling striking clock assemblies and components
- identifying and rectifying wear and faults in striking mechanisms
- ensuring correct alignment of detents in striking mechanism and adjustment of function
- lubrication, including selecting and applying correct amount, type, cleanliness and point of application

Required knowledge

Required knowledge includes:

- types of clock striking systems
- difference between designs from various manufacturers
- application of gong rods, bells and hammers to achieve correct resonant sound generation
- fault-finding techniques for ensuring strike does not impact on clock operation
- dismantling and reassembling techniques for striking mechanisms
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service and repair clock striking mechanisms to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify functions and types of chiming system 1.2. Verify clock condition and performance concerns with customer 1.3. Prepare written and verbal quotations 1.4. Agree with customer on recommended service procedures 1.5. Prepare clock for handover 1.6. Record and document repair process 1.7. Source replacement parts from industry suppliers
2. Service and repair chiming mechanisms	2.1. Remove and replace movement considering case design and chiming system employed 2.2. Confirm design and operation of the chime corrector mechanism 2.3. Determine service procedure for particular movement design 2.4. Inspect condition of chime release, activation and sound generation, and identify wear and faults 2.5. Dismantle and clean chiming components 2.6. Verify orientation of gear trains, strike and chime detents 2.7. Confirm servicing and repair requirements 2.8. Repair and rectify faults in chiming components 2.9. Reassemble chiming mechanism and verify correct setup, operation and performance 2.10. Select and apply lubricants to chime components
3. Bench test and adjust chime functions	3.1. Verify and confirm function of chiming mechanism 3.2. Verify clock operation over 24 hour period 3.3. Determine and rectify faults in chiming mechanism
4. Apply industry workshop standards to perform work	4.1. Use hand and bench tools and equipment safely and correctly 4.2. Establish appropriate working environment 4.3. Handle components without damaging or marking 4.4. Establish a clean and safe work environment

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying country of origin with respect to count wheel or locking plate chiming mechanism
- identifying various mechanical clocks by chiming features
- dismantling and reassembling chiming clock assemblies and movements
- identifying and rectifying wear and faults in chiming systems
- setting up chiming mechanisms for correct warning and chime corrector operation
- setting up and synchronising chime tunes for correct resonant sound generation
- lubrication including selecting and applying correct amount, type, cleanliness and point of application

Required knowledge

Required knowledge includes:

- types of clock chiming systems and chime correcting mechanisms
- differences between designs from various manufacturers
- application of gong rod, bells and hammers to achieve correct resonant sound generation
- dismantling and reassembling techniques for chiming mechanisms
- correct amount of warning and chime corrector operation
- fault-finding techniques for ensuring chime does not impact on clock operation
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to service mechanical chiming clocks to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • dismantle and reassemble clocks with chiming mechanisms • fault-find clocks with chiming mechanisms • repair/replace worn or damaged components • perform correct set-up, operation and performance testing on chiming clocks • adjust chiming clock mechanisms for correct operation/synchronisation with hands and sound generation/tonality • apply lubrication techniques (e.g. correct type and amount) • diagnose faults relating to chime mechanisms • verify operation of chime correctors.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in a simulated working environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. MEM21021A Restore clockwork mechanisms

Modification History

Not Applicable

Unit Descriptor

Unit descriptor	This unit of competency covers restoring and repairing clock components by manufacturing parts using hand skills and machine tools. It also covers servicing power equalisation systems.
------------------------	--

Application of the Unit

Application of the unit	<p>This unit of competency applies to restoration and repair work on clock escapements and servicing of power equalisation systems undertaken in clock service and repair workshops. This work would normally be undertaken by specialist clock repairers. The unit includes restoration and repair work to antique clocks where parts are no longer available.</p> <p>For machine manufacture of clock components, <i>MEM21022A Manufacture watch and clock components</i>, should also be selected.</p> <p>Band: B</p> <p>Unit weight: 6 points</p>
--------------------------------	---

Licensing/Regulatory Information

Not Applicable

Pre-Requisites

Prerequisite units		
	MEM21020A	Service and repair clock chiming mechanisms
	MEM21019A	Service and repair clock striking mechanisms
	MEM21017A	Service and repair clock timepieces
	MEM18001C	Use hand tools
	MEM09002B	Interpret technical drawing
	MEM06007B	Perform basic incidental heat/quenching, tempering and annealing

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify clock restoration requirements	1.1. Identify missing, damaged or worn parts 1.2. Identify prior modifications and repairs, including non-standard or non-original components 1.3. Plan repairs in consideration of original clock design and manufacture 1.4. Record and document repair
2. Service and repair power equalisation devices	2.1. Identify fusee and stopwork device 2.2. Release mainspring power 2.3. Diagnose system faults 2.4. Replace fusee chains or cables 2.5. Set up fusee and stopwork systems
3. Produce clock parts by hand	3.1. Prepare working drawings and templates of replacement parts 3.2. Plan suitable method and sequence of production 3.3. Select materials suitable for manufacturing 3.4. Transfer designs and mark out templates and work pieces 3.5. Select appropriate hand tools to undertake process 3.6. Produce components by hand to required specifications 3.7. Conduct finishing, heat treatment, polishing of components 3.8. Verify function of manufactured components
4. Refinish and polish clock components	4.1. Select appropriate refinishing process to repair worn or corroded clock components 4.2. Refinish parts to replicate original finish 4.3. Adjust refinished components for correct function
5. Repair gears, wheels and arbors	5.1. Identify worn or damaged teeth 5.2. Fit, file and shape replacement teeth 5.3. Re-pivot arbors 5.4. Secure replacement part using appropriate fixing method 5.5. Test run with matched component

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- saw piercing
- transferring designs
- precision filing
- component fitting
- dismantling, reassembling and setting up power equalisation devices
- measuring components
- re-pivoting arbors

Required knowledge

Required knowledge includes:

- clock design and manufacture
- gear forms (e.g. cycloidal and involute)
- gear terminology (e.g. pitch and root diameter)
- types and uses of files, including shapes and cuts
- jewellers saws and blades
- metal types and applications to clock components
- power equalisation devices and their function
- finishing and polishing techniques and media
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to restore clockwork mechanisms to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • manufacture by hand and fit replacement parts to specification • plan and conduct repairs to maintain originality of timepiece • dismantle, assemble and set up fusee systems.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related

EVIDENCE GUIDE	
	<p>conditions (real or simulated) and require evidence of process.</p> <ul style="list-style-type: none"> • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Clock design and manufacture	<p>Clock design and manufacture may include:</p> <ul style="list-style-type: none"> • remaining faithful to original design and finish • accounting for value and provenance • maintaining originality of parts
Record and document repair	<p>Record and document repair may include:</p> <ul style="list-style-type: none"> • date and extent of repair • cost of replacement part • time spent on procedure
Working drawings and templates	<p>Working drawings and templates may include:</p> <ul style="list-style-type: none"> • sketch or illustration by hand • photocopy original component then adhere to stock
Appropriate tools and equipment	<p>Appropriate tools and equipment may include:</p> <ul style="list-style-type: none"> • files

RANGE STATEMENT	
	<ul style="list-style-type: none"> • burnishers • oil stones • jewellers saw • finishing papers • needle files • marking out equipment • lathe/drilling tailstock
Produce components by hand	Produce components by hand may include: <ul style="list-style-type: none"> • hands • pallets • striking and chiming levers • ratchet wheels • clickwork • taper pins
Heat treatment	Heat treatment may include: <ul style="list-style-type: none"> • annealing • hardening • tempering (bluing)
Refinishing process	Refinishing process may include: <ul style="list-style-type: none"> • filing • honing • graining and polishing
Clock components	Clock components may include: <ul style="list-style-type: none"> • arbors and pinions • clicks • pallets • screws • taper pins
Fixing method	Fixing method may include: <ul style="list-style-type: none"> • loctite • low melting solder • electronic soldering iron • spirit lamp

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Establish servicing requirements and liaise with customer	1.1. Identify the need for a replacement component 1.2. Verify availability of replacement parts and advise customer of the need to manufacture in-house 1.3. Prepare written and verbal quotations 1.4. Agree with customer on recommended procedures to remedy faults, including servicing requirements 1.5. Prepare watch or clock for handover 1.6. Record and document repair process 1.7. Source material for manufacture of parts
2. Plan and organise the project	2.1. Prepare working drawings of replacement parts 2.2. Plan suitable method of production 2.3. Select materials suitable for manufacture 2.4. Perform marking out of components 2.5. Select appropriate equipment and tools to undertake process
3. Produce components using a watch and clockmaker's lathe	3.1. Set up and mount the material to be turned in appropriate chuck 3.2. Select and prepare the appropriate cutting tool for the turning operation 3.3. Perform turning or drilling operation to produce replacement parts 3.4. Undertake measurements to task tolerances
4. Produce components using milling attachments on a clockmaker's lathe or bench-mounted mill	4.1. Set up and mount the material to be milled in appropriate fixture or chuck 4.2. Select and prepare the appropriate tool or cutter for milling operation 4.3. Perform milling operation to produce replacement parts 4.4. Undertake measurements to task tolerances
5. Produce wheels and pinions	5.1. Where appropriate, select the index head and appropriate index plate to produce the required tooth count 5.2. Set up gear blank in dividing head 5.3. Select appropriate gear cutter and mount in milling spindle ensuring cutter is on centre 5.4. Machine teeth to correct depth
6. Finish manufactured components	6.1. Cross out wheel to match original component

ELEMENT	PERFORMANCE CRITERIA
	6.2.Remove any burrs and finish with appropriate media 6.3.Carry out heat treatment to suit function of replacement part 6.4.Verify function of manufactured component

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- performing lathe operations on a watch and clockmaker's lathe
- performing milling operations using milling attachment on a watch and clockmaker's lathe or a bench mill
- selecting and preparing cutting tools
- planning of project sequence
- preparing working drawings of parts
- interpreting watch and clock drawings, manuals and other documentation that provide information of part design and tolerances
- measuring tolerances

Required knowledge

Required knowledge includes:

- typical materials used in watch and clock making
- types of watch and clockmakers' lathes and attachments
- lathe accessories and tooling
- setting up and safe operation of watch and clockmakers' lathes and attachments
- milling procedures
- occupational health and safety (OHS) regulations and procedures

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to manufacture clock and watch components to industry standards, manufacturer specifications and in accordance with safety regulations and procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • manufacture, finish and fit replacement watch or clock components to original tolerances • select and use appropriate hand tools • use lathes and accessories to turn watch and clock components • perform milling operations using indexing and milling attachments on the lathe or bench-mounted milling machine to dimension and tolerances.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and information on workplace practices and OHS practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Plan workshop layout	1.1.Prepare sketches of workshop layout 1.2.Plan work zones 1.3.Source suppliers of fixtures and furnishings
2. Source and purchase tools and equipment	2.1.Establish a budget 2.2.Determine major plant equipment for after sales service 2.3.Establish an adequate supply of tools for each workbench 2.4.Source suppliers of tools and equipment 2.5.Establish costs and initiate purchase
3. Set up workshop or service centre	3.1.Purchase and set up furnishings and fittings 3.2.Install major plant bench tools and machinery 3.3.Implement ventilation, extraction and climate control systems 3.4.Establish repair administration systems 3.5.Establish spare parts systems and controls 3.6.Implement control and security measures for repair process
4. Prepare quotations and orders	4.1.Calculate profitability 4.2.Establish hourly rate 4.3.Correctly establish service and repair requirements 4.4.Determine availability and cost of spare parts 4.5.Provide customer with estimate 4.6.Prepare spare parts and other orders
5. Monitor workshop operations	5.1.Establish maintenance procedures for premises, major plant, equipment and tools 5.2.Review systems for efficiency and effectiveness 5.3.Implement improvements to operations

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE**Required skills**

Required skills include:

- planning and organising
- selecting and implementing appropriate repair systems
- preparing quotes and estimates
- preparing orders
- controlling stocks of spare parts
- sketching
- accessing information
- preparing procedures
- monitoring and reviewing procedures and systems

Required knowledge

Required knowledge includes:

- horological workshop and service centre layouts, zoning of areas and other considerations
- occupational health and safety (OHS) issues for watch and clock trade
- handling and storage/disposal of solvents and other chemicals
- job control systems and methods of monitoring work flow
- horological tools and equipment/suppliers
- ergonomics, ventilation, dust control, lighting and climate control requirements for horological industry

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Identify and implement engineering practices	1.1.Engineering practices applicable to engineering activities are identified. 1.2.Factors, conditions and contexts integral to effective engineering practice are researched and evaluated. 1.3.The application of management practices and regulatory/legal systems to engineering practice is researched and evaluated. 1.4.Elements of engineering practices are incorporated into engineering activities.
2. Negotiate, document and monitor outcomes and performance measures	2.1.Technical experts and specialists are consulted as required. 2.2.Engineering options are evaluated and ranked. 2.3.Performance measures for processes and outcomes are negotiated with stakeholders and documented.
3. Negotiate, develop and document work instructions	3.1.Work instructions are negotiated and documented with taskforce.
4. Perform hazard and risk analysis	4.1.Hazards and risks associated with project are analysed.
5. Monitor progress, respond appropriately	5.1.Progress is monitored and responded to in cooperation and consultation with stakeholders and taskforce.
6. Conclude engineering activities appropriately	6.1.Engineering activities are concluded in accordance with workplace and legislative requirements.
7. Evaluate career options and develop career development strategy	7.1.Career options are developed based on current engineering activities. 7.2.A portfolio or CV of current engineering activities that is also a framework for future engineering activities is developed.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

REQUIRED SKILLS AND KNOWLEDGE

Required skills

Look for evidence that confirms skills in:

- research and evaluation
- review and maintenance of academic development, work experience, ethical practice, indemnity, negotiation, consultation and human relations with respect to the practice of engineering
- consultation with technical experts and specialists
- evaluation and ranking of engineering options for particular applications
- designing and planning documentation for particular applications
- documenting work instructions
- implementing occupational health and safety and environmental regulations, codes of practice and statutory requirements
- identifying and analysing hazards and risks
- monitoring and consultation with stakeholders and taskforce
- research and evaluation of engineering career options based on current engineering activities

Required knowledge

Look for evidence that confirms knowledge of:

- political, social and environmental context and possible range of particular engineering activities
- the effect of government policy on industrial education and training, immigration for industrial labour/ skills, globalisation, the quality movement, JIT and competitive or lean manufacturing on a range of applications using jobbing, batch, mass or continuous production
- the significance, need for continual review and maintenance of academic development, work experience, ethical practice, indemnity, negotiation, consultation and human relations with respect to the practice of engineering
- the significance and applicability of strategic industrial management, financial management, workteams, supervision and control, industrial relations, OHS&E, enterprise based agreements, chemical registers, noise abatement, industrial law to particular industrial applications and work environments
- the application and affect of elements of engineering practice on particular engineering activities
- methods for evaluation and ranking of engineering options including the use of decision making and problem solving tools (eg. Kepler Trebor method)
- the significance of documented processes and outcomes performance measures in the context of client requirements, industrial, social, political and economic environments
- documented work instructions in the context of the objectives of the engineering activity

REQUIRED SKILLS AND KNOWLEDGE

- negotiating principles
- risk assessment tools such as 'risk matrix' and 'Monte Carlo' risk assessment
- the significance of statutory requirements disaster management strategies
- long term environmental and sustainability issues associated with the engineering activity
- documentation and conclusion procedures
- relevance of current engineering activities to future career options
- the value of a portfolio in contributing to future career options in engineering

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to perform engineering activities within one or more specified engineering disciplines. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with performing engineering activities or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency. The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Factors, conditions and contexts

- Academic development, work experience, ethical practices, indemnity, negotiation, consultation and human relations
- Applicable local, regional, national and international economic, political and social contexts

Management practices

Strategic industrial management, financial management, workteams, supervision and control.

Regulatory/legal systems

Industrial relations, OHS&E, enterprise based agreements, chemical registers, noise abatement, industrial law to particular industrial applications and work environments

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Manage self	1.1. Manage own time and own processes in an engineering environment for planning and design purposes. 1.2. Manage learning opportunities in and outside the workplace. 1.3. Complete tasks / roles in a competent and timely manner.
2. Work effectively with team	2.1. Communicate effectively with others. 2.2. Recognise cultural diversity. 2.3. Use judgement and discretion as appropriate to the situation. 2.4. Work autonomously to procedures and guidelines. Develop and maintain trust and confidence of colleagues and clients/suppliers where appropriate. 2.5. Mentor others in specific areas of engineering focus. Accept appropriate responsibility.
3. Manage information	3.1. Locate and review relevant information on materials, products, processes or services including relevant legislation, codes and national standards. 3.2. Document processes and outcomes. Include OHS&E procedures.
4. Manage work priorities and resources	4.1. Prioritise competing demands to achieve personal, team and an organisation's goals and objectives. 4.2. Prepare, monitor and review work plans, programs and budgets. 4.3. Plan resource use to achieve targets.
5. Facilitate and capitalise on change and innovation	5.1. Work with others to introduce change. 5.2. Manage emerging challenges and opportunities.
6. Establish and maintain business relationships	6.1. Work in collaborative relationships with customers/suppliers. 6.2. Manage the procurement process.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- setting personal goals and plans
- completing allocated within time limits
- seeking feedback from internal and external sources
- providing clear and precise information to team members
- communicating in meetings
- using feedback to develop ways of improving performance
- accessing and using appropriate development opportunities
- team members are mentored in specific areas of engineering relevant to their work, where appropriate.
- obtaining all relevant legislation, statutory requirements and standards
- obtaining all relevant commercial documents
- documenting the processes and outcomes
- processing and filing the masters and file copies of documents
- setting priorities
- using technology appropriately to manage work priorities and commitments
- work plans, programs and/or budgets are prepared in accordance with organisational procedures.
- monitoring, reviewing and modifying work plans, programs and/or budgets
- achieving targets by the effective and efficient use of resources
- introducing changes smoothly and with minimal disruption
- communicating changes to be implemented
- preparing plans for the implementation of authorised changes
- providing regular and complete progress reports to clients/stakeholders/suppliers/regulators
- procuring materials/supplies/services in accordance with organisational procedures

Required knowledge

Look for evidence that confirms knowledge of:

- techniques for ensuring that personal goals and plans reflect an organisation's plans and personal roles, responsibilities and accountabilities
- the way in which a person's performance acts as a role model for others
- ways in which personal goals are achieved and extended
- the importance and benefits of maintaining consistent personal performance
- the value of cultural diversity within the engineering team is recognised and the benefits
- internal and external sources of feedback on products, services and/or performance

REQUIRED SKILLS AND KNOWLEDGE

- team members roles and responsibilities
- ways of gaining and using feedback to improve personal performance
- options for suitable professional development opportunities
- the role of mentor in the engineering team
- the mentoring process
- sources of relevant codes, standards, legislation and regulations
- the need and relevance for commercial information, including insurances and indemnities
- the procedures for documenting processes and outcomes
- the procedures for processing and filing master and file
- techniques for prioritising competing demands
- options for using various types of relevant technology and the ways they can be used efficiently and effectively to manage work priorities and commitments
- the procedures for preparing work plans, programs and budgets
- the authority responsible for authorising work plans, programs and budgets
- the procedures for modifying work plans, programs and/or budgets
- human and physical resources available
- targets to be achieved
- techniques for optimising resource utilisation
- opportunities to introduce change
- the benefits of the proposed change
- the costs and risks associated with the proposed change
- those affected by change
- emerging challenges and opportunities in the area of engineering expertise
- opportunities to implement change and innovation
- reasons for implementing change and innovation
- strategies for implementing change and innovation
- customer needs
- clients/stakeholders/suppliers/regulators and their business relationships
- information required by clients/stakeholders/suppliers/ regulators
- the suppliers of materials/services/components/ equipment, etc.
- procurement procedures
- the authority responsible for authorising the procurement of materials/supplies/services
- commercial issues associated with the procurement process

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Engineering environment	Refers to a real or simulated environment dealing in engineering practices/functions/services.
Tasks/roles	Will be involved in self-directed application of knowledge - have substantial depth of knowledge in some areas and a range of skills for work tasks, roles and functions.
Cultural diversity	Refers to all aspects of diversity within the working environment such as gender, age, physical ability, sexual preference, ethnicity and culture.
Work autonomously	May work autonomously under broad guidance; may supervise others and may guide teams.
Appropriate responsibility	May have responsibility for planning and managing the work of others.
Relevant legislation codes and national standards	Refers to all the legislation that occurs in the work place such as equal employment opportunity legislation, occupational health and safety legislation and industrial relations legislation.
Document	Applies to the time frame of the design development. Agreed processes of documentation will be required and applied.
OHS&E	Occupational Health Safety and Environment recognizes that stakeholders in workplace activity

RANGE STATEMENT

	include the workforce exposed to worksite conditions, materials and processes of the activity and the broader community exposed to environmental effects of the activity. Apply in accordance with organisational policies and statutory and regulatory requirements.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Determine the existing environmental condition	1.1. Research, debate and report on case studies involving examination of environmental values. 1.2. Prepare an inventory of the existing environmental condition. 1.3. Record/report on the findings of the initial assessment.
2. Establish stakeholders' expectations	2.1. Determine expectations regarding each component of the environment. 2.2. Record and report on expectations for project/operation integration.
3. Review existing environmental conditions against stakeholders' expectations	3.1. Determine variations between expectations and the existing environmental conditions. 3.2. Establish the possibilities and options for improvement in the environment.
4. Develop and rank strategies to achieve sustainable development	4.1. Evaluates available options against assessment criteria to identify risks and priorities. 4.2. Develop an environmental report on strategies to implement the preferred options.
5. Implement strategies to achieve sustainable development	5.1. Implement strategies in consultation with appropriate stakeholders. 5.2. Collect and review data on implementation of strategies. 5.3. Evaluate progress and review strategies.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- undertaking debate on environmental values
- reporting on case studies involving examination of environmental values
- producing inventory of existing environmental conditions

REQUIRED SKILLS AND KNOWLEDGE

- documenting the findings of the initial environmental assessment
- identifying stakeholders' environmental expectations
- integrating environmental expectations with the overall outcomes of the operation/project
- communicating expected outcomes to stakeholders
- documenting variations between expected and current environmental status
- implementing strategies for improving the environmental outcomes of the project/operation
- evaluating available options
- implementing selected sustainable development options
- developing environmental management plans
- monitoring the implementation of the environmental management plan
- collecting environmental data
- reviewing and evaluating implementation strategies

Required knowledge

Look for evidence that confirms knowledge of:

- environmental conditions of the workplace/process/ operation/procedure
- the procedures for documenting environmental conditions
- applicable environmental legislation and regulations
- the legislative/regulatory reporting and recording requirements
- the tests and testing procedures required to establish environmental conditions
- stakeholders' views on specific options for environmental improvement
- opportunities for integrating project/operation outcomes with environmental improvement options
- variations between expected and current environmental status
- options for improving the environmental status of the project/operation
- the costs/benefits of the identified options
- the concept of sustainable development
- options for sustainable development
- criteria for assessing the feasibility of available options
- the risks and priorities associated with sustainable development
- strategies to implement sustainable development options
- the procedures for communicating sustainable development options to stakeholders
- strategies to implement environmental development plans
- the data necessary to evaluate the implementation of the environmental management plan
- procedures for collecting and documenting environmental data
- benchmarks against which implementation strategies can be evaluated

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Environmental values

Biophysical values eg. clean air, soil, water, biodiversity, ecosystem sustainability, sustaining the quality of natural and artificial environments, both indoor and outdoor
Socio cultural values

Existing environmental conditions

Identification of environmental relations - mapping all the relations that will be used and affected by a particular activity in both space and time, analysing the resulting relational map for areas of intense impact, especially as a result of cumulative impacts; identification of physical, socio-cultural and economic conditions for life and for the existing or desired quality of life, identification of the socio-cultural values placed on the current environmental conditions; identification of both the negative and positive environmental impacts, the potential de-sustaining and sustaining aspects of the activity; identification of where engineering interventions and follow-up are possible

Environmental report

A description of the state of the environment, an assessment of the nature and consequence of impacts, identifiable trends, available and recommended actions, identification of responsibilities and potential change agents, cost of action; a critical review of the parameters of the environmental relations considered, the criteria by which they were evaluated, the process of

MEM22012A Coordinate resources for an engineering project or operation

Modification History

Release 1 - New unit. Replaces MEM22003A, but not equivalent.

Unit Descriptor

This unit of competency covers the coordination of resources in accordance with operations or project plans and budgets formulated to meet business goals and strategic objectives.

Application of the Unit

This unit applies to engineering projects or operations that have a significant engineering component. It is suitable for people with responsibility for resources and those pursuing technical qualifications and careers at engineering technician level.

Prior or concurrently developed experience in mathematics, computer packages and file handling, engineering plant, facilities and services, materials, methods and processes is required.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Contribute to operations or project planning and budgeting	1.1	Participate in policy and procedures development
		1.2	Review sustainability implications of resources, sourcing, processing, process waste, transport, distribution, life cycle and disposal
		1.3	Participate in planning for operations or project resourcing in the context of operations, project, strategic and business plans
		1.4	Participate in development of budgets
		1.5	Participate in development of performance indicators or parameters, monitoring and continuous improvement processes
		1.6	Participate in the development of resources information distribution and control systems, including the use of software systems
2	Evaluate supply chain relations	2.1	Identify supply value chain members and contribution to project or operation
		2.2	Assess supply agreements, quality and delivery parameters against performance indicators
		2.3	Employ value analysis of product or customer service costs
		2.4	Assess tender and contract documents for risk
		2.5	Assess supply chain communications for feedback on quality, supply chain efficiency and continuous

- improvement processes
- 3 Coordinate physical resources
 - 3.1 Assess physical resource requirements and develop a resources distribution schedule consistent with the budget
 - 3.2 Coordinate efficient utilisation of physical resources
 - 3.3 Ensure compliance with work health and safety (WHS), regulatory and risk management requirements with particular emphasis on handling and use of resources
 - 4 Contribute to project or operation human resources management
 - 4.1 Identify labour and skills requirements based on assessment of timetable and project or operational requirements
 - 4.2 Program and communicate labour and skills to satisfy project or operational technical and budget requirements
 - 4.3 Organise labour and skill schedules to facilitate training
 - 4.4 Contribute to skills development and training arrangements
 - 5 Contribute to budget development and control
 - 5.1 Participate in developing budgets in the context of business and strategic operations or project plans
 - 5.2 Control delegated expenditure and cash flow
 - 5.3 Record resources utilisation and costs, including those for maintenance of assets
 - 6 Supervise and review resources delivery
 - 6.1 Apply systems thinking, constraints and contingency management, and continuous improvement techniques
 - 6.2 Monitor and review supply chain and coordinate continuous improvements
 - 6.3 Monitor physical and human resources and performance indicators and coordinate continuous improvement processes
 - 6.4 Monitor budget and coordinate response to threats

- 6.5 Monitor sustainability and coordinate responses in accordance with sustainability policy and procedures
 - 6.6 Monitor information and resources control system and implement continuous improvement
 - 6.7 Employ software packages to achieve information handling, data processing, planning and control objectives
-
- 7 Report and document resources coordination
 - 7.1 Report in accordance with procedures
 - 7.2 Maintain documentation on planning, supply chain analysis, resources requirements analysis, budgets, delivery, continuous improvement and training, WHS and regulatory requirements, and risk assessment

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- participating and communicating with others
- negotiating and seeking consensus in support of strategic objectives
- evaluating:
 - supply chain, quality, delivery and capability
 - tender and contracting processes and documents
- coordinating physical and human resources
- coordinating and controlling resource budgets
- monitoring, reviewing and improving resources delivery
- planning for operations or project resourcing in the context of operations, project, strategic and business plans
- participating, cooperating and negotiating required for dealing with customers, contractors, designers and production management
- determining take off quantities for 'bill of materials' from drawings, specifications and contracts
- reporting and documenting objectives, key performance indicators, timetables and progress

Required knowledge

Required knowledge includes:

- typical sustainability implications for engineering projects or operations
- systems thinking, constraints and contingency management, and continuous improvement techniques
- procedures for preparing and monitoring project plans, business plans and budgets
- cost planning, cost-benefit analysis, life cycle costing, valuation and cost estimation procedures
- procedures for assessing implications of design on project implementation costs or manufacturability of product and maintainability of plant and process
- resources information distribution and control systems, including the use of enterprise resource planning (ERP) and materials resource planning (MRP) software
- planning and cost control software
- supply and value chain evaluation techniques, including contract, quality and delivery parameters
- engineering-related operating procedures associated with the use of resources

- financial impact of a variety of maintenance strategies on overall costs on typical tenders, contracts and law of contract provisions, relevant to engineering projects or operations
- ability to calculate quantities from drawings, specifications and contracts
- WHS requirements, including WHS Acts and regulations
- resources expenditure and cash flow control procedures
- procedures and requirements of financial records, including records of resources and costs for maintenance of assets

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to coordinate resources for an engineering project or operation within project plans and budgets. This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • participate, communicate, cooperate and negotiate strategic objectives, policy and procedures development • evaluate supply chain, quality, delivery, capability, tender and contracting processes and documents • coordinate and control physical and human resources and resource budgets • monitor, review and improve resources delivery • report and document resource planning and use.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. • The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks

	<p>and include questioning on underpinning knowledge to ensure correct interpretation and application.</p> <ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Participate	Participation includes the requirement to communicate, cooperate, negotiate and work with others in accordance with the operations or project plans
Software packages	<p>Software packages may include:</p> <ul style="list-style-type: none"> • spreadsheets • databases • word processor • presentation • project management and cost control • system control and data acquisition (SCADA), MRPII, MRPIII and ERP
Value analysis	Value analysis is the determination of value-added, as defined by the ultimate customer at each step in the supply chain or production process or service provision. The value is often specified in contract documentation in terms of quality, cost, quantity and delivery schedule
Systems thinking	Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and

	<p>techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Continuous improvement implementation	<p>Continuous improvement implementation may relate to:</p> <ul style="list-style-type: none"> • plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
Manage constraints and contingencies	<p>Contingencies arising during operations or improvement projects are responded to in the context of constraints. Contingencies may threaten operations or improvement projects and planning for contingencies may be essential to maintain resources, skilled labour and schedules. Each contingency will have constraints on possible solutions. These may be:</p> <ul style="list-style-type: none"> • financial, organisational, procedural or cultural constraints • physical constraints, such as limits to resources, limits to site access or logistical limitations
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements

	<ul style="list-style-type: none">• conforming to all industry covenants, protocols and best practice guides• minimising ecological and environmental footprint of process, plant and product• maximising economic benefit of process plant and product to the organisation and the community• minimising the negative WHS impact on employees, community and customer

MEM22013A Coordinate engineering projects

Modification History

Release 1 - New unit. Replaces MEM22004A, but not equivalent.

Unit Descriptor

This unit of competency covers the coordination of engineering projects within project plans and budgets. It includes monitoring and maintaining the project implementation plan, performance analysis and use of project management software.

Application of the Unit

This unit applies to people with significant coordination and facilitation responsibilities for engineering or related projects. The projects will usually have fixed term or purpose and involve specific engineering-related tasks, such as installation and commissioning of plant, design of equipment or major overhauls.

The coordination role covered by the unit includes monitoring of engineering and other technical performance parameters against the project plan as well as monitoring of other project parameters that impact on engineering and technical compliance of the project. These include finance, accounting, budgeting and control, resourcing, tenders, contracts, work health and safety (WHS), risk management, human resources, and legal and regulatory requirements.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency. Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

1	Review and confirm parameters of delegated project	1.1	Review designs, drawings, standards and established implementation plan and schedule to establish scope of the engineering project
		1.2	Review budget and control measures for delegated project
		1.3	Review project management structure, functional team relationships, communications and reporting lines
		1.4	Review materials, logistics and services procurement requirements
		1.5	Review the need for appropriate technical and professional assistance
		1.6	Review physical resources requirements
		1.7	Review human resources and skills development requirements
		1.8	Review compliance requirements for project, including WHS requirements, codes of practice, regulations, standards, legal and other regulatory requirements, and enterprise procedures

- 2 Coordinate implementation of delegated project
 - 2.1 Assign and obtain team agreement to plans, communication arrangements, responsibilities, schedules and requirements
 - 2.2 Establish liaison arrangements with other functional groups
 - 2.3 Ensure efficient and documented arrangements for requests for further information (RFIs) from designers and other experts
 - 2.4 Confirm internal and external reporting requirements, including content, schedule and sign-off arrangements
 - 2.5 Confirm suppliers, contractors and delivery schedules, and any installation requirements
 - 2.6 Coordinate actions to overcome constraints and contingencies, including coordination with stakeholders and adjustments, if necessary, to plans and schedules
 - 2.7 Coordinate and monitor specialist and technical support services to meet schedules, budgets and performance requirements
 - 2.8 Maintain and monitor records of project tasks for accountability against objectives, schedule and budget
 - 2.9 Apply principles of continuous improvement to implementation
 - 2.10 Implement project management, resources control and budgeting software, when required
- 3 Report on outcomes
 - 3.1 Record progress in accordance with procedures
 - 3.2 Supervise the completion of project, including sign-off and completion of required documentation of the project

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- coordinating technically complex engineering-related projects
- project management skills, including using resources control and budgeting software, as required
- reviewing, confirming and establishing parameters for project objectives, project plan, budget and scheduling related to tasks
- communicating, negotiating and reviewing with stakeholders throughout project duration
- coordinating and monitoring task schedules and resources; addressing contingencies and constraints, continuous improvement, problem solving and decision making; and adjusting short-term planning and rescheduling, as necessary
- implementing systems thinking and concurrent engineering, as appropriate
- project planning and scheduling, including:
 - working within or establishing a project management structure
 - establishing functional team relationships, communications and reporting lines
 - ensuring compliance with business plans, financial objectives, budgets and customer brief
 - incorporating WHS and other regulatory requirements
- establishing accountabilities and responsibilities (including recording and reporting) for:
 - scheduling and implementation of project tasks
 - physical and financial resources and budget
 - the use of professional services and contractors
 - maintaining records of trades and industry contacts and sources of expert advice
 - records of procedures and regulatory compliance
 - personal and team skills development
 - maintaining task schedules, Gantt charts and other planning tools and resources
 - procedures for addressing contingencies and constraints, continuous improvement, problem solving and decision making, and adjusting short-term planning and rescheduling as necessary
 - organisational procedures for compliance with WHS, codes of practice, and other legislative requirements, environmental and social obligations, and ethical practice
 - risk management procedures

Required knowledge

Required knowledge includes:

- engineering and technology knowledge appropriate to the project
- context of project, including:
 - customer-supplier relationships
 - regulatory requirements and environment
 - materials resourcing and labour and skills supply arrangements
 - market and competitive environment
- human resources and skills development procedures and options for skill needs typical of engineering projects
- typical budget and control measures for engineering-related projects, including:
 - audit
 - tenders
 - contracts
 - schedules
 - budget categories and items:
 - personnel
 - materials
 - equipment procurement and maintenance
 - contractors
 - logistics
 - security
- requirements for and functions of technical documentation, graphics and specifications, meeting procedures, records and minute taking
- WHS Acts and regulations relevant to engineering projects
- risk management procedures, isolation and notification procedures in the event of irregularities or accident
- systems thinking, contingency and constraints management
- conflict resolution, problem solving and decision making

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to coordinate an engineering project This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • review, confirm and establish project objectives, plans and schedules • identify technical and engineering requirements of project from drawings, customer briefs, contracts and other appropriate sources • identify and manage stakeholders, including customers, suppliers, contractors and regulatory agencies • manage for contingencies and non-conformances • cooperate, communicate and negotiate effectively with stakeholders.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application.

	<ul style="list-style-type: none"> • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Personal responsibilities	<p>Personal responsibilities within the project may be defined by:</p> <ul style="list-style-type: none"> • role specification and delegations • workplace agreement or Award • negotiation with clients and/or supervisors • contracts • legal or regulatory obligations • professional and ethical considerations • agreed operational or project requirements
Systems thinking	<p>Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
WHS, regulatory	WHS, regulatory requirements and enterprise procedures may

requirements and enterprise procedures	<p>include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • environmental protection and planning law • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Stakeholders	<p>Relevant stakeholders may include:</p> <ul style="list-style-type: none"> • teams • contractors • support professionals and teams • technicians • functional groups • customers • suppliers
Records of project	<p>Records of project may include:</p> <ul style="list-style-type: none"> • tenders and contracts • schedules • personnel • resource allocations and financial management procedures • standard operating procedures, including maintenance procedures • WHS committee minutes and action • risk management and mitigation • documentation and records of current safe work methods statements (SWMS), material safety data sheets (MSDS), work permits, standards and codes of practice • audits • meetings and communications • graphics and specifications
Continuous improvement implementation	<p>Continuous improvement implementation may relate to:</p> <ul style="list-style-type: none"> • plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance. It may include techniques, such as: <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping

	<ul style="list-style-type: none"> • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers • professional and technical support for specific technologies and equipment • professional services for: <ul style="list-style-type: none"> • finance, accounts and tax • insurance and legal, • training and human resources
Constraints and contingencies	<p>Constraints and contingencies may be:</p> <ul style="list-style-type: none"> • financial, organisational, procedural or culture constraints • physical constraints, such as limits to resources, limits to site access or logistical limitations

MEM22014A Coordinate engineering-related manufacturing operations

Modification History

Release 1 - New unit. Replaces MEM22005A, but not equivalent.

Unit Descriptor

This unit of competency covers the skills and knowledge required to coordinate, monitor and maintain engineering-related manufacturing operations, including the coordination of purchasing, scheduling of materials and resources, achievement of budget with control of processes, physical resources, maintenance of operations and assets, performance analysis and process improvement, work health and safety (WHS) and risk management.

Application of the Unit

This unit applies to people with coordination and facilitation responsibilities for significant manufacturing operations.

Where the planning, scheduling and purchasing is done in an engineering or manufacturing organisation following lean principles, it is recommended that appropriate competitive systems and practices units of competency also be selected.

The unit applies where the coordination role involves application of engineering skills and knowledge to ensure safe, effective and efficient manufacturing and can include specific engineering-related tasks, such as installation and commissioning of plant, design of equipment and major overhauls.

The coordination role of the unit includes monitoring engineering and other technical performance parameters against the project plan as well as monitoring other project parameters that impact on engineering and technical compliance of the project. These include finance, accounting, budgeting and control, resourcing, tenders, contracts, WHS, risk management, human resources, and legal and regulatory requirements.

For coordination skills for time-defined engineering projects see unit MEM22013A Coordinate engineering projects.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM14091A	Integrate manufacturing fundamentals into an engineering task

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency. Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Develop the production plan	1.1	Coordinate development of, or obtain, demand forecast
		1.2	Participate in preparation of production plan in consultation with relevant stakeholders to meet quality, demand and delivery timelines within capacity and budget constraints
		1.3	Coordinate preparation of purchasing schedules
		1.4	Coordinate preparation of production schedules, including allowances for scheduled maintenance and any required shutdown periods
		1.5	Coordinate development of risk management and contingency procedures
		1.6	Review production plan with relevant stakeholders and adjust, as necessary
		1.7	Coordinate development of key performance indicators (KPIs) and monitoring procedures with relevant stakeholders
		1.8	Incorporate professional and technical assistance, as required

- 2 Coordinate the implementation of the production plan
 - 2.1 Allocate responsibilities for purchasing and detailed scheduling, including communication of priorities and KPIs
 - 2.2 Coordinate materials and product flow and transfer operations to meet plan requirements, including buffer and emergency stocks, warehousing, stores and logistics
 - 2.3 Monitor quality and process control procedures
 - 2.4 Coordinate and monitor physical, human and financial resources, and budget to achieve production plan
 - 2.5 Review and monitor information and reporting procedures to stakeholders
 - 2.6 Address systems constraints and contingencies and adjust short-term planning and reschedule, as necessary

- 3 Monitor operational performance
 - 3.1 Review actual indicators against KPIs
 - 3.2 Review manufacturing operations against production plan and other KPIs
 - 3.3 Participate in continuous improvement procedures, including lean operation principles and procedures, where implemented
 - 3.4 Monitor preventative and breakdown maintenance and review impact on operational performance
 - 3.5 Monitor implementation of risk management procedures during non-conformances and adjust, as required, in accordance with organisational procedures
 - 3.6 Report progress against production plan in accordance with procedures
 - 3.7 Provide documentation, data entry and analysis, as required

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying equipment and process capacity from information supplied by designers and suppliers
- developing production schedule demand forecast from information supplied by customers, distributors, and sales and marketing departments
- preparing master production, schedule or project plan
- detailed operations planning, scheduling, production control and contingency measures that take into account:
 - facilities
 - services
 - plant and tooling
 - enterprise resource planning (ERP) software
 - process layout
 - use of automation
 - product manufacturability
 - asset maintainability
- preparing purchasing schedules and coordinating material supplies
- complying with WHS and regulations, codes of practice, standards and risk assessment
- coordinating manufacturing operation to be consistent with business plans and legal and regulatory requirements, and coordinating systems maintenance of manufacturing operation following improvement procedures
- use of software, such as ERP, system control data acquisition (SCADA) and spreadsheets, where installed
- coordinating manufacturing operations to schedule and priority
- maintaining quality and process control procedures
- coordinating problem solving and decision making, short-term planning and rescheduling to meet constraints and contingencies, as necessary
- maintaining records, reporting and documenting in accordance with procedures

Required knowledge

Required knowledge includes:

- manufacturing management systems
- forecasting, scheduling and production control procedures

- production systems, including assembly and process layouts, material and product flows, automation and control systems
- WHS requirements, codes of practice, regulations, standards, regulatory requirements, risk management, current safe work methods statements (SWMS), material safety data sheets (MSDS) and work permits
- budgeting, costing and control measures
- quality and process control measures
- asset maintenance techniques and management options
- continuous improvement procedures
- problem solving and decision making, systems thinking, contingency and constraints management as applied to manufacturing
- requirements for and functions of technical documentation, graphics and specifications
- sustainability implications of manufacturing operations, products and processes, including social, environmental, resources and economic implications
- reporting and documenting procedures used in manufacturing, including role of standard operating procedures, engineering drawings and process control charts

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to coordinate, monitor and maintain an engineering-related manufacturing operation, including purchasing, scheduling of materials and resources and priorities. This includes working individually and as part of a team and recognising and complying with normal organisation control procedures.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • prepare production or project plan in consultation with relevant stakeholders to meet WHS, quality, demand and delivery requirements within capacity and budget constraints • apply procedures to ensure compliance of manufacturing operations with WHS, environmental and other regulatory requirements • review and monitor facilities and services, including: <ul style="list-style-type: none"> • plant, tooling and software • process layout • use of automation and automation safety • product manufacturability and asset maintainability • compliance requirements of WHS and regulations, codes of practice, standards, risk assessment and registration requirements for manufacturing plant.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package.

	<ul style="list-style-type: none"> • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Relevant stakeholders	<p>Relevant stakeholders may include:</p> <ul style="list-style-type: none"> • team • organisation functional groups • support professionals and licensed technicians • customers and suppliers
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements

Records	<p>Records may include:</p> <ul style="list-style-type: none"> • forecasts, schedules and budgets • records of operations, production quantities, quality and supply performance • process, resources and budget control measures • communications, graphics and specifications • tenders, contracts and schedules • personnel, resource allocations and financial management procedures • standard operating procedures, including maintenance procedures • records of procedures and legislative compliance
Appropriate licensed technical and professional assistance	<p>Appropriate licensed technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring or devices with high current or voltages above extra low voltage • professional support for engineering research, calculations and technologies <ul style="list-style-type: none"> • professional services in non-engineering related areas, such as: <ul style="list-style-type: none"> • finance, accounts and tax • insurance and legal • training and human resources
Continuous improvement procedures	<p>Continuous improvement procedures may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
Constraints and	Contingencies arising during operations or improvement projects will

contingencies	<p>have constraints on possible solutions. These may be:</p> <ul style="list-style-type: none"> • financial • organisation procedural or culture • physical constraints, such as limits to resources, limits to site access or logistical limitations
Systems thinking	<p>Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
Lean manufacturing	<p>Lean manufacturing uses cost, capacity and responsiveness, quality, reliability and waste minimisation as drivers of the process and measures for process improvement. Lean manufacturing is the response of many organisations to local, regional, national and global market competitiveness</p>
Software options	<p>Software may be employed for forecasting, scheduling performance analysis/modelling and may include:</p> <ul style="list-style-type: none"> • ERP • SCADA • spreadsheets
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer

MEM22015A Source and estimate engineering materials requirements

Modification History

Release 1 - New unit. Replaces MEM22006A, but not equivalent.

Unit Descriptor

This unit of competency covers the skills and knowledge required to locate and approve a materials source and estimate materials requirements against a specification or bill of materials for engineering-related operations. This includes consideration of quantities, quality and capacity of suppliers to supply in accordance with a supply plan.

Application of the Unit

The unit applies to sourcing and estimating within an engineering operation or along a value chain and can be applied to individual or team-based work. It is suitable for people working in engineering or related industries in planning, purchasing or quantity surveying functions.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Participate in planning and budgeting for materials resourcing in engineering operation or project	1.1	Participate in planning for materials resourcing in the context of operations, project, strategic and business plans and budgets
		1.2	Contribute to management processes, such as costing and value engineering, feasibility studies, cost-benefit and break even analysis, consideration of contract law pertaining to supply arrangements and life cycle costing
		1.3	Evaluate sustainability implications of materials and components being sourced
		1.4	Participate in the selection or development of materials information systems
		1.5	Review suitability of software packages for materials estimation and sourcing and related purposes
2	Estimate quantities	2.1	Consult with operations and project teams regarding their materials needs
		2.2	Estimate quantities against operations or project specifications, drawings and bill of materials documents
3	Contribute to the development of supply chain relations	3.1	Contribute to supply chain requirements, evaluation and management
		3.2	Assist in developing tender and contract documents

- | | | | |
|---|---|-----|--|
| 4 | Locate source and confirm material suppliers | 4.1 | Locate source and evaluate materials suppliers against specifications |
| | | 4.2 | Evaluate supply agreements, quality and delivery parameters against operation or project requirements |
| | | 4.3 | Coordinate approval of samples, testing and certification in accordance with specification requirements |
| | | 4.4 | Confirm or recommend suppliers according to enterprise procedures |
| 5 | Monitor and review materials and supply chain | 5.1 | Participate in development of performance indicators or parameters for materials supply chain |
| | | 5.2 | Consult, negotiate and cooperate with suppliers in relation to supply chain efficiency improvements |
| | | 5.3 | Provide feedback on quality, efficiency and continuous improvement processes to supply chain members and internal stakeholders |
| | | 5.4 | Identify and monitor work health and safety (WHS) and regulatory requirements related to materials supply, transport, handling, storage and processing |
| | | 5.5 | Monitor sustainability of sourced materials and coordinate responses in accordance with sustainability policy and procedures |
| | | 5.6 | Apply systems thinking, constraints and contingency management, as necessary, and continuous improvement techniques |
| 6 | Report and document outcomes | 6.1 | Provide reports on material sourcing in accordance with procedures |
| | | 6.2 | Maintain documentation on estimations, sources of supply, supply chain analysis performance, continuous improvement and training, WHS and regulatory requirements, and risk assessment |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- planning for materials resourcing
- estimating quantities, sourcing and evaluating materials suppliers against operations or project, specifications, drawings and bill of materials
- cooperating, communicating and negotiating effectively within team and functional groups, customers and suppliers
- monitoring and evaluating purchasing budget, expenditure and cash flow, sourcing of materials, sustainability implications, supply agreements and suppliers for quality, capacity and flexibility, conformance to regulatory requirements and test procedures
- using materials sourcing and planning software packages
- contributing to organisational management processes and materials supply chain management
- developing or using materials supply tender and contract documents
- interpreting materials requirement and purchasing schedule, purchasing budgets, and performance indices for materials supply chain
- coordinating responses to budget and delivery supply threats related to materials purchases
- participating in setting and implementing supplier payment policies
- implementing systems thinking, concurrent engineering, continuous improvement, contingency and constraint management, problem solving and decision making
- determining implications for materials sourcing of WHS, risk management, codes of practice, and sustainability policy and requirements
- reporting and documenting results of evaluations, tender analysis, and so on

Required knowledge

Required knowledge includes:

- planning procedures for materials resourcing in the context of operations, project, strategic and business plans and budgets
- use of systems and software packages to assess materials requirements information, data processing, bill of materials, estimating, supplier database and purchasing budget control
- systems for cost estimation and planning, value engineering, feasibility studies, cost-benefit analysis, life cycle costing and valuation
- supply chain management and value analysis, performance indices or parameters, and monitoring processes

- tender and contract documents, supply agreements, quality and delivery parameters, and terms of payment
- supply chain communications, feedback on quality, supply chain efficiency and continuous improvement processes
- sustainability policy and procedures
- WHS, regulatory and risk management requirements with particular emphasis on handling and use of resources
- WHS and regulatory compliance requirements, material safety data sheets (MSDS), test results, and risk management related to handling and storage
- use of systems thinking, constraints and contingency management, problem solving and decision making, and continuous improvement techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to source and estimate materials for an engineering operation, including interacting with the supply chain. It includes planning and estimating supplies and integrating purchasing into operations. This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • plan for materials resourcing • estimate quantities, source and evaluate materials suppliers • develop tender and contract documents, materials requirement and purchasing schedule, purchasing budgets, and performance indices for materials supply chain • participate, communicate, cooperate, and negotiate with stakeholders on policy and procedures development and implementation • monitor supply of materials against contract requirements and key performance indicators (KPIs) • contribute to organisational management processes, and materials supply chain management.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, or a combination of both on and off the job. The candidate should have access to a workplace where the engineering-related production or project

	<p>processes and volume of materials used enable the materials sourcing skills covered by this unit to be realistically assessed. Where part of assessment occurs off the job a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team.</p> <ul style="list-style-type: none"> • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	<p>Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.</p>

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Sustainability implications	<p>Sustainability implications for sourcing and estimating materials in engineering or engineering-related operations may include taking account of:</p> <ul style="list-style-type: none"> • resource consumption • energy consumption and conservation • processing needs • minimisation and processing of waste • transport • distribution • life cycle • reuse, recycle and disposal
Materials	<p>Materials covered by this unit are those required for the ongoing production or performance of an engineering-related project or operation and must meet an engineering specification and for which the delivery must be coordinated with a production or project schedule. The materials will typically be subject to formal supplier agreements or contracts and delivery is to specified cost, times, quality and quantities</p>
Supplier performance	<p>Supplier performance may include:</p> <ul style="list-style-type: none"> • cost • delivery reliability • conformance to quality and quantity specifications • conformance to contract and regulatory requirements • participation in efficiency improvement processes • flexibility
Software packages	<p>Software packages may include:</p> <ul style="list-style-type: none"> • spreadsheets • databases • word processor • presentation • project management and cost control • system control and data acquisition (SCADA), MRPII and enterprise resource planning (ERP)
Systems thinking	<p>Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems</p>

	should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain
Constraints and contingencies	Contingencies and constraints may include: <ul style="list-style-type: none"> • financial • sudden changes to schedules or delivery by a supplier • organisational, procedural or cultural • physical constraints, such as limits to resources, limits to site access or logistical limitations
Continuous improvement implementation	Improvement processes may include techniques, such as: <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
WHS, regulatory requirements and enterprise procedures	WHS, regulatory requirements and enterprise procedures may include: <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Standards and Codes	Standards and codes refer to all relevant Australian and international standards and applicable codes
MSDS	Organisations using or storing hazardous substances or dangerous goods are required to maintain a MSDS and dangerous goods register. Manufacturers or importers of hazardous substances are obliged to provide an MSDS whenever the substances are first supplied to a customer

MEM22017A Coordinate continuous improvement and technical development

Modification History

Release 1 - New unit. Replaces MEM22008A, but not equivalent.

Unit Descriptor

This unit of competency covers the skills and knowledge required to coordinate continuous improvement and ongoing technical development activities for engineering-related operations or projects. It includes feasibility studies, proposals for the introduction of technology or process change and development of implementation strategy, costing and budgets relating to proposals.

Application of the Unit

This unit applies to people with delegated coordination and facilitation responsibilities for implementing engineering-related continuous improvement change and technical development within organisations.

It does not cover design or implementation of major change, such as re-engineering or design and commissioning of new major plant. It is suitable for people working in engineering or related environments in design, maintenance or in operational functions.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Evaluate project or operations for improvement and technical development opportunities	1.1	Select project or operation for review in conjunction with stakeholders
		1.2	Determine current performance of operations or projects against objectives and key performance indicators (KPIs)
		1.3	Establish and monitor processes to identify shortfalls in performance and root causes
		1.4	Establish and monitor processes to identify possible opportunities for performance and technical improvements
		1.5	Evaluate hardware and software technology requirements for performance improvement opportunities
		1.6	Evaluate personnel skill requirements and training needs for performance improvement opportunities
		1.7	Confirm current or future work health and safety (WHS) requirements, codes of practice, regulations, standards and regulatory requirements related to possible opportunities for performance improvement
2	Develop recommendations for performance improvement and technical	2.1	Coordinate the specification of options for performance improvement, including required technology changes, skills development needs, timelines, budget and extent of disruption to current operations
		2.2	Coordinate feasibility analyses on options and develop

- | | |
|-------------|---|
| development | firm proposals |
| | 2.3 Prepare report and recommendations, including objectives, implementation schedule, budget and any required regulatory compliance measures |
| | 2.4 Communicate and negotiate with stakeholders to confirm recommendations for change and technological developments |
| 3 | Coordinate implementation of approved changes |
| | 3.1 Develop implementation objectives, plan, schedule and budgets for approved changes |
| | 3.2 Monitor implementation of objectives by priority, strategy and schedule |
| | 3.3 Coordinate change management, process redesign and introduction of technology |
| | 3.4 Manage physical and financial resources and budget within delegation |
| | 3.5 Monitor change and technological development for compliance with organisational policies and procedures |
| | 3.6 Assist with risk management procedures |
| 4 | Report outcomes |
| | 4.1 Record progress and results in accordance with procedures |
| | 4.2 Provide documentation, data entry and analysis, as required |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying current objectives and performance measures
- identifying change and development opportunities
- evaluating technologies, plant and other assets, hardware and software used by current operations and projects
- identifying skills, knowledge and techniques for operations or projects
- completing feasibility analyses on options and developing of proposals
- maintaining relevant records of plans, priorities, schedules and progress, legislative compliance, personal and team skills development, and sources of technical information and resources
- setting and coordinating priorities, strategy and schedule for changes, including introduction of new technology and continuous improvement operational changes
- problem solving and decision making, systems thinking, constraints and contingency management, short-term planning adjustments, and rescheduling physical and financial resources and budget within delegation
- communicating and negotiating with stakeholders, team members, support function groups, expert technical and professional assistance, customers and suppliers
- monitoring change and technological development for compliance with regulatory requirements
- reporting and documenting progress and results, data and analysis in accordance with procedures

Required knowledge

Required knowledge includes:

- project management techniques
- modern production management techniques
- context of operations, such as competitive pressures or markets, customer-supplier relationships, regulatory and industrial environment, environmental and sustainability, and resourcing and labour issues
- operations or project management structure, functional team relationships, responsibilities and delegations across the organisation, available technical and professional support services, communications and reporting lines
- procedures for audit of technologies, skills, knowledge and techniques, plant and other assets, including hardware and software used by current operations and projects

- feasibility analysis or ‘trade-off’ methods to assist selection from among options
- accountability and record keeping requirements in accordance with organisational procedures
- tendering and contract requirements and processes and their effect on continuous improvement, including agreement on design and specification, negotiations and optimisations, provisions for variations, delays and penalties
- change and technological development implications for WHS requirements, codes of practice, regulations, standards and regulatory requirements related to proposed changes and technologies
- sustainability issues related to continuous improvement of engineering-related projects and operations
- typical software for program management and budget control, use and validation options
- implementation plan, strategic and prioritised objectives and budgets
- procedures for reporting and recording of progress and records of legislative compliance in accordance with procedures for accountability against objectives, schedule and budget
- requirements for and functions of technical documentation, graphics and specifications and records of meetings, communications and agreements with stakeholders

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to review an existing engineering-related operation or project, including current context and performance objectives, and to identify and implement continuous improvements and technical developments. This includes working individually and in a team environment and recognising and complying with normal control procedures on engineering projects.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • evaluate technologies, assets, workforce and contractor skills and knowledge, personnel development strategies, hardware and software technology requirements, for technology and capability gaps and opportunities for improvement • review organisation structure, current operations and context, development opportunities, budgets and constraints, software options for opportunities for improvement • complete feasibility analyses on options and develop proposals • maintain appropriate documentation and records • demonstrate systems thinking, constraints and contingency management, short-term planning adjustments and rescheduling • manage physical and financial resources and budget within delegation • communicate and negotiate with stakeholders • report and document progress and results, data and analysis in accordance with procedures.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with

	disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Stakeholders	<p>Stakeholders may include:</p> <ul style="list-style-type: none"> • enterprise or project owners and managers • team members • support function groups • expert technical and professional assistance • customers and suppliers • colleagues identified in reporting arrangements for the engineering project or operation
Systems thinking	Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or

	<p>projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
Constraints and contingencies	<p>Constraints and contingencies may include:</p> <ul style="list-style-type: none"> • financial • organisational, procedural or cultural • physical constraints, such as limits to resources, limits to site access or logistical limitations
Organisational policies and procedures	<p>Organisational policies and procedures may include formal policy documents, operational procedures, mission statements, training manuals, orders, production schedules, safety instructions and notices, and may reference:</p> <ul style="list-style-type: none"> • enterprise agreements and awards • WHS requirements • codes of practice and other legislative requirements • environmental and social obligations • ethical practice
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Standards and codes	<p>Standards and codes refer to all relevant Australian and international standards and codes applicable to the engineering project or operation</p>
Continuous improvement implementation	<p>Continuous improvement implementation may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard

	<ul style="list-style-type: none"> • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
Lean principles	<p>Lean manufacturing uses cost, capacity and responsiveness, quality, reliability and waste minimisation as drivers of the process and measures for process improvement. Lean manufacturing is the response of many organisations to local, regional, national and global market competitiveness</p>

MEM22018A Coordinate sales and promotion of engineering-related products or services

Modification History

Release 1 - New unit. Replaces MEM22009A, but not equivalent.

Unit Descriptor

This unit of competency covers the skills and knowledge required to coordinate sales and promotion of engineering-related products or services requiring engineering knowledge. The unit covers ensuring appropriate technical advice is provided to clients, contribution and participation in strategic planning and sales budget setting, control of sales costs against budgets, and responsibility for meeting sales performance indices. It includes a requirement to provide feedback on customer satisfaction and seek out opportunities for improvements.

Application of the Unit

This unit applies to people with coordination responsibilities for sales and promotion of products or services that require engineering knowledge. It is suitable for people working in marketing and sales where detailed engineering-related advice must be provided or where technically advanced products or services are sold.

Prior or concurrently developed competence in personal and electronic communication, self-directed and group activities, planning and scheduling, process improvement, performance analysis, and an understanding of technology, skills and techniques required by operations and projects is required.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency. Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

- | | | | |
|---|---|-----|--|
| 1 | Review organisational operations, markets and customer base | 1.1 | Define sales, service and marketing strategic objectives for engineering-related products or services |
| | | 1.2 | Establish nature and context of products or services, including market potential, technical advantage, customer-supplier relationships and relevant regulatory requirements |
| | | 1.3 | Review functional team relationships and organisational fit, available technical and professional support services, communications and reporting lines |
| | | 1.4 | Review sustainability and life cycle implications of products and services |
| | | 1.5 | Review legal obligations of organisation and team related to consumer protection, trade practices, environmental and commercial legislation related to product or service delivery |
| | | 1.6 | Identify relevant organisation accounts and budgets and establish procedures for compliance |
| | | 1.7 | Identify available software for marketing and sales operations |

- | | | | |
|---|---|-----|--|
| 2 | Coordinate sales, service and promotions activities | 2.1 | Establish implementation plan, schedule and budgets to achieve promotional and sales objectives |
| | | 2.2 | Establish procedures to record progress against objectives, schedule and budget |
| | | 2.3 | Participate in and supervise engineering-related sales, service and promotions with stakeholders, including customers |
| | | 2.4 | Establish processes to ensure self and team maintain currency of technical knowledge of organisation's products and services |
| | | 2.5 | Establish continuous improvement of sales and promotion activities |
| | | | |
| 3 | Monitor sales and promotion activities | 3.1 | Communicate and negotiate with stakeholders to establish organisational capability, feedback on improvement opportunities and customer needs, marketing opportunities, and development needs of sales and marketing team |
| | | 3.2 | Address constraints and contingencies, and adjust short-term planning and reschedule, as necessary |
| | | 3.3 | Monitor implementation of objectives by priority, strategy and schedule |
| | | | |
| 4 | Report outcomes | 4.1 | Record progress and results in accordance with procedures |
| | | 4.2 | Provide documentation, data entry and analysis, as required |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- planning, scheduling and budgeting to achieve promotional, sales and service objectives
- investigating and evaluating options for sales, promotions and marketing team development and training
- identifying technical and market advantage for products or services, regulatory and industrial relations environment
- establishing customer-supplier relationships, current markets and context, marketing and sales opportunities, and constraints
- coordinating implementation of objectives, sales and promotions, personal and team training, continuous improvement, problem solving and decision making
- monitoring marketing team performance
- identifying awards, enterprise agreements personnel entitlements and remuneration arrangements that may impact on technical sales and promotion team activities
- maintaining records
- systems thinking, constraints and contingency management, short-term planning adjustments and rescheduling, marketing team resources and budgeting
- communicating and negotiating with stakeholders
- monitoring products and services for change or change opportunities
- monitoring of team compliance with relevant regulations, including enterprise agreements or awards, WHS, codes of practice, trade practices and consumer law, other legislative requirements, social and economic obligations, and ethical practice
- reporting and documenting progress and results, data and analysis in accordance with procedures

Required knowledge

Required knowledge includes:

- engineering knowledge relevant to operations and supplied products and services context of marketing and sales, such as competitive pressures or markets, customer-supplier relationships and consumer protection legislation
- organisational management structure, functional team relationships, available technical and professional support services, communications and reporting lines
- audit procedures for personnel current competence, competence gaps and training requirements within marketing team
- opportunities for technological and personnel competence improvement

- sustainability implications of products and services
- organisation mission and business strategy, operations and project plans and objectives
- opportunities and constraints related to sales and promotions
- techniques for analysis of organisational capability, current and future technological needs of customer base, and marketing opportunities
- software options for program management and budget control
- WHS, codes of practice, and other legislative requirements, sustainability and ethical practice related to products and services, marketing team changes and developments
- risk management procedures
- procedures for reporting and recording of progress and records
- legal obligations of organisation and team related to employment conditions, consumer protection, trade practices, environmental and commercial legislation related to procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to coordinate sales of products or services where such sales require engineering-related knowledge and skills, including establishing performance objectives and identifying and implementing continuous improvement.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • define sales and marketing organisational mission and strategic objectives, features and functions within the organisation • plan, schedule and budget to achieve promotional and sales objectives • identify technical and market advantage for products or services, customer-supplier relationships, current markets and context, marketing and sales opportunities, and constraints • investigate and evaluate options for sales, promotions and marketing team development, and complete feasibility analysis on marketing options • maintain records of plans, priorities, schedules and progress, legislative compliance, and personal and team skills development • coordinate implementation of objectives, sales, marketing and

	<p>promotions, personal and team training, continuous improvement, problem solving and decision making, systems thinking, constraints and contingency management, short-term planning adjustments and rescheduling, and marketing team resources and budget</p> <ul style="list-style-type: none"> • communicate and negotiate with stakeholders monitor products and services • report and document progress and results, data and analysis in accordance with procedures.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Operate a computer and/or controller system	1.1. Operate a range of hardware to complete engineering tasks. 1.2. Use appropriate software to produce required outcomes. 1.3. Identify and use available sources of help to overcome basic difficulties with applications. Ensure technical instructions are followed and inconsistencies and technical difficulties investigated and resolved. This should include adherence to occupational health and safety regulations / guidelines.
2. Develop/customise computer and/or controller systems/programs	2.1. Work plan for the programming/customising task is prepared in accordance with organizational guidelines. 2.2. Programs are written/altered/customised in the required format and computer language. Develop and maintain client engagement with project or task. 2.3. Program/system records are maintained and made available to all interested parties following company procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Look for evidence that confirms skills in:

- completing tasks using selected hardware in accordance with manufacturer's instructions and to workplace procedures
- using CPU, I/O, peripherals, interfaces, actuators and other computer/controller equipment
- accessing and using appropriate software in accordance with manufacturer's instructions to complete task requirements
- saving and storing documents and other computer/controller files are in an appropriate directory in accordance with manufacturer's instructions and workplace

REQUIRED SKILLS AND KNOWLEDGE

procedures

- identifying and analysing difficulties using appropriate help sources
- preparing work plans for programming/customising task
- writing/altering/customising programs
- testing and amending programs
- maintaining records

Required knowledge

Look for evidence that confirms knowledge of:

- functions and operating procedures of CPU, I/O, peripherals, interfaces, actuators and other computer/controller equipment
- applications of available hardware and criteria for selecting the hardware for particular tasks
- procedures for operating hardware
- procedures for checking and replacing hardware consumables
- available software and their applications
- procedures and commands for the use of identified software
- procedures and related requirements for saving and storing documents and computer/controller files
- techniques for accessing, transferring, printing documents or other computer files or using computer files to control plant and equipment
- techniques for accessing and using manuals and training booklets to solve minor problems
- procedures for accessing sources of help
- techniques for accessing help with typical difficulties with selected applications
- typical programming/customising sequencing and related issues
- techniques and procedures for preparing a work plan for a programming/customising task
- techniques and procedures for writing/customising programs in specified formats and computer language
- techniques and procedures for testing and amending programs
- procedures for checking program alteration with users
- procedures for maintaining records and reports on program/system development or enhancement
- procedures for disseminating information on program/system development

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to operate and program computers and/or controllers in engineering situations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with operating and programming computers and/or controllers in engineering situations or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Method of assessment</p>	<p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with applying calculus in engineering situations or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Guidance information for assessment</p>	

Range Statement

RANGE STATEMENT	
<p>The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.</p>	
Hardware	Personal computers, networked systems, personal organisers, communications equipment, PLC and microprocessor controllers, computer controlled machinery and systems, etc.
Tasks	To be carried out under appropriate supervision using predetermined standards of safety, computer application and technical analysis
Software	Commercial software applications, CAD and CAM software, organisation specific software, PLC or microprocessor controller software, word processing, spreadsheet, database, graphic, communication packages and presentation packages, etc
Technical instructions	Manufacturer's and organisational instructions for use of specific computer hardware
Inconsistencies and technical difficulties	Resolved in consultation with appropriate technical advisers
Occupational health and safety regulations / guidelines	Screen based equipment, computing equipment and peripherals and ergonomic work stations, etc.
Programming	Visual Basic, Ladder Logic, Flow Chart, program customising, spreadsheet programming, writing macros, setting up/varying databases and the like.
Organisational guidelines	Security procedures, OH&S procedures, maintenance procedures, etc.
Develop and maintain client engagement	Ongoing communication with clients required to ensure that engineering services are effectively delivered

MEM23004A Apply technical mathematics

Modification History

Release 1 - New unit. Replaces MEM23001A, but not equivalent.

Unit Descriptor

This unit of competency covers the application of mathematical analysis, graphical and software techniques to engineering problems. It includes exponential and logarithmic functions, trigonometric equations involving single and double angles, sequences and series, two dimensional vector analysis, complex numbers, determinants and matrices.

Application of the Unit

The unit applies to engineering or related activities requiring specific mathematical techniques. It is suitable for people giving technical support to design, operations or maintenance activities and those pursuing technical qualifications and careers at paraprofessional or technician level.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of technical mathematical techniques required for an engineering application	1.1	Analyse an engineering application for required technical mathematical tasks
		1.2	Develop systematic methods for layout and solution checking
		1.3	Determine mathematical software required for analytical and graphical solutions and validate software using traditional solutions to simple examples
2	Apply technical mathematical techniques to engineering application	2.1	Use appropriate software for analytical and graphical solutions
		2.2	Convert between different number systems
		2.3	Use appropriate mathematical techniques required for analysis and solution
		2.4	Use appropriate data representations to communicate the solution to others.
		2.5	Report results and document calculations, graphs and analysis

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- solving mathematical problems using standard engineering software packages, and validating software results of simple examples analytically and/or graphically
- manipulating values using decimal, binary and hexadecimal number systems
- graphing and analysing functions for solutions:
 - exponential and logarithmic functions
 - trigonometric functions
- using the techniques of sequences and series to solve simple mathematical problems
- using the techniques of two dimensional vectors to solve mathematic and applied problems
- solving problems involving complex quantities using the properties, operations and theorems of complex numbers
- using determinant and matrix analysis to solve algebraic and vectorial problems
- using probability to assess likely occurrences

Required knowledge

Required knowledge includes:

- software for mathematical analysis and graphical representations
- binomials and polynomials
- exponential and logarithmic functions
- trigonometric equations
- sequences and series
- two dimensional vectors
- complex numbers
- determinant and matrices
- probability
- stability analysis using plots

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment

Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to apply mathematical analysis, graphical and software techniques to engineering-related problems within the context of delegations and other checking and technical oversight procedures. The candidate may demonstrate competence through either working individually or as part of a team.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • solve mathematical problems using software • validate software results of simple examples analytically and/or graphically • manipulate values using decimal, binary and hexadecimal number systems • graph and analyse exponential, logarithmic and trigonometric functions for solutions • use the techniques of sequences and series to solve simple mathematical problems • use the techniques of two dimensional vectors to solve mathematic and applied problems • solve problems involving complex quantities using the properties, operations and theorems of complex numbers • use determinant and matrix analysis to solve algebraic and vectorial problems • use probability to assess likely occurrences.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge.

	<ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Engineering applications related to mathematical techniques in this unit	<p>Most engineering disciplines will have applications supported by the technical mathematics skills described in this unit, including mechanical, manufacturing, maintenance and mechatronics engineering. Examples of engineering applications requiring mathematical skills described in this unit may include:</p> <ul style="list-style-type: none"> • vector analysis of force systems on beams and bodies • trigonometric plots related to waveforms for amplitude, frequency and phase shift analysis • matrix and determinant solutions of vector systems or simultaneous equations • complex plane analysis of control systems for stability analysis
Scope of technical mathematical techniques	<p>The scope of technical mathematical techniques required for an engineering application will vary and may include:</p> <ul style="list-style-type: none"> • standard mathematical software • decimal, binary and hexadecimal number systems • graph exponential and logarithmic functions required for the engineering application • solve trigonometric equations involving single and double angles • solve problems using simple binomials and polynomials

	<ul style="list-style-type: none"> • solve problems involving simple sequences and series in the engineering application • analyse two dimensional vectors • analyse complex numbers and represent graphically • analyse simple algebraic and vectorial problems using determinants and matrices • evaluate probability as a predictive tool in simple situations
Number system	<p>Number systems may include:</p> <ul style="list-style-type: none"> • decimal • binary • hexadecimal

MEM23005A Apply statistics and probability techniques to engineering tasks

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the application of statistics and probability techniques to engineering applications. It includes the use and application of standard statistical and probability concepts and modelling methods, such as mean, median, mode, frequency distribution, standard deviation plus probability laws, distributions, permutations and combinations to engineering and manufacturing situations.

Application of the Unit

The unit applies to engineering or related activities requiring the application of statistical and probability techniques. It is suitable for people giving technical support to design, operations or maintenance activities and those pursuing technical qualifications and careers at paraprofessional or technician level.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of statistics or probability techniques required for an engineering application	1.1	Analyse an engineering application for required statistics or probability tasks
		1.2	Develop systematic methods for layout and solution validation, including any required external sign-off of solution
		1.3	Identify statistics or probability techniques and any software required for analysis and resolution of identified engineering tasks
		1.4	Identify sources for professional and technical assistance, if required
2	Apply statistical techniques to engineering applications	2.1	Apply standard statistics concepts and models to solve engineering problems
		2.2	Check statistical model and solution is error free
		2.3	Review model and solution to ensure they provide information relevant to resolution of engineering application task
		2.4	Report results and document calculations, graphs and analysis
3	Apply probability techniques to engineering applications	3.1	Apply standard probability concepts and models to solve engineering problems
		3.2	Check model and solution is laid out correctly and is error free

- 3.3 Review solution to ensure it provides information relevant to resolution of engineering application task
- 3.4 Report results and document calculations, graphs and analysis

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- analysing engineering applications to determine relevant statistics and probability techniques
- applying relevant statistical and probability concepts and tools and applying to engineering applications
- using appropriate software to generate solutions to statistical and probability-related engineering problems
- establishing appropriate procedures for checking and validating solutions
- logical layout and presentation of data
- reporting and effectively communicating the results of statistical and probability-based analysis

Required knowledge

Required knowledge includes:

- meaning and appropriate application of discrete and continuous data
- concepts of mean, median and mode and their application to engineering and manufacturing problems requiring statistics-based solutions
- standard deviation, range, interquartile range and frequency distributions
- use of appropriate software and/or scientific calculators to generate solutions to statistical and probability-related engineering problems and methods for presentation of data, such as:
 - frequency distribution tables
 - histograms
- the concept of variance and its application to engineering and manufacturing situations
- application of statistical modelling to engineering and manufacturing situations
- translation of statistical data into engineering parameters and the applications to:
 - process improvement techniques
 - reliability analysis
- concepts of probability:
 - single events
 - multiple events
 - with permutations and combinations
- probability distributions:
 - normal

- binomial
- sampling distributions:
 - sample size
 - statistical significance
 - confidence intervals
- application of probability-based solutions to engineering and manufacturing problems

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to apply statistics and probability techniques to engineering-related problems within the context of specified engineering applications and other solution validation and technical oversight procedures. The candidate may demonstrate competence through either working individually or as part of a team.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • solve engineering and manufacturing problems using statistics and probability techniques • validate results of simple examples using statistics and probability either analytically and/or graphically • assist decision making processes in industry by analysis of data using statistical and probability concepts and tools.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. MEM23006A Apply fluid and thermodynamics principles in engineering

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the application of fluid and thermodynamic principles to engineering applications. It includes sustainability issues; fundamental scientific principles; fundamentals of vacuum technology; properties of gases and liquids; heat transfer due to conduction, convection and radiation heat and compression processes; closed and open systems; continuity, enthalpy and energy transfers related to compressors, boilers, turbine heat exchangers, heat engines, refrigerators and heat pump performance. It also includes fluid systems and components, forces on floating and submerged bodies, turbine and pumping systems, and jet forces on blades and plates.

Application of the Unit

This unit applies to fluid and thermodynamic devices and systems used in industry. It is suitable for people working as technicians in engineering or related fields using hydrostatic, hydrodynamic, fluid power or heating, ventilation and air conditioning (HVAC) equipment and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of fluid or thermodynamic application	1.1	Determine compliance requirements of work health and safety (WHS) and regulatory requirements, codes of practice standards, risk assessment and registration requirements
		1.2	Review sustainability implications of fluid and thermodynamic tasks
		1.3	Assess fluid, thermodynamic and vacuum principles, skills and techniques required by tasks
		1.4	Review functions and features of fluid, thermodynamic and vacuum devices, machines and systems
		1.5	Assess software techniques required for analysis and graphics required by the task
2	Interpret fluid or thermodynamic system design for effective performance	2.1	Determine the energy cost for running boilers, heat engines, compressors or turbines over a billing period, the efficiency of conversion of energy source to electrical, fluid, thermal or mechanical power and the sustainability of the processes
		2.2	Select components for thermal and fluid systems ensuring compatible materials, pressure, temperature and flow capacity and appropriate performance
		2.3	Determine pumping system power requirements to provide for raising fluid, adequate flow rate and specified system losses
		2.4	Specify vacuum system components and performance requirements for moulding, dust removal, film

- deposition, chemical reaction control, and prove or test performance of specified system or individual components
- 2.5 Seek technical and professional assistance or clarification of design information, as required
- 2.6 Ensure clear and logical process of specification development and compatibility of units in calculations
- 3 Report results
 - 3.1 Record results of investigation, evaluation and application
 - 3.2 Provide documentation, such as calculations, diagrams, programs and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining and confirming parameters and context of tasks, personal responsibilities, team and support personnel relations, chain of responsibility, WHS, regulatory requirements, risk management and organisational procedures
- reviewing sustainability implications, functions and features of fluid, thermodynamic and vacuum devices, machines and systems
- assessing and applying fluid, thermodynamic and vacuum principles and software skills and techniques
- ensuring clear and logical process of specification development and compatibility of units in calculations
- reporting and documenting results of investigation, evaluation and application, calculations, diagrams, programs and files

Required knowledge

Required knowledge includes:

- definition of fluid mechanics and thermodynamics and recognition of applications
- analytical, graphical, semi-graphical and software assisted techniques for applications for fluid and thermodynamic principles in engineering
- energy and sustainability concepts relevant to fluid and thermodynamic applications
- principles of turbines and heat engines
- basic properties and concepts common to fluids and thermodynamics:
 - atoms, molecules, inter-molecular forces, molecular motion, states of matter, solids, liquids, gases, basic properties and units
 - ideal or perfect gases and liquids
 - definitions
- energy types and concepts:
 - potential energy, kinetic energy and internal energy
 - chemical energy = energy content of a fuel
 - work, constant and variable force, relationship to pressure and volume changes
 - sensible heat and specific heat capacity (C_p and C_v)
 - phase change, latent heat, enthalpy and enthalpy diagram
- heat transfer processes

- concepts and properties of gases
- energy transfer in closed and open systems:
 - definition of a closed system
 - non-flow energy equation definition of an open system
 - mass and volume flow rate and the continuity equation
- fluid mechanics
- fluid system components
- fluid statics
- fluid dynamics
- fluid power
- vacuum technology:
 - definition of vacuum
 - states of matter
 - purposes of vacuums
 - degrees of vacuum
- methods of lowering pressure:
 - displacement or transfer of gas
 - sorption or condensation
- barometric pressure:
 - inverted mercury tube
 - variation of atmospheric pressure with altitude
- quantity of gas:
 - mole, Avogadro's Number and molar mass
- types of vacuum pumps for evacuating volumes
- description of typical vacuum vessels, features and functions
- applications of vacuum technology in industry

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to apply fluid, thermodynamic and vacuum principles to the selection and evaluation of components and systems.</p> <p>This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.</p>

MEM23007A Apply calculus to engineering tasks

Modification History

Release 1 - New unit. Replaces MEM23002A, but not equivalent.

Unit Descriptor

This unit of competency covers the application of calculus, including differentiation and integration techniques to engineering applications. It includes the use and application of standard differentiation and integration rules, finding maximum and minimum values of curves, application to rates of change and slope, finding definite integrals, using method of substitution, using trigonometric identities and finding areas under curves.

Application of the Unit

The unit applies to engineering or related activities requiring the application of mathematical techniques using calculus. It is suitable for people giving technical support to design, operations or maintenance activities and those pursuing technical qualifications and careers at paraprofessional or technician level.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of calculus techniques required for an engineering application	1.1	Analyse an engineering application for required calculus tasks
		1.2	Develop systematic methods for layout and solution validation, including any required external sign-off of solution
		1.3	Identify calculus technique and any software required for analysis and resolution of identified engineering application tasks
		1.4	Identify sources for professional and technical assistance, if required
2	Apply differential techniques to engineering applications	2.1	Apply standard differentiation rules to solve engineering problems
		2.2	Check solution is laid out correctly and is error free
		2.3	Review solution to ensure it provides information relevant to resolution of engineering application task
		2.4	Report results and document calculations, graphs and analysis
3	Apply integration techniques to engineering applications	3.1	Apply standard integration rules to solve engineering problems
		3.2	Check solution is laid out correctly and is error free
		3.3	Review solution to ensure it provides information

relevant to resolution of engineering application task

- 3.4 Report results and document calculations, graphs and analysis

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- analysing engineering applications to determine relevant calculus techniques
- applying relevant differentiation and integration concepts and tools to engineering applications
- using appropriate software and/or scientific calculators to generate solutions to statistical and probability-related engineering problems
- using differentiation to find rates of change
- applying special calculus techniques to solve more complex integrals, such as:
 - method of substitution
 - using trigonometric identities
- identifying and solving simple first and second order differential equations
- identifying key points to find constants of integration
- finding integrals of algebraic, trigonometric and exponential functions
- establishing appropriate procedures for checking and validating solutions
- logical layout and presentation of data developed using calculus
- reporting and effectively communicating the results of calculus-based analysis

Required knowledge

Required knowledge includes:

- identifying appropriate limits and applying to engineering problems being solved with calculus techniques
- differentiation rules and techniques
- partial differentiation
- relationship between differentiation and attributes of mathematical curves and graphs
- optimisation of variables based on maximum and minimum values of mathematical curves and graphs
- integration as the reverse of differentiation
- integration rules and techniques
- the definite integral

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

MEM23008A Apply advanced algebra and numerical methods to engineering tasks

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the application of advanced mathematics and numerical methods techniques to engineering situations. It includes the use and application of advanced mathematics and numerical methods, concepts and modelling methods, such as vectors in 3-D with i, j, k notation; analytical geometry; graphing techniques; complex numbers; linear algebra, including solving matrices, numerical solutions, errors and propagation of errors; plus interpolation and extrapolation.

Application of the Unit

The unit applies to engineering or related activities requiring the specific application of advanced mathematics or numerical methods techniques. It is suitable for people giving technical support to design, operations or maintenance activities and those pursuing technical qualifications and careers at paraprofessional or technician level.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency. Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of advanced mathematics and numerical methods required for an engineering application	1.1	Analyse an engineering application for required advanced mathematics or numerical methods tasks
		1.2	Develop systematic methods for layout and solution validation, including any required sign-off of solution

2	Apply advanced mathematics techniques to engineering applications	2.1	Apply advanced mathematics concepts and models to solve engineering or manufacturing problems
		2.2	Check answer by appropriate means
		2.3	Interpret answer to determine information required by problem definition
		2.4	Report results and document calculations, graphs and analysis
3	Apply numerical methods to engineering applications	3.1	Apply numerical methods concepts and models to solve engineering problems
		3.2	Check solution is laid out correctly and is error free
		3.3	Review solution to ensure it provides information relevant to resolution of engineering application task
		3.4	Report results and document calculations, graphs and analysis

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- analysing engineering applications to determine relevant algebra and numerical methods
- applying relevant advanced mathematics and numerical methods concepts and tools to engineering situations
- using appropriate software and/or scientific calculators to generate solutions to algebra and numerical methods problems
- establishing appropriate procedures for checking and validating solutions
- logical layout and presentation of data developed using algebra and numerical methods
- reporting and effectively communicating the results of advanced mathematics and numerical methods-based analysis

Required knowledge

Required knowledge includes:

- vectors:
 - vectors in 3-D
 - i , j and k notation
 - magnitude of a vector
 - unit vectors and direction angles
 - scalar or 'dot' product of two vectors
 - vector or 'cross' product of two vectors
 - resolution of vectors
 - differentiation and integration of vectors
- dynamics:
 - Newton's Laws of Motion
 - energy, work and power
 - work-energy theorem
 - moment of a force
- analytical geometry:
 - equation of a plane
 - angle between two planes
 - distance from a point to a plane

- lines in 3-D space
- graphing techniques:
 - coordinate geometry
 - graphs of exponential growth and decay
 - graphs with logarithmic scales
 - method of least squares
 - polar coordinates and polar graphs
 - graphs of functions of two variables
 - quadric surfaces
- complex numbers:
 - introduction to complex numbers
 - cartesian form
 - the Argand plane
 - trigonometric and polar form
- linear algebra:
 - matrix algebra
 - transformations
 - determinants
- numerical solutions:
 - finite difference techniques
- errors:
 - computer arithmetic
 - propagation of errors
- interpolation and approximation:
 - polynomial interpolation
 - Lagrange form
 - Newton's divide formula
 - error bound

-------------------------------	--

	oversight procedures. The candidate may demonstrate competence through either working individually or as part of a team.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • solve engineering problems using advanced mathematics and numerical methods techniques • validate results of simple examples using advanced mathematics and numerical methods either analytically and/or graphically using appropriate software or scientific calculators • assist decision making processes in industry by analysis of data using advanced mathematics and numerical methods concepts and tools.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

<p>Engineering applications related to advanced mathematics and numerical methods techniques in this unit</p>	<p>Most engineering disciplines will have applications supported by the advanced mathematics and numerical methods skills described in this unit, including mechanical, manufacturing, maintenance and mechatronics engineering. Examples of engineering applications requiring advanced mathematics and numerical methods skills described in this unit may include:</p> <ul style="list-style-type: none"> • assisting decision making in industry by analysis of data using advanced mathematics and numerical methods concepts and tools • assisting presentation of data in industry by use of advanced graphical techniques • solution of problems involving rectilinear and rotation motion • solution of problems involving work, energy and power • solution of problems in electrostatics and wave propagation
<p>Scope of advanced mathematics and numerical methods techniques</p>	<p>The scope of advanced mathematics and numerical methods techniques required for an engineering or manufacturing application will vary and may include:</p> <ul style="list-style-type: none"> • vectors in 3-D, including i, j, k notation, scalar and vector products • dynamics, including Newton's Laws of Motion, energy, work and power and work-energy theorem • analytical geometry • graphing techniques, including coordinate geometry, polar coordinates and polar graphs • complex numbers, including Cartesian, trigonometric and polar form • linear algebra, including matrix algebra • numerical solutions, including finite difference techniques • errors and propagation of errors • interpolation and approximation

MEM23052A Apply basic electro and control scientific principles and techniques in aeronautical engineering

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers applying basic electro and control scientific principles and techniques to aeronautical engineering situations.

Application of the Unit

Applications of this unit include applying basic electro and control scientific principles and techniques as a member of a design and development team in support of the design and development of engineering applications; identifying a significant range of basic electro and control scientific principles and techniques relevant to aeronautical engineering; selecting electro and control principles and techniques for particular aeronautical applications; and applying electro and control principles and techniques appropriately to aeronautical engineering tasks.

Licensing/Regulatory Information

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|--|--|
| 1 Research and identify the range of basic electro and control scientific principles and techniques relevant to aeronautical engineering | 1.1 Research and report on basic electro and control scientific principles relating to aeronautical engineering from appropriate sources of information and examination of applications |
| | 1.2 Identify basic electro and control techniques and associated technologies, software and hardware required to implement scientific principles relating to aeronautical engineering situations |
| 2 Select basic electro and control scientific principles and techniques relevant to particular aeronautical engineering applications | 2.1 Select the relevant basic electro and control scientific principles for particular aeronautical engineering situations |
| | 2.2 Select the relevant basic electro and control techniques and associated technologies, software and hardware for particular aeronautical engineering situations |
| 3 Apply the relevant basic electro and control scientific principles and techniques appropriately | 3.1 Apply basic electro and control scientific principles in a consistent and appropriate manner to obtain any required solution |
| | 3.2 Use appropriate calculations and coherent units in the solution of engineering calculations |
| | 3.3 Use significant figures in engineering calculations |
| | 3.4 Apply basic electro and control techniques and associated technologies, software and hardware in a consistent and appropriate manner to obtain required solutions |
| 4 Quote the results of the application of the basic electro and control scientific principles and techniques correctly | 4.1 Quote solutions for applications involving engineering calculations in an appropriate style |
| | 4.2 Quote solutions for applications not involving engineering calculations in an appropriate style |

Required Skills and Knowledge

Required knowledge includes:

- electro and control scientific principles
- limitations of selected basic scientific principles
- basic electro and control techniques and related technologies, software and hardware associated with implementing scientific principles in aeronautical engineering solutions
- limitations of basic techniques and associated technologies, software and hardware
- applicability and limitations of basic electro and control scientific principles
- applicability and limitations of basic electro and control and associated technologies, software and hardware
- appropriateness of calculations
- fundamental and derived quantities
- common systems of units
- the procedure for converting between systems of units
- common prefixes used with units and their values
- the procedure for carrying out dimensional analysis
- the concept of significant figures
- uncertainty of computations based on experimental data
- procedures for determining the significance of figures in calculations
- procedures for estimating errors in derived quantities

Required skills include:

- selecting appropriate basic electro and control scientific principles to suit specified applications
- selecting appropriate basic electro and control techniques and associated technologies, software and hardware to suit specified applications
- applying basic electro and control scientific principles to particular aeronautical engineering situations
- applying and manipulating appropriate formulas for applications involving engineering calculations
- applying appropriate calculations to engineering situations
- checking the validity of equations using dimensional analysis
- applying basic electro and control techniques and associated technologies, software and hardware in a manner appropriate to the application and identified scientific principles
- referring solutions to the original aim of the application
- quoting solutions in appropriate units, using appropriate significant figures
- quoting limitations of solutions, due to assumptions, scientific principles and techniques used

Evidence Guide

Overview of assessment	A person who demonstrates competency in this unit must be able to apply basic electro and control scientific principles and techniques in aeronautical engineering situations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p> <p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.</p>
Context of and specific resources for assessment	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>
Method of assessment	This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with applying basic electro and control scientific principles and techniques in mechanical and manufacturing engineering situations or other units requiring the exercise of the skills and knowledge covered by this unit.
Guidance information for assessment	

Range Statement

Aeronautical engineering	Aeronautical engineering refers to: <ul style="list-style-type: none">the engineering discipline concerned with the conceptual development, research, design, manufacture, implementation, installation, commissioning and maintenance of aerospace mechanical, hydraulic, pneumatic, fuel and fire products, processes, systems or services for civil and military applications
Sources of information	Sources of information may include: <ul style="list-style-type: none">reference textsmanufacturer catalogues and industrial magazineswebsitesuse of phone, email and fax information gathering
Basic scientific techniques and principles	Basic scientific techniques and principles refers to calculations and the use of coherent units in the completion of tasks, and may include: <ul style="list-style-type: none">basic hand and power tool operationsmachiningfittingweldingmouldingfabricatingwiringprogramming
Aeronautical engineering situations	Aeronautical engineering situations may include: <ul style="list-style-type: none">electro-hydraulic and electro-pneumatic systemsfuel storage and distribution systemsengine control systemspropeller control systemsflight control systems

MEM23063A Select and test mechanical engineering materials

Modification History

Release 1 - New unit. Replaces MEM23061A, but not equivalent.

Unit Descriptor

This unit of competency covers the skills needed to interpret design information for material and material test requirements, select appropriate tests and use results in the selection of appropriate materials for mechanical and manufacturing engineering-related applications.

Application of the Unit

This unit applies to the selection of materials and material tests, sourcing materials data, ensuring appropriate performance and physical standards for mechanical and manufacturing applications, documenting materials tests, and ensuring calibration standards. The unit applies to mechanical and manufacturing engineering applications in mass production, batch production, jobbing shop and prototyping.

Activities may be performed as a member of a design and development team.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23109A	Apply engineering mechanic principles

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Distinguish classes of materials, based on properties and materials tests, relevant to mechanical and manufacturing engineering	1.1	Relate material properties to common mechanical and manufacturing engineering methods and processes
		1.2	Identify common characteristics, faults or flaws in materials, components and product
		1.3	Identify engineering-related test methods for materials and components or product properties
		1.4	Identify common industrial test standards/codes, calibration requirements, regulations and authorities relevant to selection of materials and products for mechanical and manufacturing engineering applications
2	Utilise sources of information on engineering materials, materials tests and test equipment	2.1	Review design information for material specifications and required material tests
		2.2	Identify and use appropriate sources of information on materials, material tests and test calibration
		2.3	Identify and use appropriate sources of information on methods of testing of properties of materials
		2.4	Investigate and report on relevant standards and codes
		2.5	Identify and use appropriate sources of information on materials safety data sheets (MSDS)
		2.6	Establish availability of technical and professional assistance

- | | | | |
|---|--|-----|---|
| 3 | Test for or obtain the properties of engineering materials | 3.1 | Specify required materials tests and manage implementation of tests to ensure quality, safety and suitability for applications |
| | | 3.2 | Ensure traceability of measurement standard |
| | | 3.3 | Obtain test sheets/certificates for appropriate materials for applications in accordance with organisational procedures and/or codes and regulations |
| | | 3.4 | Obtain appropriate MSDS for applications in accordance with organisational procedures and/or codes and regulations |
| 4 | Select and implement materials for mechanical/manufacturing engineering applications | 4.1 | Select materials for use in given mechanical or manufacturing engineering applications based on relevant test information |
| | | 4.2 | Incorporate materials and components into mechanical and manufacturing processes in accordance with design functional requirements |
| 5 | Document materials design data and methods and results of materials tests | 5.1 | Report and record materials selections against design functional requirements in accordance with organisational procedures, codes and regulations |
| | | 5.2 | Undertake any required environmental impact and sustainability assessment |
| | | 5.3 | Report and record materials tests and test sheets or certificates in accordance with organisational procedures, codes and regulations, including appropriate calibration and traceability |
| | | 5.4 | Report and record appropriate MSDS for applications in accordance with organisational procedures, codes and regulations |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- selecting class of materials for an application based on comparison of properties for a significant range of materials classes
- selecting class of materials for an application suitable to mechanical and manufacturing engineering-related methods and processes
- identifying common characteristics, faults or flaws in materials
- identifying test methods for properties of, and faults and flaws in, materials and components
- identifying industrial test standards and regulations for materials and particular engineering applications
- selecting the most appropriate tests and test methods from a range of possible tests
- identifying and applying standards and regulations for materials and components
- sourcing and using materials test sheets and certificates
- sourcing and implementing MSDS
- implementing tests correctly for materials and component properties and faults
- interpreting design documentation for materials and materials testing requirements
- applying environmental and sustainability requirements to material selection
- reporting, recording and filing test reports and documentation
- implementing materials tests and test sheets/certificates, test calibration and traceability

Required knowledge

Required knowledge includes:

- properties of materials classes
- the effect of material properties, faults or flaws on mechanical and manufacturing engineering methods and processes
- test methods and procedures for materials and components, including specific industrial test standards, regulations and authorities related to particular engineering applications
- test methods for faults or flaws in materials and components or product
- sources and uses of information on materials and materials tests, including test certificates, regulations, standards, regulatory bodies and industrial authorities
- methods of accessing MSDS
- significance of test sheets/certificates to applications
- significance of MSDS and relevance of procedures
- materials selections in relation to design functional requirements

- environmental impact and sustainability assessment
- significance of test procedures, reports and documentation to applications, including the need for obtaining and filing test sheets and certificates
- significance of test calibration and traceability

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to select and test mechanical engineering materials.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • review design information for materials and materials test requirements • select classes of materials relevant to design for further research, testing and evaluation • identify standards, codes and regulatory requirements relevant to materials testing and application • specify appropriate tests and interpret test results for material selection • select materials consistent with test results and design and regulatory requirements • ensure traceability in material selection process • correctly document all results and tests.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate. • This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with selecting and testing mechanical engineering materials or other units requiring the exercise of the skills and knowledge covered by this unit.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with

	<p>application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Classes of materials	<p>Classes of materials include:</p> <ul style="list-style-type: none"> • non-ferrous metals and alloys • ferrous metals • non-metals (e.g. timber, concrete, ceramics, polymers and fabrics, adhesives and lubricants) • thermal and electrical conductors and insulators
Properties and characteristics of materials	<p>Properties and characteristics of materials may include:</p> <ul style="list-style-type: none"> • physical properties (e.g. strength; elasticity; plasticity; malleability; hardness; toughness; brittleness; fatigue endurance; mouldability; weldability; machinability; formability; resistance to creep and stress relaxation; resistance to degradation, such as use of plastic fillers to enhance UV resistance; adhesion; electrical, magnetic, thermal, chemical and optical; material structure and effect on properties)

	<ul style="list-style-type: none"> • susceptibility to corrosion • conductivity and resistance – both thermal and electrical • the effect of manufacturing and construction processes on material properties
Mechanical engineering	Mechanical engineering is the engineering discipline concerned with the conceptual development, research, design, manufacture, implementation, installation, commissioning and maintenance of mechanical products, processes, systems or services for converting energy into power and motion, materials into product and components into machines and systems
Manufacturing engineering	Manufacturing engineering includes conceptual development, design, manufacture, construction, implementation, installation, optimisation, commissioning and maintenance of resources and processes employed for the manufacture of product and components, machines and systems
Sources of information	<p>Sources of information may include:</p> <ul style="list-style-type: none"> • standards and codes • MSDS • reference texts • manufacturer catalogues and other published information • regulatory bodies • technical, professional and industrial associations and societies
Standards and codes	Standards and codes refer to all relevant Australian and international standards and codes applicable to the mechanical engineering analysis task
Tests of materials	<p>Tests of materials include:</p> <ul style="list-style-type: none"> • destructive, including tensile, compression, impact, hardness, fatigue, corrosion, stress relaxation and creep, fatigue and peel resistance (adhesives) • non-destructive, including hardness, ultrasonics, X-ray, die penetrant, eddy current, surface friction, conductivity, heat expansion, photoelastic, heat capacity refractive index and magnetic hysteresis loop
Traceability	Test calibrations can be traced back to the relevant base unit in the relevant measurement system

| 4 | Select and implement materials and components for mechatronic engineering applications | 4.1 | Select materials for use in given mechatronic engineering applications based on relevant test information |
| | | 4.2 | Incorporate materials and components into mechatronic processes in accordance with design functional requirements |
| 5 | Report on and record materials design data and methods and results of materials tests | 5.1 | Report and record materials selections against design functional requirements in accordance with organisational procedures, codes and regulations |
| | | 5.2 | Include environmental impact and sustainability assessment |
| | | 5.3 | Report and record materials tests and test sheets/certificates in accordance with organisational procedures, codes and regulations, including appropriate calibration and traceability |
| | | 5.4 | Report and record appropriate MSDS for applications in accordance with organisational procedures, codes and regulations |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- selecting class of materials suitable for mechatronic applications based on comparison of material properties
- identifying for common characteristics, faults or flaws in materials
- identifying test methods for properties of, and faults and flaws in, materials and components
- identifying specific industrial test standards and regulations for materials and particular engineering applications
- selecting the most appropriate tests from a range of possible tests
- identifying and applying standards and regulations for materials and components
- sourcing and using materials test sheets and certificates
- sourcing and implementing MSDS
- implementing tests correctly for materials and component properties and faults
- interpreting design documentation for materials and materials testing requirements
- addressing environmental and sustainability requirements related to material selection
- reporting, recording and filing test reports and documentation
- implementing materials tests and test sheets/certificates, test calibration and traceability

Required knowledge

Required knowledge includes:

- properties of materials classes
- the effect of material properties, faults and flaws on mechatronic engineering methods and processes
- test methods and procedures for materials and components, including specific industrial test standards, regulations and authorities related to particular engineering applications
- sources and uses of information on materials and materials tests, including test certificates, regulations, standards, regulatory bodies and industrial authorities
- methods of accessing MSDS
- significance of test sheets/certificates to applications
- significance of MSDS and relevance of procedures
- materials selections in relation to design functional requirements
- environmental impact and sustainability assessment
- significance of test procedures, reports and documentation to applications, including the need for obtaining and filing test sheets and certificates

- significance of test calibration and traceability

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to select and test mechatronic engineering materials.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • review mechatronic design information for materials and materials test requirements • select classes of materials relevant to design for further research, testing and evaluation • identify mechatronic engineering-related standards, codes and regulatory requirements relevant to materials testing and application • specify appropriate tests and interpret test results for material selection • select materials consistent with test results and design and regulatory requirements • ensure traceability in material selection process • correctly document all results and tests.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate. • This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with selecting and testing mechatronic engineering materials or other units requiring the exercise of the skills and knowledge covered by this unit.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of

	<p>workplace relevant contexts) together with application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Classes and types of materials	<p>Classes and types of materials include:</p> <ul style="list-style-type: none"> • non-ferrous metals and alloys • ferrous metals • non-metals (e.g. timber, concrete, ceramics, polymers and fabrics, adhesives, fibres and lubricants) • thermal and electrical conductors and insulators • semiconductors • substrates • cables and cable supports • fluids and lubricants
Properties and characteristics of materials	<ul style="list-style-type: none"> • Properties and characteristics of materials may include: • physical properties (e.g. strength, elasticity, plasticity, malleability, hardness, toughness, brittleness, fatigue endurance, mouldability,

	<p>weldability, machinability, formability, resistance to creep and stress relaxation, resistance to degradation – use of plastic fillers to enhance UV resistance – and adhesion)</p> <ul style="list-style-type: none"> • electrical related properties (e.g. resistivity, conductivity, electro-magnetic, i.e. permeability, permittivity and electro-static susceptibility) • thermal, chemical and optical • material structure and effect on properties • susceptibility to corrosion • effects of manufacturing and construction processes on material properties
Mechatronic engineering	<p>Mechatronics is usually defined as the integration of mechanical, electronics, programming, electrical and fluid power in an engineering product. The skills and underpinning knowledge of mechatronics are common with general automation of processes, systems and services. The definition of mechatronics is here broadened to include general automation.</p>
Sources of information	<p>Sources of information may include:</p> <ul style="list-style-type: none"> • standards and codes • MSDS • reference texts • manufacturer catalogues and other published information • regulatory bodies • technical, professional and industrial associations and societies
Standards and codes	<p>Standards and codes refer to all relevant Australian and international standards and codes applicable to the mechatronic engineering analysis task</p>
Tests of materials	<p>Tests of materials include:</p> <ul style="list-style-type: none"> • destructive, including tensile, compression, impact, hardness, fatigue, corrosion, stress relaxation and creep, fatigue and peel resistance (adhesives) • non-destructive, including hardness, ultrasonics, X-ray, die penetrant, eddy current, surface friction, conductivity, heat expansion, photo-elastic, heat capacity refractive index and magnetic hysteresis loop • electrical-related testing (e.g. conductivity, insulation, earthing resistance and safety)

Traceability	Test calibrations can be traced back to the relevant base unit in the relevant measurement system

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Research and categorise methods, processes and construction techniques for aeronautical applications
 - 1.1 Research and categorise methods, processes and construction techniques for aeronautical engineering applications using appropriate information sources
 - 1.2 Identify methods, processes and construction techniques to suit continuous production, mass, batch or jobbing shop production, prototype applications
 - 1.3 Identify applications suitable for sequential or work cell manufacture or assembly
 - 1.4 Identify manufacturing requirements of total quality management (TQM), just in time (JIT) and competitive (lean manufacturing) environments
- 2 Evaluate and select appropriate methods, processes and construction techniques for particular aeronautical engineering applications
 - 2.1 Consider or apply appropriate scientific principles to enable methods, processes and construction techniques choices
 - 2.2 Provide for appropriate materials properties knowledge in methods, processes and construction techniques choices
 - 2.3 Implement appropriate materials handling procedures, including compliance with occupational health and safety (OHS) and environment requirements, legislative and regulatory requirements
 - 2.4 Use appropriate calculations and assumptions to enable methods, processes and construction techniques choices
 - 2.5 Apply appropriate waste and pollution treatment and recycling techniques and policies to applications
 - 2.6 Consider suitability of application to continuous production, mass, batch or jobbing shop production, prototyping sequential or work cell manufacture or assembly appropriately in choice of methods, processes and construction techniques
 - 2.7 Research and evaluate manufacturing requirements of TQM, JIT, group technology and competitive (lean manufacturing) environments for a range of applications
 - 2.8 Select and evaluate measurement and test methods

for particular product or process outputs

- 3 Specify and implement methods, processes and construction techniques for aeronautical engineering applications
 - 3.1 Select, specify and implement applicable methods, processes and construction techniques for particular aeronautical applications

- 4 Apply basic workshop knowledge and skills relevant to aeronautical engineering applications
 - 4.1 Identify the range and applications of basic workshop skills
 - 4.2 Demonstrate relevant basic workshop skills
 - 4.3 Apply appropriate basic workshop skills to particular engineering applications

Required Skills and Knowledge

Required knowledge includes:

- methods and results of research and categorising of methods, processes and construction techniques for engineering applications
- methods of accessing and using alternative information sources
- applications for methods, processes and construction techniques
- applications suitable for continuous, mass, batch or jobbing shop production, work cell or sequential manufacture and assembly
- applications suitable for a range of materials handling techniques
- manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- the reasons for considering or using particular scientific principles
- the provision for particular materials properties in the choice of methods, processes and construction techniques
- the use of particular materials handling procedures
- reasons for compliance with regulations, standard procedures and MSDS specifications
- the reasons for using particular calculations and assumptions
- effects of waste and pollution from the application on the environment
- options for treatment and recycling as well as future developments that might be incorporated at a later date
- the suitability of application to particular continuous, mass, batch, jobbing shop, sequential or cellular manufacture and assembly
- manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- measurement and test methods for product or process output
- specification and implementation process for methods, processes and construction techniques in particular applications in the context of manufacturing requirements
- manufacturing requirements, including volume considerations, TQM, JIT and competitive (lean) manufacturing
- applications for particular basic workshop skills
- procedures used in the application of skills
- OHS procedures for basic workshop skills

Required skills include:

- applying research and categorising methods, processes and construction techniques for engineering applications
- using equipment suppliers' printed data and websites
- applying methods, processes and construction techniques
- documenting applications suitable for continuous, mass, batch or jobbing shop production, work cell or sequential manufacture and assembly
- documenting applications suitable for a range of materials handling techniques
- researching and documenting manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments

- selecting scientific principles in the choice of methods, processes and construction techniques
- identifying materials properties in the choice of methods, processes and construction techniques
- using appropriate materials handling techniques
- handling and storing materials and products in accordance with regulations, standard procedures and material safety data sheets (MSDS) specifications
- applying waste and pollution treatment and recycling techniques and policies applications to meet code and regulatory requirements
- selecting methods, processes and construction techniques consistent with continuous, mass, batch, jobbing, prototype, sequential or cellular production process requirements
- manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- evaluating measurement and test methods for product or process output
- specifying and implementing methods, processes and construction techniques in an efficient and optimal manner for manufacturing requirements
- applying workshop skills for a range of applications
- applying OHS practices
- selecting appropriate workshop skills for particular engineering applications

Evidence Guide

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to select and apply aeronautical engineering methods, processes and construction techniques. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p> <p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>
<p>Method of assessment</p>	<p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with selecting and applying aeronautical engineering methods, processes and construction techniques or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Guidance information for assessment</p>	

Range Statement

<p>Methods, processes and construction techniques</p>	<p>Methods, processes and construction techniques may include:</p> <ul style="list-style-type: none"> • casting, moulding and forming • metal hot and cold working • fabricating, machining and hand working • materials handling/moving/storing • waste and pollution treatment and recycling
<p>Aeronautical engineering</p>	<p>Aeronautical engineering refers to:</p> <ul style="list-style-type: none"> • the engineering discipline concerned with the conceptual development, research, design, manufacture, implementation, installation, commissioning and maintenance of aerospace mechanical, hydraulic, pneumatic, fuel and fire products, processes, systems or services for civil and military applications
<p>Information sources</p>	<p>Information sources may include:</p> <ul style="list-style-type: none"> • reference texts • manufacturer catalogues and industrial magazines • websites • use of phone, email and fax information gathering
<p>Total quality management (TQM)</p>	<p>TQM refers to:</p> <ul style="list-style-type: none"> • a customer driven amalgamation of quality assurance, quality control and quality improvement <p>Tools of TQM include:</p> <ul style="list-style-type: none"> • flow charts • Pareto • Ishikawa (cause and effect) • process capability analysis • sampling and control charting • run charts • correlation analysis
<p>JIT</p>	<p>JIT refers to:</p> <ul style="list-style-type: none"> • a system of ordering, manufacturing and supply of raw material, component parts and product at the point in time required by the process system or service. The objective is to minimise buffer stocks and inventory and the associated costs of buffer stocks and inventory
<p>Competitive (lean) manufacturing principles and techniques</p>	<p>Competitive (lean) manufacturing principles and techniques refers to:</p> <ul style="list-style-type: none"> • an integrated approach to manufacturing aimed at

	<p>competing for market share by maximising efficiency and minimising cost by comparison with alternative manufacturers</p> <p>Techniques used include:</p> <ul style="list-style-type: none"> • sequential and cellular manufacture and assembly with multi-skilling of work teams, workplace improvement (including Kaizen, a gradual and continual improvement to products, processes, systems and services.), TQM (including use of TQM tools), JIT, quick changeover, process and productivity improvement, cost reduction, supply and demand chain management, quality optimisation, design for reliability, optimum maintenance, and computer-managed maintenance
<p>Aeronautical applications</p>	<p>Aeronautical applications may include:</p> <ul style="list-style-type: none"> • airframe and power plant support structure and structural components • landing gear and landing gear systems and components • aircraft mechanical systems and components • hydraulic systems and components • pneumatic systems and components • fuel systems and components

MEM23074A Select and apply avionic engineering methods, processes and construction techniques

Modification History

Not applicable.

Unit Descriptor

This unit of competency covers selecting appropriate methods, processes and construction techniques within avionic engineering.

Application of the Unit

Applications of this unit include identifying the range of manufacturing and construction methods and processes required for avionic engineering applications, identifying sources of information on methods and processes, selecting methods and processes, and specifying or implementing methods and processes for applications.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEA272A	Apply basic scientific principles and techniques in avionic engineering situations
---------	--

Employability Skills Information

This unit contains employability skills

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- 1 Research and categorise methods, processes and construction techniques for avionic applications
 - 1.1 Research and categorise methods, processes and construction techniques for avionic engineering applications using appropriate information sources
 - 1.2 Identify methods, processes and construction techniques to suit continuous production, mass, batch or jobbing shop production, prototype applications
 - 1.3 Identify applications suitable for sequential or work cell manufacture or assembly
 - 1.4 Identify manufacturing requirements of total quality management (TQM), just in time (JIT) and competitive (lean manufacturing) environments
- 2 Evaluate and select appropriate methods, processes and construction techniques for particular avionic engineering applications
 - 2.1 Consider or apply appropriate scientific principles to enable methods, processes and construction techniques choices
 - 2.2 Provide for appropriate materials properties knowledge in methods, processes and construction techniques choices
 - 2.3 Implement appropriate materials handling procedures, including compliance with occupational health and safety (OHS) environmental, legislative and regulatory requirements
 - 2.4 Use appropriate calculations and assumptions to enable methods, processes and construction techniques choices
 - 2.5 Apply appropriate waste and pollution treatment and recycling techniques and policies to applications
 - 2.6 Consider suitability of application to continuous production, mass, batch or jobbing shop production, prototyping sequential or work cell manufacture or assembly in choice of methods, processes and construction techniques
 - 2.7 Research and evaluate manufacturing requirements of TQM, JIT, group technology and competitive (lean manufacturing) environments for a range of applications

- 2.8 Evaluate and select measurement and test methods for particular product or process outputs
- 3 Specify and implement methods, processes and construction techniques for avionic engineering applications
 - 3.1 Select, specify and implement applicable methods, processes and construction techniques for particular avionic applications
- 4 Apply basic workshop knowledge and skills relevant to avionic engineering applications
 - 4.1 Identify the range and applications of basic workshop skills
 - 4.2 Demonstrate relevant basic workshop skills
 - 4.3 Apply appropriate basic workshop skills to particular engineering applications

Required Skills and Knowledge

Required knowledge includes:

- methods and results of research and categorising of methods, processes and construction techniques for engineering applications, including:
 - electrical wiring and loom specification and construction:
 - selection of wire material and gauge
 - selection of insulation type
 - selection of wire marking system and method
 - specification of wire length and loom routing requirements
 - selection of termination methods
 - selection and specification of testing requirements
 - thermocouple harness material selection, construction methods and test requirements
 - data cable (selection of cable type, including fibre optic, selection of termination hardware, determination of length and routing requirements, construction method and test requirements)
 - antenna cables and pulse system transmission lines:
 - determination of performance characteristics
 - selection of antenna cable/transmission line materials
 - selection of termination hardware
 - determination of cable length and routing requirements
 - specification of test requirements
 - HF radio antenna design and construction
 - design principles, material selection, construction methods and test requirements for single and multi-layer printed circuit boards
 - metallic and non-metallic materials and construction methods for avionic component covers and requirements and attachment methods for mounts
 - design and construction methods for instrument panels, including layout, ergonomic considerations, materials, mounting requirements and lighting systems
 - methods of accessing and using alternative information sources
 - applications for methods, processes and construction techniques
 - applications suitable for continuous, mass, batch or jobbing shop production, work cell or sequential manufacture and assembly
 - applications suitable for range of materials handling techniques
 - manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
 - reasons for considering or using particular scientific principles
 - the provision for particular materials properties in the choice of methods, processes and construction techniques
 - the use of particular materials handling procedures and reasons for compliance with regulations, standard procedures and MSDS specifications
 - reasons for using particular calculations and assumptions

- effects of waste and pollution from the application on the environment
- options for treatment and recycling as well as future developments that might be incorporated at a later date
- suitability of applications to particular continuous, mass, batch, jobbing shop, sequential or cellular manufacture and assembly
- manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- measurement and test methods for product or process output
- specification and implementation process for methods, processes and construction techniques in particular applications in the context of manufacturing requirements
- manufacturing requirements, including volume considerations, TQM, JIT, competitive (lean) manufacturing
- applications for particular basic workshop skills
- procedures used in the application of skills
- OHS procedures for basic workshop skills

Required skills include:

- applying research and categorising methods, processes and construction techniques for engineering applications
- using equipment suppliers' printed data and websites
- selecting applications for methods, processes and construction techniques
- documenting applications suitable for continuous, mass, batch or jobbing shop production, work cell or sequential manufacture and assembly
- documenting applications suitable for a range of materials handling techniques
- researching and documenting manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- selecting scientific principles in the choice of methods, processes and construction techniques
- identifying materials properties in the choice of methods, processes and construction techniques
- using appropriate materials handling techniques
- handling and storing materials and products in accordance with regulations, standard procedures and material safety data sheet (MSDS) specifications
- applying waste and pollution treatment and recycling techniques and policies applications to meet code and regulatory requirements
- selecting methods, processes and construction techniques consistent with continuous, mass, batch, jobbing, prototype, sequential or cellular production process requirements
- manufacturing requirements of TQM, JIT and competitive (lean manufacturing) environments
- evaluating measurement and test methods for product or process output
- specifying and implementing methods, processes and construction techniques in an efficient and optimal manner for manufacturing requirements
- applying workshop skills for a range of applications
- applying OHS practices
- selecting appropriate workshop skills for particular engineering applications

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

- | | |
|--|---|
| 1 Identify the range of aeronautical scientific principles and techniques relevant to aeronautical engineering | 1.1 Research and report on aeronautical scientific principles relating to aeronautical engineering using appropriate sources of information |
| | 1.2 Research and report on aeronautical techniques and associated technologies, software and hardware associated with implementing scientific principles relating to aeronautical engineering applications using appropriate sources of information |
| 2 Select scientific principles and techniques relevant to aeronautical engineering applications | 2.1 Select the relevant scientific principles for particular aeronautical engineering situations |
| | 2.2 Select the relevant aeronautical techniques and associated technologies, software and hardware for particular aeronautical engineering situations |
| 3 Apply the relevant scientific principles and techniques appropriately | 3.1 Apply the scientific principles in a consistent and appropriate manner to obtain any required solution |
| | 3.2 Use appropriate calculations and correct units to establish quantities |
| | 3.3 Use coherent units in equations in a systematic manner to ensure meaningful solutions |
| | 3.4 Use significant figures in engineering calculations |
| | 3.5 Apply the techniques and associated technologies, software and hardware in a consistent and appropriate manner to obtain required solutions |
| 4 Quote the results of the application of the aeronautical scientific principles and techniques correctly | 4.1 Quote solutions for applications involving engineering calculations in an appropriate style |
| | 4.2 Quote solutions for applications not involving engineering calculations in an appropriate style |

Required Skills and Knowledge

Required knowledge includes:

- aeronautical techniques and related technologies, software and hardware associated with implementing scientific principles in engineering solutions and related to appropriate engineering applications. Principles include:
 - physics:
 - momentum and center of gravity
 - gravity
 - circular motion
 - orbital motion
 - rotational motion
 - oscillation and simple harmonic motion
 - digital electronics:
 - logic circuits
 - logic families
 - construction and testing techniques
 - flip flop circuits
 - analogue to digital conversion
 - digital to analogue conversion
 - timing and control
 - circuit analysis
 - stress analysis:
 - 2D force systems
 - equilibrium in 2D
 - plane trusses
 - plane frames and machines
 - 3D force systems
 - equilibrium in 3D
 - space trusses and frames
 - properties of areas
 - engineering concepts of stress and strain
 - axial force and deformation
 - shear force and deformation
 - thin walled pressure vessels
 - 2D stress
 - 2D strain
 - relationship between elastic constants
 - joints
 - instability

- stress concentration
- mechanics of flight:
 - boundary layer calculations relating to drag coefficient and skin friction
 - lift augmentation
 - thrust and power available
 - range and endurance
 - static stability
 - supersonic aerodynamics
 - rotary wing aerodynamics
- aircraft dynamic stability:
 - states of stability
 - the aerodynamic derivatives employed in the aircraft equations of motion
 - aircraft longitudinal stability
 - lateral dynamic stability
 - control mechanisms
 - aeroelastic effects
- aircraft mechanisms:
 - friction mechanisms
 - linkages
 - bearings
 - gear mechanisms
 - mechanical vibration
 - static and dynamic balancing
- limitations of aeronautical techniques and associated technologies, software and hardware
- relevance of scientific principles to aeronautical engineering
- applicability and limitations of an extensive range of aeronautical techniques and associated technologies, software and hardware
- choice of aeronautical scientific principles for particular applications
- applicability of particular aeronautical techniques and associated technologies, software and hardware to specific applications
- choice of aeronautical techniques and associated technologies, software and hardware for particular applications
- the method of application of the scientific principles
- fundamental and derived quantities
- common systems of units
- the procedure for converting between systems of units
- common prefixes used with units and their values
- the procedure for ensuring coherent units for meaningful solutions to equations
- the concept of significant figures
- the uncertainty of computations based on experimental data
- procedures for determining the significance of figures in calculations

- procedures for estimating errors in derived quantities
- the method of application of the aeronautical techniques and associated technologies, software and hardware
- significance of the calculation solution style in relation to the original task
- significance of the non-calculation solution style in relation to the original task

Required skills include:

- applying advanced scientific principles relevant to aeronautical engineering
- analysing the given situation to determine what is required in the manner of a solution
- analysing the given situation to determine which aeronautical scientific principles are selected
- selecting appropriate aeronautical techniques and associated technologies, software and hardware to suit applications
- applying appropriate aeronautical principles in determining the required solution
- applying and manipulating formulas and calculations for engineering applications
- using the correct units to solve engineering calculations
- checking the validity of equations using a systematic method for ensuring coherent units
- applying aeronautical techniques and associated technologies, software and hardware in a manner appropriate to the application and identified scientific principles
- referring solutions to the original aim of the application
- quoting solutions in appropriate units and using appropriate significant figures
- presenting solutions referring to the original aim of the application

Evidence Guide

Overview of assessment	<p>A person who demonstrates competency in this unit must be able to apply scientific principles and techniques in aeronautical engineering situations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>

MEM23086A Apply scientific principles and techniques in avionic engineering situations

Modification History

Release 1 - New unit. Based on and equivalent to MEM23085A

Unit Descriptor

This unit of competency covers applying advanced scientific principles to avionic engineering situations.

Application of the Unit

This unit applies to selecting and applying advanced avionic scientific principles and techniques.

Computer techniques, graphical methods and mathematical calculations should complement scientific principles chosen and include unit analysis, appropriate precision and accuracy, and use conservative estimations.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEA272A Apply basic scientific principles and techniques in aeronautical engineering situations

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|--|
| 1 | Identify the range of scientific principles and techniques relevant to avionic engineering | 1.1 | Identify the scientific principles relating to avionic engineering |
| | | 1.2 | Research and report on avionic scientific principles using appropriate sources of information |
| | | 1.3 | Identify the techniques and associated technologies, software and hardware associated with implementing scientific principles relating to avionic engineering applications |
| | | 1.4 | Research and report on avionic techniques using appropriate sources of information |
| 2 | Select scientific principles and techniques | 2.1 | Select relevant scientific principles for specific avionic engineering situations |
| | | 2.2 | Select relevant avionic techniques and associated technologies, software and hardware for specific avionic engineering situations |
| 3 | Apply the relevant scientific principles and techniques | 3.1 | Apply applicable scientific principles in a consistent and appropriate manner to obtain any required solution |
| | | 3.2 | Use appropriate calculations and correct units to establish quantities |
| | | 3.3 | Use coherent units in equations in a systematic manner to ensure meaningful solutions |
| | | 3.4 | Use significant figures in engineering calculations |

- 3.5 Obtain required solutions by applying chosen techniques and associated technologies, software and hardware in a consistent and appropriate manner

- 4 Document the results of the application of the avionic scientific principles and techniques
 - 4.1 Document solutions involving engineering calculations in an appropriate style
 - 4.2 Document solutions not involving engineering calculations in an appropriate style

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- applying advanced scientific principles relevant to avionic engineering
- analysing the given situation to determine what is required in the manner of a solution
- analysing the given situation to determine which avionic scientific principles are selected
- selecting appropriate avionic techniques and associated technologies, software and hardware to suit the application/s
- applying appropriate avionic principles in determining the required solution
- applying and manipulating formulas and calculations for engineering applications
- using the correct units to solve engineering calculations
- checking the validity of equations using a systematic method for ensuring coherent units
- applying avionic techniques and associated technologies, software and hardware in a manner appropriate to the application and identified scientific principles
- referring solutions to the original aim of the application
- quoting solutions in appropriate units and using appropriate significant figures
- presenting solutions referring to the original aim of the application

Required knowledge

Required knowledge includes:

- physics – analysis and application of:
 - linear kinematics
 - planar kinematics
 - Newton's Laws of Motion
 - friction
 - momentum and center of gravity
 - gravity
 - circular motion
 - orbital motion
 - rotational motion
 - oscillation
- electronic fundamentals – determination of required values and characteristics for:
 - resistors (including light and voltage dependent resistors)
 - capacitors

- inductors
- transformers
- diodes
- transistors
- power amplifiers
- oscillators
- silicon controlled rectifiers
- thyristor power control circuits
- opto-couplers
- selection of appropriate test equipment
- digital electronics – design, construction and testing of:
 - clocked sequential circuits
 - registers
 - oscillators
 - timers
 - interfacing circuits
 - program logic array
 - state machines
- data communications – analysis and application of:
 - selection of data transmission methods
 - universal asynchronous receiver transmitter construction
 - multiplexers and demultiplexers
 - data encryption/decryption theory
- electronic circuit analysis involving the application of:
 - Fourier Transforms
 - Laplace Transforms
- aerodynamics – application of:
 - drag and speed
 - power/thrust available and power/thrust required
 - manoeuvring flight
 - stability and control
- strength of materials – application of:
 - bending and shear in beams
 - forces in trusses and frames
 - engineering concepts of stress and strain
 - properties of areas
 - torsion
 - mechanical properties of materials
 - two dimensional stress and strain, including elastic constants
- computer software/programming – application of:

- high level languages
- algorithm design and testing
- Pascal and Turbo-Pascal programming
- the limitations of avionic techniques and associated technologies, software and hardware
- the procedure for ensuring coherent units for meaningful solutions to equations
- the concept of significant figures
- the uncertainty of computations based on experimental data
- the procedures for determining the significance of figures in calculations
- the procedures for estimating errors in derived quantities
- the method of application of the avionic techniques and associated technologies, software and hardware
- the application of the calculation solution style
- the significance of the non-calculation solution style

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	Evidence should be provided through the application of scientific principles and techniques in a range of avionic engineering situations.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors should ensure that candidates can: <ul style="list-style-type: none"> • consistently select and apply appropriate scientific principles in avionic engineering situations • document in an appropriate style the solutions obtained through the application of chosen scientific principles in avionic engineering situations.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • Assessment may occur on the job or in an appropriately simulated environment. Access is required to real or appropriately simulated situations, including work areas, materials and equipment, and to information on workplace practices and work health and safety (WHS) and environment practices. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning

	and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure its correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Sources of information	<p>Sources of information include:</p> <ul style="list-style-type: none"> • reference texts • manufacturer catalogues and industrial magazines • internet search engines and websites • email • the use of phone and fax • airworthiness and design authority regulations and
-------------------------------	--

	associated advisory material
Avionic engineering	<p>Avionic engineering is:</p> <ul style="list-style-type: none"> the engineering discipline concerned with the conceptual development, research, design, manufacture, implementation, installation, commissioning and maintenance of aerospace electrical, instrument, radio and electronic systems and components and related test equipment for civil and military applications
Avionic engineering applications	<p>Avionic engineering applications are defined as:</p> <ul style="list-style-type: none"> the description or definition of an objective or challenge within a real or simulated engineering environment or state requiring a conceptual development, design, manufacture and/or implementation and/or installation, commissioning and maintenance response to affect a solution or improvement with regard to: <ul style="list-style-type: none"> electrical systems and related wiring and components (power generation, distribution, control interfaces with hydraulic and pneumatic systems, and caution and warning systems) mechanical and electro-mechanical flight instruments and indication systems (quantity, pressure, temperature, position) and components electronic systems and components (communications, radio navigation, pulse, display, automatic flight control, flight management, and engine management) automatic test stations, adapters and software

Elements and Performance Criteria

- | | |
|---|---|
| 1 Identify the range of aeronautical system design principles and techniques relevant to aeronautical engineering | 1.1 Research and report on aeronautical system design principles using appropriate sources of information |
| | 1.2 Identify the aeronautical system design principles relating to aeronautical engineering applications |
| | 1.3 Research and report on aeronautical system design techniques and associated technologies, software and hardware associated with implementing scientific principles relating to aeronautical engineering applications using appropriate sources of information |
| 2 Select aeronautical system design principles and techniques relevant to aeronautical engineering applications | 2.1 Select the relevant aeronautical system design principles for particular aeronautical engineering situations |
| | 2.2 Select the relevant aeronautical system design techniques and associated technologies, software and hardware for particular aeronautical engineering situations |
| 3 Apply the relevant aeronautical system design principles and techniques appropriately | 3.1 Apply the aeronautical system design principles in a consistent and appropriate manner to obtain any required solution |
| | 3.2 Use appropriate calculations and correct units to establish quantities |
| | 3.3 Use coherent units in equations in a systematic manner to ensure meaningful solutions |
| | 3.4 Use significant figures are used in engineering calculations |
| | 3.5 Apply the aeronautical system design techniques and associated technologies, software and hardware in a consistent and appropriate manner to obtain required solutions |
| 4 Quote the results of the application of the aeronautical system design principles and techniques correctly | 4.1 Quote solutions for applications involving engineering calculations in an appropriate style |
| | 4.2 Quote solutions for applications not involving engineering calculations in an appropriate style |

Required Skills and Knowledge

Required knowledge includes:

- aeronautical engineering techniques and related technologies, software and hardware associated with implementing scientific principles in engineering solutions and related to appropriate engineering applications
- the limitations of aeronautical engineering techniques and associated technologies, software and hardware
- the relevance of scientific principles to aeronautical engineering
- the applicability and limitations of an extensive range of aeronautical engineering techniques and associated technologies, software and hardware
- the choice of aeronautical engineering scientific principles for particular applications
- the applicability of particular aeronautical engineering techniques and associated technologies, software and hardware to specific applications
- the choice of aeronautical engineering techniques and associated technologies, software and hardware for particular applications
- the method of application of the scientific principles
- fundamental and derived quantities
- common systems of units
- the procedure for converting between systems of units
- common prefixes used with units and their values
- the procedure for ensuring coherent units for meaningful solutions to equations
- the concept of significant figures
- the uncertainty of computations based on experimental data
- procedures for determining the significance of figures in calculations
- procedures for estimating errors in derived quantities
- the method of application of the aeronautical engineering techniques and associated technologies, software and hardware
- the significance of the calculation solution style in relation to the original task
- the significance of the non-calculation solution style in relation to the original task

Required skills include:

- applying advanced scientific principles relevant to aeronautical engineering
- analysing the given situation to determine what is required in the manner of a solution
- analysing the given situation to determine which aeronautical engineering scientific principles are selected
- selecting appropriate aeronautical engineering techniques and associated technologies, software and hardware to suit the application/s
- applying appropriate aeronautical engineering principles in determining the required solution
- applying and manipulating formulas and calculations for engineering applications
- using the correct units to solve engineering calculations
- checking the validity of equations using a systematic method for ensuring coherent units
- applying aeronautical engineering techniques and associated technologies, software and

hardware in a manner appropriate to the application and identified scientific principles

- referring solutions to the original aim of the application
- quoting solutions in appropriate units and using appropriate significant figures
- presenting solutions referring to the original aim of the application

Evidence Guide

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to apply aeronautical system design principles and techniques in mechanical engineering situations. Competency in this unit cannot be claimed until all prerequisites have been satisfied.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.</p> <p>Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.</p>
<p>Context of and specific resources for assessment</p>	<p>This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. The assessment environment should not disadvantage the candidate.</p> <p>The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.</p>
<p>Method of assessment</p>	<p>This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with applying aeronautical system design principles and techniques in aeronautical engineering situations or other units requiring the exercise of the skills and knowledge covered by this unit.</p>
<p>Guidance information for assessment</p>	

Range Statement

Aeronautical systems	Aeronautical systems may include: <ul style="list-style-type: none">• hydraulic systems (utility and flight control)• pneumatic systems• mechanical systems• air and vapour cycle air conditioning systems• pressurisation systems• fuel storage and distribution systems• fire extinguishing systems
Sources of information	Sources of information include: <ul style="list-style-type: none">• reference texts• manufacturer catalogues and industrial magazines• websites• use of phone, email and fax information gathering

MEM23109A Apply engineering mechanics principles

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the application of mechanics and strength of materials principles to devices, machines and systems and their components in order to identify key mechanical properties. It includes a range of basic analyses of static and dynamic loads and moments, stresses and deflections, velocities and accelerations.

Application of the Unit

This unit applies to analysis of mechanical devices, machines and systems and their components to determine a range of mechanical related properties. It covers the analysis of 2-D forces and moments, stresses and deflections on bodies, frames and beams. It is suitable for people working as technicians in engineering or related fields using basic mechanics principles and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Identify scope of required analysis	1.1	Identify device, machine or system and component parts for analysis
		1.2	Assess engineering mechanics principles, skills and techniques required by tasks
		1.3	Review functions and features of devices, machines and systems
		1.4	Assess software techniques required for basic analysis and graphics required by the task
		1.5	Identify stakeholders to be consulted on analysis tasks
		1.6	Confirm work health and safety (WHS) and regulatory requirements, risk management and organisational procedures
		1.7	Review sustainability implications of tasks
		1.8	Determine available sources for any required technical and professional assistance
2	Apply engineering mechanics principles and techniques to tasks	2.1	Identify appropriate engineering mechanics principles and analytical, graphical and software-assisted techniques applicable to task
		2.2	Validate software results using analytical and graphical methods
		2.3	Ensure clear and logical process of analysis and compatibility of units in calculations

- 2.4 Apply resultant loads and reactions on machines, support frames and beams due to parallel and oblique, concentrated and distributed loads and moments
 - 2.5 Apply the torque and power required to drive translation screws and winding drums against inclined and vertically suspended loads subject to gravitation, acceleration and friction resistance loads
 - 2.6 Select a range of standard hardware to meet specifications
 - 2.7 Analyse bending and shear stresses in beams subject to static point and distributed loads
- 3 Report results
 - 3.1 Record results of investigation, evaluation and application
 - 3.2 Provide documentation, such as calculations, diagrams, programs and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying parameters and context of tasks, chain of responsibility, WHS and regulatory requirements, risk management and organisational procedures
- confirming personal functions and responsibilities, team and support functional group interdependencies and communications, appropriate qualifications and delegations, and appropriate support
- reviewing sustainability implications, functions and features of devices, machines and systems
- assessing and applying mechanics principles, software basic analysis and graphics skills and techniques to mechanical devices and systems
- employing techniques to ensure clear and logical process of analysis and compatibility of units in calculations
- reporting and documenting results of investigation, evaluation and application, calculations, diagrams, programs and files

Required knowledge

Required knowledge includes:

- mathematical techniques, including arithmetic, algebra, trigonometry, geometry and differential calculus
- definition of typical applications of mechanics, statics, dynamics, kinematics, kinetics and strength of materials
- analytical, graphical, semi-graphical and software-assisted techniques for all tasks
- physical quantities and dimensions, including international system of units (SI) and fundamental dimensions and units
- basic principles of statics applicable to mechanical devices and systems
- application of force systems applied to bodies, frames and beams
- friction laws and applications in mechanical devices and systems
- stress and strain:
 - axial stress
 - shear stress
 - bolted and welded joints
 - torsional stress
- bending of beams
- dynamics applicable to mechanical devices and systems, including:

- kinematics of rectilinear motion:
 - displacement, velocity and acceleration
 - equations of rectilinear motion
 - equations of simple harmonic motion
 - uniform acceleration and sinusoidal acceleration
- kinetics of rectilinear motion:
 - force, mass and acceleration
 - freely falling bodies
 - acceleration against resistance (accelerating force = unbalanced force)
 - acceleration against gravity and terminal velocity
 - acceleration against dry sliding friction and air resistance
 - forces diagrams
- curvilinear motion:
 - normal acceleration in curvilinear motion
 - centrifugal force
 - circular motion as a particular case of curvilinear motion
- kinematics of rotation:
 - rotational motion
 - angular displacement
 - angular velocity
 - angular acceleration
 - conversions of units of angular motion
 - equations of rotation with uniform acceleration
 - relation between linear and angular motion
- kinetics of rotation:
 - moment of inertia, second moment of mass, concept and units
 - torque due to inertia compared with torque due to winding drum rope force
- the law of a machine
- work, energy and power
- specifications for engineering hardware applicable to mechanical devices and systems

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to apply principles of mechanics to machines, support frames, beams and related components to determine static and dynamic loads, stresses and deformations to contribute to the design and component selection process.</p> <p>This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine parameters and context of tasks • apply WHS, regulatory requirements, risk management and organisational procedures • confirm personal functions and responsibilities • review sustainability implications, functions and features of devices, machines and systems • assess and apply engineering mechanics principles, including use of software basic analysis and graphics skills and techniques • ensure compatibility of units in calculations • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.

Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Engineering mechanics tasks	<p>Engineering mechanics tasks covered by this unit include, but are not limited to:</p> <ul style="list-style-type: none"> • application of resultant loads and reactions on machines, support frames and beams • application of the torque and power required to drive translation screws and winding drums against inclined and vertically suspended loads subject to gravitation, acceleration and friction resistance loads • selecting a range of standard hardware, such as shafts, bolts and hooks, subject to plane axial or shear stresses and deformation limits
------------------------------------	--

	<ul style="list-style-type: none"> analysing bending and shear stresses in beams subject to static point and distributed loads
Motion	Motions described in this unit may be of constant velocity, constant acceleration or sinusoidal accelerations (e.g. sprung bodies). Other non-uniformly accelerated motions may be described for contrast only. This unit confines itself to 2-D plane motion
Appropriate licensed technical and professional assistance	<p>Appropriate licensed technical and professional assistance may include:</p> <ul style="list-style-type: none"> technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> high pressure energised fluid vessels high temperatures and heat energy capacity wiring with high current control voltages above extra low voltage professional support for technologies may include: <ul style="list-style-type: none"> specialist electric motor drives and controllers specialist materials, plastics, metal alloys and nano materials special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> WHS Acts and regulations relevant standards codes of practice from Australian and overseas engineering and technical associations and societies risk assessments registration requirements safe work practices state and territory regulatory requirements
Analysis	<p>Analysis may include:</p> <ul style="list-style-type: none"> static and dynamic analysis of loads the stresses and deformations resulting the transmitted power, torque and speed graphical and mathematical methods and software options

MEM23111A Select electrical equipment and components for engineering applications

Modification History

Release 1 - New unit. Replaces MEM23051A, but not equivalent.

Unit Descriptor

This unit of competency covers the identification and matching of electrical supply and electrical system equipment and components to mechanical, manufacturing and mechatronic engineering applications. It includes electrical principles and laws, inductive and capacitive effects on AC supplies, control system power supply fundamentals, electrical safety and earthing systems, electrical motors and motor controls.

Application of the Unit

This unit applies to people working as technicians in engineering or related fields where electrical power supply, equipment and systems must be considered. The unit applies to mechanical, manufacturing and mechatronic engineering applications which include electrical equipment, including domestic, commercial or industrial situations. Electrical equipment and component identification covered by this unit is from manufacturer catalogues or other standard specifications. The unit does not cover one-off design or modification to electrical equipment.

The unit does not cover the undertaking of licensed electrical work but will often apply to individuals working as part of a team that includes licensed electricians.

This unit includes knowledge of electrical dangers and safety procedures and the need to comply with work health and safety (WHS) and electrical regulatory requirements.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|---|
| 1 | Investigate context of electrical equipment and supply | 1.1 | Review functions and features of devices |
| | | 1.2 | Identify safe machine |
| | | 1.3 | Identify WHS and regulatory requirements |
| | | 1.4 | Determine available sources for any required licensed electrical |
| | | 1.5 | Review sustainability implications of energy source options |
| 2 | Determine electrical supply, equipment and components required for engineering-related tasks | 2.1 | Assess electrical supply specifications for engineering application |
| | | 2.2 | Analyse electrical motors and their control options for suitability |
| | | 2.3 | Estimate power factor requirements for engineering applications |
| | | 2.4 | Examine engineering application control and communication requirements |
| | | 2.5 | Appraise isolation, shutdown and emergency equipment options |
| | | 2.6 | Analyse maintenance, life cycle and sustainability requirements of electrical systems and equipment options |
| | | 2.7 | Apply specification, documentation and graphical techniques, modelling, mock-up or prototyping |

- techniques, where required, to achieve or test options
- 2.8 Identify preferred electrical supply system, equipment and components
- 3 Report results
 - 3.1 Record results of investigation, evaluation and application
 - 3.2 Provide documentation, such as calculations, diagrams, programs and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- evaluating relevance of WHS, regulatory requirements, standards and codes of practice
- evaluating multiple solutions against design criteria, risk, sustainability and cost factors
- applying life cycle design and sustainability parameters to identification of task
- solving problems and making decisions with systems thinking approach for contingencies and constraints and continuous improvement
- reviewing sustainability implications, functions and features of devices, machines and systems employing electricity and electrical principles
- integrating electrical evaluation techniques with overall engineering application requirements, including mechanical; fluid power; electronic; heating, ventilation, air conditioning and refrigeration (HVAC/R); and controller and networking
- assessing and applying basic electrical principles and techniques, software basic analysis and graphics skills and techniques to engineering tasks
- ensuring safe electrical working practice
- ensuring compatibility of units in calculations
- reporting and documenting results of investigation, evaluation and application, calculations, diagrams, programs and files

Required knowledge

Required knowledge includes:

- energy source options, sustainability implications of electricity generation, distribution and use
- sustainable sources of energy
- features and function of electrical systems in a range of engineering applications, such as:
 - sources and reliability of supply (e.g. mains, generators and batteries)
 - fault and other protection requirements
 - electrical system control and interfacing with other systems
 - maintainability
 - efficiency
 - fitness for purpose
- WHS and regulatory requirements with particular emphasis on automation safety, codes of practice, standards, risk management and registration requirements
- the effects of electricity on humans, including dangerous high currents and voltages

related to extra low, low and high voltage applications and relating these to engineering applications

- licensed technical and professional assistance
- electrical laws and theorems
- electrical circuit components
- AC and DC electrical supply systems:
 - single and 3-phase power
 - power factor
 - distribution systems, including transformers, cables and switchboards
 - local area distribution considerations and supply authority requirements
 - typical and possible faults and dangerous situations
 - earthing systems, such as multiple earth neutral (MEN) system
- circuit protection devices, such as fuses, thermal relays, circuit breakers and residual current devices
- basic electrical circuits and applications for lighting, motors, controllers, heaters and coolers
- graphical symbols and diagrammatic representation of basic circuits and power supply fundamentals
- electrical power consumption
- electrical measurements and techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to apply electrical principles to ensure safe practice, assist with systems development, component selection and maintenance and broadly evaluate electrical features, functions and performance of machines or systems.</p> <p>This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • identify effects and dangers of electricity • review sustainability implications, functions and features of electrical devices, machines and systems • assess and apply basic electrical principles and techniques • evaluate of suitability of electric power supply for applications • apply appropriate calculations and methods for electric motor control • ensure safe electrical working practice and compatibility of units in calculations • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. MEM23112A Investigate electrical and electronic controllers in engineering applications

Modification History

Release 1 - New unit. Replaces MEM23051A, but not equivalent.

Unit Descriptor

This unit of competency covers investigation of new or existing controllers for suitability in automated systems used in engineering applications. The unit includes the application of fundamental controller programming techniques and control system power supply requirements, basic programmable logic controller (PLC), microcontroller and system control and data acquisition (SCADA) applications.

Application of the Unit

The unit applies to controllers used in automated systems in industry. Typical applications of the unit include assessing the ongoing suitability of existing controllers, programming of PLCs, adjustments to controllers for new equipment or products, and condition monitoring. It is suitable for people working as automation or mechatronics technicians and for people using the services of electrical and control systems technicians. It is suitable for those pursuing careers and qualifications in mechatronic or automated system design and maintenance.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23111A	Select electrical equipment and components for engineering applications

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|--|
| 1 | Determine scope of electro and controller operation | 1.1 | Assess current or proposed controller context for electrical and automation safety and risks |
| | | 1.2 | Identify potential or actual dangerous high currents and voltages and check for regulatory compliance requirements related to extra low, low and high voltage applications |
| | | 1.3 | Identify work health and safety (WHS) and regulatory requirements with particular emphasis on automation safety, codes of practice, standards, risk management and organisational procedures |
| | | 1.4 | Identify stakeholders to be consulted on investigation task |
| | | 1.5 | Investigate software and software techniques required for basic analysis and graphics required for controller investigation task |
| | | 1.6 | Ensure appropriate support, including licensed electrical, technical and professional assistance is available |
| 2 | Review functions and features needed in controller application | 2.1 | Use analytical and graphical software, as required, to review controller application and function |
| | | 2.2 | Validate software results |
| | | 2.3 | Undertake instrument readings, as required |

- | | | | |
|---|---|-----|--|
| 3 | Program controllers and SCADA applications for required functions | 3.1 | Program controller as required for required sequencing and actuations for applications |
| | | 3.2 | Develop simple SCADA applications for required interactions with inputs and outputs of controllers |
| 4 | Report results | 4.1 | Record outcomes of investigation, evaluation and application |
| | | 4.2 | Provide documentation, such as calculations, diagrams, programs and files |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying parameters and context of tasks, WHS, regulatory requirements, risk management and organisational procedures
- reviewing effects of electricity on humans, dangerous high currents and voltages and automated systems, regulatory requirements related to extra low, low and high voltage applications, and relating these to electrical and electronic applications in engineering
- reviewing sustainability implications of functions and features of devices, machines, controllers, interfaces, signal conditioning and networks programming and interfacing of PLCs, including sequencing two or more actuations with start, stop and actuation motion confirmation signals
- ensuring safe electrical working practice, including use of licensed personnel
- describing information flow and control as a flowchart
- reporting and documenting results of investigation, evaluation and application, calculations, diagrams, programs and files

Required knowledge

Required knowledge includes:

- the effects of electricity on humans
- electrical laws:
 - Ohm's law
 - Kirchhoff's voltage and current laws
 - analogies with hydraulics, pressure drop and continuity
- automated systems and mechatronic devices (Note: This unit does not include design or modification of interfacing with these devices)
- common software requirements of control systems, including SCADA, distributed control systems (DCS) and programming
- PLC and microcontroller basic programming functions
- SCADA, including basic editing and programming techniques
- documentation techniques, circuit diagrams, programs and applications
- specifications for hardware applicable to controller techniques in engineering

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	<p>A person who demonstrates competency in this unit must be able to apply controller principles to ensure safe practice, assist with systems development, component selection and maintenance and broadly evaluate electrical, electronic and controller features and functions.</p> <p>This includes working individually and as part of a team and recognising and complying with normal control procedures on engineering projects.</p>

MEM23113A Evaluate hydrodynamic systems and system components

Modification History

Release 1 - New unit. Replaces MEM23081A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of fluid systems and system components. It includes hydrodynamic fundamentals, including properties of fluids and system component materials, evaluation of system component performance related to flow rates, pressures, forces and power of containment, transport and use of fluids, work health and safety (WHS) compliance requirements and risk management procedures.

Application of the Unit

This unit applies to evaluation of fluid systems and components used in hydrodynamic systems. It is suitable for people working as technicians in these industries or system designers, draftspersons and maintainers, and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23006A	Apply fluid and thermodynamics principles in engineering

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Establish scope of hydrodynamic system	1.1	Determine fluid systems and system components to be evaluated
		1.2	Identify stakeholders to be consulted on evaluation tasks
		1.3	Confirm that appropriate support, including technical and professional assistance, is available
		1.4	Determine WHS and regulatory requirements, risk management and organisational procedures
		1.5	Investigate sustainability implications of hydrodynamic applications
2	Apply principles and techniques required for evaluation of hydrodynamic system and components	2.1	Review features and functions of hydrodynamic system and components
		2.2	Determine hydrodynamic principles and techniques required to evaluate system and select and optimise components
		2.3	Determine appropriate analysis techniques, software and software validation techniques
3	Evaluate hydrodynamic system and components	3.1	Assess components and system compatibility with fluid properties
		3.2	Assess suitability of pumps and pump performance in hydrodynamic system
		3.3	Assess forces on bends and section changes in piping

- systems and confirm they are within specification
 - 3.4 Assess hydrodynamic performance of components, such as fittings, valves and hoses
 - 3.5 Assess open channel systems and optimise for required flow rates
 - 3.6 Evaluate collar and cylindrical bearings subject to boundary, transitional and hydrodynamic lubrication
- 4 Report results
- 4.1 Record outcomes of evaluation
 - 4.2 Provide documentation, such as calculations, component and system layouts, and functional diagrams

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining parameters and context of tasks
- identifying WHS and regulatory requirements
- identifying risk management and organisational procedures
- reviewing sustainability implications, features and functions of hydrodynamic systems and components
- identifying hydrodynamic principles and techniques, analysis techniques, software and software validation techniques
- ensuring compatibility of units in calculations
- evaluating components and system compatibility with fluid properties, pumps, turbines, piping forces, hydrodynamic performance of components, open channel systems, collar and cylindrical bearing lubrication
- selecting equipment and instruments for use in evaluation considering properties and compatibility
- reporting and documenting results of scoping, principles and techniques identification, evaluation of applications, calculations, component and system layouts, and functional diagrams

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, standards, risk management and registration requirements
- availability of professional and technical assistance for engineering specialisations
- current options and trends in performance analysis software, including underpinning program techniques and software validation techniques
- properties of fluids:
 - fluid types
 - relevant units of measurement
 - chemical properties
- sustainability issues:
 - hydrodynamic energy, generation and consumption
 - environmental effects of manufacturing and use
- fluid statics

- fluid dynamics, including:
 - flow
 - velocity
 - viscosity
 - pressure
 - fluid power
 - hydrodynamic forces
- hydrodynamic system components
- head loss in pipes and fittings
- pumping systems, including components and methods for determining efficiency
- forces developed by flowing fluids
- open channel flow
- oiled bearings

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate hydrodynamic systems, including evaluation of system performance, selection of components and calculation of fluid force.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine parameters and context of evaluation task • determine WHS, regulatory requirements, risk management and organisational procedures • identify features, functions and components of a range of hydrodynamic systems • investigate and review sustainability implications, features and functions of hydrodynamic systems and components • apply correct hydrodynamic principles and techniques for particular hydrodynamic systems • evaluate components and systems to determine safety, efficiency and fitness for purpose • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and

	<p>accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge.</p> <ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Hydrodynamic systems	<p>Hydrodynamic systems include:</p> <ul style="list-style-type: none"> • fluid vessels (e.g. static dams, tanks and pools, and vessel in dynamic applications) • pumping systems (e.g. industrial wash, fire prevention and irrigation) • turbines for hydro-electric power generation • components, such as fluid containers, ducts, pipes, valves, pumps, turbines and fluid measuring devices • open channels for liquid transfer
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best

	<p>practice guides</p> <ul style="list-style-type: none"> • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
Appropriate licensed technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements applying to electrical work
Standards and codes	<p>Standards and codes refers to all relevant Australian and international standards and codes applicable to a particular hydrodynamic system task</p>

MEM23114A Evaluate thermodynamic systems and components

Modification History

Release 1 - New unit. Replaces MEM23081A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of thermodynamic systems and components, such as heat exchangers, heat engines, refrigeration and air conditioners, and air compressors.

Application of the Unit

This unit applies to the evaluation of thermodynamic systems and components. The evaluation may be undertaken as part of a design or system selection process or to assess system condition, sustainability or efficiency. It is suitable for people working as technicians or system designers and draftspersons, and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23006A	Apply fluid and thermodynamics principles in engineering

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of thermodynamic system	1.1	Determine thermodynamic system and system components to be evaluated
		1.2	Determine stakeholders to be consulted on the evaluation
		1.3	Confirm that appropriate support, including technical and professional assistance, is available
		1.4	Determine work health and safety (WHS) and regulatory requirements, risk management and organisational procedures
		1.5	Investigate sustainability implications of thermodynamic applications
2	Identify principles and techniques required for evaluation of thermodynamic system and components	2.1	Review features and functions of thermodynamic system and components
		2.2	Determine thermodynamic principles and techniques required to evaluate system and select and optimise components
		2.3	Determine appropriate analysis techniques, software and software validation techniques
3	Evaluate thermodynamic applications and components	3.1	Assess the performance of heat transfer devices
		3.2	Assess heat engine performance
		3.3	Assess combustion processes

- 3.4 Assess steam processes, where present
 - 3.5 Assess refrigeration and air conditioning processes, where present
 - 3.6 Assess air compression processes, where present
- 4 Report results
- 4.1 Record outcomes of evaluation
 - 4.2 Provide documentation, such as calculations, component and system layouts, and functional and thermodynamic cycle diagrams

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining parameters and context of tasks
- identifying WHS and regulatory requirements
- identifying risk management and organisational procedures
- investigating and reviewing sustainability implications, features and functions of thermodynamic systems and components
- identifying thermodynamic principles and techniques, analysis techniques, software and software validation techniques
- evaluating components, combustion, steam, air compression, refrigeration and air conditioning processes
- system compatibility with fluid properties, pumps, turbines, piping forces and thermodynamic performance of components
- selecting equipment and instruments for use in evaluation considering properties and compatibility
- reporting and documenting results of scoping, principles and techniques identification, evaluation of applications, calculations, component and system layouts, and functional diagrams and thermodynamic cycle diagrams

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, standards and risk management requirements
- availability of professional and technical assistance
- current options and trends in performance analysis software, including underpinning program techniques and software validation techniques
- descriptions of thermodynamic devices and systems, such as boilers, turbines, refrigerators, gas-turbines and rockets
- concepts related to thermodynamics, such as:
 - properties, process and state
 - mass, conservation of mass, specific volume and density, force, weight, pressure and temperature
 - systems, cycles and steady state
- energy forms

- effects of heating of solids and liquids
- heat transfer, conduction, convection and radiation, including related laws and calculations
- typical thermodynamic devices and engines, and thermal cycles
- closed and open systems:
 - non-flow, internal energy
 - flow systems, mass and volumetric flow and continuity of flow
- steady flow and enthalpy, turbines, compressors, boilers and heat exchanger applications
- zeroth and first laws in detail and second law (conceptual)
- gas laws and characteristics
- gas compression effects, measurements and calculations
- compressor types and characteristics heat engines, including types, cycles, performance and efficiency fuels and combustion steam plant and processes for steam generation, heat transfer and power production, including:
 - steam saturation steam tables
- air conditioning, refrigeration and heat pumping plant and processes

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate thermodynamic systems, including evaluation of system performance and selection of components.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine parameters and context of evaluation task • determine WHS, regulatory requirements, risk management and organisational procedures • identify features, functions and components of a range of thermodynamic dynamic systems and components • investigate and review sustainability implications, features and functions of thermodynamic systems and components • evaluate components and systems to determine safety, efficiency and fitness for purpose • evaluate combustion, steam, air compression and refrigeration and air conditioning processes • determine system performance and heat transfer • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. MEM23115A Evaluate fluid power systems

Modification History

Release 1 - New unit. Replaces MEM23081A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of hydraulic and pneumatic systems and components, including automated fluid power applications characterised by two or three actuators requiring digital control of valves and preset flow and pressure control.

Application of the Unit

This unit applies to the evaluation of manual and automated fluid power systems and components. The evaluation may be undertaken as part of a design or system selection process or to assess system condition, sustainability or efficiency. It is suitable for people working as fluid power technicians or system designers, draftspersons and maintainers, and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23006A	Apply fluid and thermodynamics principles in engineering

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of fluid power system evaluation	1.1	Determine fluid power systems and components to be evaluated
		1.2	Identify stakeholders to be consulted on the evaluation
		1.3	Confirm that appropriate support, including technical and professional assistance, is available
		1.4	Determine relevant work health and safety (WHS) and regulatory requirements, risk management and organisational procedures
		1.5	Investigate sustainability implications of fluid power applications
2	Identify principles and techniques required for evaluation of fluid power systems and components	2.1	Review features and functions of pneumatic systems and components for relevance to evaluation
		2.2	Review features and functions of hydraulic systems and components for relevance to evaluation
		2.3	Determine fluid power principles and techniques required to evaluate systems and select and optimise components
		2.4	Determine appropriate analysis techniques, software and software validation techniques

-
- | | | | |
|---|---|-----|---|
| 3 | Evaluate fluid power systems and components | 3.1 | Assess fluid suitability, compatibility, and treatment relative to systems |
| | | 3.2 | Assess features, functions and suitability of hydraulic systems and components for applications |
| | | 3.3 | Assess features, functions and suitability of pneumatic components for applications |
| | | 3.4 | Assess suitability of fluid power system and components in automated power applications using two or three actuator hydraulic or pneumatic circuits with digital fluid and electrical/electronic control elements |
| 4 | Report results | 4.1 | Record outcomes of evaluation |
| | | 4.2 | Provide documentation, such as calculations, component and system layouts, and functional diagrams and fluid power process, and control signal diagrams |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining parameters and context of fluid power systems
- identifying WHS and regulatory requirements
- identifying risk management and organisational procedures
- investigating and reviewing sustainability implications, features and functions of fluid power systems and components
- identifying fluid power principles and techniques, analysis techniques, including use of software and software validation techniques
- evaluating fluid suitability, compatibility and treatment, features and functions of hydraulic and pneumatic components and systems both automated and non-automated, digital fluid and electrical/electronic control elements
- reporting and documenting results of scoping, principles and techniques identification, evaluation of applications, calculations, component and system layouts, functional diagrams and fluid power process and control signal diagrams

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, standards, risk management requirements
- availability of professional and technical assistance
- current options and trends in performance analysis software, including underpinning program techniques and software validation techniques
- common applications for pneumatics and hydraulics
- comparative advantages of fluid power over mechanical and electrical power for particular applications
- characteristics and properties of pneumatic and hydraulic fluids and relative compressibility of air and hydraulic fluid
- applications and selection criteria for mineral, synthetic and fire-resistant fluids and compatibility of fluids with system materials
- fluid power fundamental principles and calculations for system components, including:
 - conservation of energy
 - energy measurement and units
 - energy forms
 - hydraulics fundamentals, such as pressure, temperature and flow rate relative to actuator

force

- pneumatic fundamentals, such as gas laws, pressure difference and flow rate, and flow to atmosphere
- features and functions and selection criteria of fluid power components in applications, including:
 - pumps
 - valves electrical circuits and control elements actuators
 - accumulators
 - compressors (pneumatics)
 - reservoirs
 - gauges and instrumentation
 - hoses, pipes, filters and fittings
- types and requirements for fluid and electrical circuits maintenance requirements for fluid power systems
- methods of circuit presentation, standard symbols, circuit sequence and signal condition diagrams for multi-actuator circuits

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate fluid power systems both automatic and non-automated for safety, economy and fitness for purpose, including selection of components.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • determine parameters and context of evaluation task • determine WHS and regulatory requirements, risk management and organisational procedures • investigate and review sustainability implications, features and functions of fluid power systems and components • identify fluid power principles and techniques analysis techniques, software and software validation techniques • evaluate fluid suitability, compatibility and treatment, features and functions of hydraulic and pneumatic components and systems, digital fluid and

	<p>electrical/electronic control elements</p> <ul style="list-style-type: none"> • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. MEM23116A Evaluate programmable logic controller and related control system component applications

Modification History

Release 1 - New unit. Replaces MEM23082A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of automated devices, machines and processes controlled by programmable logic controllers (PLCs). It includes basic PLC architecture, associated control system components and programming techniques, work health and safety (WHS) compliance requirements, risk management, automation safety, networking for data sharing and remote control, and broad implications of wiring rules.

Application of the Unit

This unit applies to evaluations of PLCs and their use in engineering applications. The evaluation may be undertaken as part of a PLC selection process or to assess PLC and control system condition or efficiency. It is suitable for people working as automation, mechatronics or maintenance technicians or for those pursuing qualifications or careers in those disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

MEM23111A Select electrical equipment and components for engineering applications

MEM23112A Investigate electrical and electronic controllers in engineering applications

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|---|-----|--|
| 1 | Determine scope of evaluation | 1.1 | Confirm and apply safe electrical working practice |
| | | 1.2 | Review the currents and voltages present in the PLC applications and check for regulatory requirements and dangerous high currents and voltages, including effects on humans and on application equipment and components |
| | | 1.3 | Identify WHS and regulatory requirements with particular emphasis on automation safety, codes of practice, standards, risk management and organisational procedures |
| | | 1.4 | Determine requirement for PLC and related control system components |
| | | 1.5 | Ensure appropriate support, including licensed electrical, technical and professional assistance, is available. |
| | | 1.6 | Determine software and software techniques for analysis and graphics required by the evaluation task |
| | | 1.7 | Identify stakeholders to be consulted on evaluation |
| | | 1.8 | Investigate sustainability implications of PLC applications |
| 2 | Establish existing features of PLC applications | 2.1 | Review the functions and features of devices, machines and processes controlled by PLCs |
| | | 2.2 | Identify features and functions of PLC systems and components |

-
- 2.3 Review PLC programming and functions
 - 2.4 Identify system integrating principles and techniques, signal conditioning and power interfacing
 - 2.5 Identify networking and system supervision, data acquisition and systems control options
- 3 Evaluate PLC applications
 - 3.1 Determine suitability of components of application including sensor/transducers, PLC and output devices, signal conditioning and interfacing
 - 3.2 Establish suitability of controller functions, PLC software and programming
 - 3.3 Determine suitability of network, system control and data acquisition (SCADA) communications protocols, standards and network topologies, human-machine interfaces (HMIs) and graphical user interfaces (GUIs) used by applications
 - 3.4 Evaluate compliance of application with WHS and regulatory requirements, codes of practice, standards and risk management procedures
- 4 Report results
 - 4.1 Record results of evaluation
 - 4.2 Provide documentation, such as layouts, programs, flow charts, state diagrams and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying features and functions of PLCs and control systems, including:
 - components
 - signal conditioning and power interfacing
 - networking and system supervision, data acquisition and systems control options
- ensuring safe electrical working practice, including use of licensed personnel, where required
- investigating sustainability implications of PLC applications
- evaluating safety, condition, efficiency and functionality of PLCs and associated applications, including:
 - controller functions and programming
 - network and interfacing, including SCADA, communications protocols, standards and network topologies
 - suitability of HMIs and GUIs
 - compliance with WHS and regulatory requirements
- applying WHS, regulatory and automation safety requirements, risk management and organisational procedures
- reporting and documenting results of evaluation, including layouts, programs, flow charts or state diagrams and files

Required knowledge

Required knowledge includes:

- features of a range of PLC and related control system component applications used in engineering environments
- effects of electricity on humans, dangerous high currents and voltages and automated systems, regulatory requirements related to extra low, low and high voltage applications
- relevant compliance requirements of WHS, regulations, codes of practice, standards, and risk assessment requirements for integrated manufacturing systems with particular emphasis on automation safety
- hardware functions, options and integration into PLC and related control systems
- input devices/sensors
- output devices/actuators
- PLCs
- interfacing and signal conditioning

- communications and networking options for devices
- HMIs and GUIs
- PLC architecture
- Input/Output (I/O) functions and arrangements
- typical input signals and sensor/transducers
- shielding and twisted pairing for noise mitigation
- calibration techniques
- reading of discrete levels from analog input data (other analog I/O functions not required by this unit)
- input signal conditioning
- digitally driven output devices and interface requirements power supply
- programming techniques and options

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to evaluate PLCs and related control system component applications for safety, efficiency and function.</p>

<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
<p>Guidance information for assessment</p>	<p>Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.</p>

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

<p>PLC applications</p>	<p>PLC applications may include:</p> <ul style="list-style-type: none"> • industrial (e.g. motor controllers, fault detectors and power controllers) • multi-axis machine control • process automation • packaging, shrink-wrapping, labelling and palletising • utilities, water treatment and effluent treatment • industrial distributed control system • amusement rides • agricultural machine and irrigation controllers
--------------------------------	--

	<ul style="list-style-type: none"> • military and aerospace automation (except aircraft systems) • mineral and chemical, and petroleum processing
PLC software	<p>PLC software and programming language may cover:</p> <ul style="list-style-type: none"> • ladder diagram (LD) – graphical • function block diagram (FBD) – graphical • structured text (ST) – textual • instruction list (IL) – textual • sequential function chart (SFC) – elements to organise programs for sequential and parallel control processing <p>PLC programming language standards may comply with IEC 61131-3 or other standards</p>
Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies may include: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Standards and codes	<p>Standards and codes refer to all relevant Australian and international standards and codes applicable to a particular PLC related task</p>
Automation safety	<p>Automation safety refers to the reliance on emergency stop,</p>

	failsafe design, redundancy, system interlocks and data integrity. Standards apply to general plant design and use as well as the 'functional safety of safety-related electrical, electronic and programmable electronic control systems'
Data and communications protocols and standards	Data and communications protocols and current standards may include: <ul style="list-style-type: none"> layered communications and networking protocols, such as Open Systems Interconnection Model (OSI Model) – 7 layers TCP/IP Internet Protocol Suite {Transmission Control Protocol (TCP) and the Internet Protocol (IP)} – 4 or 5 layers IEEE 802 Wireless PAN, LAN, MAN and WPAN standards interface standards, such as RS232 and RS485, Fieldbus, Modbus and DNP3.0
Network topologies	Network topologies may include: <ul style="list-style-type: none"> daisy-chain, star, ring, branch, linear and tree wired and wireless options
Sustainability	Sustainability is used to mean the entire sustainable performance of the organisation/plant, including: <ul style="list-style-type: none"> meeting all regulatory requirements conforming to all industry covenants, protocols and best practice guides minimising ecological and environmental footprint of process, plant and product maximising economic benefit of process plant and product to the organisation and the community minimising the negative WHS impact on employees, community and customer

Unit Sector(s)

Competency field

Unit sector Engineering science

Custom Content Section

Not applicable.

MEM23117A Evaluate microcontroller applications

Modification History

Release 1 - New unit. Replaces MEM23082A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of automated devices, machines and processes controlled by microprocessors. This includes integration of input devices/sensors, output devices/actuators, controllers, interfacing and signal conditioning, human-machine interfaces (HMIs), networking options, data and communications protocols software, and programming of microcontrollers and automation safety. Analog interfacing is included but not proportional integral derivative (PID) interfacing.

Application of the Unit

This unit applies to the evaluation of microcontrollers and their use in automated devices, machines and engineering processes. It is suitable for people working as automation, mechatronics or maintenance technicians or for those pursuing qualifications or careers in those disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23111A	Select electrical equipment and components for engineering applications
MEM23112A	Investigate electrical and electronic controllers in engineering applications

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of evaluation	1.1	Confirm and apply safe electrical working practice
		1.2	Review the currents and voltages present in the microcontroller applications and check for regulatory requirements and dangerous high currents and voltages, including effects on humans and on application equipment and components
		1.3	Identify work health and safety (WHS) and regulatory requirements with particular emphasis on automation safety, codes of practice, standards, risk management and organisational procedures
		1.4	Identify software techniques and graphics required for evaluation
		1.5	Identify stakeholders to be consulted on evaluation tasks
		1.6	Identify sources of technical and professional assistance
		1.7	Investigate sustainability implications of microcontroller applications
2	Establish existing features of microprocessor applications	2.1	Review the functions and features of devices, machines and processes controlled by microprocessors
		2.2	Identify features and functions of microprocessor devices and components
		2.3	Review microprocessor programming and functions
		2.4	Identify system integrating principles and techniques,

- signal conditioning and power interfacing
- 2.5 Identify networking and system supervision, data acquisition and systems control options
- 3 Evaluate microcontroller applications
 - 3.1 Determine suitability of components of application, including sensor/transducers, microcontroller and output devices, signal conditioning and interfacing used by applications
 - 3.2 Assess scope and suitability of microcontroller functions, software and programming to applications
 - 3.3 Assess suitability of network, system control and data acquisition (SCADA) options, communications protocols, standards and network topologies, HMIs and graphical user interfaces (GUIs) used by applications
 - 3.4 Review application for compliance with WHS and regulatory requirements, codes of practice, standards and risk management procedures
- 4 Report results
 - 4.1 Record results of scoping, principles and techniques identification, and evaluation of applications
 - 4.2 Provide documentation, such as layouts, programs, flow charts, state diagrams and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying features and functions of microcontroller systems, including:
 - components
 - system integrating principles and techniques
 - signal conditioning and power interfacing
 - networking and system supervision, data acquisition and systems control options
- ensuring safe electrical working practice, including use of licensed personnel
- investigating sustainability implications of microcontroller applications
- evaluating safety, condition, efficiency and functionality of microcontrollers and their applications, including
 - components of applications
 - controller functions and programming, network, SCADA, communications protocols, standards and network topologies
 - HMIs and GUIs
- compliance with WHS and regulatory requirements
- applying WHS, regulatory and automation safety requirements, risk management and organisational procedures
- reporting and documenting results of scoping, principles and techniques identification, and evaluation of applications, layouts, programs and flow charts or state diagrams

Required knowledge

Required knowledge includes:

- features of a range of microcontrollers and related control system component applications used in engineering environments
- compliance requirements of WHS, regulations, codes of practice, standards and risk assessment
- effects of electricity on humans, dangerous high currents and voltages and automated systems, and regulatory requirements related to extra low, low and high voltage applications
- hardware functions, options and integration with microprocessor applications
- input devices/sensors, output devices/actuators, controller, interfacing and signal conditioning, communications, HMIs, GUIs, and networking options for devices
- appropriate use of microprocessor related terminology
- microcontroller features and function, including:

- volatile and non-volatile memory and data storage
- one-time programmable and reprogrammable microcontrollers
- typical microcontroller architecture characteristics
- central processing unit (CPU) functions
- interrupt structures
- Input/Output (I/O) functions
- timers and clocks
- logic
- programming methods and techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate microprocessor devices, machines and processes for safety, economy and fitness for purpose.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • identify and assess compliance with WHS and regulatory requirements, and risk management procedures • review dangers and effects of electricity on humans • identify microprocessor related systems and components, integrating principles and techniques • assess suitability of programming • investigate sustainability implications of microprocessor related applications • assess and apply basic electrical and electronic, control principles, controller programming principles and techniques, software basic analysis, and graphics skills and techniques • evaluate components of applications against application specifications for safety, economy and fitness for purpose • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge.

	<ul style="list-style-type: none"> • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Microcontroller	Microcontrollers are typically an integrated circuit consisting of a CPU combined with support functions, such as a crystal oscillator, timers, watchdog timer, serial and optional analog I/O. A limited amount of read/write memory on the chip along with program memory in the form of reprogrammable flash or 'one-time programmable' ROM
Microcontroller applications	Microcontroller applications are found in most industries. Typical applications include: <ul style="list-style-type: none"> • motor controllers • fault detectors • power controllers • communications • security systems • machine and process automation • automotive and transport applications • domestic appliances • medical equipment

Standards and codes	Standards, codes and protocols refer to all relevant Australian and international standards, codes and protocols applicable to microprocessor related tasks
Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies may include: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Automation safety	Automation safety refers to the reliance on emergency stop, failsafe design, redundancy, system interlocks and data integrity. Standards apply to general plant design and use as well as the functional safety of safety-related electrical, electronic and programmable electronic control systems.
Network topologies	<p>Network topologies include:</p> <ul style="list-style-type: none"> • daisy-chain, star, ring, branch, linear and tree • wired and wireless options
Software for microcontroller applications	<p>Software for microcontroller applications may include:</p> <ul style="list-style-type: none"> • integrated development environment software which may include programmer, editor, assembler, compiler, linker, simulator and emulator • HMI software

	<ul style="list-style-type: none"> • network software • modem software
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer

Competency field

Unit sector Engineering science

Custom Content Section

Not applicable.

MEM23118A Apply production and service control techniques

Modification History

Release 1 - New unit. Replaces MEM23083A, but not equivalent.

Unit Descriptor

This unit of competency covers the application of techniques for production and service control to maintain efficient and effective supply of product or service delivery to customers and to provide data for improvements to enhance competitiveness. This unit includes monitoring and measurement of quality, costs, quantities and reliability of processes in the value chain, including maintenance activities to ensure customer requirements. It requires the use of statistical process control (SPC), and control charts and the graphical representation of results.

Application of the Unit

This unit applies to individuals who are required to control production and/or service delivery processes to ensure quality and for product manufacture or the provision of services to defined quality and operational requirements. It is suitable for people working as service providers, supervisors or technicians and those pursuing manufacturing, engineering or related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM30012A Apply mathematical techniques in a manufacturing, engineering or related environment

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Establish scope of required production or service control	1.1	Identify products or services required by customers, including quality and delivery requirements
		1.2	Identify current production or service control tasks, key performance indicators (KPIs), and context within organisation strategic objectives and markets
		1.3	Identify software techniques required for production or service control, communications and reporting
		1.4	Identify stakeholders to be consulted on the production or service control tasks
		1.5	Confirm work health and safety (WHS) and regulatory requirements, codes of practice, standards and risk assessment requirements
2	Review current data collection and production or service provision	2.1	Determine measurable parameters of production process or service delivery
		2.2	Determine parameters of product or service that are open to control and establish tolerances or acceptable variation
		2.3	Review process control functions
		2.4	Review production control performance indicators/indices
		2.5	Review the role of probability in sampling and SPC
		2.6	Review process capability and SPC evaluation, control

- charts and sampling
- 2.7 Review features and functions of graphical methods for display of data
- 3 Analyse data and apply production control principles to improve product manufacture or service provision
- 3.1 Obtain or record production or service data or appropriate data samples using a range of manual and automated devices
- 3.2 Use software and control chart techniques to generate histograms, Pareto diagrams, flowcharts, tallycharts, scatter plots and/or run charts in accordance with procedures
- 3.3 Analyse data for trends and correlations and apply to process improvement, quality control and other support functions according to procedures
- 3.4 Determine process capability indices for an appropriate sample of a product or service delivery
- 3.5 Establish required performance indicators for production or service operations
- 3.6 Take corrective action in accordance with procedures
- 3.7 Monitor production or service delivery using control charts to determine compliance of the product or service with specified performance limits
- 3.8 Take further corrective action, as required
- 4 Report results
- 4.1 Provide required reports
- 4.2 Provide documentation, such as data, graphics, capability assessments, control and continuous improvement processes

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying production control task parameters and context within organisation strategic objectives and markets
- confirming stakeholder and support functional group interdependencies and communications, reporting and information flow
- determining controllable parameters of product or service and acceptable variation
- using manual and automatic methods for measurement, data gathering and analysis
- production of different charts used in production and service control, including:
 - histograms
 - Pareto diagrams
 - flowcharts
 - tallycharts
 - scatter plots
 - run charts
- applying a range of sampling plans to products or measurable aspects of services and justifying the choice of sampling plan
- analysing data for trends and correlations
- setting of KPIs capable of measurement and ongoing monitoring
- determining appropriate corrective actions based on analysis of measurable production or service performance parameters

Required knowledge

Required knowledge includes:

- process capability, including:
 - capable processes definition
 - upper, lower and target specification limits
 - in-control
 - out-of-control, assignable causes and trends
 - corrective action plans, such as Western Electric, Wheeler or Nelson rules
 - capability indices
 - sample estimators
 - confidence intervals for indices and Chi square distribution

- role of production or process control in supporting lean processes, for example:
 - value stream management
 - standardised work
 - demand pull
 - just-in-time (JIT)
 - process levelling
 - cycle time
 - quick changeover
 - preventative maintenance
 - waste minimisation
 - efficient process layout
- role of production control in quality maintenance:
 - mistake proofing process
 - defect detection, production halt and correction procedures
 - total quality management (TQM), quality assurance (QA) procedures and quality control (QC), and SPC processes
 - role of SPC and process capability
- production control performance indicators/indices
- applications where role of probability in sampling and SPC is important
- SPC, including:
 - data types and frequency distributions
 - population mean and standard deviation
 - sample mean and standard deviation
 - upper and lower specification limits and target
 - upper and lower process control limits and centre line
 - data mean and process control centre line offset
 - 3 sigma σ and 6 sigma σ
 - sigma shift to account for long-term drift of data
- types and functions of control charts
- attributes and variables of sampling plans
- features and functions of graphical methods for display of data:
 - Ishikawa 'Fishbone' diagrams
 - histograms
 - Pareto analysis diagrams
 - flowcharts
 - tallycharts
 - scatter plots
 - run charts, including control charts
- types of manual and automated data collection and information flow

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to measure and analyse production or service performance data and apply techniques for process control to maintain efficient and effective production or supply or service to customers and to provide data for improvements to enhance competitiveness. This includes working individually and as part of a team in accordance with organisational procedures</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine measurable and controllable parameters of product or service, • determine acceptable variation of production or service parameters • use manual and automatic methods for measurement, data gathering and analysis • apply software and control chart techniques for SPC, performance analysis and graphical representations, including generating histograms, Pareto diagrams, flowcharts, tally charts, scatter plots and/or run charts from production or measurable service data • review production and service functions in order to recommend or make process improvements that are based on statistical analyses • identify WHS and regulatory requirements, risk management and related organisational procedures • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. • The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability.

	<ul style="list-style-type: none"> • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Production control related tasks	<p>Production control related tasks covered by this unit may include:</p> <ul style="list-style-type: none"> • measuring and recording data either manually or using automated data collection • determining process capability indices for a large sample of a product with a particular dimension normally distributed within upper and lower specification limits • applying a range of sampling plans to products or measurable aspects of services and justify the choice of sampling plan based
---	---

	<p>on the properties required of the plan</p> <ul style="list-style-type: none"> • applying control charts to a sample from a product or service to determine acceptability of the product or service within set limits (e.g. 3σ and 6σ limits) • analysing data for trends and taking corrective action in accordance with procedures • selecting and employing appropriate control charts from c-chart, p-chart and X-bar and R or np control charts • employing a Pareto analysis to determine priority issues for solutions related to a specific problem
Process control	Process control includes the qualitative and quantitative analysis of the process and production data necessary to ensure customer requirement
Required performance indicators for production or service operations	<p>Required performance indicators for production or service operations will vary according to the nature of the product or service and may include:</p> <ul style="list-style-type: none"> • design features, such as dimensional and weight specifications and tolerances • production schedules • organisation or customer specified target error rates and waste, including those set under lean systems, such as 6σ • equipment availability indices • mass balancing targets • WHS related indicators (e.g. lost time injury) • takt time compliance
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Lean principles	Lean principles and techniques use cost, capacity and responsiveness, quality, reliability and waste minimisation as drivers of the process and measures for process improvement.

MEM23119A Evaluate continuous improvement processes

Modification History

Release 1 - New unit. Replaces MEM23083A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of continuous improvement processes for production, engineering and associated services. It requires the evaluation of improvement processes, and the efficiency and effectiveness of their response to continuous feedback from customers and other sources. It requires consideration of the effect of improvements or change on entire systems.

Application of the Unit

This unit applies to production and engineering activities where continuous improvements, such as those to product, process or service, efficiency or competitiveness, is required. It is suitable for people working as service providers, supervisors or technicians and those pursuing manufacturing, engineering or related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23118A	Apply production and service control techniques
MEM30012A	Apply mathematical techniques in a manufacturing, engineering or related environment

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|---|
| 1 | Establish scope of continuous improvement evaluation | 1.1 | Identify industrial and market context for continuous improvement |
| | | 1.2 | Identify features, functions and measurable parameters of products, processes, systems or services, assets and operations subject to continuous improvement |
| | | 1.3 | Assess software techniques required for continuous improvement |
| | | 1.4 | Review sustainability implications of evaluation task |
| | | 1.5 | Identify stakeholders in continuous improvement processes and appropriate licensed technical and professional assistance to be consulted on the tasks |
| | | 1.6 | Determine compliance requirements of relevant work health and safety (WHS) and regulatory requirements, codes of practice, standards and risk assessment procedures |
| 2 | Prepare for evaluation | 2.1 | Identify appropriate measurement, data gathering, software and other analysis methods to be used for evaluation |
| | | 2.2 | Identify performance criteria or indices |
| | | 2.3 | Identify existing process capability, evaluation, control and run charts and sampling procedures |
| | | 2.4 | Identify existing qualitative continuous improvement processes |

- 3 Evaluate organisation continuous improvement processes
 - 3.1 Evaluate manual and automatic methods for measurement of parameters of products or services
 - 3.2 Evaluate data gathering, analysis and performance indices
 - 3.3 Evaluate software techniques for performance analysis and visual display generation
 - 3.4 Evaluate quantitative and qualitative continuous improvement processes
 - 3.5 Apply systems thinking, constraint and contingency management, problem solving and decision making to evaluation tasks
 - 3.6 Evaluate sustainability implications of improvements

- 4 Report results
 - 4.1 Record results of scoping, identification of principles and techniques and evaluation of continuous improvement techniques
 - 4.2 Provide documentation, such as reports, data, graphics, flow charts and performance indices

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining suitability of measurable parameters of products, processes, systems and services for continuous improvement activities
- undertaking measurement, data gathering and analysis, including identifying trends and improvements
- reviewing performance indices, software for data analysis and visual representations and continuous improvement techniques
- evaluating continuous improvement, systems thinking, constraint and contingency management, and lean systems requirements
- producing and interpreting charts used in production and service control, including:
 - histograms
 - Pareto diagrams
 - flowcharts
 - tallycharts
 - scatter plots
 - run chart
- evaluating sustainability implications of improvements
- reporting and documenting results of scoping, identification of principles and techniques and evaluation of continuous improvement techniques, data, graphics, flow charts and performance indices

Required knowledge

Required knowledge includes:

- features of products, processes, systems and services subject to improvement processes
- economic, social and sustainability implications of products, processes, systems, services and implications of improvement processes
- continuous improvement drivers and mechanisms, such as:
 - market competitiveness
 - maintenance of a technological edge
 - customer expectations
- WHS requirements, codes of practice, regulatory requirements, and standards problem solving and decision making techniques:
 - brainstorming

- current and future state mapping
- seven tools of quality:
 - Ishikawa ‘Fishbone’ diagrams
 - histograms
 - Pareto analysis
 - flowcharts
 - scatter plots
 - run charts
 - control charts
- data, performance metrics, graphics and visual indicators
- software options, such as:
 - budgeting, financial and business planning performance metrics analysers and graphics generators
 - maintenance downtime and cost data generators
 - system control and data acquisition (SCADA), distributed control systems (DCS), enterprise resource planning (ERP) and materials resource planning (MRP) system data generators
 - performance data analysis and graphics generators
- statistical process control (SPC) techniques
- qualitative improvement techniques

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate continuous improvement processes for production, engineering and related services. This includes working individually and as part of a team in accordance with organisation procedures.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • determine measurable and controllable parameters of product or service and their suitability in continuous improvement processes • identify WHS, regulatory requirements, risk management and related organisational procedures • evaluate manual and automatic methods for measurement

	<p>and data gathering, including analysis and performance indices, software analysis and visual display</p> <ul style="list-style-type: none"> • evaluate qualitative continuous improvement processes • evaluate sustainability implications of improvements • measure and gather data, record and analyse for trends and improvements • evaluate continuous improvement, systems thinking, constraint and contingency management and lean systems requirements • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. • The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for	Assessment processes and techniques must be culturally

assessment	appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.
-------------------	--

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Features, functions and measurable parameters of products, processes, systems or services, assets and operations subject to continuous improvement	<p>Features, functions and measurable parameters of products, processes, systems, services and assets subject to continuous improvement may include:</p> <ul style="list-style-type: none"> • sustainability • software • product manufacturability • process design • process control • equipment and tooling • material and product flow • plant layout and transfer operations • standard operating procedures • maintenance • lean systems • labour and skills distribution • information flow • value chain • sales, marketing and planning • management
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer

<p>WHS, regulatory requirements and enterprise procedures</p>	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
<p>Standards and codes</p>	<p>Standards and codes refer to all relevant Australian and international standards and codes applicable to a particular thermodynamic system task</p>
<p>Systems thinking</p>	<p>Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
<p>Continuous improvement processes</p>	<p>Continuous improvement processes may relate to plant, products, production processes, systems and services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training

	<ul style="list-style-type: none"> • qualitative improvement processes, such as: <ul style="list-style-type: none"> • toolbox meetings • suggestion schemes • mentoring • changes in work organisation, responsibilities and recruitment
Constraints and contingencies	<p>Constraints and contingencies may be:</p> <ul style="list-style-type: none"> • financial • organisational, procedural or cultural • physical constraints, such as limits to resources, limits to site access or logistical limitations
Lean principles	<p>Lean manufacturing uses cost, capacity and responsiveness, quality, reliability and waste minimisation as drivers of the process and measures for process improvement. Lean manufacturing is the response of many organisations to local, regional, national and global market competitiveness</p>

Custom Content Section

Not applicable.

MEM23120A Select mechanical machine and equipment components

Modification History

Release 1 - New unit. Replaces MEM23091A, but not equivalent.

Unit Descriptor

This unit of competency covers the technical selection of mechanical machine and equipment components. It includes analysis of the application to determine suitability of components and use of performance analysis software.

Application of the Unit

This unit applies to selecting components of machines or equipment based on mechanical engineering-related technical criteria in order to ensure appropriate performance and compliance with standards. The unit applies to selection tasks based on analyses completed by an individual or the use of technical criteria supplied by professional engineers or equipment suppliers. The use of calculus for technical analysis is not covered by this unit.

The unit is suitable for people working as mechanical detailers or designers and draftspersons and those pursuing careers and qualifications in mechanical engineering or related disciplines. This unit does not cover selection of electric motors; electrical components; fluid power components, including pumps, control components and support structures; and structural fastening and welding with eccentric loadings. These are covered in other units.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23109A	Apply engineering mechanic principles

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Establish scope of machine components selection task	1.1	Identify stakeholders to be consulted on selection tasks
		1.2	Determine relevant compliance requirements of work health and safety (WHS) and regulatory requirements, codes of practice, standards, and risk assessment requirements for machines and equipment
		1.3	Review features and functions of mechanical machines and components
		1.4	Investigate sustainability implications of component selection task
		1.5	Establish availability of technical and professional assistance
2	Examine technical specifications for component selection	2.1	Confirm performance requirements of particular machines or equipment components
		2.2	Select appropriate analysis techniques using graphs, tables, nomograms or computer-aided solutions, as appropriate
		2.3	Analyse operating conditions of components and determine component selection criteria
		2.4	Review design loads, working stresses, allowable deformations and factor of safety for machine components
		2.5	Determine component arrangement, limits, fits and clearances, assembly, fastening and alignment methods

- 3 Select machine components
 - 3.1 Specify arrangement and assembly requirements
 - 3.2 Advise stakeholders of selection and make any required adjustments
 - 3.3 Ensure traceability of analysis and component selection

- 4 Report results
 - 4.1 Record results of scoping, principles and techniques identification and component selection procedures
 - 4.2 Provide documentation, such as calculations, estimations, specifications, diagrams and drawings

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- applying safe working practices and procedures when working with machines and equipment
- component arrangement, limits, fits and clearances, assembly, fastening and alignment methods
- investigating sustainability implications of machine development, manufacture and use
- reviewing features and functions of machines and components
- identifying design features of machines, equipment and components, including:
 - loads
 - working stresses
 - allowable deformations and factor of safety
 - component arrangements
 - limits and fits
 - assembly, adjustment and fastening methods
- identifying relevant analysis support, such as graphs, tables, nomograms or computer-aided solutions and validation techniques
- selecting and specifying machine and equipment components, arrangement and assembly requirements
- communicating with stakeholders, professionals and technicians
- identifying and complying with relevant WHS and regulatory requirements and risk assessment procedures
- reporting and documenting results of component selection, including calculations, specifications, diagrams and drawings

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, standards and risk management requirements relevant to mechanical component selection processes
- current options and trends in performance analysis software, including underpinning program techniques and software validation techniques
- conditions for equilibrium
- reactions at beam supports (e.g. simply supported, overhung and cantilever beam with vertical and oblique concentrated, uniform and variable distributed loads and couples)

- shear force and bending moments, including diagrams
- vertical and oblique concentrated and uniform and variable distributed loads
- bending and shear stresses
- torsion distribution diagrams
- combined stresses
- properties of common machine and component materials
- stress concentration and fatigue due to alternating stresses
- deflection of beams
- bolted and welded connections with central loads (bolted joints may include friction forces)
- static versus dynamic forces, balanced and unbalanced
- dynamics and laws of rotational motion
- work and forms of mechanical energy and power
- dynamic systems
- mechanical power and drive efficiency
- mechanical drives
- block, band and disk brakes and clutches with single contact surface
- mechanical couplings and devices
- dynamic balancing of rotating masses
- stresses in flywheels
- stresses in thin walled pressure vessels

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to select a wide variety of mechanical machine and equipment components for safety, economy and fitness for purpose. Selections must be able to be justified through appropriate engineering analysis.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine component arrangement, limits, fits and clearances, assembly, fastening and alignment of components • investigate sustainability implications of components selection task • review features and functions of machine and equipment components, design loads, working stresses, allowable deformations and factor of safety • select and specify machine components, including arrangement and assembly requirements • evaluate machine components and arrangements for compliance with WHS and regulatory requirements and risk assessment • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
<p>Method of assessment</p>	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering

	<p>Training Package.</p> <ul style="list-style-type: none"> • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
<p>Guidance information for assessment</p>	<p>Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.</p>

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

<p>Machine and equipment components</p>	<p>Machine and equipment components for this unit are limited to components performing mechanical functions. Examples include:</p> <ul style="list-style-type: none"> • shafts • bearings • couplings • power screws • gear drives • spur gears • chain and belt drives • brakes • clutches
--	--

Standards and codes	Standards and codes refer to all relevant Australian and international standards and codes applicable to a particular selection of mechanical machine and equipment components task
Appropriate licensed technical and professional assistance	<p>Appropriate licensed technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
Sustainability implications	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
Analysis of machine and components	<p>Analysis of machine and equipment components may include:</p> <ul style="list-style-type: none"> • static and dynamic analysis of loads • the stresses and deformations resulting • the transmitted power, torque and speed • machine/operator interface in terms of ergonomics and safety • environmental effects, including noise, energy efficiency, heat generation and dust generation • graphical and mathematical methods and software options

Appropriate computer-aided solutions and validation techniques	Appropriate computer-aided solutions include: <ul style="list-style-type: none">• performance analysis and computer-aided design (CAD) modelling Validation techniques include: <ul style="list-style-type: none">• comparison of traditional solutions for simple design problems with software solutions to the same design problems• review of previously implemented design challenges which were completed using the software

MEM23121A Analyse loads on frames and mechanisms

Modification History

Release 1. Replaces MEM23091A, but not equivalent.

Unit Descriptor

This unit of competency covers the analysis of loads on mechanisms, frames and structural support elements, such as linkages, rods, shafts and beam elements within machines and mechanisms. It includes safe working practices, work health and safety (WHS) compliance requirements, function and features of frames and mechanisms, load and deflection analysis for static and dynamic elements, and traditional and software-based techniques.

Application of the Unit

This unit applies to the analysis of loads on mechanisms, beams, frames and support elements either individually or with the assistance of a professional engineer for more complex calculations of loads and stresses. It is suitable for people working as mechanical detailers or designers and draftspersons, and those pursuing careers and qualifications in mechanical engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23007A	Apply calculus to engineering tasks
MEM23109A	Apply engineering mechanics principles

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|---|-----|--|
| 1 | Establish scope of frame and mechanism analysis | 1.1 | Determine compliance requirements of relevant WHS and regulatory requirements, codes of practice, standards and risk assessment and for design and use of machines and equipment |
| | | 1.2 | Identify features, functions, operating conditions and performance requirements of frames, beams and mechanisms |
| | | 1.3 | Investigate sustainability implications of frames and mechanisms |
| | | 1.4 | Review design loads, working stresses, allowable deformations and factor of safety for elements |
| | | 1.5 | Review element arrangements, assembly and fastening methods |
| | | 1.6 | Identify any complex load calculations to be done with or obtained from a professional engineer |
| | | 1.7 | Establish availability of other technical and professional assistance |
| | | 1.8 | Identify and evaluate appropriate analysis techniques, software and software validation techniques |
| | | 1.9 | Identify stakeholders to be consulted on selection tasks |

-
- | | | | |
|---|--|-----|---|
| 2 | Analyse loads and performance of frames and mechanisms | 2.1 | Estimate static and dynamic operating conditions and determine design or selection parameters |
| | | 2.2 | Optimise frame, beam and mechanism elements for strength, deflection, arrangement and fastening |
| | | 2.3 | Review analysis with stakeholders and make any required adjustments |
| | | 2.4 | Confirm compliance of frames and mechanisms with WHS and regulatory requirements, standards and codes of practice |
| 3 | Report results | 3.1 | Record results of scoping, principles and techniques identification and analysis |
| | | 3.2 | Provide documentation, such as calculations, specifications diagrams and drawings |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- applying safe working practices and procedures when working with frames, mechanisms and equipment
- evaluating frames, beams and mechanisms for WHS, regulations and risk management requirements
- investigating sustainability implications of frames and mechanisms
- reviewing design features, functions and performance requirements of frames, beams and mechanisms, including:
 - dynamics
 - design loads
 - working stresses
 - allowable deformations and factor of safety element arrangements
 - assembly and fastening methods
- selecting appropriate analysis techniques, software and software validation techniques
- identifying relevant analysis support, such as graphs, tables, nomograms or computer-aided solutions and validation techniques
- analysing static and dynamic operating conditions and determining design or selection parameters
- optimising frame, beam and mechanism elements for strength, deflection, arrangement and fastening
- communicating with stakeholders
- reporting and documenting results of analysis, including calculations, specifications, diagrams and drawings

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, and directives and standards, including those related to risk management
- current options and trends in performance analysis software, including underpinning program and software validation techniques
- types and functions of frames and mechanisms
- mechanisms for converting linear to rotary motion and rotary to linear motion
- lifting machines

- design loads, working stresses, allowable deflections and factor of safety for machine elements
- conditions for equilibrium
- non-coplanar and force systems
- equilibrium of non-coplanar and non-concurrent force systems
- reactions at beam supports (e.g. simply supported, overhung and cantilever beam with vertical and oblique concentrated, uniform and variable distributed loads and couples)
- shear force and bending moments
- shear force and bending moment diagrams
- vertical and oblique concentrated and uniform and variable distributed loads
- types and locations of stresses, including:
 - combined stresses
 - thermal stress due to restrained expansion
 - stress concentration and fatigue due to alternating stresses
- centre of gravity
- centre of percussion
- methods of analysis of frames and trusses
- deflection of beams
- statically indeterminate beams
- buckling of compressed members
- loads and stresses on bolted and welded connections
- static versus dynamic forces, balanced and unbalanced
- dynamics and laws of rotational motion
- dynamic analysis of mechanisms
- linked bodies in motion, including types, impulse, momentum and work energy methods
- work, energy and power for balanced and unbalanced force systems

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to analyse loads on a variety of frames and mechanisms to confirm performance and safety compliance.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • identify and review features, functions and performance requirement of frames, beams and mechanisms • identify complex calculations requiring professional engineering assistance • establish dynamics, design loads, working stresses, allowable deformations and factor of safety element arrangements for calculations to be done • evaluate assembly and fastening methods, analysis techniques, software and software validation techniques • analyse static and dynamic operating conditions and determine design or selection parameters • optimise frame, beam and mechanism elements for strength, deflection, arrangement and fastening • communicate and negotiate with stakeholders, professionals and technicians and make adjustments accordingly • evaluate frames, beams and mechanisms for WHS and regulatory requirements, and risk management compliance • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. MEM23122A Evaluate computer integrated manufacturing systems

Modification History

Release 1 - New unit. Replaces MEM23092A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of computer integrated manufacturing (CIM) systems. It includes hardware, controllers, networks and data handling for business, planning and control, manufacturing operations, automation safety, work health and safety (WHS) and risk management compliance, software and system integration.

Application of the Unit

This unit applies to evaluation of computer integrated systems used in manufacturing. It is suitable for people working as manufacturing technicians or paraprofessionals and draftspersons and those pursuing manufacturing, engineering or related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23111A	Select electrical equipment and components for engineering applications
MEM23112A	Investigate electrical and electronic controllers in engineering applications

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of CIM application	1.1	Identify stakeholders to be consulted on the evaluation
		1.2	Confirm that appropriate support, including technical and professional assistance, is available
		1.3	Identify WHS and regulatory requirements, codes of practice, standards and risk assessment requirements for CIM systems with particular emphasis on automation safety
		1.4	Identify appropriate analysis techniques, software techniques and graphics required for evaluation
		1.5	Identify stakeholders to be consulted on evaluation tasks
		1.6	Investigate sustainability implications of CIM systems
2	Evaluate CIM components and systems	2.1	Evaluate parameters and requirements of manufacturing operations
		2.2	Evaluate machines, processes and data flow for machine and process control in CIM systems
		2.3	Evaluate system control, signal generation and conditioning, controller functions and actuator power interfacing
		2.4	Evaluate data collection, sharing and control software and programming for hardware integration
		2.5	Evaluate the data and communications protocols, standards and network topologies for the applications

- 2.6 Evaluate system integration of hardware, controllers, human-machine interfaces (HMIs) and graphical user interfaces (GUIs) and network
 - 2.7 Evaluate system analysis and simulation software and validation techniques
 - 2.8 Evaluate automation safety and compliance with WHS, regulatory requirements, standards and risk management implementation
- 3 Report results
- 3.1 Record results of scoping, principles and techniques identification and evaluation of systems
 - 3.2 Provide documentation, such as layouts, programs, flow charts and files

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required knowledge includes:

- relating manufacturing context and requirements to existing or planned CIM applications and continuous improvement requirements
- identifying WHS, regulatory requirements and risk management compliance
- evaluating CIM systems against automation safety requirements
- investigating sustainability implications of CIM systems
- evaluating features and functions of existing or planned CIM systems against:
 - components
 - processes and data flow
 - controller functions
 - signal and power interfacing
 - communications protocols
 - standards and network topologies
 - HMIs and software
 - automation safety
 - compliance with WHS and regulatory requirements
- applying CIM related software analysis, and software validation techniques
- reporting and documenting results of scoping, principles and techniques identification and evaluation of systems, layouts, programs and flow charts

Required knowledge

Required knowledge includes:

- types of manufacturing operations, their features and parameters and potential for CIM applications, for example:
 - continuous, mass, batch and jobbing
 - prototype manufacture
 - cellular manufacturing
 - jobbing
 - just-in-time (JIT) and other lean manufacturing systems and techniques
 - maintenance systems and techniques (e.g. condition monitoring)
- compliance requirements of WHS and regulatory requirements, codes of practice, standards, and risk assessment for CIM systems with particular emphasis on automation safety

- sustainability implications of CIM systems
- CIM hardware
- CIM principles and techniques required to evaluate systems and select and optimise components
- current options and trends in performance analysis and programming software, including underpinning program techniques and algorithms
- LAN and WAN network communications in CIM applications
- documentation, drawings, specifications, instructions required, process information and programming
- interdependencies and communications linkages between team members, support functional groups, and licensed technical and professional support

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate CIM systems for safety, economy and fitness for purpose. This includes working individually and as part of a team in accordance with organisational procedures.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: <ul style="list-style-type: none"> • evaluate compliance with WHS, regulatory requirements and risk management with particular emphasis on automation safety • investigate sustainability implications of CIM systems • review features and functions of CIM systems • identify CIM principles and techniques, analysis, software and software validation techniques • evaluate parameters of manufacturing operations and the features and suitability of CIM components and systems • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. • The competencies covered by this unit would be

	<p>demonstrated by an individual working alone or as part of a team.</p> <ul style="list-style-type: none"> • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	<p>Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.</p>

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

CIM	CIM uses mechatronic and manufacturing technologies integrated
------------	--

	across an enterprise by the communication of data to control plant and operations, plan production, marketing, maintenance and feedback to the business planning process
Standards and codes	Standards and codes refer to all relevant Australian and international standards and codes applicable to CIM applications and systems
Automation safety	Automation safety refers to the reliance on emergency stop, failsafe design, redundancy, system interlocks and data integrity. Standards apply to general plant design and use as well as the 'functional safety of safety-related electrical, electronic and programmable electronic control systems'
Appropriate technical and professional assistance	Appropriate technical and professional assistance may include: <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	WHS, regulatory requirements and enterprise procedures may include: <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
CIM hardware	Hardware options for CIM systems may include: <ul style="list-style-type: none"> • robots • pick and place, materials handling, automated guided vehicles (AGVs) and transfer devices • fluid power components • pumping and wash equipment

	<ul style="list-style-type: none"> • boilers, heating and drying equipment • pasteurising, chilling and refrigeration equipment • welding equipment • moulding, casting and forging equipment • pressing, forming, drawing and cropping equipment • surface finishing, plating and painting • packaging equipment • mechanical linkages and support structures • pressure, temperature, proximity sensor/transducers, relative and absolute encoders, vision systems and smart cameras • controllers, programmable logic controllers (PLCs) and remote telemetry units (RTUs) • HMIs (e.g. touch screens) • power interfaces and signal processors for digital and analog control • stepper motors • servo motors, torque, speed and position control • special purpose equipment (e.g. package labelling equipment, logistics and warehousing requirements) • wired and wireless networking systems
<p>Data and communications protocols and standards</p>	<p>Data and communications protocols and standards include the set of standardised rules for data and signal syntax, checking and error detection. Hardware and software generate data in accordance with a protocol that allows generators and receivers to understand or translate the data as information, control signals integrity and error checks. These may include the following or their current updates:</p> <ul style="list-style-type: none"> • layered communications and networking protocols • Open Systems Interconnection Model (OSI Model) – 7 layers • TCP/IP Internet Protocol Suite {Transmission Control Protocol (TCP) and the Internet Protocol (IP)} – 4 or 5 layers • IEEE 802 LAN/MAN group of standards, including IEEE 802.3 Ethernet standard, IEEE 802.11 Wireless networking standard • Interface standards, such as: RS232 and RS485, Fieldbus, Modbus and DNP3.0
<p>Network topology</p>	<p>Network topology refers to the arrangement of connected hardware. These include:</p> <ul style="list-style-type: none"> • bus, ring, star, tree, mesh and in-line (2 way comms.) arrangements • wired and wireless options
<p>Sustainability</p>	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant, including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements

	<ul style="list-style-type: none"> • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
<p>Continuous improvement implementation</p>	<p>Continuous improvement implementation may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training

MEM23123A Evaluate manufacturing processes

Modification History

Release 1 - New unit. Replaces MEM23093A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of plant, facilities, services, labour and skills distribution used for manufacturing processes against defined process performance parameters. It includes the evaluation and assessment of plant layout and material flows for efficient manufacturability of product and maintainability of the plant and process.

Application of the Unit

This unit applies to manufacturing processes for products, machinery, tools or components for structures. Evaluations may be required for a variety of reasons, including assessing impact of proposals for new products or investigating potential change in processes to meet regulatory, sustainability or efficiency requirements. Efficiency evaluations are based on lean systems and techniques. Where more in-depth training in lean systems and techniques is required relevant competitive systems and practices units should be selected.

The unit is suitable for people working as, supervisors, technicians, and design draftspersons and those pursuing manufacturing, engineering or related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

1	Determine scope of manufacturing processes	1.1	Identify manufacturing context and processes
		1.2	Identify features and functions of plant, facilities, services, labour and skill distribution used for manufacturing processes
		1.3	Identify stakeholders to be consulted as part of the evaluation
		1.4	Confirm work health and safety (WHS) and regulatory requirements, codes of practice, standards, risk assessment and registration requirements for manufacturing plant
		1.5	Investigate sustainability implications of manufacturing processes
		1.6	Identify sources of professional and technical assistance
2	Evaluate manufacturing processes	2.1	Identify manufacturing principles and techniques required to evaluate and optimise the processes
		2.2	Identify appropriate analysis techniques, software and software validation techniques
		2.3	Evaluate and assess facilities, services, plant and tooling in relation to product manufacturability and maintainability
		2.4	Evaluate and assess process layout, use of automation and process control using lean systems and techniques

- 2.5 Evaluate and assess materials, product flow and transfer operations, buffer and emergency stocks, warehousing, stores and logistics using lean systems and techniques
 - 2.6 Evaluate WHS and regulatory compliance and risk management practices of manufacturing processes and maintenance procedures
 - 2.7 Evaluate processes for sustainability
 - 2.8 Evaluate process compatibility with maintenance management system
 - 2.9 Evaluate labour requirements and skills distribution
 - 2.10 Evaluate process information flows for control and process improvement
- 3 Report results
 - 3.1 Review results of evaluation and assessment with stakeholders
 - 3.2 Provide recommendations for improvements, where appropriate
 - 3.3 Provide reports and documentation, such as layouts, programs and flow charts

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying parameters and context of manufacturing processes
- investigating sustainability implications of manufacturing processes
- identifying appropriate manufacturing processes and analysis techniques and software
- evaluating WHS and regulatory requirements, automation safety and risk management compliance, sustainability and standards
- investigating existing or planned software against manufacturing technical and efficiency requirements
- applying lean systems and techniques to evaluate:
 - facilities and services
 - plant and tooling
 - process layout
 - automation and process control
 - materials and product flow
 - buffer and emergency stocks
 - stores and warehousing
 - transport and logistics
 - maintenance management system
 - labour and skill requirements
- reporting and documenting results of scoping, principles and techniques identification and evaluation of systems, layouts, programs and flow charts

Required knowledge

Required knowledge includes:

- important features of products and processing options with regard to:
 - marketing options and advantages
 - economic, social and sustainability implications of products and processes
 - WHS and other regulatory requirements
- plant, facilities, services and process layout
- range of common modern manufacturing technical and work organisation processes, including:
 - volume production using transfer lines

- cellular manufacturing
- jobbing
- metal shaping processes, such as casting, forging and machining
- metal assembly, fabricating and joining
- plastic and rubber product manufacturing, including various types of moulding and assembly
- surface finishing based processes (e.g. electroplating)
- process transfers and materials handling
- packaging
- warehousing, stores, and provision for logistics and transport
- labour and skills distribution requirements of plant and processes
- asset maintainability and reliability concepts and processes
- process automation and control options
- techniques for process improvement, including:
 - material and product flow measurement and improvement
 - feedback on product manufacturability for possible product modification
 - feedback from maintenance and life cycle costs for plant
 - quality assurance (QA), quality control (QC) and statistical process control (SPC) feedback
 - customer feedback on cost, quality, delivery and reliability
- maintenance management systems and compatibility with manufacturing processes
- information flows and software options for process measurement and control
- budgeting and costing processes
- WHS, risk management, safe work methods statements (SWMS), work permits, material safety data sheets (MSDS), codes of practice, regulations, standards and regulatory requirements

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

<p>Overview of assessment</p>	<p>A person who demonstrates competency in this unit must be able to evaluate plant, facilities, services and processes against defined process performance parameters. This includes working individually and as part of a team in accordance with organisational procedures.</p>
<p>Critical aspects for assessment and evidence required to demonstrate competency in this unit</p>	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine features and functions of manufacturing processes, including manufacturing principles and techniques used and relevant internal and external context of manufacturing processes • identify relevant lean systems and techniques and apply in evaluation of manufacturing processes • evaluate WHS, regulatory, automation safety and risk management compliance • investigate sustainability implications of manufacturing processes • evaluate software, facilities, services, plant and equipment tooling, process layout, automation and process control • identify appropriateness of materials and product flow and transfer operations, buffer and emergency stocks, warehousing, stores and compatibility of maintenance management system • report and document results.
<p>Context of and specific resources for assessment</p>	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. • The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning

	and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Defined parameters	<p>Defined parameters may include</p> <ul style="list-style-type: none"> • target cost • target outgoing quality levels and warranty costs • production rates • stock levels and availability to customer order • productivity • working capital
---------------------------	--

	<ul style="list-style-type: none"> • plant utilisation
Context of manufacturing processes	<p>The context of manufacturing operations includes:</p> <ul style="list-style-type: none"> • customer requirements • market considerations • product and process sustainability • lean systems • product manufacturability • system maintainability • facilities, services, plant and tooling requirements • supply chains • material and product flow • transfer operations • process control • labour requirements and skills distribution • information flow • systems thinking • continuous improvement and constraint and contingency management • WHS and regulatory requirements and risk management
Automation safety	<p>Automation safety refers to the reliance on emergency stop, failsafe design, redundancy, interlocks and data integrity. Standards apply to general plant design and use as well as the functional safety of safety-related electrical, electronic and programmable electronic control systems</p>
Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements, codes of	<p>WHS, regulatory requirements and enterprise procedures may include:</p>

practice and enterprise procedures	<ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements applying to electrical work
Standards and codes	Standards and codes refer to all relevant Australian and international standards and codes applicable to a particular manufacturing process
Sustainability	<p>Sustainability is used to mean the entire sustainable performance of the organisation/plant including:</p> <ul style="list-style-type: none"> • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
Continuous improvement implementation	<p>Continuous improvement of manufacturing processes may result in changes to plant, facilities, services, layout, materials flows, handling and logistics. It may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training • systems thinking • constraints and contingency management
Lean systems and techniques	<p>Lean systems and techniques used in evaluations can vary according the type of production and product and may include:</p> <ul style="list-style-type: none"> • performance indicators based on customer value • continuous improvement, including kaizen • just-in-time (JIT) and kanban

	<ul style="list-style-type: none"> • pull system for production and services • elimination and/or limitation of waste, where waste is defined as effort and resources not contributing to customer value • mistake proofing • standardisation of work • quick changeover • planning benchmarks and techniques: <ul style="list-style-type: none"> • cycle time • takt time • pack out • pitch • line balancing • overall equipment effectiveness (availability x performance efficiency x quality rate) • problem solving and decision making tools: <ul style="list-style-type: none"> • total quality management (TQM) tools • root cause analysis (RCA) • failure mode and effects analysis (FMEA) • design review based on failure mode (DRBFM) • constraints and contingencies management • total productive maintenance • value stream analysis • visual factory techniques
Automation	Automation options range from manual operations with manual information generation, handling, analysis and storage to islands of automation supported by manual interfaces with some electronic information processing to systems with major automation and networked data handling
Information flow requirements	<p>Information flow may include:</p> <ul style="list-style-type: none"> • SPC and QA data • production planning and maintenance systems information • visual information feedback to stakeholders <p>Information processing may include:</p> <ul style="list-style-type: none"> • software and networks for automated data handling, analysis, display and storage

MEM23124A Measure and analyse noise and vibration

Modification History

Release 1 - New unit. Replaces MEM23094A, but not equivalent.

Unit Descriptor

This unit of competency covers the monitoring, measurement and analysis of noise and vibration. It includes equipment calibration and use, analysis of data, standards for exposure limits, work health and safety (WHS) and mitigation measures.

Application of the Unit

This unit applies to machinery and equipment generated noise and vibration, including mechanical shock generated in commercial and industrial environments. It is suitable for people working as asset maintenance technicians or noise and vibration specialists. It is suitable for people working as technicians in engineering or related industries and those pursuing careers and qualifications in engineering or related disciplines.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|--|
| 1 | Determine scope of investigation into noise or vibration | 1.1 | Identify machinery and equipment to be investigated for noise and vibration measurement and analysis |
| | | 1.2 | Determine stakeholders to be consulted on analysis tasks |
| | | 1.3 | Determine software required for the analysis of the task |
| | | 1.4 | Determine regulatory, standards and risk management noise and vibration compliance requirements |
| | | 1.5 | Investigate sustainability implications of noise and vibration |
| | | 1.6 | Apply systems thinking, continuous improvement problem solving and constraint and contingency management |
| | | 1.7 | Determine available sources for any required technical and professional assistance |
| 2 | Prepare for noise measurement and analysis | 2.1 | Identify noise exposure limits appropriate to the equipment, process and employee, community and environmental context |
| | | 2.2 | Review and identify available sound measuring equipment and components and suitability for required measurements |
| | | 2.3 | Select sound measuring equipment |

- | | | | |
|---|--|-----|--|
| 3 | Measure and analyse sound data | 3.1 | Set up and site sound measurement equipment for desired measurements |
| | | 3.2 | Calibrate sound measurement equipment |
| | | 3.3 | Take sound measurements using appropriate techniques for particular application and environment |
| | | 3.4 | Process, analyse and interpret noise data |
| | | 3.5 | Relate data to plant and equipment performance |
| 4 | Review options for noise elimination or mitigation and protection | 4.1 | Review options for noise elimination, mitigation and protection measures |
| | | 4.2 | Prepare report and make recommendations |
| 5 | Prepare for vibration measurement and analysis | 5.1 | Identify vibration exposure limits appropriate to the equipment, process and employee, community and environmental context |
| | | 5.2 | Review and identify available vibration measuring equipment and components and suitability for required measurements |
| | | 5.3 | Select vibration measuring equipment |
| 6 | Measure and analyse vibration and shock data | 6.1 | Set up and site or mount vibration and shock measurement equipment |
| | | 6.2 | Calibrate equipment |
| | | 6.3 | Take measurements |
| | | 6.4 | Process, analyse and interpret vibration and shock data |
| | | 6.5 | Relate data to plant and equipment performance |
| 7 | Review options for vibration and shock elimination or mitigation and | 7.1 | Review options for vibration and shock elimination or damping and isolating |
| | | 7.2 | Prepare report and make recommendations |

protection

- | | | | |
|---|--|-----|--|
| 8 | Investigate developments in the field of noise and vibration measurement in predictive equipment maintenance | 8.1 | Investigate developments in acoustic, vibration and shock measurement |
| | | 8.2 | Investigate the use of condition monitoring in predictive maintenance programs |
| 9 | Record and report | 9.1 | Record and report results of review, measurement, analysis and recommendations |
| | | 9.2 | Provide documentation, such as calculations, data records and analysis and assessments |

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- determining parameters and context of noise and vibration measurement and analysis tasks
- determining WHS, other regulatory and risk management compliance requirements, including noise and vibration, noise dose and vibration exposure limits
- reviewing physics of sound and vibration, effects of noise, vibration and shock on humans, measuring equipment and mitigation measures
- selecting equipment
- siting, setting up and calibrating equipment prior to use
- measuring, analysing, interpreting and recording
- relating data to plant and equipment performance
- applying systems thinking, continuous improvement problem solving and constraint and contingency management
- investigating sustainability implications, developments in acoustic, vibration and shock measurement, condition monitoring in predictive maintenance programs
- recording, reporting and documenting results of review, measurement, data, analysis and calculations, interpretations and recommendations

Required knowledge

Required knowledge includes:

- characteristics and measurement of noise and vibration, and sources of noise and vibration
- noise and vibration concepts and terminology
- ISO and other vibration severity standards
- limitations of broadband vibration and trend analysis
- principles of using vibration analysis as an indicator of machine and equipment condition
- causes and effects of vibration and noise in industrial and commercial equipment, such as damaged product, limited processing speeds and catastrophic machine failure
- typical engineering components subject to vibration
- relevant WHS and regulatory requirements, codes of practice, standards, risk minimisation and registration requirements
- calculations, formulae and laws relating to vibration and sound measurement, including allowable exposure using AS 2670 Physiological effects of noise and vibration
- range and capacity of equipment for measuring vibration and sound
- noise measurement and testing techniques and equipment for various environments and

- sound characteristics in vibration measurement and testing
- acoustic emission in vibration measurement and testing
- shock testing, including applications requiring laboratory testing (e.g. anechoic chambers)
- vibration trend analysis
- noise and vibration concepts (e.g. vibration, noise, transmission of noise and vibration and harmonic excitation)
- common sources of noise generation (e.g. fans, motors, engines and ducts)
- noise mitigation and protection measures, such as:
 - isolation
 - insulation
 - personal hearing protection
 - exposure limitation policies
- vibration and shock control equipment and techniques
- community noise
 - noise and vibration measurement and analysis applications, such as:
 - condition monitoring for plant
 - acoustic emissions for fault detection
 - modal analysis of dynamic properties of structures or room acoustics
 - correlation of modal analysis with finite element analysis (FEA)
 - statistical energy analysis

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to measure and analyse noise and vibration and make recommendations for mitigation and protection.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • determine compliance with WHS and regulatory requirements, and risk management with particular emphasis on automation safety • review physics of sound and vibration, effects of noise, vibration and shock on humans, measuring equipment and mitigation measures • identify noise and vibration, noise dose and vibration exposure limits • select appropriate measuring equipment for measuring task • calibrate, site and set up equipment • correctly measure and record noise and vibration • analyse and interpret measurement results • relate data to plant and equipment performance • recommend noise and vibration elimination, mitigation and protection measures • investigate sustainability implications • report and document results and recommendations • apply systems thinking, continuous improvement problem solving and constraint and contingency management.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.

Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Sound measuring equipment	<p>Sound measuring equipment may include:</p> <ul style="list-style-type: none"> • microphones • cables/connectors • meters • recorders • analysers/comper and software
Set-up and measurement techniques	<p>Set-up and measurement techniques may include:</p> <ul style="list-style-type: none"> • microphone positioning • meter time constants • frequency filter settings
Purpose for sound	Purposes for sound measurements may include:

measurements	<ul style="list-style-type: none"> • simple sound level or spectrum • limited or full frequency band • standards to be met • impulsive or consistent noise
Vibration	Vibration refers to continuous or sporadic vibration whether or not associated with noise and also includes mechanical shock
Vibration and shock measuring equipment	<p>Vibration and shock measuring equipment may include:</p> <ul style="list-style-type: none"> • accelerometer • impedance heads • cables • mounting media • calibrators • preamplifier • meters • filters • recorders • analysers/computer and software
Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices

	<ul style="list-style-type: none"> state and territory regulatory requirements
Standards and codes	Standards and codes refer to all relevant Australian and International standards and codes applicable to a particular noise and vibration measurement and analysis task
Systems thinking	Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain
Continuous improvement	<p>Continuous improvement implementation may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> balanced scorecard current and future state mapping measuring performance against benchmarks process improvement, problem solving and decision making data management, generation, recording, analysing, storing and use of software training for improvement systems participation technical training
Constraints and contingencies	<p>Constraints and contingencies may be:</p> <ul style="list-style-type: none"> financial organisational, procedural or cultural physical constraints, such as limits to resources, limits to site access or logistical limitations

MEM23125A Evaluate maintenance systems

Modification History

Release 1 - New unit. Replaces MEM23094A, but not equivalent.

Unit Descriptor

This unit of competency covers the evaluation of maintenance management systems, including analysing the effect of any action or breakdown on achieving strategic objectives. The unit requires evaluation of maintainability and reliability of assets, maintenance management systems, personnel participation, monitoring, responding to indicators, prioritising action, sustainability, lean systems maintenance requirements, work health and safety (WHS) compliance, risk minimisation, facilities and services maintenance, costing and data analysis, and performance indices.

Application of the Unit

This unit applies to evaluation of both corrective and preventative maintenance systems for plant, facilities and services used in industry. Evaluations may be required for variety of purposes and may apply to evaluations of a maintenance system for a whole process, plant or enterprise. The unit is suitable for operations managers, maintenance personnel and those pursuing maintenance or manufacturing, engineering or related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM14088A	Apply maintenance engineering techniques to equipment and component repairs and modifications
MEM14092A	Integrate maintenance fundamentals into an engineering task

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|---|-----|---|
| 1 | Determine scope of maintenance processes | 1.1 | Determine parameters of maintenance management system to be evaluated |
| | | 1.2 | Assess engineering principles, skills and techniques required by tasks |
| | | 1.3 | Assess software and software techniques required for evaluation task |
| | | 1.4 | Identify stakeholders to be consulted |
| | | 1.5 | Determine compliance requirements of WHS and regulatory requirements, codes of practice, standards and risk assessment requirements for maintenance processes |
| | | 1.6 | Investigate sustainability implications of maintenance processes |
| 2 | Identify principles and techniques required by evaluation | 2.1 | Review trends in maintenance practice and equipment with particular emphasis on integrated management systems |
| | | 2.2 | Review maintenance system and implementation strategies for relevance to evaluation |
| | | 2.3 | Identify features and functions of maintenance information systems |

- 3 Evaluate maintenance management systems
 - 3.1 Evaluate organisational maintenance safety and risk management procedures
 - 3.2 Evaluate maintenance processes for sustainability
 - 3.3 Evaluate asset reliability, maintainability and performance against against lean indices, production targets and system design parameters
 - 3.4 Audit plant, facilities, services and systems for provision of parts and consumables, adequacy of labour, skills and technical support
 - 3.5 Evaluate maintenance system data generation and collection and reporting for performance analysis required for process improvement
 - 3.6 Evaluate the use of maintenance management software
 - 3.7 Evaluate manual and automated condition monitoring, testing and analysis
 - 3.8 Evaluate implementation of maintenance management systems techniques, including up-time preparations, spares availability, tooling and equipment readiness
 - 3.9 Evaluate asset categorisation, maintenance scheduling and prioritising
 - 3.10 Evaluate implementation of maintenance continuous improvement processes
- 4 Report results
 - 4.1 Record results of scoping, principles and techniques identification and evaluation of maintenance systems
 - 4.2 Provide documentation, such as layouts, schedules, performance analysis and flow charts

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- identifying WHS, regulatory and risk management compliance requirements for maintenance systems
- investigating sustainability implications of maintenance processes
- identifying and reviewing features and functions of maintenance and information systems, trends and implementation strategies and software
- evaluating organisational maintenance safety and risk management procedures, sustainability, asset reliability and maintainability, lean indices, system design parameters, data generation and collection, reporting, storage and analysis, condition monitoring, implementation, facilities and services maintenance response systems, asset categorisation, maintenance scheduling and prioritising, and continuous improvement
- auditing plant, facilities and services, systems for provision of parts and consumables, and adequacy of labour, skills and technical support for maintenance activities
- reporting and documenting results of scoping, principles and techniques identification and evaluation of maintenance systems, layouts, schedules, performance analysis, flow charts, calculations, programs and files

Required knowledge

Required knowledge includes:

- maintenance requirements of various organisations and industry trends
- features of integrated management systems within organisations and industry trends:
 - monitoring, adjustment, lubrication, consumables, breakdown maintenance required by typical plant equipment and facilities
 - labour and training requirements for typical maintenance systems
 - maintenance performance indices, such as mean time between failure (MTBF) and overall equipment efficiency (OEE), and relationship to maintenance strategies, business financial objectives and maintenance system design criteria, such as life cycle cost and break-even point
 - maintenance management systems, such as terotechnology
 - maintenance management within ILS
- sources of information, software and hardware required by maintenance systems
- systems thinking in relation to maintenance, failure analysis, problem solving and decision making processes, constraint and contingency management
- compliance requirements of WHS, regulations and standards relevant to maintenance

- risk management requirements and analyses for maintenance of plant, including failure mode effects analyses (FMEA)
- maintainability and reliability related to life cycle costing, system design, cost predictions and break-even analysis
- audit processes for plant, facilities and services, provision of parts and consumables, labour, skills and technical support
- maintenance system data generation and collection, reporting and response processes, data storage and performance analysis for process improvement against performance parameters, such as MTBF and OEE
- manual and automated condition monitoring, testing and analysis
- maintenance system and implementation strategies, including corrective, preventative, predictive, precision, proactive, total productive and reliability centred maintenance
- facilities and service maintenance response systems
- asset categorisation and maintenance scheduling and prioritising
- organisational maintenance safety procedures, such as:
 - risk management procedures
 - WHS committees
 - standard operating procedures
 - safe work methods statements (SWMS)
 - material safety data sheets (MSDS)
 - permits
 - standards related to significant maintenance or plant modifications
- terotechnology
- engineering, plant, facilities and services maintenance requirements
- continuous process improvement
- data generation, analysis, storage and feedback
- reporting techniques and documentation required

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to evaluate maintenance systems and processes for safe, cost-effective and sustainable operation.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>Assessors must be satisfied that the candidate can competently and consistently:</p> <ul style="list-style-type: none"> • investigate sustainability implications of maintenance processes • identify and review features and functions of maintenance and information systems, trends and implementation strategies and software • evaluate safety and risk management, sustainability, asset reliability and maintainability, lean indices, system design parameters, data generation, collection, reporting, storage and analysis, condition monitoring, facilities and services maintenance response systems, asset categorisation, maintenance scheduling and prioritising, and continuous improvement, implementation • audit plant, facilities and services, provision of parts and consumables provision, labour, skills and technical support • report and document results.
Context of and specific resources for assessment	<ul style="list-style-type: none"> • This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment

	<p>Guidelines of the MEM05 Metal and Engineering Training Package.</p> <ul style="list-style-type: none"> • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate technical and professional assistance	<p>Appropriate technical and professional assistance may include:</p> <ul style="list-style-type: none"> • technical support and advice relating to elements which have intrinsic dangers, such as: <ul style="list-style-type: none"> • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low voltage • professional support for technologies, such as: <ul style="list-style-type: none"> • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano
--	---

	<p>materials</p> <ul style="list-style-type: none"> • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	<p>WHS, regulatory requirements and enterprise procedures may include:</p> <ul style="list-style-type: none"> • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • ministerial directives • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Standards and codes	<p>Standards and codes refer to all relevant Australian and international standards and codes applicable to a particular maintenance system</p>
Systems thinking	<p>Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain</p>
Continuous improvement	<p>Continuous improvement implementation may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance.</p> <p>Improvement processes may include techniques, such as:</p> <ul style="list-style-type: none"> • balanced scorecard • current and future state mapping • measuring performance against benchmarks • process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation

	<ul style="list-style-type: none"> • technical training
Constraints and contingencies	<p>Constraints and contingencies may be:</p> <ul style="list-style-type: none"> • financial • organisational, procedural or cultural • physical constraints, such as limits to resources, limits to site access or logistical limitations
Maintenance systems	<p>Maintenance systems include:</p> <ul style="list-style-type: none"> • breakdown maintenance • preventive maintenance • predictive maintenance (on-condition) • precision maintenance • proactive maintenance • reliability centred maintenance • total productive maintenance
Lean systems maintenance	<p>Lean maintenance systems aim at maximising machine and process up-time, minimising waste and costs, maintaining quality and delivery and customer service. Maintenance processes and procedures are subject to continuous improvement and are set to complement engineering business objectives</p>
Integrated maintenance management systems (terotechnology)	<p>Terotechnology is an integrated maintenance management system combining management, financial, engineering and other practices for cost-effective maintenance of assets, such as plant, equipment and facilities. It involves the design for reliability and maintainability, manufacture, installation, commissioning and eventual write-off and replacement of the assets. Data is collected and analysed to assess the reliability, life cycle costs and productivity of the assets against the design criteria.</p> <p>Reliability relates to the productivity of assets, that is, the maintenance of service or product output (quantities) and its quality within cost parameters. In the context of terotechnology, the cost parameters include life cycle costs</p>
Integrated logistic support (ILS)	<p>ILS is the management and technical process through which supportability and logistic support considerations are integrated into the design and taken into account throughout the life cycle of systems/equipment and by which all elements of logistic support are planned, acquired, tested, and provided in a timely and cost-effective manner. Maintenance systems and schedules are part of this process</p>
Maintenance priority	<p>Assets may be prioritised for maintenance according to different criteria and categories, such as:</p>

	<ul style="list-style-type: none"> • critical assets: <ul style="list-style-type: none"> • high cost of replacement • unavailability of replacement or spares • failure will or may immediately endanger life and property • essential to quality • high cost of disruption to production or service delivery • failure would require an immediate response • semi-critical assets: <ul style="list-style-type: none"> • shutdown produces partial loss of capacity • asset is regulated • difficult to repair • alternative asset may be available • some spare parts are stored • medium priority for response • non-critical: <ul style="list-style-type: none"> • breakdown affects minimal production loss • asset used infrequently • parts readily available • lowest priority attended to as time and resources allow
Maintenance activity audit	<p>An audit of plant, facilities and services may be used to identify maintenance requirements with details listed in the maintenance database according to different criteria, such as:</p> <ul style="list-style-type: none"> • criticality, locality, machine type and maintenance activities required • skills and techniques required for corrective actions • sources and availability of spares • specialised corrective skills and techniques for specific equipment
Maintainability	<p>Maintainability refers to the design of product, machines and processes with an objective of reducing maintenance downtime, resources, specialist tools and skills required to maintain reliability. Design techniques may include modular design for ease of replacement, provision of bypass opportunities to isolate the failure for repair while processes continue or provision of substitute equipment</p>
Monitoring and testing	<p>Monitoring and testing may be undertaken for both corrective and proactive and predictive maintenance. Tests may include:</p> <ul style="list-style-type: none"> • manual inspections • instrumented monitoring • lubricant testing (tribology)

	<ul style="list-style-type: none"> • lidar (light for atmospheric particle detection) • gas chromatography • mandatory inspections • performance and condition monitoring • radiographic examination for material imperfections • microwave for non-metallic solid or liquid test • camera and scope techniques
Maintenance system data	<p>Maintenance system data may include:</p> <ul style="list-style-type: none"> • asset ID and plant warranties • procedural documents: <ul style="list-style-type: none"> • monitoring and preventative maintenance schedules • SWMS • MSDS • work permits • monitoring reports and system measurements • maintenance actions and costs • spares inventory control

Unit Sector(s)

Competency field

Unit sector Engineering science

Custom Content Section

Not applicable.

MEM23126A Evaluate industrial robotic applications

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the evaluation of industrial and mobile robotic applications, including loading and positioning capability, accuracy, repeatability, communications requirements, networks and protocols, and effectiveness of integration into automation systems. It includes evaluation of standard industrial robot types as well as mobile robots and other automated elements.

Application of the Unit

This unit applies to the use of industrial and mobile robotic devices or systems for commercial, industrial, machine and process automation in engineering and related applications.

It is suitable for people working as automation or robotics technicians or paraprofessionals and draftspersons, and those pursuing related technical qualifications and careers.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A	Apply technical mathematics
MEM23111A	Select electrical equipment and components for engineering applications
MEM23112A	Investigate electrical and electronic controllers in engineering applications
MEM23116A	Evaluate programmable logic controller and related control system component applications
MEM23117A	Evaluate microcontroller applications

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|--|-----|---|
| 1 | Establish scope of robotics evaluation | 1.1 | Determine parameters and context of robotics applications to be evaluated |
