 - parts of an electronic systems and equipment that operate at LV and ELV
 - parts of an electronic systems and equipment where high currents are likely
- risks and control measures associated with high voltage (HV) encompassing:
 - parts of an electronic systems and equipment that operate at HV
 - the terms ‘touch voltage’, ‘step voltage’, ‘induced voltage’ and ‘creepage’ as they relate to the hazards of HV
 - control measures used for dealing with the hazards of HV
- risks and control measures associated with LV encompassing:
 - risks associated with installation, fault finding, maintenance and repair
 - control measures before, while and after working on electronic systems or equipment
 - isolation and tagging-off procedures
 - risks and restrictions in working live
 - control measures for working live
- risks and control measures associated with working on aerial cables encompassing:
 - soundness of pole for aerial cabling
 - use of aerial safety equipment
 - procedure to apply pole top rescue
- aerial construction methods and regulations
- joining aerial cables
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant tools, equipment and testing devices
- relevant workplace documentation
- relevant workplace quality, policies and procedures
- sustainable energy practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to installing aerial communication cables
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0003 Install and connect cabling for direct access to telecommunications service

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and connect cabling for direct access to telecommunications service.

It includes working safely, preparing cabling routes, laying and connecting cabling for direct access to telecommunication services, terminating cabling, inspecting and testing, and completing cabling documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
and

UEEDV0013 Solve problems in voice and data communications circuits

or

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to lay and connect cabling for direct access to telecommunication services

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risks are identified and risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Remote power feeding is identified and risk control measures prepared
- 1.4** Scope of work is determined from documentation and/or discussions with relevant person/s
- 1.5** Cable routes are planned within the constraints of the building structure, significant and regulations
- 1.6** Earthing requirements are determined with existing earthing arrangements and cable system earth upper and lower resistance limitations
- 1.7** Advice is sought from relevant person/s to ensure work is coordinated effectively with others
- 1.8** Sources of materials required for work are checked in accordance with routines and workplace procedures
- 1.9** Tools, equipment and testing devices required to carry out work are obtained and checked for correct operation and safety

2 Lay and connect cabling for direct access to telecommunication services

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2** Installed support structure is checked to ensure cable is protected against damage during installation and general operation
- 2.3** Sufficient excess is allowed at cable ends to facilitate termination
- 2.4** Telecommunication outlet ends of cable are uniquely labelled to match identifier at originating location in accordance with relevant industry standards
- 2.5** Cable is placed and secured to maintain safety and interference segregation in accordance with relevant industry standards
- 2.6** Cable ties are tightened without damage to cable sheath or transmission impairment and trimmed flush in accordance with workplace procedures
- 2.7** Cables are installed as catenaries or supported by catenaries in internal and external environment to meet above ground clearances and clearances from hazardous electrical services in accordance with relevant industry standards
- 2.8** Cables are installed underground to meet depth of cover and segregation from hazardous electrical and relevant services in accordance with relevant industry standards
- 2.9** Over-voltage protection devices are fitted to all cable pairs, as required, to suppress voltage surges with devices protectively earthed in accordance with relevant industry standards
- 2.10** Telecommunications reference conductor (TRC)/communications earth system (CES)/earth wire insulation is protected and segregated against damage in accordance with relevant industry standards
- 2.11** Workplace procedures for referring unplanned events to immediate supervisor for directions are followed
- 2.12** Cabling is installed without waste of materials, energy, services, damage to apparatus and the surrounding environment
- 2.13** Quality checks are carried out to ensure cabling is in accordance with relevant industry standards

- 3 Terminate, inspect and test cables and earth wires**
- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 3.2** Cable sheath is removed to allow for correct termination length without damage to underlying conductors and relevant insulation
 - 3.3** Network termination device is installed and cable pairs sequentially fanned for termination in accordance with manufacturer specifications
 - 3.4** Conductors are terminated with colour code sequence using relevant termination tools in accordance with manufacturer specifications
 - 3.5** Cable shield is earthed in accordance with manufacturer specifications and relevant industry standards
 - 3.6** Visual inspection is conducted to confirm termination colour code sequence prior to end-to-end testing of wire and pair termination integrity
 - 3.7** Cable pairs are inspected, tested and labelled to provide accurate identification in accordance with relevant industry standards
 - 3.8** TRC/CES/earth wires are terminated with connectors in accordance with relevant industry standards and manufacturer specifications
 - 3.9** TRC/CES/earth wire continuity is maintained throughout and interface requirements and electrical systems are observed
 - 3.10** TRC/CES/earthing installation is inspected and tested for continuity, insulation resistance and conductive resistance in accordance with industry standards
 - 3.11** Compatibility of alterations with existing systems and new work is confirmed and tested in isolation and integrated with existing systems
 - 3.12** Workplace procedures for referring unplanned events to immediate supervisor for directions are followed
 - 3.13** Cabling is terminated without waste of materials, energy and/or damage to apparatus, the surrounding environment and/or services

- 3.14** Quality checks are carried out and defects rectified to ensure cabling is in accordance with workplace procedures and relevant industry standards
- 4 Complete cabling work records and reporting**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 4.3** Cabling completion advice is documented and reported in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Cabling installations must include at least the following:

- single telephone line (two-pair) and directly connected to telephone sockets

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF101A Install and connect cabling for direct access to telecommunications service.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEDV0003 Install and connect cabling for direct access to telecommunications service

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- terminating at both network termination device and at least two different outlet types and locations
- placing of cables on support structures and building faces for both internal and external locations
- securing cables correctly for above locations
- avoiding cable damage such as crushing, burning, kinking, sheath twist, cutting and nicking, and bending radius
- reading and interpreting drawings related to outlet and service entry location
- conducting and interpreting cable test results
- correctly interpreting and applying standards and regulations
- completing the required documentation
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control methods
- completing cabling work records and reporting
- inspecting and testing cables and earth wires
- installing support structure against damage during installation and general operation
- installing cable without waste of materials, energy, services, damage to apparatus and the surrounding environment
- labelling telecommunication outlet ends of cable
- laying and connecting cabling for direct access to telecommunication services
- obtaining and checking tools, equipment and testing devices
- preparing cabling for direct access to telecommunication services
- terminating cables and earth wires
- terminating telecommunications reference conductor (TRC)/communications earth system (CES)/earth wires.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- telecommunications restricted cabling provider rules (CPR) regulations and installations, safe working practices and relevant standards, codes and regulations, including:
 - telecommunication industry overview encompassing:
 - telecommunication industry
 - overview of telecommunications network
 - overview of Telecommunications Act 1997
 - role of Australian Communications Media Authority (ACMA) and ACIF
 - telecommunications terminology
 - telecommunication technical standards encompassing:
 - ACMA Technical Standards TS008 and TS009
 - SAA Communications Cabling Manual (restricted) (starter kit) as approved by relevant bodies – Standards Australia/ACIF
 - international standards – ISO, IEC and ITU
 - Building Code of Australia (BCA)
 - AS/NZS 3000
 - National Association of Testing Authorities (NATA)
 - CPR encompassing:
 - ACMA
 - telecommunications CPR
 - CPR registration
 - old telecommunication licensing structures
 - inspection of work
 - documentation – TCA1 form
 - cable type and identification encompassing:
 - cable types – unshielded twisted pair, shielded twisted pair, indoor, underground and aerial
 - cable construction
 - cable identification – codes (colour, banded, numbered and lettered)
 - cable installation encompassing:
 - cable damage
 - cable packaging
 - cable dispensing devices
 - cable insertion and hauling
 - lead-in conduit requirements (including wall box installation)
 - wiring diagrams

- segregation of cables
- aerial cable fittings and additional safety aspects required
- termination of telecommunication cables encompassing:
 - sheath stripping – methods and precautions
 - pair identification
 - end-to-end testing
 - filled cable termination
 - termination systems – telephone outlets and sockets, and network terminating devices (NTD)
 - connector jointing e.g. external to internal cable where required
- telecommunication earthing and protection encompassing:
 - customer lightning protection (CLP)
 - CLP earthing
 - carrier's policy requirement covering materials (including surge suppression devices) and
 - practices (including earth bonding arrangements)
- basic telephony encompassing:
 - basic telephone service
 - telephone
 - exchange number
 - connection equipment/lead-in cable
 - dialling signals – pulse dialling, tone dialling and ring equivalence number (REN)
- problem-solving techniques
- relevant earthing requirements
- relevant industry standards
- relevant manufacturer specifications and operating instruction
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant TRC/CES/earth wires
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do

so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to laying and connecting cabling for direct access to telecommunication services
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0004 Install and connect data and voice communication equipment

Modification History

Release 2. This minor update is to amend the Performance Criteria numbering.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and connect data and voice communication equipment.

It includes working safely, preparing and installing communications equipment, and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

UEEDV0008 Install, modify and verify coaxial and structured communication copper cabling

UEEDV0006 Install and modify optical fibre performance data communication cabling

AND

UEECD0043 Solve problems in direct current circuits

OR

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install communications equipment

2 Install communications equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Installation of communications equipment is prepared in consultation with others and sequenced appropriately
- 1.3** Scope of work is determined from documentation and/or discussion with relevant person/s for work to be undertaken
- 1.4** Location of communications equipment and associated equipment is planned within the constraints of the building structure, significant and relevant industry standards
- 1.5** Advice is sought from relevant person/s to ensure the work is coordinated effectively with others
- 1.6** Material needed for the installation work is obtained in accordance with workplace procedures and job requirements
- 1.7** Tools, equipment and testing devices required for installation work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.8** Preparatory work is checked to ensure no damage has occurred in accordance with workplace procedures
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Communications equipment tests are carried out in accordance with WHS/OHS requirements and

workplace procedures

- 2.3 Communications equipment is installed with sufficient access to affect terminations, adjustments and maintenance in accordance with job requirements and relevant industry standards
 - 2.4 Cabling is terminated at communications equipment in accordance with manufacturer requirements and relevant industry standards
 - 2.5 Methods for dealing with unplanned situations are discussed with relevant person/s for approval and documented
 - 2.6 Unplanned situations are dealt with safely and with the approval of an authorised person/s
 - 2.7 Quality checks of the installed communications equipment are conducted in accordance with workplace procedures
 - 2.8 Communications equipment installation is carried out efficiently without waste of materials or damage to communications equipment, circuits, surrounding environment and/or services using sustainable energy principles
- 3 Complete and report installation activities**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Final checks are made to ensure that the installed communications equipment is in accordance with relevant industry standards
 - 3.4 'As-installed' communications equipment is documented and relevant person/s notified in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and connecting must include the following:

- at least three different types of voice and data communications equipment
- at least three types of communications cable

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF109A Install and connect data and voice communication equipment.

Assessment Requirements for UEEDV0004 Install and connect data and voice communication equipment

Modification History

Release 2. This minor update is to amend the Performance Criteria numbering.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- carrying out communications equipment installation without waste of materials or damage to communications equipment, circuits, surrounding environment and/or services using sustainable energy principles
- completing and reporting installation activities
- completing required documentation
- connecting communications equipment
- dealing with unplanned events
- dealing with unplanned situations
- installing communications equipment and associated equipment
- installing communications equipment with sufficient access to affect terminations, adjustments and maintenance
- obtaining and checking tools, equipment and testing devices
- placing and securing communications equipment accurately
- planning location of communications equipment and associated equipment
- preparing to install communications equipment and associated equipment
- terminating cabling
- testing communications equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- analogue and digital signals
- basics of encoding networking signals

- internet services
- local area network (LAN) architectures
- network signal propagation
- networking protocols and the open systems interconnection (OSI) model
- problem-solving techniques
- relevant building structure and significant
- relevant industry standards
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures
- sustainable energy principles
- transmission control protocol (TCP)/internet protocol (IP)
- types of networks, network components and hardware.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to installing and connecting voice and data communications equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Errors that don't impact unit outcomes in the Range of Conditions, Performance and Knowledge Evidence were corrected.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and maintain telecommunications cabling in buildings and premises.

It includes working to relevant regulations, legislation, codes of practice and industry standards and to Australian Communications and Media Authority's (ACMA) Telecommunications Cabling Provider Rules; installing multiple telecommunication lines for multiple access to telecommunication services; terminating at telecommunication outlets, termination modules and distributors; testing for compliance and completing cabling documentation.

This unit applies to customer cabling terminated on distributors and to the installation, maintenance and modification of indoor, external, underground cabling and customer cabling and may be used to connect devices for a range of applications, including telecommunications phones, data (video and multimedia) and security (alarms and fire protection).

Work functions in the occupational areas where this unit may be used are subject to regulatory requirements. Refer to the UEE Electrotechnology Training Package Companion Volume Implementation Guide or the relevant regulator for specific guidance on requirements.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install and maintain cabling

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** Hazards are identified, risks are assessed and control measures and workplace procedures are implemented
- 1.3** Nature and location of the work is determined from documentation or relevant person/s to determine scope of work to be undertaken
- 1.4** Cable routes are planned within the constraints of the building structure and in accordance with relevant regulations, legislation, codes of practice and industry standards
- 1.5** Earthing requirements are determined in accordance with existing earthing arrangements, where applicable, and cable system, earth upper and lower resistance limitations
- 1.6** Advice is sought from relevant person/s to ensure work is coordinated effectively with others
- 1.7** Materials required for the work are obtained in accordance with workplace procedures
- 1.8** Tools, equipment and testing devices required for the

2 Install and maintain cabling

- work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Installed support structure is checked for compliance to ensure cable will not be exposed to damage during installation and general operation
 - 2.3** Catenary supports are secured to building structure and tensioned, as required, to ensure cable weight can be carried in operating conditions, with interference and safety segregation maintained in accordance with relevant regulations, legislation, codes and standards
 - 2.4** Protective earthing of metal work is installed in accordance with job requirements and industry standards
 - 2.5** Cables/wires are installed in accordance with manufacturer application, tension and bending stress requirement specifications
 - 2.6** Sufficient cable excess is allowed at cable ends to facilitate termination in accordance with workplace procedures
 - 2.7** Cable ends terminating at a telecommunication outlet are labelled in accordance with industry standards
 - 2.8** Cable is placed and secured to maintain safety and interference segregation in accordance with legislative and industry standards
 - 2.9** Cable ties are tightened correctly and safely in accordance with workplace procedures and industry standards
 - 2.10** Customer cabling is installed in accordance with relevant regulations, codes of practice and industry standards
 - 2.11** Surge suppression devices are fitted to all cable pairs as required with the devices protectively earthed in accordance with relevant regulations, codes of practice and industry standards
 - 2.12** Telecommunications reference conductor (TRC)/communications earth system (CES)/protective earth (PE) insulation is protected against damage and TRC/CES and PE are segregated in accordance with

relevant regulations, codes of practice and industry standards

2.13 Cabling is installed without waste of materials and energy or damage to apparatus, the surrounding environment or services using sustainable energy practices

2.14 Regular quality checks are conducted in accordance with workplace procedures to ensure cabling complies with requirements

3 Terminate, inspect and test cables and earth wires

3.1 WHS/OHS risk control work measures and workplace procedures for carrying out work are followed

3.2 Cable sheath is removed to allow for correct termination length and without damage to underlying conductors and their insulation

3.3 Terminating modules are installed in accordance with manufacturer specifications and cable pairs neatly and sequentially fanned for termination

3.4 Conductors are terminated in accordance with recommended colour code sequence and using relevant termination tools in accordance with manufacturer guidelines and operating instructions

3.5 Cable shields are earthed, as required, in accordance with manufacturer specifications, relevant regulations, codes of practice and industry standards

3.6 Visual inspection is undertaken prior to end-to-end testing of wire and pair termination integrity to confirm termination colour code sequence has been followed

3.7 Cable pairs are tested and clearly labelled to provide accurate identification in accordance with job requirements and workplace procedures

3.8 TRC/CES/PE are terminated with connectors in accordance with manufacturer specifications, relevant industry codes of practice and industry standards

3.9 TRC/CES/PE wire continuity is maintained in accordance with workplace procedures and interface requirements with electrical systems are followed

3.10 TRC/CES/PE installation is tested for continuity insulation resistance and conductive resistance in

accordance with relevant industry standards

- 3.11 Earthing system is labelled in accordance with job requirements and workplace procedures
- 3.12 New work is tested both in isolation and when integrated with existing systems, and compatibility of alterations with existing systems is confirmed
- 3.13 Cabling is terminated without waste of materials and energy or damage to apparatus, the surrounding environment or services
- 3.14 Regular quality checks are conducted and any defects rectified to ensure cabling complies with requirements

4 Complete cabling work records and reporting

- 4.1 WHS/OHS risk control measures and procedures for work completion are followed
- 4.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 4.3 Record sheets, plans of cable location type and infrastructure are accurately created or updated and stored in accordance with customer requirements and workplace procedures
- 4.4 Cable pair record books are created or updated to provide an accurate record of pair locations, inter-connections and usage in accordance with relevant regulations, codes of practice and industry standards
- 4.5 Telecommunications cabling advice (TCA 1) is documented and reported in accordance with requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Cable laying and connecting to larger commercial and industry installations must include:

Terminating systems at both distributor and outlet locations must include:

- multi-pair cables
- multi-story buildings
- termination modules and distributors
- two jumperable distributors with one having a capacity of 100 pair or greater
- a cable in excess of 20 pair and a 4 pair

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF102A Install and maintain cabling for multiple access to telecommunication services.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Errors that don't impact unit outcomes in the Range of Conditions, Performance and Knowledge Evidence were corrected.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - using risk control measures
- accessing and interpreting telecommunication systems diagrams
- planning cable route within building constraints
- checking tools, equipment and testing devices for correct operation and safety
- laying and connecting cables for multiple access to telecommunication services, including:
 - terminating cabling at both distributor and outlet locations with one cable being greater than 20prs, one cable of 20pr or less and one 4pr cable installing and terminating two jumperable distributors with a capacity of 100 pair or greater
 - allowing excess cable to terminate
 - labelling outlet ends in accordance with industry standards
 - securing cables in accordance with industry standards
 - reading and interpreting drawings related to cable layouts, outlet location, cable coding system, identifiers and distributor locations
 - installing and termination a network termination device (NTD)
- determining earthing requirements and earthing conductors within resistance limitations
- segregating and protecting telecommunications reference conductors (TRC)/communications earth systems (CES)/protective earth (PE) wires against damage
- installing surge suppression devices
- completing documentation in accordance with industry standards and telecommunications carrier requirements

- terminating and testing cables
- commissioning a telecommunications cabling system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- customer interfaces, devices and system distribution
- installation and termination requirements, including:
 - Australian Communications and Media Authority (ACMA) regulations and requirements
 - technical standards
 - relevant manufacturer specifications
 - compliance with current Australian Standards, including AS/CA S009 Installation requirements for customer cabling (Wiring Rules)
- Cabling Provider Rules, including:
 - cabling registrars, auditors and inspectors
 - mandatory and voluntary requirements for cabling work
 - registration
- general installation requirements, including:
 - Cabling Provider Rules requirements
 - earth potential rise
 - catenary cabling systems
 - optical fibre and coaxial cabling systems
 - conduits
- cable distribution devices, including:
 - cable distribution devices
 - clearances
 - general requirement
- network boundaries, including:
 - terminations
 - hazards
 - regulations
- indoor cabling, including:
 - general requirements for indoor cabling
 - required minimum clearances
 - damp situations
 - cables in lift and hoist shafts
- underground cabling, including:
 - requirements for underground cabling

- minimum depth cover
- protection of underground cabling
- segregation from other services
- aerial cabling, including:
 - requirements for aerial cabling
 - minimum clearances
 - segregation requirements
- earthing protection, including:
 - earthing requirements
 - function of earthing
 - TRC/CES/PE purposes
 - TRC/CES earthing installation tests
 - earthing systems
 - earthing of equipment
 - equipotential bonding
- surge suppression and system purpose, types and operation
- miscellaneous regulations, including:
 - cabling in heritage buildings
 - cabling in public places
 - cabling in hazardous areas
- cable identification, including:
 - plans and drawing
 - labelling
 - documentation
- telecommunication cable types including:
 - construction
 - transmission characteristics
 - applications
- cable installation, including:
 - hazards
 - cable damage prevention
 - cable dispensers
 - cable enclosures
 - types
 - fixing
 - regulations
 - distribution boxes and back mounts
- techniques for general cable installation, including:
 - correct cable length for termination
 - cable identification and labelling

- unique label outlet ends of cable match identifier
- cable damage prevention
- fixing of cables to support stems
- maintaining ground clearance and hazardous clearances
- techniques to terminate and test, including:
 - removal of cable sheath
 - install terminating modules
 - terminate conductors
 - termination boundaries
- earthing concepts, including:
 - earthing cable shield
 - testing
 - earth of metallic barriers
 - purpose of earth testing instruments
 - earth potential rise
 - earthing test procedures
 - interpretation of results
- cable shielding and interference, including:
 - electromagnetic interference (EMI)/radio frequency interference (RFI) principles
 - sources
 - reduction techniques
 - earthing cable shields
 - interference segregation
- end-to-end testing, including:
 - pair termination integrity
 - cable pairs labelling
 - surge suppression devices
- hazards, including:
 - electronic components and circuits
 - printed circuit boards
 - physical
 - static discharge
 - chemical.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- two jumperable distributors with a capacity of 100 pair or greater
- a cable in excess of 20 pair, a cable of 20 pair or less and a 4 pair
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0006 Install and modify optical fibre performance data communication cabling

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and modify optical fibre performance data communication cabling.

It includes working safely, installing optical fibre cabling, terminating at distributors, testing and compliance checks, and completing cabling documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to install and modify optical fibre cabling

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Installation and modification of wiring is prepared in consultation with others and sequenced appropriately
- 1.3 Scope of work is determined from documentation and/or discussions with relevant person/s
- 1.4 Advice is sought from relevant person/s to ensure work is coordinated effectively with others
- 1.5 Material required for the installation work is obtained in accordance with workplace procedures and job requirements
- 1.6 Tools, equipment and testing devices required for the installation work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred and is in accordance with workplace procedures and relevant industry standards

2 Install and modify optical fibre cables

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Optical fibres are tested for optical continuity
- 2.3 Cables are installed and modified with sufficient excess to affect terminations in accordance with manufacturer specifications, relevant industry standards and job requirements
- 2.4 Methods for dealing with unplanned situations are discussed with relevant person/s for approval and documented in accordance with workplace procedures
- 2.5 Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.6 Quality checks of the installed wiring are conducted in accordance with workplace procedures
- 2.7 Cable installation and modification is conducted without waste of materials, damage to apparatus, circuits or

- surrounding environment using sustainable energy practices
- 3 Terminate optical fibre cables**
- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 3.2** Cable termination work area and optical fibre cables are cleaned and safety measures implemented in accordance with WHS/OHS requirements and workplace procedures
- 3.3** Cables are prepared for termination in accordance with manufacturer specifications and relevant industry standards
- 3.4** Optical fibre connectors are fitted in accordance with manufacturer specifications and relevant industry standards
- 3.5** Relevant methods are used to splice optical fibre cables in accordance with WHS/OHS requirements, manufacturer specifications and relevant industry standards
- 3.6** Cable performance tests are conducted and results documented
- 3.7** Causes of defects indicated by test results are identified and rectified
- 3.8** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 3.9** Quality checks of the installed wiring are conducted in accordance with workplace procedures
- 3.10** Cable terminations are completed without waste of materials, damage to apparatus, circuits or surrounding environment using sustainable energy practices
- 4 Document installation and modification and verify optical fibre cabling performance**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 4.3** Final checks to the installed cabling are conducted in accordance with job requirements

- 4.4 Documentation certifying system performance is issued to a relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing or modifying cabling must include at least two of the following:

- performance optical fibre cables

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF105A Install and modify optical fibre performance data communication cabling.

Links

Companion Volume implementation guides are found in VETNet - -
<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEDV0006 Install and modify optical fibre performance data communication cabling

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including applying risk control measures
- completing documentation
- conducting cable performance tests and documenting results
- dealing with unplanned events
- documenting installation and modification and verifying optical fibre cabling performance
- identifying and rectifying anomalies
- identifying and rectifying defects
- installing and modifying optical fibre cables
- obtaining and checking tools, equipment and testing devices
- preparing and terminating each type of cable in accordance with relevant industry standards
- preparing to install and modify optical fibre cabling
- routing, placing and securing cables in accordance with relevant industry standards
- terminating cable in accordance with manufacturer specifications and relevant industry standards
- terminating optical fibre cables
- testing optical fibres for optical continuity.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- building construction and building codes
- installation and modification
- installation of cables
- optical fibre principles of operation
- optical fibre safety - hazards

- optical fibre safety - laser
- optical theory
- problem-solving techniques
- relevant industry standards
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including risk management principles
- relevant workplace documentation, including administration and management records
- relevant workplace quality, policies and procedures
- support structures and fixings
- sustainable energy principles
- terminating of fibre cables
- testing of optical fibre cables.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to installing and modifying performance data communication optical fibre cabling
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0007 Install underground communication cables

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install underground communication cables.

It includes working safely, preparing and filling trenches, placing conduits and ducts, drawing cables and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to install underground communication cables

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risks are identified, and risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Safety hazards that have not previously been identified are noted and risk control measures implemented
- 1.4** Cabling installation is prepared in consultation with others affected by the work and sequenced in accordance with workplace procedures
- 1.5** Scope of the work is determined from documentation and/or discussions with relevant person/s to establish the work to be undertaken
- 1.6** Cable routes are planned in accordance with the precinct, structure, significants and relevant industry standards
- 1.7** Advice is sought from relevant person/s to ensure the work is coordinated effectively with others
- 1.8** Material required for installation work is obtained in accordance with workplace procedures and job specifications
- 1.9** Tools, equipment and testing devices required for the installation work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.10** Preparatory work is checked to ensure no damage has occurred in accordance with job specifications requirements

2 Install underground communication cables

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2 Trenching is checked in accordance with job specifications and relevant industry standards
 - 2.3 Ducts/conduits are laid in accordance with job specifications and relevant industry standards
 - 2.4 Cables are drawn-in without stain or damage in accordance with job specifications and relevant industry standards
 - 2.5 Cable ends are protected from damage in preparation for termination
 - 2.6 Methods for dealing with unplanned situations are discussed with relevant person/s for approval and documented in accordance with workplace procedures
 - 2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.8 Quality checks of the installed wiring are undertaken in accordance with workplace procedures
 - 2.9 Cable installation is carried out efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Document and verify installation of underground communication cables**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Documentation of cable installation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assessment Requirements for UEEDV0007 Install underground communication cables

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- reading and interpreting drawings related to cable schedules and routes
- installing ducts/conduits below ground correctly
- drawing in cables without strain or damage
- protecting cable ends
- completing the necessary documentation accurately
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- carrying out cable installation efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- checking trenching in accordance with job specifications and relevant industry standards
- documenting and verifying installation of underground communication cables
- installing underground communication cables
- obtaining material required for installation work
- obtaining tools, equipment and testing devices required for the installation work and checking for correct operation and safety
- preparing to install underground communication cables.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- telecommunication underground cabling requirements and techniques, safe working practices and relevant standards, codes and regulations, including:
 - hazards and control measures in underground cabling working environment:
 - risk management and assessment of risk:
 - principle and purpose of risk management
 - processes for conducting a risk assessment

- hazards associated with low voltage (LV), extra-low voltage (ELV) and high currents:
 - parts of an electronic systems and equipment that operate at LV and ELV
 - parts of an electronic systems and equipment where high currents are likely
- risks and control measures associated with high voltage (HV):
 - parts of an electronic systems and equipment that operate at HV
 - the terms ‘touch voltage’, ‘step voltage’, ‘induced voltage’ and ‘creepage’ as they relate to the hazards of HV
 - control measures used for dealing with the hazards of HV
- risks and control measures associated with LV:
 - risks associated with installation, fault finding, maintenance and repair
 - control measures before, while and after working on electronic systems or equipment
 - isolation and tagging-off procedures
 - risks and restrictions in working live
 - control measures for working live
- risks and control measures associated with trenches:
 - identification of trenching conditions
 - notification of relevant authorities/utilities and permits
 - digging and trenching equipment safety
 - methods of shoring
 - public safety
 - personal safety equipment
- telecommunication below ground cabling:
 - types and purposes of mechanical and manual aids
 - purpose, location, and capacity of manholes and pits
 - types of underground cable
 - procedure for the excavation of a site for the installation of a manhole, pit, pipe and conduit
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant tools, equipment and testing devices
- relevant workplace documentation
- relevant workplace quality, policies and procedures
- sustainable energy practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to installing underground communication cables
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0008 Install, modify and verify coaxial and structured communication copper cabling

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install, modify and verify coaxial and structured communication copper cabling in buildings and premises intended for connection to a telecommunications network as permitted by the Australian Communications and Media Authority (ACMA).

It includes working safely to industry standards; installing generic, structured twisted pair cabling (category 5 and above) and coaxial cabling that terminate at distributors, termination modules and telecommunication outlets; testing for compliance; and completing cabling documentation.

Work functions in the occupational areas where this unit may be used are subject to regulatory requirements. Refer to the UEE Electrotechnology Training Package Companion Volume Implementation Guide or the relevant regulator for specific guidance on requirements.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install and/or modify copper cabling

2 Install or modify copper cables

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures are implemented
- 1.3 Installation or modification of wiring is coordinated after consultation with relevant person/s affected by the work
- 1.4 Nature and location of work is obtained from relevant person/s and/or documentation, diagrams, cable layout drawings and cable schedules to determine the scope and details of work to be undertaken
- 1.5 Cable routes are planned in accordance with relevant regulations, constraints of the building structure, fire walls, cultural/heritage requirements and regulations
- 1.6 Advice is sought from relevant person/s to ensure work is coordinated effectively with others
- 1.7 Material required for the installation work is determined and obtained in accordance with workplace procedures and checked against job requirements
- 1.8 Tools, equipment and testing devices required for the installation are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.9 Preparatory work is checked to ensure compliance with regulations, workplace procedures, safety and job requirements
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2 Cables are installed or modified with sufficient excess to affect terminations in accordance with manufacturer specifications, technical standards and job requirements
- 2.3 Cable installation/modification is carried out without waste of materials or damage to apparatus, circuits or the surrounding environment and using sustainable energy practices
- 3 **Terminate copper cables**
 - 3.1 WHS/OHS risk control measures and procedures for work completion are followed
 - 3.2 Cable termination work area is cleaned and safety measures implemented
 - 3.3 Cables are prepared for termination in accordance with manufacturer specifications, technical standards and workplace procedures
 - 3.4 Surge suppression devices are fitted to cables with metallic components in accordance with manufacturer specifications, technical industry standards and workplace procedures
 - 3.5 Cable shields are earthed in accordance with manufacturer specifications, technical standards and workplace procedures
 - 3.6 Twist ratio of generic, structured metallic cables is maintained in accordance with manufacturer specifications and technical standards
 - 3.7 Twisted pair cables are terminated in accordance with manufacturer specifications, technical standards and workplace procedures
 - 3.8 Cable performance tests are conducted accurately and results documented in accordance with workplace procedures
 - 3.9 Cause of defects indicated by inspection and test results are identified and rectified in accordance with manufacturer specifications, technical industry standards and workplace procedures
 - 3.10 Regular quality checks of the installed wiring are undertaken in accordance with workplace procedures
 - 3.11 Cable terminations are carried out without waste of

- materials, damage to apparatus, circuits or the surrounding environment and using sustainable energy practices
- 4 Verify and document copper cabling installation and performance**
- 4.1** WHS/OHS risk control measures and workplace procedures for work completion are followed
 - 4.2** Final checks are made to installed cabling to ensure it conforms to performance requirements and regulations
 - 4.3** Telecommunications cabling advice (TCA) forms are completed in accordance with workplace procedures and issued to relevant person/s
 - 4.4** Worksite is cleaned and made safe in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, modifying and verifying coaxial and structured communication copper cabling must include:

- distributor frames
- patch panels
- a range connectors/outlets
- a range of cable types

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF104A Install, modify and verify coaxial and structured communication copper cabling.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEDV0008 Install, modify and verify coaxial and structured communication copper cabling

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including applying risk control measures
- obtaining correct materials, tools and equipment to undertake the work
- checking tools, equipment and testing devices for correct operation and safety
- installing, terminating and testing unshielded twisted pair (UTP), FTP or shielded twisted pair (STP) customer cables that are rated Category 5 or above
- installing, terminating and testing coaxial cable installation systems
- installing and modifying performance data communication copper cabling, including:
 - reading and interpreting drawings and diagrams related to cable layouts, schedules and apparatus locations
 - routing, placing and securing cables to comply with industry standards
 - preparing and terminating each type of cable to comply with industry standards
 - ensuring copper cables are installed or modified with sufficient excess to affect terminations
 - maintaining twist ratio of generic, structured twisted pair copper cables
 - earthing cable shields
 - fitting surge suppression devices
 - conducting cable performance tests
- completing necessary documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- telecommunication cable types, including:
 - construction
 - transmission characteristics

- applications
- cable identification, including:
 - plans and drawing
 - labelling
 - documentation
- cable installation, including:
 - hazards
 - cable damage prevention
 - cable dispensers
- distributors and distributor enclosures, including:
 - types
 - regulations
 - termination interfaces
- termination methods and requirements
- category 5 and above generic, structured cabling, including:
 - design principles
 - functional elements
 - cabling sub-systems
- uses and construction of category UTP, FTP and STP generic and coaxial structured cabling installation systems
- performance requirements for structured cabling, including:
 - approved practices
 - safety requirements
 - connectors
 - terminating tools
 - continuity tests
 - fault diagnosis
 - recording results
- testing and commissioning structured cabling systems
- constraints of building structure, fire walls and cultural/heritage requirements
- techniques to identify and rectify faults/defects.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational

situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0009 Select and arrange data and voice equipment for local area networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select and arrange data and voice equipment for local area networks (LANs).

It includes selecting compliant equipment, arranging locations of equipment and cable routes, applying solutions based on calculated measures and completing network documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

UEEDV0008 Install, modify and verify coaxial and structured communication copper cabling

UEEDV0006 Install and modify optical fibre performance data communication cabling

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to select equipment

1.1 Scope of work communications network is determined from documentation and/or discussions with relevant person/s

1.2 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for the communications network area are identified, obtained and applied

2 Arrange locations of equipment and cable routes

2.1 Location of equipment is arranged in accordance with job specifications and relevant industry standards

2.2 Cable routes are planned to ensure maximum lengths in accordance with relevant industry standards and manufacturer specifications

2.3 Cable routes are planned in accordance with job specifications and relevant industry standards

2.4 Earthing is arranged in accordance with job specifications and relevant industry standards

3 Select cables and equipment

3.1 Cable types are selected for the environment/s and performance requirements in accordance with job specifications and relevant industry standards

3.2 Cable sizes are selected for capacity and performance requirements in accordance with job specifications

3.3 Earthing components are selected for earthing requirements in accordance with job specifications and relevant industry standards

3.4 Network equipment is selected in accordance with WHS/OHS requirements and relevant industry standards

- 3.5** Electronic equipment types are selected for the environment/s and performance requirements in accordance with job specifications and relevant industry standards
- 4 Document communications network**
- 4.1** Justifications for selections of cable and electronic equipment and relevant calculations are documented in accordance with workplace procedures
- 4.2** Communications network arrangement and specifications for all selected items are documented in accordance with workplace procedures and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting and arranging equipment for LANs, comprising a distribution frame, must include at least the following:

- two fibre outlets
- 20 sets of two data outlets
- one private automatic branch exchange customer access equipment (CAE)
- or Virtual PBX
- one server

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF110A Select and arrange data and voice equipment for local area networks.

- arranging locations of equipment and cable routes
- arranging network equipment
- documenting communications network
- documenting installation arrangements and specifications for items selected and reasons for the selections made
- documenting justifications for selections of cable and electronic equipment
- planning cable routes in accordance with job specifications and relevant industry standards
- preparing to select equipment
- selecting appropriate earthing components
- selecting cables and equipment
- selecting electronic equipment types
- selecting types and sizes of cables.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- local area network (LAN) fundamentals
- performance of copper or fibre installation and termination
- customer switching system (CSS) customer access equipment (CAE)
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures
- switches, hubs and routers.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to selecting and arranging equipment for LANs
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0010 Select and arrange equipment for wireless communication networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select and arrange equipment for wireless communication networks.

It includes selecting compliant equipment, developing wireless communication network arrangements, complying with regulations (based on calculations), justifying solutions and completing network documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to select equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Scope of the communications network is determined from job specifications

1.2 Work health and safety (WHS)/occupational health and safety (OHS) processes and relevant industry standards

for the wireless network area are identified, obtained and applied

2 Arrange locations of equipment and cable routes

2.1 Location of equipment is arranged in accordance with job specifications and relevant industry standards

2.2 Cable routes are planned to ensure maximum lengths in accordance with relevant industry standards and manufacturer specifications

2.3 Cable routes are planned in accordance with job specifications and relevant industry standards

2.4 Earthing is arranged in accordance with job specifications and relevant industry standards

3 Select cables and equipment

3.1 Cable types are selected and installed for the environments in accordance with job specifications and relevant industry standards

3.2 Cable sizes are selected in accordance with job specifications and relevant industry standards

3.3 Earthing components are selected in accordance with job specifications and relevant industry standards

3.4 Network equipment is selected and documentation obtained in accordance with WHS/OHS requirements

3.5 Electronic equipment is selected for the environments in accordance with job specifications and relevant industry standards

4 Document communications network

4.1 Justification for selection of equipment and calculations are documented in accordance with workplace procedures

4.2 Wireless network equipment for arrangement and specifications for all selected items are documented in accordance with workplace procedures and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF108A Select and arrange equipment for wireless communication networks.

Links

Assessment Requirements for UEEDV0010 Select and arrange equipment for wireless communication networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- arranging and selecting earthing components
- arranging earthing
- arranging locations of equipment and cable routes
- arranging network equipment
- documenting installation arrangement, specification for items selected and reasons for the selections made
- documenting justification for selection and calculations
- planning and selecting types and sizes of cables
- planning cable routes
- selecting electronic equipment types for the environment
- selecting network equipment and obtaining documentation of equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- operating systems and networks
- relevant cable routes and earthing
- relevant cables, components and equipment
- relevant industry standards
- relevant manufacturer specifications and installing instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including:

- wireless network documentation
- relevant workplace policies and procedures
- wireless network components for local area networks (LANs) and wide area networks (WANs)
- wireless network configurations
- wireless network security.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to selecting and arranging equipment for wireless networks
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0011 Set up and configure basic data communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and configure basic data communication systems.

It includes working safely, installing data communications hardware, installing and configuring data communications software, and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECS0003 Assemble, set up and test computing devices

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to set up and configure data communication systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Set-up and configuration work are determined from job specifications and in consultation with relevant person/s
 - 1.3 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
 - 1.4 Hardware and software required for work are obtained in accordance with workplace procedures and job specifications
 - 1.5 Preparatory work is checked to ensure no damage has occurred in accordance with workplace procedures and job specifications
- 2 Set up, configure and maintain data communication equipment**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Layout of data communications hardware cabling and outlets is determined from job specifications and/or in consultation with relevant person/s
 - 2.3 Hardware is installed in accordance with the data communications system requirements
 - 2.4 Data communications software is installed and configured in accordance with network requirements
 - 2.5 Data communications operations are tested and anomalies identified and corrected
 - 2.6 Reported data communications failures and faults are reviewed and relevant tools and methods are used in accordance with workplace procedures
 - 2.7 Identified causes of reported problems are rectified and the data communications link is tested in accordance with workplace procedures
 - 2.8 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.9 Set-up configuration and maintenance are carried out efficiently without waste of materials or damage to apparatus, surrounding environment and/or services using sustainable energy practices
- 3 Complete work and**
- 3.1 WHS/OHS risk control work completion measures and

document activities

workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Data communications configuration and maintenance records are maintained in accordance with workplace procedures
- 3.4 Service report is completed and forwarded to relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and configuring data communications systems must include at least the following:

- communication modem/s
- communication port/s

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF114A Set up and configure basic data communication systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEDV0011 Set up and configure basic data communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- carrying out set-up configuration and maintenance efficiently without waste of materials or damage to apparatus, surrounding environment and/or services using sustainable energy practices
- completing work and documenting activities
- dealing with unplanned situations
- determining layout of data communications hardware cabling and outlets
- determining the extent of work schedule
- documenting network configurations and activity results for future referencing
- finding the cause of faults
- identifying and correcting anomalies
- installing and configuring software to requirements
- installing data communications software
- installing hardware
- laying out network in accordance with job specifications
- obtaining specified hardware and software
- preparing to set up and configure data communication systems
- rectifying identified causes of reported problems
- reviewing reported data communications failures and faults
- setting up, configuring and maintaining data communication equipment
- testing data communications operations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- characteristics and limitations of the types of transmission media
- communications configuration and maintenance records
- problem-solving techniques
- process of data transmission
- protocols
- relevant data communications software
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including communications configuration and maintenance records
- relevant workplace policies and procedures
- sustainable energy principles
- types, characteristic specifications and limitations of fibre optic systems
- types, characteristics and limitations of modems and interface standards.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to setting up and configuring basic data communications systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0012 Set up and configure the wireless capabilities of communications and data storage devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and configure the wireless capabilities of communications and data storage devices.

It includes applying safe working practices, checking device software installation, following work instructions and procedures, and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to enter operating instructions

1.1 Work supervisor and/or customers are consulted to determine functions of the device and relevant parameter/s

1.2 Tools, equipment and testing devices required to carry out work are obtained and checked for correct operation

- and safety
- 1.3** Device installation is checked in accordance with job specifications and relevant industry standards
- 2 Enter operating instructions**
- 2.1** Status of relevant function of the device is entered and parameters set in accordance with manufacturer specifications
- 2.2** Entered data is checked in accordance with workplace procedures and job specifications
- 2.3** Workplace procedures for referring unplanned events to supervisor for directions are followed
- 3 Test device operation and report**
- 3.1** Device operation is tested
- 3.2** Operating anomalies are identified and corrected in accordance with workplace procedures
- 3.3** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.4** Work completion is reported and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Entering and verifying operating instructions must include at least two types of microprocessor equipped devices with built-in icon-based programmable functions of the following:

- programmable relays
- timers
- temperature controllers
- detection devices for security and fire

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF107A Set up and configure the wireless capabilities of communications and data storage devices.

Assessment Requirements for UEEDV0012 Set up and configure the wireless capabilities of communications and data storage devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- correcting programming anomalies
- dealing with unplanned events
- entering functions and parameters correctly
- entering operating instructions
- identifying operating anomalies of device installation
- identifying required operating functions and parameters
- obtaining and checking tools, equipment and testing devices required to carry out work
- preparing to enter operating instructions
- verifying device operation
- testing device operation and completing reports.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating principles at sub-system level
- programming functions
- relevant device functions and parameters
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to setting up the wireless capabilities of communications and data storage devices
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0013 Solve problems in voice and data communications circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in voice and data communications circuits.

It includes working safely; applying problem-solving procedures; using basic voltage, current and resistance measuring devices; and providing known solutions to predictable communication circuit problems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on voice and data communications circuits

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 WHS/OHS risk control work preparation measures and workplace procedures are followed
 - 1.3 Scope of circuit/s problem is obtained from documentation and/or from work supervisor to determine the work to be undertaken
 - 1.4 Advice is sought from the work supervisor to ensure work is coordinated with others
 - 1.5 Sources of materials required for work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required to carry out work are obtained and checked for correct operation and safety
- 2 Solve identified problems in voice and data communications circuits**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Measured and calculated value routines are used to solve circuit problems for single path, single source circuits
 - 2.5 Problems are solved without damage to apparatus, circuits, the surrounding environment and/or services using sustainable energy practices
- 3 Complete work and document problem solving activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to solve circuit problems is documented
 - 3.4 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF106A Solve problems in voice and data communications circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEDV0013 Solve problems in voice and data communications circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- altering an existing circuit to comply with specified operating parameters
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- checking and isolating circuits
- completing documentation of justification for solution
- completing work and documenting problem-solving activities
- determining sources of materials required for work
- determining the operating parameters of an existing circuit
- measuring and calculating value routines to solve circuit problems
- obtaining and checking tools, equipment and testing devices required to carry out work
- obtaining the scope of circuit/s problem from documentation and/or from work supervisor
- preparing to work on voice and data communications circuits
- solving identified problems in voice and data communications circuits
- solving problems without damage to apparatus, circuits, the surrounding environment and/or services using sustainable energy practices
- testing and measuring live work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- alternating current (a.c.) principles
- capacitance
- circuit parameter relationships
- direct current (d.c.) resistive circuits
- effects of electrical current
- electrical circuits
- electromotive force (EMF) sources

- isolation procedures
- magnetism and electromagnetic induction
- measurement instruments (voltage, current and resistance)
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant measurements and calculations values
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles
- testing and measuring of live work.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment used in industry
- resources that reflect current industry practices in relation to solve problems in voice and data communications circuits
- applicable documentation including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEDV0014 Test, report and rectify faults in data and voice installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to test, report and rectify faults in data and voice installations.

It includes working safely, conducting performance testing, applying fault-finding procedures, testing functionality of the network, conducting repairs and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEDV0005 Install and maintain cabling for multiple access to telecommunication services

UEEDV0008 Install, modify and verify coaxial and structured communication copper cabling

UEEDV0006 Install and modify optical fibre performance data communication cabling

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Data and Voice

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to test, report and rectify faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Testing is prepared in consultation with others affected by work and sequenced in accordance with workplace procedures
- 1.3 Scope of the work is determined from documentation and/or discussions with relevant person/s to establish the work to be undertaken
- 1.4 Advice is sought from relevant person/s to ensure work is coordinated effectively with others
- 1.5 Material needed for testing, reporting and rectifying work is obtained in accordance with workplace procedures and job requirements
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred in accordance with job requirements and workplace procedures

2 Test and rectify faults

- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
- 2.2 Tests are carried out in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Tests are prepared and conducted in accordance with test equipment operating instructions and job requirements

- 2.4 Cable performance tests are conducted and results documented in accordance with workplace procedures
 - 2.5 Causes of defects and/or faults indicated by test results are identified and rectified in accordance with workplace procedures
 - 2.6 Methods for dealing with unplanned situations are discussed with relevant person/s for approval and documented in accordance with workplace procedures
 - 2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.8 Quality checks of the installed equipment are undertaken in accordance with workplace procedures
 - 2.9 Testing and rectifying faults is carried out without waste of materials or damage to equipment, circuits, surrounding environment or services using sustainable energy principles
- 3 Document and verify installation performance**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Service reports are completed as required in accordance with workplace procedures
 - 3.4 Documentation certifying system performance is issued to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Testing, reporting and rectifying faults in voice • two different items of customer premises

and data installations must include at least the following equipment

- a local area network (LAN)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEF111A Test, report and rectify faults in data and voice installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEDV0014 Test, report and rectify faults in data and voice installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- carrying out work without waste of materials or damage to equipment, circuits, surrounding environment or services using sustainable energy principles
- completing documentation
- dealing with unplanned situations
- identifying defects/faults from test results
- interpreting test results
- obtaining and checking tools, equipment and testing devices for correct operation and safety
- preparing and conducting tests of faults
- preparing test reports
- rectifying faults
- undertaking quality checks in accordance with workplace procedures
- verifying installation performance.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- causes of non-compliant test results
- networking fundamentals
- optical time domain reflectometer (OTDR) operating principles, applications and calibration procedures
- performance of copper cable measuring devices and techniques
- performance of optical fibre measuring devices and techniques
- performance parameters associated with copper cables, coaxial cables and optical cables
- recording, reporting and maintaining test results

- relevant industry standards
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures
- problem-solving techniques
- test results for compliance with required regulation, standards and/or codes for structured copper cables, coaxial and optical fibre cables
- testing and validation of a customer premises cabling installation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to testing, reporting and rectifying faults in voice and data installations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0001 Analyse the performance of wireless-based electronic communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to analyse the performance of wireless-based electronic communication system.

This includes analysis of wireless-based electronic systems to provide solutions to mobile communications performance. It encompasses working safely, applying extensive knowledge of mobile communications parameters, gathering and analysing data, applying problem-solving techniques, and developing and documenting results and solutions for use in design work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to analyse the performance of wireless-based system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
 - 1.3 Extent of the wireless-based electronic system issues are determined from performance specifications, situation reports and in consultation with relevant person/s
 - 1.4 Work activities are planned to meet scheduled timelines in consultation with other person/s involved in the work
 - 1.5 Effective strategies are formed to ensure solution development and implementation is carried out efficiently
- 2 Analyse the wireless-based electronic system performance**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work activities are followed
 - 2.2 Wireless communications principles are applied to analytical solutions to electronic systems
 - 2.3 Parameters, specifications and performance requirements in relation to wireless-based electronic systems are obtained in accordance with workplace procedures
 - 2.4 Approaches to analysing wireless-based electronic system parameters are carried out to provide the most effective solution
 - 2.5 Unplanned events are dealt with safely and effectively consistent with regulatory requirements and enterprise policies
 - 2.6 Quality of work is monitored against personal performance agreement and/or established organisational or professional standards
- 3 Document and report results of wireless-based electronic system performance analysis and actions taken**
- 3.1 Solutions to wireless-based electronic system issues are evaluated to determine their effectiveness and modified, as required
 - 3.2 Analysis is documented, including details of all findings, calculations and assumptions
 - 3.3 Analysis is reported to appropriate person/s to establish appropriate action to be taken based on findings

- 3.4** Justification for findings and any actions to be undertaken in relation to the equipment is documented for inclusion in work/project or development records in accordance with professional standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Analysing performance of wireless-based electronic systems must include at least the following:

- two wireless-based electronic systems in at least two different contexts

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH183A Analyse the performance of wireless-based electronic - communication systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0001 Analyse the performance of wireless-based electronic communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- analysing wireless-based electronic system performance
- applying sustainable energy principles and practices
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining effective strategies for analysing wireless-based electronic system performance
- determining wireless-based electronic systems performance issues
- documenting analysis details of all findings, calculations and assumptions
- documenting justification of actions to be implemented in accordance with professional standards
- evaluating results of wireless-based electronic communication system analysis
- implementing relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including the use of risk control measures
- obtaining wireless-based electronic systems performance parameters, specifications and performance requirements appropriate to each situation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- fundamentals of wireless security, including:
 - access points
 - antennas
 - application design and site survey preparation
 - bridges
 - emerging technologies
 - network interface cards (NICs)

- security
- troubleshooting, management, monitoring and diagnostics
- wireless topologies
- networking fundamentals, including:
 - encoding networking signals
 - how information is carried
 - internet services
 - local area network (LAN) architectures
 - network signal propagation
 - networking protocols and the open systems interconnection (OSI) model
 - signal distortion, including attenuation, reflection, noise, dispersion, jitter, latency and collisions, and bit error rate
 - transmission control protocol (TCP)/internet protocol (IP)
 - types of networks, network components and hardware
- relevant industry standards, codes of practice and regulations of Australian Communications and Media Authority (ACMA)
- relevant risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- wireless-based electronic communications system performance, principles and practices
- wireless networks infrastructure, including network configurations and wireless network security.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry

- resources that reflect current industry practices in relation to analysing the performance of wireless-based electronic systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0002 Assemble and install reception antennae and signal distribution equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assemble and install reception antennae and signal distribution equipment.

It includes preparing to install and set up reception antennae and signal distribution systems, installing and setting up reception antennae and signal distribution systems and reporting.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to install and set up reception antennae and

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- signal distribution systems** for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
 - 1.4 Nature and location of the work is obtained from relevant person/s to determine the scope of work
 - 1.5 Instructions for coordinating work with others is obtained from relevant person/s and applied
 - 1.6 Materials required for work are determined in accordance with workplace procedures
 - 1.7 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety
- 2 Install reception antennae and signal distribution systems**
- 2.1 Workplace risk control measures and workplace procedures are applied
 - 2.2 Circuits/components are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Optimum location for installation of antenna is determined from signal tests and limitations imposed by the customer and relevant regulations
 - 2.4 Accessories are installed straight and square in required locations and within acceptable tolerances
 - 2.5 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
 - 2.6 Unplanned events are reported to relevant person/s in accordance with workplace procedures
 - 2.7 Installation is conducted efficiently without waste of materials, damage to apparatus, circuits or the surrounding environment applying sustainable energy practices
- 3 Set up reception antennae**
- 3.1 WHS/OHS work completion risk control measures and

and signal distribution systems and report

workplace procedures are followed

- 3.2 Adjustments are made to the antenna and the system to optimise reception at each outlet
- 3.3 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.4 Relevant person/s is notified of completion of installation work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, connecting and setting up reception antennae and signal distribution systems must include at least the following:

- a reception antenna
- a signal distribution system

Systems must consist of at least the following:

- two outlets for two users

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH108A Assemble and install reception antennae and signal distribution equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0002 Assemble and install reception antennae and signal distribution equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- accurately placing and securing antennae and accessories
- adjusting for optimum reception at each outlet
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- correctly terminating cable and conductors
- dealing effectively with unplanned events
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- reading and interpreting drawings of circuit arrangements and component locations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- antenna assembly and installation, including:
 - antenna distribution systems
 - antenna testing, fault finding and repair
 - relevant standards, codes and regulations
 - satellite receivers
 - signal reception
 - transmission line types and characteristics
 - TV antenna types, operating characteristics and terminology
- relevant manufacturer specifications

- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to assembling and erecting reception antennae and signal distribution equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0003 Assemble and set up basic security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assemble, set up and install electronic security system with up to 50 connected devices, typically used in single domestic and small commercial premises.

It includes working safely to industry standards, assembling and setting up wired and wireless security system, and connecting security system components.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to assemble and set up wired and wireless security system

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Hazards which have not previously been identified are reported in accordance with workplace procedures and advice on risk control measures are sought from work supervisor
- 1.4 Nature, location and security system required is obtained from supervisor or other relevant person/s and/or workplace documentation to determine the scope and details of work to be undertaken
- 1.5 Advice is sought from work supervisor or other relevant person/s to ensure work is coordinated effectively with others
- 1.6 Security system and relevant materials required for work are determined and obtained in accordance with workplace procedures
- 1.7 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety

2 Assemble wired and wireless security system

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS workplace requirements and procedures
- 2.3 Security controllers, access, intrusion and surveillance devices are positioned for optimum performance in accordance with workplace procedures and within limitations imposed by customers and regulations

- 2.4 Security system components are installed straight and square in the required locations and within acceptable tolerances in accordance with workplace procedures
 - 2.5 Cables and conductors are terminated at security system components in accordance with manufacturer specifications and regulatory requirements
 - 2.6 Unplanned events are referred to supervisor for directions in accordance with workplace procedures
 - 2.7 Security installation is carried out without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Complete and document security systems installation**
- 3.1 WHS/OHS risk control measures and workplace procedures for work completion are followed
 - 3.2 Worksite and equipment are cleaned and made safe in accordance with WHS/OHS requirements and workplace procedures
 - 3.3 Security system installation is documented in accordance with regulatory requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing security systems must include the following:

- one wired and one wireless security system

Security systems must consist of:

- a controller and access device and at least two other different connected devices both wired and wireless

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH150A Assemble and set up basic security systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0003 Assemble and set up basic security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - using risk control measures
 - checking tools, equipment and testing devices for correct operation and safety
 - checking circuits/machines/plant are isolated
 - terminating cables and conductors safely
- applying sustainable energy principles and practices
- assembling and setting up wired and wireless security systems, including:
 - placing and securing devices and security system components accurately
 - terminating cable and conductors correctly
 - completing and documenting installation
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - installing system without waste or damage
- communicating effectively with relevant stakeholders
- complying with relevant electrical regulations
- complying with relevant security regulations and legislations
- consulting with work supervisor
- determining the nature, location and security system required for work
- maintaining a clean worksite and equipment
- obtaining correct system and relevant materials.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- closed-circuit television (CCTV), including application, types of cameras and monitors, switching methods, earthing and ambient lighting
- communication systems, including:
 - Ademco contact ID
 - dialler systems
 - panel to base systems
 - relevant wired and wireless communication methods
- circuit arrangements, including:
 - end line resistors and a range of typical resistor values used in alarm systems
 - wiring of a detector with split end of line (EOL) resistors
 - zone doubling and open circuits and short circuits
- relays, including normally open and normally closed types, transistor as a switch, wiring diagram for a relay connected to an open collector output on an alarm panel, and typical uses for a relay type output
- electro-mechanical detectors, including:
 - active and passive infrared beams
 - reed magnetic reed switches and optical fibre cable
 - strain system
 - types: ultrasonic, microwave, glass break and smoke
- effective communication techniques
- locations for accessories to be installed
- positioning of security controllers, access, intrusion and surveillance devices for optimum performance
- mechanical detectors, including pressure pads, trip wires, window tape, screens, switches and vibration
- relevant customer-imposed limitations
- relevant electrical industry standards, codes of practice and regulations
- relevant electrical regulations and legislations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant security regulations and legislation, including Acts and industry standards
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- relevant workplace referral and reporting procedures
- security panels, including:
 - batteries and locks commonly used in the security industry
 - features, applications, types, and maintenance of commonly used panels
 - operation of programmable and non-programmable panels

- panel to base communication systems
- power and sound sources used with security alarms
- security controllers, access, intrusion and surveillance devices, including:
 - mechanical detectors
 - electro-mechanical detectors
 - CCTV
 - communication systems
- security system assembly and set-up
- security system components and accessories, including:
 - relays
 - security panels
- techniques to check if circuits/machines/plant are isolated
- techniques to check if tools, equipment and testing devices are operating correctly and safely
- techniques to install security system without damage
- techniques to terminate cable and conductor
- tools, equipment and testing devices
- types of security systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0004 Assemble and set up fixed video/audio components and systems in buildings and premises

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assemble and set up fixed video/audio components and systems in buildings and premises.

It includes preparing to install audio/video components and systems, installing audio/video components and systems, completing installation work and reporting.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to install audio/video components and systems

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures are followed in preparation for the work
- 1.3 Safety hazards which have not previously been identified are reported and advice on risk control measures are sought from the work supervisor
- 1.4 Nature and location of the work is obtained from relevant person/s to determine the scope of work
- 1.5 Instructions for coordinating work with others is obtained from relevant person/s and applied
- 1.6 Materials required for the work are determined in accordance with workplace procedures
- 1.7 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Install audio/video components and systems

- 2.1 Workplace risk control measures and procedures are applied
- 2.2 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Audio/video components are installed in accordance with relevant industry standards and job specifications with sufficient excess to affect terminations
- 2.4 Accessories are installed straight and square in required locations within acceptable tolerances
- 2.5 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
- 2.6 Unplanned events are reported to relevant person/s in accordance with workplace procedures
- 2.7 Installation is conducted efficiently without waste of materials, damage to apparatus, circuits or the

surrounding environment applying sustainable energy practices

3 Complete installation work and report

- 3.1** WHS/OHS work completion risk control measures and procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Completion of installation is reported to relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assembling and setting up fixed video/audio components and systems must include at least the following:

- assembling and setting up fixed audio/video systems in buildings and premises

Systems must include the following:

- surround sound and multi-room speakers
- central audio and home theatre components

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH106A Assemble and set up fixed video/audio components and systems in buildings and premises.

Assessment Requirements for UEEEC0004 Assemble and set up fixed video/audio components and systems in buildings and premises

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- completing relevant documentation, including handing over all system/component documents to the customer
- connecting components in accordance with manufacturer instructions
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system
- placing and securing components and accessories accurately
- reading and interpreting drawings of circuit arrangements and component locations
- setting functional controls to customer's requirements
- terminating cable and conductors correctly
- testing functional operation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements

- relevant workplace documentation
- relevant workplace policies and procedures
- video/audio components and system assembly and setting up in buildings and premises, including:
 - electronic safe working practices
- audio reproduction electronic components, including:
 - graphic equalisers
 - power and integrated amplifiers
 - preamplifiers
- audio reproduction and speaker fundamentals
- audio/video recording and replay components repair basics
- audio/video control equipment
- relevant standards, codes and regulations
- sound reproduction fundamentals
- video systems installation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to assembling and setting up fixed audio/video components and systems in buildings and premises
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0005 Assess electronic apparatus compliance

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assess electronic apparatus compliance with relevant industry standards and regulations for certification or approval.

It includes preparing and evaluating electronic apparatus in determining specified compliance requirements, inspecting and setting up performance tests, evaluating inspection and test results, and documenting evaluation outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to evaluate electronic apparatus compliance

- 1.1** WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks are assessed, and control measures and workplace procedures are implemented in preparation for work
- 1.3** Examination and testing areas are checked for safety hazards and risk control measures are implemented in accordance with workplace safety policy and procedures
- 1.4** Relevant documentation is obtained and read to determine the certification/approval specifications for which the apparatus/equipment is to be assessed
- 1.5** Advice is sought from the relevant supervisor to ensure work is coordinated effectively with others
- 1.6** Tools, testing devices and materials needed to carry out work are obtained and checked for correct operation and safety

2 Evaluate electronic apparatus compliance

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out evaluation work are followed
- 2.2** Need to inspect, test or measure live work is determined in accordance with WHS/OHS requirements and workplace safety procedures
- 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Operating requirements of the electronic apparatus are identified and applied to the assessment process
- 2.5** Apparatus examination, inspection and tests are set up in accordance with certification/approval specifications, test methods and workplace procedures

- 2.6** Apparatus examination, inspection and tests are carried out methodically with results and comments systematically documented in accordance with certification/approval specification requirements
- 2.7** Unplanned situations are dealt with safely and with the approval of an authorised person/s
- 2.8** Assessment is carried out without unnecessary damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete work and document evaluation results**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Examination, inspection and test results are evaluated and non-compliance issues identified
- 3.4** Examination, inspection, test results and comments on non-compliance issues are documented and reported to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assessing electronic apparatus compliance must include at least two different electronic apparatus of the following:

- audio amplifiers
- radio and televisions receivers
- video displays
- audio and video recording/replay devices
- two-way radios
- cell phones
- instrumentation devices

- control devices

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH147A Assess electronic apparatus compliance.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0005 Assess electronic apparatus compliance

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using risk control measures
- applying sustainable energy principles and practices
- identifying electronic apparatus compliance certification/approval specifications
- interpreting compliance documents
- setting up and conducting appropriate examinations, inspections and tests
- evaluating electronic apparatus compliance
- identifying non-compliance defects
- reporting examination and test results and non-compliance issues clearly and accurately
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- completing apparatus assessment and documenting results
- preparing to evaluate electronic apparatus certification/approval specifications compliance.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- compliance certification, including:
 - the purposes of certification of equipment
 - the parties involved in the assessment/testing and certification of equipment
 - the scheme for recognition of assessment/testing and certification
- compliance testing and assessment of electronic apparatus equipment, including:
 - types of assessment, inspection and tests

- test set-ups and workplace procedures
- recording and reporting requirements of conformity assessment
- preparation required to assess equipment for compliance with industry standards, including:
 - documentation required prior to conducting conformity assessment
 - tests necessary to establish that an item of equipment conforms with relevant industry standards
- relevant compliance certification/approval specifications
- relevant job safety assessments or risk mitigation processes, including:
 - safe working practices
- relevant manufacturer specifications
- relevant technical industry standards, regulations, codes of practice for electronic apparatus and WHS/OHS legislated requirements
- relevant workplace documentation, including:
 - as marketed technical performance
 - industry technical standards
 - product quality endorsement standards
 - safety requirements
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to assessing compliance of electronic apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0006 Carry out repairs of predictable faults in video and audio replay/recording apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to carry out repairs of predictable faults in video and audio replay/recording apparatus.

It includes preparing to repair replay/recording apparatus, finding and repairing faults, completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0028 Fault find and repair complex power supplies

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to repair replay/recording apparatus

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Nature of the fault is determined from documentation or relevant person/s to determine scope of work
- 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5** Materials required for the work are determined in accordance with workplace procedures
- 1.6** Tools, equipment, testing devices and service manual required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS and workplace procedures
- 2.3** Apparatus is checked and isolated, where necessary, in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding is undertaken methodically applying replay/recording apparatus and circuit principles using measured and calculated values of apparatus parameters and/or with reference to manufacturer service manuals
- 2.5** Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6** Faulty components are rechecked and their fault status confirmed

- 2.7 Repairs are undertaken in accordance with manufacturer instructions and approval of relevant person/s
 - 2.8 Apparatus is reassembled and tested for safety and functionality in preparation for return to the customer
 - 2.9 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.10 Repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification is provided in the required format for repairs to apparatus
 - 3.4 Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Carrying out repairs of predictable faults in video replay/recording apparatus must include the following:

- at least two predictable faults in two different video replay/recording apparatus

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH117A Carry out repairs of predictable faults in

video and audio replay/recording apparatus.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0006 Carry out repairs of predictable faults in video and audio replay/recording apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- isolating circuits/machines/systems
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- identifying and accessing materials, tools, apparatus and testing devices
- applying methodical fault-finding techniques
- efficiently finding faults
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- audio and video recording and replaying apparatus, including:
 - audio reproduction:
 - electronic components
 - speaker fundamentals
 - audio/video control equipment
 - audio/video recording and replay components repair basics
 - compact disk (CD) players

- digital audio
- digital versatile disc (DVD) and CD
- DVD processors
- electronic communications systems
- relevant industry standards, codes and regulations
- sound reproduction fundamentals
- technical manuals and catalogues
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to carrying out repairs of predictable faults in audio and video replay/recording apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0007 Commission electronics and communications systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to commission electronics and communications systems.

It includes undertaking commissioning procedures of electronics and communications systems to comply with predetermined parameters and delivery to client. It also includes working safely, testing system parameters, analysing and adjusting to assure optimum performance, following workplace procedures, and documenting final operating parameters and settings.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare electronics and

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- communications system** for a given work area are obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the electronics work are followed
 - 1.3 Safety hazards that have not previously been identified are noted on job safety assessment, assessed and risk control measures implemented
 - 1.4 Appropriate person/s is consulted to ensure the electronics work is coordinated effectively with others involved on the worksite
 - 1.5 System operating parameters are identified by reviewing system specifications and component technical data
 - 1.6 Tools, equipment and testing devices needed for the electronics work are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.7 Preparatory work is checked to ensure no unnecessary damage has occurred and complies with requirements
 - 1.8 Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Commission electronics and communications system**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out commissioning work are followed
 - 2.2 Testing/measuring devices are connected and set up in accordance with job requirements for the communication system
 - 2.3 Measurements and adjustments are made to electronics and communications equipment to provide optimum system performance in accordance with system specifications and/or regulatory requirements
 - 2.4 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.5 Methods for dealing with unexpected situations are selected on the basis of safety and specified work outcomes

- 2.6 System commissioning workplace procedures are performed in accordance with job requirements and industry standards
 - 2.7 Commissioning is carried out efficiently without unnecessary waste of materials or damage to electronic apparatus, the surrounding environment or services using sustainable energy principles
 - 3 **Complete and report commissioning activities**
 - 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Adjustment settings are documented in accordance with workplace procedures
 - 3.3 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.4 Commissioning results and work completion are communicated to appropriate person/s in accordance with established procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning electronics and communications systems must include at least the following:

- two different types of electronics and communications systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH167A Commission electronics and communications systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0007 Commission electronics and communications systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and includes:

- identifying system design performance parameters and requirements
- measuring and adjusting system components to provide optimum system performance
- ensuring system operates within regulatory and/or specification requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic and communication systems commissioning
- commissioning processes:
 - purpose of commissioning
 - commissioning planning and documentation
 - procedures for commissioning systems encompassing:
 - configuring
 - calibrating
 - tuning
 - validating system performance to specification
 - procedures followed to commission instrument systems
 - purpose and importance of documentation
- project to be carried out in accordance with current WHS/OHS procedures
- relevant job safety assessments or risk mitigation processes

- relevant manufacturer specifications
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to commissioning electronics and communications systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0008 Commission large fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to commission commercial fire protection systems.

It includes commissioning fire protection systems that include multiple connected detection, warning and fire control devices and remote monitoring. It also includes working safely, using fire protection industry standards and protocols, entering system instructions, testing functionality of fire protection components and system operation, and documentation of commissioning activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0041 Install fire detection and warning system apparatus

UEEEEC0076 Verify compliance and functionality of fire protection system installations

UEEEEC0026 Enter and verify programs for fire protection systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare fire protection system for commissioning

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
 - 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
 - 1.3 Safety hazards which have not previously been identified are risk assessed, documented and risk control measures devised and implemented in consultation with appropriate person/s
 - 1.4 Extent of commissioning is determined from reports, documentation and discussions with appropriate person/s
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the work site
 - 1.6 Tools, equipment and testing devices needed to commission fire protection system are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Commission fire protection system
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out commissioning work are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and conducted within workplace safety procedures

- 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fire protection system components are verified as complying with design specifications and regulations
 - 2.5 Fire protection devices are checked for correct location and alignment
 - 2.6 Fire protection functions are inspected and tested in accordance with industry standards commissioning requirements
 - 2.7 Sources of fire protection system anomalies are identified and corrected
 - 2.8 Decisions for dealing with unplanned situations are made from discussions with appropriate person/s and job specifications and requirements
 - 2.9 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.10 Commissioning activities are carried out efficiently without waste of materials or damage to fire apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report commissioning activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is made safe in accordance with workplace safety procedures
 - 3.3 'As-installed' fire protection system is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning fire alarms and warning systems must include at least the following:

- two different fire alarms and warning systems, including:
 - one fire alarm system with at least 50 input devices, 20 output devices and two system interface controls
 - one fire warning system with at least 50 speakers, five interface communication devices and two warning indicators
 - voice message facilities

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH164A Commission large fire protection systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0008 Commission large fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting 'as-installed' system correctly
- identifying and correcting function anomalies
- identifying the extent of the fire protection system
- inspecting and testing system functionality
- verifying compliance of components.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commissioning planning and documentation
- commissioning process for commercial fire protection system
- initial inspection, tests and adjustments requirements, including industry standards
- input devices, including conventional, analogue or analogue addressable fire detectors, flow switch connections or switch connections
- interface communication devices can be warden in communication phones and remote public address (PA) inputs
- output devices, including shutdown signal, door or system release controls and solenoid valve controls
- purpose of commissioning
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation

processes

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures, including fire protection system commissioning procedures
- system interface controls, including communication signals to remote control and indicating equipment, building monitoring systems, paging system and colour graphics
- warning indicators, including flashing lights for hearing impaired persons and fire brigade building indication.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to commissioning commercial fire protection systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0009 Commission satellite and microwave communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and adjust satellite and microwave communication systems.

It includes setting up and adjusting of satellite and microwave communication systems for optimum performance. It also includes working safely, signal testing and analysis, adjusting equipment, following procedures and completing documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to set up satellite and microwave system 1.1

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- measuring instruments** for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for communication system work
 - 1.3 Safety hazards that have not previously been identified are noted on job safety assessments, risk assessed and risk control measures implemented
 - 1.4 Appropriate person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
 - 1.5 Measurement parameters are identified by reviewing transmission/reception requirements and equipment manufacturer instructions
 - 1.6 Tools, equipment and testing devices needed for the communication system work are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.7 Preparatory work is checked to ensure no unnecessary damage has occurred and complies with job requirements
 - 1.8 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and conducted within workplace safety procedures
 - 1.9 Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Set up satellite and microwave communication system measuring instruments**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out satellite and microwave communication work are followed
 - 2.2 Testing/measuring instruments and devices are connected and set up in accordance with requirements for satellite and microwave communication system
 - 2.3 Measuring instruments are set up and adjusted in accordance with transmission/reception requirements and equipment manufacturer instructions
 - 2.4 Adjustments are made to provide optimum transmission/reception performance within regulatory

requirements

- 2.5 Decisions for dealing with unplanned situations are made from discussions with appropriate person/s and job specifications and requirements
 - 2.6 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.7 Setting-up satellite and microwave communication system is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report set-up activities**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Adjustment settings are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning satellite and microwave communication systems must include at least the following:

- two microwave/satellite communication systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH186A Commission satellite and microwave communication systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0009 Commission satellite and microwave communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying measurement parameters
- setting up and adjusting in accordance with communication systems requirements and equipment manufacturer's instructions
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying sustainable energy principles and practices
- commissioning microwave and satellite communications system
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) workplace procedures and practices, including the use of risk control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic communications, satellite and microwave, safe working practices and relevant standards, codes and regulations, including:
 - propagation of electromagnetic waves through the atmosphere, transmission lines and waveguides, including characteristic impedance, impedance matching, standing waves and microwave frequency bands
 - microwave device parameters involving wavelength, phase, voltage standing wave ratio (VSWR), impedance matching, circuit parameters, amplifiers, transmission, reception, oscillation, noise figure and noise temperature
 - microwave devices and components
 - microwave operational constraints and operating parameters such as power, bandwidth, gain, efficiency, operational life, electrical parameters, stability, cooling, size, testing and device selection
 - microwave measurements, test equipment and testing techniques

- EMI/EMC, generation, suppression and reduction
- satellite communications systems encompassing:
 - types of satellite systems and sub-systems
 - earth station locality and antenna parameters
 - link specifications and link calculations
 - base band signalling processes
 - modulation and system access
- commissioning electronic communication systems encompassing:
 - purpose of commissioning
 - commissioning planning and documentation
 - initial tests and adjustments
 - commissioning procedures
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to commissioning microwave and satellite communication systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0010 Design and develop advanced digital systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design and develop digital systems.

It includes designing and developing a digital system. It also includes working safely, following design brief, interpreting device/component specifications, constructing prototype devices, applying programming techniques to programmable devices, testing developed system prototype operation, verifying compliance of the design against the final brief, and documenting design and development work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design and develop digital system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace processes and procedures for a given design work area are identified and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the design work
 - 1.3 Extent of the proposed digital system development is determined from the design brief or in consultation with appropriate person/s
 - 1.4 Design development work is planned to meet scheduled timelines in consultation with other person/s involved in the development work
 - 1.5 Materials and devices/components required for the development work are selected on compatibility of their specifications with digital system requirements and project budget constraints
 - 1.6 Tools, equipment and testing devices needed to carry out the development work are obtained and checked for correct operation and safety
- 2 Design and develop advanced digital system**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Digital devices and system and compliance industry standards are applied to the digital system design
 - 2.3 Alternative arrangements for the design are considered based on the requirements outlined in the design brief
 - 2.4 Safety, functional and budget considerations are incorporated in the design
 - 2.5 Prototype devices and circuits are constructed and tested for compliance with the design brief, industry standards and regulatory requirements
 - 2.6 Prototype malfunctions are rectified and retested to ensure effective operation of design
 - 2.7 Digital system design is documented for submission to appropriate person/s for approval
 - 2.8 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 3 Obtain approval for the design**
- 3.1 Design is presented and explained to client representative and/or relevant person/s

- 3.2 Requests for modifications to the design are negotiated with relevant person/s within the constraints of workplace policy
- 3.3 Final design is documented and approval obtained from appropriate person/s
- 3.4 Quality of work is monitored against design brief performance agreement and/or workplace procedures or industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing and developing an advanced digital system must include at least the following:

- five variables
- sequential functions
- combinatorial functions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH148A Design and develop advanced digital systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0010 Design and develop advanced digital systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- constructing and testing prototype devices and circuits in accordance with design brief and regulatory requirements
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing outlines of alternative designs
- developing the design within the safety and functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- verifying compliance of the design against the final brief.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- analogue to digital conversion
- connection of test/measuring devices into a circuit
- current types of oscillators based on their characteristics and operation
- current memory and storage devices based on their characteristics and operation
- design of complex sequential logic circuits (as a minimum three level sequential circuits), including current techniques - equation writing, reduction and propagation delay calculation
- design techniques for combinational and sequential logic circuits (as a minimum three levels and four input circuits)
- digital system design and development requirements

- digital to analogue conversion
- programmable logic devices
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes and electronic safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to designing and developing advanced digital systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0011 Design and develop electronics/computer systems projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design and develop an electronics/computer system project.

It includes working safely; and designing, constructing, recording, evaluating and reporting of an electronics/computer system design project.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify electronics/computer system project requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks are assessed,

control measures and workplace procedures are implemented in preparation for work

- 1.3 Scope of proposed project design/development work is determined from design brief in consultation with appropriate person/s
- 1.4 Project work is planned to meet scheduled timelines in consultation with others involved on the worksite
- 1.5 Resources required for work are selected based on compatibility with project requirements and budget constraints
- 1.6 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety

2 Design and develop electronics/computer system

- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
- 2.2 Electronics/computer devices and systems and industry standards are applied to the design specifications
- 2.3 Alternative designs are considered based on the design brief
- 2.4 Safety, functional and budget considerations are incorporated in the design
- 2.5 Electronic/computer hardware and/or software systems are constructed and tested for compliance with design brief and regulatory requirements
- 2.6 Electronic/computer faults are rectified and retested to ensure effective operation of design
- 2.7 Project design specifications are documented for submission to appropriate person/s for approval
- 2.8 Solutions to unplanned situations are implemented in accordance with workplace policy

3 Obtain approval for electronics/computer system

- 3.1 Electronic/computer system design is presented and explained to client representative and/or relevant person/s
- 3.2 Modifications to design are negotiated with relevant person/s within the constraints of workplace policy

- 3.3** Final project design is documented and approval obtained from appropriate person/s
- 3.4** Quality of work is monitored against performance agreement and/or workplace or industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing and developing a medium-sized electronics/computer systems project includes designing, modifying, installing and applying the following:

- at least four digital and four analogue inputs and outputs (I/O), and at least one human-machine interface (HMI)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH188A Design and develop electronics - computer systems projects.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0011 Design and develop electronics/computer systems projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using risk control measures
- constructing and testing prototype hardware and/or software according to design brief and regulatory requirements
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing outlines/plans of alternative designs
- developing the design within the safety and functional requirements and budget limitations/constraints
- documenting and presenting design effectively
- obtaining final design approval
- successfully negotiating design alteration requests
- verifying compliance of the design against the final brief
- identifying and preparing to design and develop electronic/computer system in accordance with design brief.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- connection of test/measuring devices into a circuit
- design objectives (specifications) to satisfy a customer attribute/brief
- design plan and solution synthesis (by selecting or creating the solution)
- electronic measuring instruments
- engineering design process

- functional and non-functional requirements of a customer project
- relevant job safety assessments or risk mitigation processes, including:
 - risks and control measures associated with low voltage (LV) machines
- relevant industry standards, regulations, codes of practice and WHS/OHS legislated requirements
- relevant manufacturer specifications
- relevant workplace documentation
- relevant workplace policies and procedures
- validations of the resulting design against the customer's needs.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing and developing electronics/computer systems projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0012 Design custom electronic equipment installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design custom electronic equipment installations.

It includes preparing to design custom electronic installations, and developing and obtaining approval for installation designs.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

UEEEEC0077 Verify functionality and compliance of custom electronic installations

UEEEEC0004 Assemble and set up fixed video/audio components and systems in buildings and premises

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

- | | |
|--|--|
| 1 Prepare to design custom electronic installations | 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied |
| | 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work |
| | 1.3 Extent of the proposed custom electronic installation is determined from the design brief or in consultation with relevant person/s |
| | 1.4 Design development work is planned in consultation with others to meet scheduled timelines |
| 2 Develop installation design | 2.1 Principles of audio/video components, home theatre acoustics and regulations are applied to the design |
| | 2.2 Installation design alternatives are considered based on the requirements outlined in the design brief |
| | 2.3 Safety, functional and budgetary considerations are incorporated in the installation design |
| | 2.4 Installation design draft is checked for compliance with the design brief and relevant industry standards |
| | 2.5 Installation design is submitted to relevant person/s for approval |
| | 2.6 Solutions to unplanned events are provided in accordance with workplace procedures |
| 3 Obtain approval for installation design | 3.1 Installation design is presented and explained to client and/or relevant person/s |
| | 3.2 Requests for design alterations are negotiated with relevant person/s in accordance with workplace procedures |
| | 3.3 Final design is submitted for approval of relevant person/s |
| | 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing custom electronic equipment installations must include at least the following:

- two custom electronic installations, one of which must incorporate a dedicated home theatre

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH135A Design custom electronic equipment installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0012 Design custom electronic equipment installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- coordinating work with relevant person/s
- determining scope of design work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria range of conditions and include knowledge of:

- custom electronic equipment installation design, safe working practices and relevant standards, codes and regulations, including:
 - integrated audio systems:
 - types of audio control and switching devices
 - types of surround sound systems
 - operation of system control circuits, including the remote device
 - video and display set-up:
 - projectors encompassing:
 - aspect ratio
 - screen size

- orientation
- throw distance, vertical elevation and horizontal orientation
- direct view monitors adjustments
- audio/video control equipment:
 - types of control devices and their operating principles
 - control equipment arrangement in an audio/video system
- technical standards, regulations and codes for extra-low voltage (ELV) work:
 - limitation imposed by regulations
 - how to read and apply a standard
 - aspects of technical standards that apply to ELV work
- environmental and heritage awareness:
 - purpose of environmental and heritage regulation
 - typical issues affecting electrotechnology services and systems
 - meeting requirements
- acoustics, spatial treatment and sound reproduction:
 - effects of room dimensions, spatial shape and surface textures on acoustics
 - ideal acoustic for specific purposes - speech, solo or small group music, rock music, orchestral music, choral music and cinema
 - measuring room response
 - speaker placement and room response
 - room treatment methods to improve acoustic response
 - active methods to improve acoustic response
- equipment installation design:
 - requirements
 - limitations
 - procedures
 - documentation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace

operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to designing custom electronic installations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0013 Design electronic printed circuit boards

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design electronic printed circuit boards.

It includes designing electronic printed circuit boards. It also includes developing alternative printed circuit board design schemes based on design brief and customer relations, and documenting designs.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design printed circuit board assembly

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and be applied
- 1.2 Extent of the proposed circuit board and sub-assemblies design is determined from the design brief or in consultation with appropriate person/s

- | | | |
|---|------------|---|
| | 1.3 | Design development work is planned to meet scheduled timelines in consultation with relevant person/s involved |
| 2 Develop printed circuit board assembly design | 2.1 | Electronic components, sub-assemblies and industry standards are applied to the design |
| | 2.2 | Alternative arrangements for the printed circuit board design are considered based on the requirements outlined in the design brief |
| | 2.3 | Safety and functional considerations are incorporated in the printed circuit board design |
| | 2.4 | Printed circuit board design draft is checked for compliance with the design brief and design rules |
| | 2.5 | Printed circuit board design is documented for submission to appropriate person/s for approval |
| | 2.6 | Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment |
| 3 Provide assembly drawings and artwork files ready for production | 3.1 | Printed circuit board design is presented and explained to client representative and/or relevant person/s |
| | 3.2 | Requests for alterations to the printed circuit board design are negotiated with relevant person/s within the constraints of workplace policy |
| | 3.3 | Final printed circuit board design is documented and approval obtained from appropriate person/s |
| | 3.4 | Quality of work is monitored against performance agreement and/or workplace procedures or industry standards |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing electronic printed circuit boards must include at least the following:

- two printed boards for different component population densities and related sub-assemblies, including:
 - single-sided printed circuit board
 - doubled-sided printed circuit board

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH181A Design electronic printed circuit boards.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEC0013 Design electronic printed circuit boards

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- creating a library of components
- creating custom component footprints and schematic elements using physical measurements and/or applicable datasheets
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- designing single and double-layer boards
- developing outlines of alternative designs
- developing the design within safety and functional requirements
- documenting and presenting design effectively
- extracting and checking manufacturing files/gerber and drill/excelon
- implementing common design rule parameters used by printed circuit board fabrication houses
- modifying existing component footprints and schematic elements using physical measurements and/or applicable datasheets
- running design rule and error checks within software package
- using a version control system (VCS) or implementing a version control strategy
- using an industry standard printed circuit board design software package
- using both surface mount device (SMD)/surface mount technology (SMT) and through-hole components
- using Vias in accordance with industry standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- design principles and industry standards
- design tools and software
- factors influencing design, including component placement, routing and auto-routing and design rules
- printed circuit board techniques, including materials and processes overview (photographic, mechanical, thermal and dielectric) and types of printed circuit board (single-sided, double-sided and multi-layer)
- relevant job safety assessments or risk mitigation processes
- relevant printed circuit board manufacturer specifications, including component specifications and their implications in a given circuit
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sources of components and technical data, including sources of components and technical data (data sheets and manufacturer's data) and circuit/apparatus parameters and specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to designing electronic printed circuit boards
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0014 Design signal-conditioning sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design signal-conditioning sub-systems incorporating digital and analogue elements.

It includes following design brief, applying knowledge of digital and analogue devices, interpreting device specifications, constructing prototypes, testing developed system prototype operation, and documenting design and development work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify design signal-conditioning sub-system requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are obtained and applied
- 1.2 Hazards are identified, WHS/OHS risks are assessed, control measures and workplace procedures are

implemented in preparation for work

- 1.3 Scope of proposed signal-conditioning sub-system is determined from design brief in consultation with appropriate person/s
 - 1.4 Design signal-conditioning sub-systems development work is planned to meet scheduled timelines in consultation with person/s involved on the worksite
 - 1.5 Materials and devices/components required for work are determined on compatibility of their specifications with data acquisition system requirements and project budget constraints
- 2 Design signal-conditioning sub-system**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Digital and analogue device elements used in signal-conditioning sub-systems and relevant industry standards are applied to the design specification
 - 2.3 Alternative design/s are considered based on the design brief
 - 2.4 Safety, functional and budget considerations are incorporated in the design specification
 - 2.5 Prototype devices and circuits are constructed, programmed and tested for compliance with design brief and regulatory requirements
 - 2.6 Prototype faults are rectified and retested to ensure effective operation of design
 - 2.7 Design specifications are documented for submission to appropriate person/s for approval
 - 2.8 Solutions to unplanned situations are implemented in accordance with workplace policy
- 3 Obtain design approval for signal-conditioning sub-system**
- 3.1 Signal-conditioning sub-system design is presented and explained to client representative and/or relevant person/s
 - 3.2 Modifications to design are negotiated with relevant person/s within the constraints of workplace policy, as required
 - 3.3 Final sub-system design is documented and approval

obtained from appropriate person/s

- 3.4** Quality of work is monitored against performance agreement and/or workplace or industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH185A Design signal-conditioning subsystems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0014 Design signal-conditioning sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- constructing signal-conditioning sub-systems prototype
- dealing with unplanned situations in accordance with workplace procedures
- developing outlines of alternative designs
- developing the design within the safety and functional requirements, and budget constraints
- documenting and presenting design effectively
- negotiating design alteration requests
- planning to design signal-conditioning sub-systems
- reading and interpreting design brief.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- comparator circuits (open loop, limited swing and hysteresis) using operational amplifiers
- design brief specifications and work requirements
- differential amplifiers of suitable characteristics
- feedback control systems basics
- operational amplifier circuits
- principles of signal conditioning
- relevant industry standards, regulations, codes of practice and WHS/OHS legislated requirements
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant workplace documentation
- relevant workplace policies and procedures
- sensors and transducers.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing signal-conditioning sub-systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0015 Develop basic plans for integrating security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop plans for integrating security systems.

It includes integrating security components to form a complete security system with up to 100 connected intrusion and access devices based on common security scenarios. It also includes applying common security scenarios and security network industry standards and protocols, selecting network topology and physical media, applying disaster recovery planning, conducting performance management and documenting work activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0003 Assemble and set up basic security systems

UEEEEC0050 Program and commission commercial security systems

UEEEEC0048 Program and commission commercial access control security systems

UEEEEC0049 Program and commission commercial security closed-circuit television systems

UEEEEC0052 Program and test large security systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to develop integrated security system

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Extent of the proposed integrated security system is determined from the system specification or in consultation with appropriate person/s
- 1.4 Development work is planned to meet scheduled timelines in consultation with other person/s involved on the worksite

2 Develop integrated security system plan

- 2.1 Security scenarios and security network industry standards and protocols, network topology, physical media and disaster planning are applied to security system plan
- 2.2 Alternative system arrangements are considered in accordance with job requirements and specifications
- 2.3 Safety, functional and budget considerations are incorporated in the security system plan
- 2.4 Security system draft plan is checked for compliance with job specifications and regulatory requirements
- 2.5 Security system plan is documented for submission to appropriate person/s for approval
- 2.6 Dealing with unplanned situations are discussed with appropriate persons in accordance with job specifications and requirements

3 Obtain approval for system plan

- 3.1 Security system design is forwarded to client representative and/or relevant person/s for approval
- 3.2 Requests for alterations to the security plan are negotiated with relevant person/s in accordance with workplace procedures

- 3.3 Final security system plan is documented and approval obtained from appropriate person/s
- 3.4 Quality of work is monitored in accordance with performance agreement and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing basic plans for integrating security systems must include at least the following:

- two integrated security systems with up to 100 connected intrusion and access devices

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH157A Develop basic plans for integrating security systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0015 Develop basic plans for integrating security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using of risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing outlines of alternative system plan
- developing the plan within safety and functional requirements and budget limitations
- documenting the security system plan effectively
- obtaining approval for final plan.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- alternative access arrangement
- integration with other systems
- intrusion protection and monitoring options
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant technologies
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, facilities, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to developing integrated security systems plans
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0016 Develop engineering solutions to RF amplifier problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions to resolve problems with radio frequency (RF) amplifiers.

It includes developing engineering solutions to resolve problems with RF amplifiers. It also includes working safely, gathering and analysing data, applying problem-solving techniques, and developing and documenting solutions and alternatives.

Typical RF amplifier electronic problems are those encountered in meeting performance requirements and compliance standards, revising a RF amplifier electronic operating parameter and dealing with RF amplifier electronic malfunctions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop engineering solution for RF amplifier electronic problems

2 Develop engineering solution for RF amplifier electronic problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed
- 1.3 Extent of the RF amplifier problem is determined from performance specifications, situation reports and in consultation with relevant person/s
- 1.4 Activities are planned to meet scheduled timelines in consultation with person/s involved in the work
- 1.5 Effective strategies are formed to ensure solution development and implementation are carried out efficiently
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 RF amplifier circuit device operation characteristics and applications are applied to developing engineering solutions to RF amplifier problems
- 2.3 Parameters, specifications and performance requirements in relation to RF amplifier problems are obtained in accordance with workplace procedures
- 2.4 Engineering approaches to resolving RF amplifier problems are analysed to provide most effective solutions
- 2.5 Unplanned situations are responded to in accordance with regulatory requirements and workplace procedures in a manner that minimises risk to personnel and

		equipment
	2.6	Quality of work is monitored against performance agreement and/or workplace procedures or industry standards
3	Test, document and implement engineering solution for RF amplifier electronic problems	
	3.1	Engineering solutions to RF amplifier problems are tested to determine their effectiveness and modified, as required
	3.2	Adopted engineering solution is documented, including instructions for implementation, that incorporates risk control measures to be followed
	3.3	Competent person/s required to implement solutions to RF amplifier problems is coordinated in accordance with regulatory requirements and workplace policies
	3.4	Justification for engineering solution used to solve RF amplifier problems is documented for inclusion in work/project development records in accordance with industry standards and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing solutions to RF amplifier problems must include at least the following:

- four RF amplifier electronic problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH182A Develop engineering solutions to RF amplifiers problems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0016 Develop engineering solutions to RF amplifier problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the radio frequency (RF) amplifiers electronic problems
- forming effective strategies for solution development and implementation
- obtaining RF amplifiers electronic parameters, specifications and performance requirements appropriate to each problem
- testing and solutions to RF amplifiers electronic problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- RF amplifiers problems, including:
 - RF amplifiers:
 - selection of RF components
 - frequency response of amplifiers
 - gain levelling techniques
 - tuned amplifiers
 - techniques for impedance matching capacitive and transformer coupling
 - double-tuned circuits
 - tapped C and L circuits for Z-matching (use of S parameters and Smith charts)

- small signal RF amplifiers
- RF power amplifiers class A,B,C,D - low power (1W)/high power (kW) - typical circuits
- power combiners
- strip line circuit techniques
- transmission lines and antennas:
 - reflectometry minimum and maximum voltage and current values on a transmission line carrying an RF signal
 - transmission line loss measured in decibels
 - E/H field directions in relation to antenna elements
 - WHS/OHS standards, codes and regulations of Australian Communications and Media Authority (ACMA) for power, frequency and antenna gain
- engineering principles
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to developing solutions to RF amplifiers problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0017 Develop engineering solutions to analogue electronic problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions to analogue electronic problems.

It includes preparing to develop engineering solutions for analogue electronic problems; developing engineering solutions for analogue electronic problems; testing, reporting on and implementing engineering solution for analogue electronic problems.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus, site rehabilitation

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0067 Troubleshoot basic amplifier circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop engineering solutions for analogue electronic

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and

- problems** applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3 Extent of the analogue electronic problem is determined from performance specifications, situation reports and in consultation with relevant person/s
 - 1.4 Activities are planned to meet scheduled timelines in consultation with relevant person/s
 - 1.5 Effective strategies are identified to ensure solution development and implementation is conducted efficiently
- 2 Develop engineering solution for analogue electronic problems**
- 2.1 Workplace risk control measures and procedures are applied
 - 2.2 Principles of analogue electronics circuit device operation characteristics and applications are applied to developing solutions to analogue electronic problems
 - 2.3 Parameters, specifications and performance requirements related to each analogue electronic problem are obtained in accordance with workplace procedures
 - 2.4 Approaches to resolving analogue electronic problems are analysed to determine most effective solutions
 - 2.5 Unplanned events are dealt with safely and effectively in compliance with regulatory requirements and enterprise policies
 - 2.6 Quality of work is monitored against relevant performance measures and/or established organisational or professional standards
- 3 Test, report on and implement engineering solution for analogue electronic problems**
- 3.1 Solutions to analogue electronic problems are tested to determine their effectiveness and modified where necessary
 - 3.2 Adopted solutions are recorded in the required format, including implementation instructions and risk controls
 - 3.3 Relevant qualified person/s required to implement solutions to analogue electronic problems are

coordinated in accordance with regulatory requirements and workplace procedures

- 3.4** Justification for solutions used to solve analogue electronic problems is recorded for inclusion in work/project development records in accordance with professional standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering solutions for analogue electronic problems must include at least the following:

- two analogue electronic problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH145A Develop engineering solutions to analogue electronic problems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0017 Develop engineering solutions to analogue electronic problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining the extent of the analogue electronic problem
- identifying effective strategies for solution development and implementation
- obtaining analogue electronic parameters, specifications and performance requirements appropriate to each problem
- recording implementation instructions for solutions, including risk controls
- reporting justification for solutions implemented in accordance with professional standards
- testing solutions to analogue electronic problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- active filters
- advanced power amplifiers
- amplifiers with given piecewise linear transfer characteristics
- classes of power amplifiers and typical maximum efficiencies for each class
- comparator circuits (open loop, limited swing and hysteresis) using operational amplifiers
- differential amplifiers using discrete components (transistors) to meet system objective
- operation and building of precision half-wave and full-wave rectifiers
- operation of each class and type of power amplifier circuit
- operational amplifier circuits
- oscillators

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant standards, codes and regulations
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- single-stage analogue electronics.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to developing solutions to analogue electronic problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0018 Develop engineering solutions to audio electronic problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions to audio electronic problems.

It includes developing engineering solutions to resolve problems with audio electronics. It also includes working safely, gathering and analysing data, applying problem-solving techniques, and developing and documenting solutions and alternatives.

Typical audio electronic problems are those encountered in meeting performance requirements and compliance standards, revising audio electronic operating parameters and dealing with audio electronic malfunctions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0067 Troubleshoot basic amplifier circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify audio electronic problems

2 Develop engineering solution for audio electronic problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 Extent of the audio electronic problem is determined from performance specifications, situation reports and in consultation with relevant person/s
- 1.4 Activities are planned to meet scheduled timelines in consultation with others involved in the electronic work
- 1.5 Effective strategies are formed to ensure solution development and implementation are in accordance with workplace procedures
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the electronic work are followed
- 2.2 Audio electronics circuit device/component operation, characteristics and their application are applied to resolve audio electronic problem
- 2.3 Parameters, specifications and performance requirements in relation to each audio electronic problem are obtained in accordance with workplace procedures
- 2.4 Approaches to resolving audio electronic problems are analysed to provide most effective solutions
- 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 3 Test, document and implement engineering solution for audio electronic problems**
- 2.6** Quality of work is monitored against performance agreement and/or workplace procedures or professional industry standards
 - 3.1** Solutions to audio electronic problems are tested to determine their effectiveness and modified, as required
 - 3.2** Adopted solutions are documented and include instructions for their implementation that incorporates risk control measures to be followed
 - 3.3** Appropriately competent and qualified person/s required to implement solutions to audio electronic problems are coordinated in accordance with regulatory requirements and workplace policies
 - 3.4** Justification for solutions used to solve audio electronic problems is documented for inclusion in work/project development records in accordance with professional standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering solutions to audio electronic problems must include the following:

- at least four audio electronic problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH149A Develop engineering solutions to audio electronic problems.

Assessment Requirements for UEEEC0018 Develop engineering solutions to audio electronic problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the audio electronic problem
- forming effective strategies for solution development and implementation
- obtaining audio electronic parameters, specifications and performance requirements appropriate to each problem
- testing and solutions to audio electronic problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- audio electronics engineering solutions, safe working practices and relevant standards, codes and regulations, including:
 - acoustics, spatial treatment and sound reproduction:
 - effects of room dimensions, spatial shape and surface textures on acoustics
 - ideal acoustic for specific purposes - speech, solo or small group music, rock music, orchestral music, choral music and cinema
 - measuring room response
 - speaker placement and room response
 - room treatment methods to improve acoustic response

- active methods to improve acoustic response
- audio reproduction and electronic components:
 - preamplifiers amplifier encompassing:
 - function in the reproduction chain
 - typical circuit arrangements
 - power and integrated amplifiers encompassing:
 - function in the reproduction chain
 - typical circuit arrangements
 - graphic equalizers encompassing:
 - function in the reproduction chain
 - typical circuit arrangements
 - component interconnections
- advanced electronic testing and measuring devices and techniques:
 - test/measuring devices and their application - frequency counters, and synthesisers, spectrum analysers, noise and distortion meters and radio frequency (RF) communications service monitor
 - connection of test/measuring devices into a circuit encompassing:
 - safety procedures
 - loading and matching
 - storage and delay
 - circuit arrangement of test/measuring devices
 - taking and interpreting readings
 - notion of decibels, including dBm, dBr, dBu and dBo
- audio system advanced diagnostic techniques:
 - perception and measurement of sound
 - acoustics and equalisation
 - sound recording and reproduction technologies
- audio component testing, measurements and adjustments - frequency response for given loads, small signal test, distortion measurement, noise measurement, frequency versus distortion, intermodulation spectrum, spectral-decay plots, acoustic cross-over, anechoic response, lateral and vertical response
- engineering principles
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to developing solutions to audio electronic problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0019 Develop software solutions for microcontroller-based systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop software solutions for microcontroller-based systems.

It includes preparing to develop code, developing code, testing and documenting the development of code.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop code

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied

1.2 Extent of code development is determined from job

performance specifications and in consultation with relevant person/s

- 1.3 Activities are planned to meet scheduled timelines in consultation with relevant person/s in accordance with workplace procedures
- 1.4 Development kit and software are selected based on specified requirements and performance standard
- 1.5 Strategies are implemented to ensure programming is carried out efficiently

2 Develop code

- 2.1 Correct syntax is applied when developing code
- 2.2 Key features of the programming language used are applied to develop and test solutions
- 2.3 Approaches to issues/problems are analysed to determine effective solution/s
- 2.4 Quality of work is monitored against relevant performance measures in accordance with workplace procedures and relevant industry standards

3 Test and document the development of code

- 3.1 Testing procedures are developed to analyse code
- 3.2 Problems and bugs in code are rectified to ensure specifications are met
- 3.3 Reports are prepared in accordance with professional standards and presented to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing software solutions in

- modifying an existing microcontroller program to comply with specified operating

microcontrollers/microprocessors must include at least the following:

- parameters
- developing microcontroller software to comply with a specified function and operating parameters
- debugging code
- analogue to digital converter (ADC)
- digital to analogue converter (DAC)
- external interrupt
- pulse width modulation (PWM)
- serial communications ports

Configuring and using at least one of the internal peripherals present on the device of the following:

Unit Mapping Information

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- configuring the microcontroller to use the input/output (I/O) ports for reading digital inputs and writing to digital outputs
- configuring microcontroller timers
- configuring timers to provide different microcontroller functions
- coordinating work with relevant person/s
- implementing a program for a specific task
- implementing code to perform specific tasks.
- providing justification for solutions to problems
- providing solutions to microcontroller software problems
- uploading code to a microcontroller using the correct set-up for the architecture and using appropriate programming hardware
- using a microcontroller and attached relevant components to test and debug code
- using industry standard integrated development environment (IDE) to develop code
- using methodical problem-solving methods
- using the inbuilt functions of an IDE to simulate the functions and registers of a microcontroller in order test and debug code.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures
- software programming fundamentals, including:
 - addressing modes
 - arithmetic and logic instructions
 - I/O ports
 - microprocessor/microcontroller architecture
 - relevant standards, codes and regulations
 - sub-routines
 - timing loops.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to developing software solutions in microcontroller-based systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0020 Develop solutions for air surveillance apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions for air surveillance apparatus and systems in compliance with relevant regulatory requirements of the Civil Aviation Safety Authority (CASA) and national operating standards.

It includes working safely, interpreting diagrams, applying logical engineering solution methods of air surveillance apparatus and systems, conducting safety inspections and functional testing, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

UEEEEC0068 Troubleshoot communication systems

UEEEEC0053 Provide engineering solutions to air traffic control system problems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Identify air surveillance apparatus and system problems

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** Operational safety workplace procedures for air surveillance work areas are obtained and applied
- 1.3** WHS/OHS risk control measures and workplace procedures are followed in preparation for work activities
- 1.4** Safety hazards that have not previously been identified are documented on job safety assessments, risks assessed and control measures devised and implemented in consultation with appropriate person/s
- 1.5** Extent of air surveillance apparatus problems is determined from reports, diagrams, relevant documentation and discussions with appropriate person/s
- 1.6** Appropriate person/s is consulted to ensure the work activity is coordinated effectively with others
- 1.7** Tools, equipment, inspection and testing devices needed to provide engineering diagnosis are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Provide air surveillance apparatus and systems engineering solution

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work activities are followed
- 2.2** Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and conducted within workplace safety procedures
- 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Logical diagnostic methods are applied to provide engineering solutions to problems in air surveillance apparatus and systems using measurements and estimations of system operating parameters with reference to system operational requirements

- 2.5 Suspected air surveillance problem scenarios are tested to determine the source of system problems
 - 2.6 Source of the fault is identified and an appropriately competent person/s engaged to rectify the fault in accordance with workplace procedures
 - 2.7 Problems in the electronic components of the system are rectified in accordance with air surveillance and observation system operation standards
 - 2.8 Air surveillance system is inspected and tested to verify that the system operates as intended and to specified requirements
 - 2.9 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.10 Decisions for dealing with unexpected situations are made from discussions with appropriate persons and job specifications and requirements
 - 2.11 Rectification activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report air surveillance apparatus and system engineering solution activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is made safe in accordance with workplace safety procedures
 - 3.3 Engineering solutions for air surveillance apparatus and systems are documented in accordance with workplace procedures
 - 3.4 Appropriate person/s is notified in accordance with workplace procedures that the system faults have been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying engineering solutions in air surveillance and observation systems must include at least the following:

- two engineering solutions in two of the following:
 - primary surveillance radar (PSR)
 - secondary surveillance radar (SSR)
 - mode S SSR
 - radar track processors
 - radar remote control monitoring system (RCMS)
 - air defence system (ADS)
 - multilateration (MLAT)
 - surveillance track messages
 - airborne collision avoidance system (ACAS)/traffic alert and collision avoidance system (TCAS)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH192A Develop solutions for air surveillance apparatus and systems.

Assessment Requirements for UEEEC0020 Develop solutions for air surveillance apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using test equipment to test the apparatus and system
- identifying problems and competency needed to provide solutions
- implementation of solutions
- verifying that the system operates correctly
- documenting engineering solutions
- dealing with unplanned events
- applying sustainable energy principles and practices
- creating test scenarios in developing engineering solutions for air surveillance apparatus and systems
- performing radar spectrum check
- providing solutions in air surveillance apparatus and systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic communications air surveillance systems, including:
 - basic radar principles encompassing:
 - requirement of surveillance to support efficient, safe and effective air traffic control (ATC) operations
 - aircraft aspects
 - basic radar history
 - electromagnetic waves
 - radiation hazards and work health and safety (WHS)/occupational health and safety (OHS) considerations

- radar principles of operation
- types of radar and radar block diagram
- main inputs and outputs for designated blocks of a given diagram
- requirement for redundancy
- go/no-go concept
- radar performance limitations
- different types of radar self- testing
- surveillance- original environment and developing environment
- surveillance users
- radar locations and radar coverage map
- principles of operation of a primary surveillance radar (PSR) encompassing:
 - purpose of a PSR
 - principles of radar blind speed and measures to overcome this
 - why radars use pulse compression and the types of modulation used
 - diversity operation is used in Primary radars
 - radiation pattern for a 'cosec²' and slotted waveguide antenna
 - radars use high / low coverage
 - features of primary radars currently in service
- principles of operation of a classical secondary surveillance radar (SSR) encompassing:
 - similarities and differences between PSR and SSR
 - requirement to use wobble
 - relevant International Civil Aviation Organisation (ICAO) (Annex 10) specifications
 - modes of operation
 - transponder special replies and their functions
 - SSR radiation patterns
 - reasons for "No Reply" from an aircraft
 - definition of garbling
 - definition of false replies unsynchronised in time (FRUIT)
 - function of a site monitor
 - advantages and disadvantages of SSR over primary radar
 - features of classical SSRs
- principles of operation of a mode S SSR encompassing:
 - improvements mode S has over classical SSR
 - ICAO requirements relating to the use of aircraft addresses and interrogator codes
 - purposes of all-call and roll-call interrogations
 - principles of acquiring aircraft
 - users of mode S transponders quitter
 - protocols used to reduce FRUIT
 - principles of all-call lockouts and lockout overrides

- requirement for classical SSR and mode S SSR compatibility
- benefits to a controller of using elementary and enhanced surveillance
- features of mode S SSRs
- principles of operation of radar track processors encompassing:
 - function of radar track processor currently in service
- principles of operation of radar remote control monitoring system (RCMS):
 - requirement for RCMS
 - RCMS network layouts
- principles of operation of air defence system (ADS) encompassing:
 - principles of operation of ADS-B
 - aircraft data transmitted by ADS-B
 - aircraft ADS-B transmission rates
 - principles of operation of ADS-C
- principles of operation of multilateration (MLAT) encompassing:
 - introduction, definition and history of MLAT
 - TDOA concepts
 - airport/local area concept
 - airborne/wide area concept
 - data and identification
 - surveillance strategies
 - MLAT coverage
 - principles of operation of MLAT
 - message formats used by MLAT systems
 - similarities and differences between MLAT and ADS-B systems
- principles of surveillance track messages encompassing:
 - requirement for duplicated data paths
 - ATS centre processing and displaying of surveillance tracks
 - contents of data messages sent from radar sites
 - contents of data messages sent from ADS-B radar sites
- principles of airborne collision avoidance system (ACAS)/traffic alert and collision avoidance system (TCAS) encompassing:
 - purpose and types of ACAS/TCAS
 - function of ACAS/TCAS
 - how ACAS/TCAS acquires and tracks aircraft
 - ICAO requirements with respect to complying with RAs
- performance characteristics and checks encompassing:
 - measurement of radar performance
 - measurement of radar pulse shape/timing check
 - measurement of radar transmitter frequency
 - performing radar spectrum check

- identification of radar performance with or outside documented performance limits
- relevant apparatus manufacturer specifications
- relevant Civil Aviation Safety Authority (CASA) national operating standards, and workplace policies and procedures
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS requirements
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to providing engineering solutions for air surveillance apparatus and systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0021 Diagnose and rectify faults in air navigation circuits and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in aviation navigation circuits and systems in compliance with relevant regulatory requirements of the Civil Aviation Safety Authority (CASA) and national operating standards.

It includes diagnosing aviation navigation circuits and system faults, interpreting circuit diagrams, rectifying faults, conducting safety inspections and functional testing, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0061 Set up and adjust commercial radio frequency (RF) transmission and reception systems

UEEEEC0068 Troubleshoot communication systems

UEEEEC0053 Provide engineering solutions to air traffic control system problems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to diagnose aviation navigation circuits and system faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Aviation operational safety procedures for a given work area are obtained and applied
- 1.3 WHS/OHS risk control measures and workplace procedures are followed in preparation for aviation work activity
- 1.4 Safety hazards that have not previously been identified are documented on job safety assessments, risks assessed and control measures implemented in consultation with appropriate person/s
- 1.5 Extent of faults is determined from reports, circuit diagrams and other relevant documentation, and discussions with appropriate person/s
- 1.6 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the work site
- 1.7 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Diagnose and rectify aviation navigation system faults

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work activities are followed
- 2.2 Need to inspect, test or measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
- 2.3 Circuits, machines and plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Logical diagnostic methods are applied to diagnose aviation navigation system faults, employing measurements and estimations of system operating parameters in accordance with system operational requirements

- 2.5 Suspected fault scenarios are tested as being the source of navigation system problems
 - 2.6 Source of the fault is identified and competent person/s engaged to rectify the fault in accordance with workplace procedures
 - 2.7 Faults in the electronic components of the system are rectified in accordance with navigation system operation standards
 - 2.8 Aviation navigation system is inspected and tested to verify the system operates as intended and to specified requirements
 - 2.9 Decisions for dealing with unplanned situations are made from discussions with appropriate person/s and job specifications and requirements
 - 2.10 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.11 Diagnosis and rectification activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Commission aviation navigation system**
- 3.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 3.2 Testing and measuring devices are connected and set up in accordance with job requirements and the particular air navigational system
 - 3.3 Measuring instruments are set up and adjusted in accordance with transmission/reception requirements and equipment manufacturer instructions
 - 3.4 Adjustments are made to provide optimum transmission/reception performance within regulatory requirements
 - 3.5 Decisions for dealing with unplanned situations are made from discussions with appropriate person/s and job specifications and requirements
 - 3.6 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises

- risk to personnel and equipment
- 3.7** Setting up is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 4 Complete and report fault diagnosis and rectification activities**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2** Worksite is made safe in accordance with workplace safety procedures
- 4.3** Rectification of faults is documented in accordance with workplace procedures
- 4.4** Appropriate person/s is notified in accordance with workplace procedures that the aviation navigation system faults have been rectified and recommission

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying system faults in electronic air navigation systems must include at least the following:

- four system faults in four of the following systems:
 - non-directional beacon (NDB)
 - very high frequency (VHF) omni directional radio range (VOR)
 - distance measuring equipment (DME)
 - instrument landing system (ILS)
 - global navigation satellite system (GNSS)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH191A Diagnose and rectify faults in air

navigation circuits and systems.

Assessment Requirements for UEEEC0021 Diagnose and rectify faults in air navigation circuits and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying sustainable energy principles and practices
- commissioning of air navigational system
- completing and reporting fault diagnosis and rectification activities
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic communications - air navigation systems, including:
 - aviation navigation services and principles encompassing:
 - role of navigation aids in providing air traffic control (ATC) services
 - functions provided by navigational aids
 - Rho Theta concept in context of navigational aids used within aviation
 - relevant International Civil Aviation Organisation (ICAO) (Annex 10) specifications
 - monitoring – equipment, status and pilot
 - principle of operation of the non-directional beacon (NDB) encompassing:

- simple block diagram of an NDB
- frequency band of operation
- parameters ICAO requires to be monitored
- typical radiation hazard issues
- simple block diagram of the aircraft automatic direction finding (ADF) display
- NDB used by pilots and ATC
- principle of operation of the CVOR/DVOR encompassing:
 - simple block diagram of a CVOR labelling each part
 - basic principles of variable and reference information
 - radio frequency (RF) phasing and far field space modulation
 - frequency band of operation
 - features of a typical aircraft display
 - possible errors and their cause in a CVOR
 - typical CVOR and DVOR facilities
 - main differences of operation between CVOR and DVOR
- principle of operation of the distance measuring equipment (DME) encompassing:
 - simple block diagram of a DME
 - typical timing diagram from interrogation to reply
 - features of aircraft display system
 - frequency band of operation
 - modes of operation
- principle of operation of the instrument landing system (ILS):
 - frequency band of operation
 - simple diagram of the localiser antenna pattern marking on it the zero DDM line, the represented colour and modulating frequency of each lobe and the clearance signal
 - simple sketch showing the glide path and the location of the marker beacons listing their identification, frequency and duration
 - simple block diagram to show the generation of the carrier and sidebands and sideband only signals
 - ILS antenna arrays and far field radiation patterns
 - far field phasing and space modulation
 - terms DDM and SDM
 - performance requirements for CAT I, CAT II and CAT III ILS
- principle of global navigation satellite system (GNSS):
 - basic principles of the wide area differential global positioning system (WADGPS)
 - basic principles of the local area differential global positioning system (LADGPS)
- NDB technology and maintenance:
 - key functional modules of a contemporary NDB transmitter
 - function of the aerial coupling unit
 - radiation hazard issues, site restrictions and safety considerations in context of an

NDB facility

- signals in and out of the main components
- key features and theory of operation of an NDB antenna (field pattern, capacity hat and ground plane)
- hardware configurations of current models of NDB used in the National Airways System of Australia
- indicators on NDB equipment that may be used to determine status and locate a fault
- method(s) for conducting routine performance measurements on NDB equipment
- process for removing an NDB from service
- correct test equipment based on measurement tolerance and parameter being measured
- correct use of selected test equipment
- process for returning the aid to service
- locate and identify appropriate NDB documentation (AEIs)
- mandated flight check of an NDB
- DME technology and maintenance:
 - key functional modules of a contemporary DME beacon
 - modes of operation and relevant channel spacing for the interrogation and reply of the beacon
 - purpose of the "squitter"
 - typical DME block diagram, the signal flow through the beacon from incoming interrogation to outgoing reply
 - function of each module in a contemporary DME
 - term "Gaussian shaped pulse" and why it is used
 - operation and purpose of the identification signal including test transmissions
 - definition of "dead time"
 - monitored parameters of a DME
 - controls and indicators
 - correct ON/OFF sequence
 - process for removing a DME from service
 - auto-recycle operation
 - typical function of the CTU for testing
 - typical alarm registers
 - measurement of parameters such as beacon delay, pulse spacing, pulse width, Ident, beacon sensitivity, selectivity, reply rate, dead time, frequency, monitor limits, antenna VSWR and using the correct test equipment
 - correct use of test equipment
 - correlate the measurements to the standard operating conditions (SOC)
 - maintenance actions that may be performed without the requirements of a flight inspection
 - flight calibration check of an DME
 - process for returning the aid to service

- location and identification of appropriate DME documentation (AEIs)
- CVOR technology and maintenance:
 - principles of operation of a VOR and how the component signals are generated in a contemporary CVOR beacon
 - basic operation and functionality of the transmitter, goniometer, modulation eliminator, monitor and antenna
 - typical monitored parameters for a CVOR
 - purpose of monitor bypass
 - correct use of test equipment and interpretation of results
 - measurement of performance parameters using the correct test equipment
 - correct use of test equipment
 - correlate the measurements to the SOC
 - maintenance actions that may be performed without the requirements of a flight inspection
 - maintenance actions that do require a flight inspection
 - importance of beacon accuracy
- DVOR technology and maintenance:
 - principles of operation of a DVOR and how the component signals are generated in a contemporary DVOR beacon
 - basic operation and functionality of the modules used in the following sub-systems: carrier generation and modulation, timing sequence generation, sideband amplifier and modulator, sideband antenna commutation, monitor and controller
 - front panel indications under normal and fault conditions
 - operation and functionality of the following circuits: carrier amplifier and modulation (CGD, CPA, CDC and CMP), timing signals generation (TSD), reference phase generator (RPG), antenna switching (ASD and ADS), sideband generator (SGN, SMA and SCU), control unit (CTU), monitor unit (MRF, MSC, MFI, MBD and MSD)
 - typical monitored parameters for a DVOR
 - correct use of test equipment and interpretation of results
 - measurement of performance parameters using the correct test equipment
 - correct use of test equipment
 - correlate the measurements to the SOC
 - maintenance actions that may be performed without the requirements of a flight inspection
 - maintenance actions that do require a flight inspection
 - importance of beacon accuracy
- ILS technology and maintenance:
 - ILS functional blocks and typical cabinet modules of a localiser and glide path (NM7000 series)
 - main functional elements of a contemporary marker beacon
 - location and function of modules and system interconnections: transmitter, changeover, monitor, transmitter controller, remote control, RMS/RMM and power

- block diagram illustration at specified points, the signal flow out from the distribution side and/or return via the recombination side of a localiser and/or glide path
- operation of a specified localiser antenna array
- operation of an 'M'-array or other specified glide path antenna array
- the features and function of the RMM and/or RMS
- performance requirements for CAT I, CAT II and CAT III ILS and how these are provisioned in the system hardware and monitoring
- function of equipment indicators and controls, including the correct operation of controls to achieve a nominated function
- typical monitored parameters for a localiser, glide path and marker beacon
- correct use of test equipment (BITE and external) and interpretation of results
- measurement of performance parameters using the correct test equipment
- correct use of test equipment
- correlate the measurements to the SOC
- maintenance actions that may be performed without the requirements of a flight inspection
- maintenance actions that do require a flight inspection
- typical tests and maintenance actions required during a flight calibration of an ILS
- relevant Civil Aviation Safety Authority (CASA) national operating standards, workplace policies and procedures
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS and CASA legislated requirements
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults

in air navigation systems

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0022 Diagnose and rectify faults in camera circuits and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in camera circuits and equipment.

It includes fault finding and repairing faults in camera circuits and equipment. It also includes working safely, applying logical diagnostic methods of camera circuit components, rectifying faults, safety and functional testing, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0029 Fault find and repair electronic apparatus

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and

- rectify camera circuits and equipment faults**
- safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for camera circuits and equipment work
- 1.3** Safety hazards that have not previously been identified are risk assessed, documented and risk control measures devised and implemented in consultation with appropriate person/s
- 1.4** Extent of faults is determined from reports, documentation and discussions with appropriate person/s
- 1.5** Appropriate person/s is consulted to ensure the camera circuits and equipment work is coordinated effectively with others involved on the worksite
- 1.6** Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Diagnose and rectify camera circuits and equipment faults**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out camera circuits and equipment work are followed
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted within workplace safety procedures
- 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Logical diagnostic methods are applied to diagnose camera circuit faults using measurements of circuit operating parameters in accordance with camera operating specifications
- 2.5** Suspected fault scenarios are tested as being the source of camera circuit problems
- 2.6** Faults in the electronic components of the camera circuits are rectified to camera circuits operation and industry standards
- 2.7** Circuits are inspected and tested to verify that the

camera operates to specified requirements

- 2.8** Unplanned situations are responded to in accordance with workplace procedures, discussions with appropriate person/s and consistent with job specifications and requirements in a manner that minimises risk to personnel and equipment
- 2.9** Diagnosis and rectification activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is made safe in accordance with workplace safety procedures
- 3.3** Rectification of faults is documented in accordance with workplace procedures
- 3.4** Appropriate person/s is notified in accordance with workplace procedures that camera circuit faults have been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in camera circuits and equipment must include at least the following:

- two circuit faults in two different types of cameras

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH178A Diagnose and rectify faults in camera

circuits and equipment.

Assessment Requirements for UEEEC0022 Diagnose and rectify faults in camera circuits and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of circuit faults
- identifying the cause faults using logical diagnostic methods
- rectifying faults effectively
- verifying that the camera operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- camera circuits and equipment diagnostics safe working practices and relevant standards, codes and regulations, including:
 - operation of camera circuits
 - recording media, standards and formats
 - pick-up tubes and charge coupled devices
 - operation of optical transducers and lenses
 - colour separation techniques and signal processing
 - charge coupled devices
 - mechanics and adjustments
 - power supplies and batteries
 - MPEG capability

- camera circuit diagnosis encompassing:
 - sub-system components (i.e. functional blocks) and their operating parameters
 - environment factors effecting system performance
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing
 - sub-system adjustments
- WHS/OHS enterprise responsibilities encompassing:
 - provisions of relevant WHS/OHS legislation
 - principles and practice of effective WHS/OHS management
 - management arrangements relating to regulatory compliance
 - enterprise hazards and risks, control measures and relevant expertise required
 - characteristics and composition of workforce and their impact on WHS/OHS management
 - relevance of enterprise management systems to WHS/OHS management
 - analysis of working environment and design of appropriate WHS/OHS management systems
 - analysis of relevant data and evaluation of WHS/OHS effectiveness
 - assess resources to establish and maintain WHS/OHS systems
- relevant manufacturer specifications
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in camera circuits
- applicable documentation, including workplace procedures, equipment specifications,

regulations, codes of practice and operation manuals.

UEEEEC0023 Diagnose and rectify faults in digital transmission circuits and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in digital transmission circuits and systems.

It includes fault finding and repair of faults in digital transmission systems. It also includes working safely, applying logical diagnostic methods of digital transmission systems circuit components, rectifying faults, safety and functional testing, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0024 Diagnose and rectify faults in electronic display circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify digital

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

transmission circuits and system faults

for a given work area are obtained and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for digital transmission circuits and system work
- 1.3 Safety hazards which have not previously been identified are risk assessed, documented and risk control measures devised and implemented in consultation with appropriate person/s
- 1.4 Extent of faults is determined from reports, documentation and discussions with appropriate person/s
- 1.5 Appropriate person/s is consulted to ensure digital transmission circuits and system work is coordinated effectively with others involved on the worksite
- 1.6 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Diagnose and rectify digital transmission circuits and system faults

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out digital transmission circuits and system work are followed
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
- 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Logical diagnostic methods are applied to diagnose digital transmission apparatus faults using measurements of circuit operating parameters in accordance with apparatus operating specifications
- 2.5 Suspected fault scenarios are tested as being the source of digital transmission circuit system problem
- 2.6 Faults in the electronic components of the digital transmission apparatus are rectified to circuit and system operation standard

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH180A Diagnose and rectify faults in digital transmission circuits and systems.

Assessment Requirements for UEEEC0023 Diagnose and rectify faults in digital transmission circuits and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of circuit faults
- identifying the cause faults using logical diagnostic methods
- rectifying faults effectively
- verifying that the apparatus operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- digital television transmission faults, advanced digital television principles, digital television transmission towers and equipment, applying safe working practices and relevant standards, codes and regulations, including:
 - audio component encompassing:
 - audio encoding
 - audio masking
 - audio sub-band encoding
 - Dolby AC-3
 - MPEG-2 system layer encompassing:
 - PES packet construction
 - time stamps

- programme clock reference (PCR)
- transport packet header
- programme specific information (PSI)
- channel encoding:
 - forward error correction (FEC)
 - bit error rate (BER)
 - puncturing
- interleaving
- modulation:
 - phase shift keying (PSK)
 - quadrature amplitude modulation (QAM)
 - orthogonal frequency division multiplexing (OFDM)
 - coded orthogonal frequency division multiplexing (COFDM)
- hierarchical modulation:
 - terrestrial channel encoder
 - satellite channel encoder
 - carrier to noise ratio (C/N)
- single frequency networks:
 - guard interval
 - mega-frames
- the requirements of digital television terrestrial broadcast (DTTB) program input and monitoring equipment encompassing:
 - basic system arrangement: a central router connected to a number of control rooms
 - terminologies: vertical, multi-level; tie-line routing and cross point
 - typical signal types processed by a router
 - the purpose of redundant central processing units (CPUs) and power supply units
 - common control protocols used in routers
 - typical analogue audio and video output voltage levels present at the router
 - typical specifications for digital data signals present at the router
 - function of various test equipment used in DTTB measurements
- the operating characteristics of a DTTB transmitter encompassing:
 - typical DTTB digital transmission system
 - safety precautions required when working with high power radio frequency (RF) transmitters
 - operating characteristics of a typical MPEG encoder
 - operation of a COFDM modulator
 - arrangement of sub-system components in a DTTB transmitter
 - purpose of an up converter in a DTTB transmitter
 - typical characteristics of a DTTB power amplifier
 - advantages and disadvantages of air and liquid cooling systems used in transmitters

- typical DTTB transmitter measurements techniques
- the performance requirements of the DTTB combiner and antenna systems encompassing:
 - minimum channel separation required between digital and analogue television channels
 - typical specifications of an antenna combiner system
 - the need for combiner systems in DTTB systems
 - typical system faults in combiners and antenna system
- the requirements of remote monitoring and measurement equipment encompassing:
 - purpose of control panel indicators and controls
 - process by which the system manages a critical failure: power supplies and CPUs
 - different system alarm signals
 - periodic equipment self-tests and diagnostic routines on DTTB systems
 - DTTB systems fault diagnostic and rectification techniques
 - function of the basic components of a DTTB system
 - typical units of a DTTB telemetry system
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in digital transmission systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0024 Diagnose and rectify faults in electronic display circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in electronic display circuits.

It includes fault finding and repair of faults in cathode ray tubes, liquid crystal and plasma display circuits. It also includes working safely, applying logical diagnostic methods and rectifying faults, safety and functional testing, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0070 Troubleshoot faults in television receivers

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify electronic display

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- circuit faults** for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
 - 1.3 Safety hazards which have not previously been identified are risk assessed, documented and risk control measures devised and implemented in consultation with appropriate person/s
 - 1.4 Extent of faults is determined from reports, documentation and discussions with appropriate person/s
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 1.6 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Diagnose and rectify electronic display circuit faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out electronic display circuit work are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Logical diagnostic methods are applied to diagnose display circuits faults, employing measurements of circuit operating parameters referenced to display operating specifications
 - 2.5 Suspected fault scenarios are tested as being the source of display circuit problems
 - 2.6 Faults in the electronic components of the display circuits are rectified to display circuits operation and industry standards
 - 2.7 Circuits are tested to verify that the display operates as intended in accordance with industry standards and to

specified requirements

- 2.8** Unplanned situations are responded to in accordance with workplace procedures, discussions with appropriate person/s and consistent with job specifications and requirements in a manner that minimises risk to personnel and equipment
- 2.9** Diagnosis and rectification activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is made safe in accordance with workplace safety procedures
- 3.3** Rectification of faults is documented in accordance with workplace procedures
- 3.4** Appropriate person/s is notified in accordance with workplace procedures that display circuit faults have been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in electronic display circuits must include at least the following:

- two circuit faults in two different types of displays

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH176A Diagnose and rectify faults in electronic

display circuits.

Assessment Requirements for UEEEC0024 Diagnose and rectify faults in electronic display circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of circuit faults
- identifying the cause faults using logical diagnostic methods
- rectifying faults effectively
- verifying that the display operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- connecting test/measuring devices into a circuit in accordance with industry standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic displays faults, applying safe working practices and relevant standards, codes and regulations, including:
 - cathode ray tube displays encompassing:
 - operation and characteristics of various types of cathode-ray tubes, including delta, in-line and precision in-line
 - voltages, statics and x-rays around cathode ray tubes
 - set-up and adjustment techniques
 - rear and front projection television systems
 - typical faults
 - plasma displays and their circuit control operation encompassing:
 - advantages of flat panel displays (over conventional cathode ray tubes and raster

- geometry)
- theory of plasma gas discharge and phosphor excitation
- scanning techniques (column/row addressing)
- luminance/colour aspects (the need to re-address pixels to control light output)
- gamma correction considerations (reversal of the gamma correction that is carried out at the television studio to compensate for the non-linearity of light output of a conventional cathode ray tube)
- plasma flat panel construction (and handling)
- liquid crystal displays and the control circuit operation encompassing:
 - principles of transmissive liquid-crystal display (LCD) (as opposed to reflective types)
 - light polarisation (polarisation twisting characteristics of liquid crystal and the need for polarisation filters in display panel)
 - voltage/current requirements and need for electric field
 - fluorescent back light (need for high frequency operation and power requirements)
 - scanning techniques (colour/row addressing and thin film transistors)
 - light attenuation (caused by the many layers/filters the back light has to pass through)
 - construction and handling
- display circuit diagnostics encompassing:
 - sub-system components (i.e. functional blocks) and their operating parameters
 - factors effecting system performance
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing
 - sub-system adjustments
- advance electronic measuring instruments encompassing:
 - test/measuring devices and their application: frequency counters and synthesisers, spectrum analysers, noise and distortion meters, and radio frequency (RF) communications service monitor
- connection of test/measuring devices into a circuit encompassing:
 - safety procedures
 - loading and matching
 - storage and delay
 - circuit arrangement of test/measuring devices
- taking and interpreting readings
- notion of decibels, including dBm, dBr, dBu and dBo
- WHS/OHS enterprise responsibilities encompassing:
 - provisions of relevant WHS/OHS legislation
 - principles and practice of effective WHS/OHS management
 - management arrangements relating to regulatory compliance
 - enterprise hazards and risks, control measures and relevant expertise required
 - characteristics and composition of workforce and their impact on WHS/OHS management

- relevance of enterprise management systems to WHS/OHS management
- analysis of working environment and design of appropriate WHS/OHS management systems
- analysis of relevant data and evaluation of WHS/OHS system effectiveness
- assess resources to establish and maintain WHS/OHS management systems
- relevant manufacturer specifications
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in display circuits
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0026 Enter and verify programs for fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to enter and verify programs for fire protection systems.

It includes programming fire protection systems that include multiple connected detection, warning and fire control devices and remote monitoring. It also includes working safely, using fire protection industry standards and protocols, entering system instructions, testing functionality of fire protection components and system operation, and documenting activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0041 Install fire detection and warning system apparatus

UEEEEC0076 Verify compliance and functionality of fire protection system installations

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to enter operating instructions

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

1.2 WHS/OHS risk control measures and procedures are followed in preparation for the work

1.3 Safety hazards that have not previously been identified are assessed, reported and advice on risk control measures sought from work supervisor

1.4 Extent of programming work is determined from job specifications and in consultation with appropriate person/s

1.5 Tools, equipment and testing devices needed to carry out fire protection work activities are obtained and checked for correct operation and safety

1.6 Fire protection device installation is checked for compliance with job specification, industry standards and regulations

2 Enter software operating instructions

2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.3 Status of each function of the fire protection device is entered and their parameters set in accordance with manufacturer programming instructions

2.4 Entered data is checked as meeting those specified by work activity and job specifications

2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

2.6 Programming is carried out efficiently without waste of materials and energy or damage to apparatus, the

- surrounding environment or other services
- 3 Test fire protection device operation and report findings**
- 3.1** Fire protection device operation is tested in accordance with WHS/OHS requirements and workplace procedures
- 3.2** Operating anomalies are identified and corrected in accordance with workplace procedure
- 3.3** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.4** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.5** Work completion is reported and appropriate person/s notified in accordance with workplace procedure

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Entering and verifying programs for fire protection systems must include at least the following:

- two types of microprocessor fire protection control and indicating equipment with:
 - at least 50 input devices
 - at least 20 output devices
 - at least 1 system interface control
 - at least 2 logic timers
 - system variables

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH163A Enter and verify programs for fire protection systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0026 Enter and verify programs for fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- apply sustainable energy principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- correcting programming anomalies
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- entering functions and parameters correctly
- identifying non-compliance conditions of device installation
- performing program backups, version controls and documentation
- testing and verifying device operation
- understanding required operating functions and parameters.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- fire protection systems programming methods
- input devices, including conventional alarm zones, analogue or analogue addressable fire detectors, flow switch connections or switch connections
- logic times, including software programs that control the operation of non-latching detectors and timer periods before operation of fire system suppression systems
- output devices, including shutdown signal, door or system release controls and solenoid valve controls
- program backup, version control and documentation requirements
- program loading methods and relevant information technology
- program testing methods
- relevant manufacturer specifications

- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system interface controls, including verify signals to remote control and indicating equipment, building monitoring systems, paging system and colour graphics
- system variables, including standard software functions that operate smoke detector controls, dual zone alarm configurations, alarm and fault global functions
- vender programming codes and functions, including:
 - input/output (I/O) instructions
 - variables
 - timers
 - limitations of vender software.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to entering and verifying programs for fire protection systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0027 Enter instructions and test wired and wireless security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to enter instructions and test wired and wireless security systems.

It includes entering instructions and testing electronic security systems with up to 50 connected devices typically used in single domestic and small commercial premises. It also includes working safely, programming as directed in user manuals, adjusting security devices, system testing and following written and oral instruction and workplace procedures.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0003 Assemble and set up basic security systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to enter instructions and test security system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied

1.2 WHS/OHS risk control measures are followed in preparation for security system work

1.3 Safety hazards not previously identified are risk assessed, reported and advice on risk control measures sought from the work supervisor

1.4 Nature and location of security system work is obtained from work supervisor or other appropriate person/s to determine the scope of work to be undertaken

1.5 Advice is sought from the work supervisor or other appropriate person/s to ensure the work is coordinated effectively with others

1.6 Sources of materials required for security system work are determined in accordance with workplace routines

1.7 Tools, equipment and testing devices needed to carry out security system work are obtained and checked for correct operation and safety

2 Enter instructions and test wired and wireless security system

2.1 WHS/OHS risk control measures for carrying out the work are followed

2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.3 Security devices are checked for correct location and alignment

- 2.4 Security functions are entered into the security system in accordance with manufacturer instructions
 - 2.5 Security system is inspected and tested in accordance with manufacturer instructions
 - 2.6 Security system operational malfunctions are identified and corrected
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures and discussions with immediate supervisor for directions in a manner that minimises risk to personnel and equipment
 - 2.8 Security program and testing is carried out efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Complete and document security system work activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Security system is documented in accordance with regulatory requirement and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Security system must consist of a controller and an access device and at least two other different connected devices, both wired and wireless and include at least the following:

- entering instructions and testing wired and wireless security systems for two security systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH152A Enter instructions and test wired and wireless security systems.

Links

Assessment Requirements for UEEEC0027 Enter instructions and test wired and wireless security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting 'as-installed' system correctly
- entering system instructions using relevant information technology
- identifying and correcting operational malfunctions
- testing system functions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- access and detection functions
- diagnostic functions and their use
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- security systems software function and configurations, including relevant information technology and configuration options.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to entering instructions, and testing basic wired and wireless security systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0028 Fault find and repair complex power supplies

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair complex power supplies.

It includes preparing to find and repair faults in complex power supplies, finding and repairing faults, and completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0043 Solve problems in direct current circuits

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and repair faults in complex power

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

supplies

for relevant work area are identified, obtained and applied

- 1.2 WHS/OHS risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Nature of the fault is obtained from documentation or discussions with relevant person/s to determine scope of work
- 1.4 Relevant person/s is consulted to ensure the work is coordinated effectively with others
- 1.5 Materials required for the work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1 WHS/OHS risk control measures and procedures are applied
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Apparatus is isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding is approached methodically, applying principles of complex power supplies, analysing faults through reference to block and schematic diagrams and using measured and calculated values of power supply parameters
- 2.5 Apparatus components are dismantled, as necessary, and parts stored to protect against loss or damage
- 2.6 Faulty components are rechecked and their fault status confirmed
- 2.7 Materials required for repair work are sourced and obtained in accordance with workplace procedures
- 2.8 Effectiveness of the repair is tested in accordance with workplace procedures
- 2.9 Apparatus is reassembled, tested and prepared for return

to customer

- 2.10** Unplanned situations are dealt with safely and with approval of relevant person/s
- 2.11** Fault-finding and repair activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair activities**
- 3.1** WHS/OHS risk control measures and workplace procedures are applied
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification is made in the required format for repairs to apparatus
- 3.4** Work completion is documented in accordance with workplace procedures and relevant person/s notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Finding and repairing faults in complex power supplies must include at least the following:
- fault finding two faults in each of the following types of power supply:
 - linear regulated power supply
 - switch mode power supply

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH138A Fault find and repair complex power supplies.

Assessment Requirements for UEEEC0028 Fault find and repair complex power supplies

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of work
- efficiently finding faults
- finding and repairing faults in complex power supplies
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system
- providing justification for the repairs
- replacing components without damage
- selecting relevant test equipment and test methods
- making and analysing measurements to verify circuit operation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex power supplies fault finding and repair
- off-line switching regulators
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes

- relevant standards, codes and regulations
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- relevant principles of switching regulation
- series regulation
- series regulator employing closed loop control
- switching regulation - closed loop control of output
- block and schematic diagrams for typical power supply circuits
- heatsink selection considerations
- circuit protection methods - crowbar and current-limiting
- verification of circuit operation
- fault-finding techniques
- electromagnetic radiation (EMR) considerations with switch mode supplies
- inductance and transformer theory
- diode and semiconductor basics
- rectification and filtering.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in complex power supplies
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0029 Fault find and repair electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair electronic apparatus. It includes preparing to find and repair faults, finding faults, and completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and repair faults

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied

1.2 Risk control measures are applied in accordance with

workplace procedures prior to commencing work

- 1.3 Nature of the fault is obtained from documentation and/or from relevant person/s to determine scope of work
- 1.4 Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5 Materials required for the work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find faults

- 2.1 Workplace risk control measures and procedures are applied
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding is undertaken methodically applying principles of data circuits using measured and calculated values of apparatus parameters
- 2.5 Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6 Faulty components are rechecked and their fault status confirmed
- 2.7 Effectiveness of the repair is tested in accordance with workplace procedures
- 2.8 Apparatus is reassembled, tested and prepared for return to customer
- 2.9 Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.10 Fault finding is conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

- 3 Complete and report repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Work area is cleaned and made safe in accordance with workplace procedures
 - 3.3** Justification is provided for repairs to apparatus in the required format
 - 3.4** Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and repairing faults in electronic apparatus must include at least the following:

- two different faults in two different electronic apparatus

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH118A Fault find and repair electronic apparatus.

Assessment Requirements for UEEEC0029 Fault find and repair electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of work
- efficiently finding faults
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- drawings and diagrams
- electronic communications systems
- electronic fault finding
- electronic testing, measuring devices and techniques
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in electronic apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0030 Fault find and repair electronic medical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair electronic medical equipment.

It includes preparing to find and repair faults, finding and repairing faults, and completing and reporting on fault-finding and repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0019 Develop software solutions for microcontroller-based systems

UEEEEC0028 Fault find and repair complex power supplies

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0065 Solve problems in basic electronic circuits

or

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair faults

2 Find and repair faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4 Extent of faults is determined from reports, other relevant documentation and discussions with relevant person/s
- 1.5 Relevant person/s is consulted to ensure the work is coordinated effectively with others
- 1.6 Tools, equipment and testing devices required to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 Workplace risk control measures and workplace procedures are applied
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and

- workplace procedures
- 2.3 Circuits/machines/plant are isolated, as necessary, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Logical diagnostic methods are applied to diagnose electronic medical equipment faults employing measurements and estimations of system operating parameters referenced to system operational requirements
 - 2.5 Suspected fault scenarios are tested as being the source of system problems
 - 2.6 Source of the fault is identified and appropriately qualified person/s engaged to rectify the fault where it is outside the scope of capability in accordance with workplace procedures
 - 2.7 Faults in electronic components are rectified to raise electronic medical equipment to its operation standard
 - 2.8 System is tested to verify that it operates as intended and to specified requirements
 - 2.9 Decisions for dealing with unexpected situations are made based on job specifications, work requirements and discussions with relevant person/s
 - 2.10 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.11 Diagnosis and rectification activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report fault-finding and repair activities**
- 3.1 Workplace risk control measures and workplace procedures are applied
 - 3.2 Worksite is made safe in accordance with workplace procedures
 - 3.3 Rectification of faults is reported in accordance with workplace procedures

- 3.4 Relevant person/s is notified that the system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fault finding and repairing faults in electronic medical equipment must include at least the following:

- two system faults in two different types of electronic medical equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH134A Fault find and repair electronic medical equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0030 Fault find and repair electronic medical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic medical equipment fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - medical equipment principles:
 - equipment categories, types, functions and operation
 - hazards and safety procedures
 - causes of failure

- safety testing requirements and methods
- categories and examples of medical equipment, including:
 - cardiovascular systems: blood warmers, cardiac catheterisation systems and defibrillators
 - electrocardiogram (ECG) machines, ECG monitors, heart-lung machines and infusion
 - pumps, intra-aortic balloon pumps, pacemakers, syringe pump and cardiac output measurement equipment
 - respiratory systems: anaesthetic delivery and monitoring units, medical gases, oxygen concentrator, pulse oximeter, respiratory humidifier, respiratory support units and ventilators
 - neurological systems: electroencephalograph (EEG) recorder, electromyograph (EMG) recorder and intracranial pressure (ICP) monitoring
 - renal systems: haemodialysis machine, continuous veno-venous hemofiltration (CVVH) machine and peritoneal dialysis
 - medical imaging: x-ray equipment, computerised axial tomography (CAT scan), magnetic resonance imaging (MRI), nuclear medicine and diagnostic ultrasound equipment
 - physiological equipment: blood pressure monitors, foetal cardiotocograph, infant care systems, multiparameter systems, thermometry, telemetry, networking and patient warmers
 - miscellaneous equipment: electrosurgery, electric stimulators, and endoscopy and laparoscopy systems, laser, operating microscopes, therapeutic diathermy and ultrasound
- medical equipment, anatomy and physiology and infection control:
 - nature of infection
 - control of microbial growth
 - infection control strategies
 - body systems
- medical equipment safe working practices:
 - risk management and assessment of risk encompassing:
 - principle and purpose of risk management, and
 - processes for conducting a risk assessment
 - hazards associated with medical equipment, encompassing:
 - infections
 - toxic materials
 - electrical components
 - radiation
 - risks and control measures associated with working with medical equipment
- fault finding and repair:
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing

- component replacement
- equipment adjustments
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that assessment should reflect current industry practices in relation to diagnosing and rectifying faults in electronic medical equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0031 Fault find and repair global positioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair global positioning systems (GPS).

It includes preparing to find and repair faults, finding and repairing faults, and completing and reporting on fault-finding and repair activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

UEEEEC0067 Troubleshoot basic amplifier circuits

UEEEEC0063 Solve fundamental electronic communications system problems

UEEEEC0068 Troubleshoot communication systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0065 Solve problems in basic electronic circuits

or

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4 Extent of faults is determined from reports, other relevant documentation and discussions with relevant person/s
- 1.5 Relevant person/s is consulted to ensure the work is coordinated effectively with others

- 1.6** Tools, equipment and testing devices required to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find and repair faults**
- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Logical diagnostic methods are applied to diagnose GPS faults employing measurements and estimations of system operating parameters referenced to system operational requirements in accordance with workplace procedures and job specifications
- 2.5** Suspected fault scenarios are tested in accordance with workplace procedures and job specifications
- 2.6** Source of the fault is identified and relevant person/s engaged to rectify the fault where it is outside the scope of capability in accordance with workplace procedures and relevant industry standards
- 2.7** Faults in electronic components are rectified to raise GPS to its operation standard
- 2.8** System is tested to verify that the system operates as intended and to specified requirements
- 2.9** Decisions for dealing with unplanned situations are made in accordance with workplace procedures, relevant industry standards and discussions with relevant person/s
- 2.10** Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
- 2.11** Diagnosis and rectification activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

- 3 Complete and report fault-finding and repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is made safe in accordance with workplace procedures
 - 3.3** Rectification of faults is reported in accordance with workplace procedures
 - 3.4** Relevant person/s is notified that the system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fault finding and repairing faults in GPS must include at least the following:

- two system faults in electronic GPS

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH132A Fault find and repair global positioning systems.

Links

Assessment Requirements for UEEEC0031 Fault find and repair global positioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- global positioning system (GPS) fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - sub-system components (i.e. functional blocks) and their operating parameters
 - environment factors effecting system performance
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing

- component replacement
- sub-system adjustments
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in GPS
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0032 Fault find and repair high-volume office equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair high-volume office equipment.

It includes preparing to find and repair faults, finding and repairing faults, and completing and reporting on fault-finding and repair activities.

Permits may be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0059 Repair routine business equipment faults

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to find and repair faults**
 - 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
 - 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3** Scope of the fault is obtained from documentation, relevant person/s and customer to determine work
 - 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
 - 1.5** Materials required for work are determined in accordance with workplace procedures
 - 1.6** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find and repair faults**
 - 2.1** Workplace risk control measures and procedures are applied
 - 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Apparatus is checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Fault finding is undertaken methodically applying principles of office equipment and using measurements of operating parameters and built-in fault indicators in accordance with manufacturer instructions and workplace procedures
 - 2.5** Equipment components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.6** Faulty components are rechecked and their fault status confirmed
 - 2.7** Faulty components are readjusted or replaced in accordance with workplace procedures
 - 2.8** Effectiveness of the repaired component is tested in accordance with workplace procedures

- | | |
|--|---|
| 3 Complete and report fault-finding and repair activities | <p>2.9 Apparatus is reassembled, tested and prepared for return to customer</p> <p>2.10 Unplanned situations are dealt with safely and with the approval of relevant person/s</p> <p>2.11 Fault finding and repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices</p> <p>3.1 WHS/OHS work completion risk control measures and procedures are followed</p> <p>3.2 Work area is cleaned and made safe in accordance with workplace procedures</p> <p>3.3 Justification is provided in the required format for repairs to apparatus, including components and materials used</p> <p>3.4 Acceptance that the reported fault/s has been repaired is sought from relevant person/s in accordance with workplace procedures</p> |
|--|---|

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and repairing faults in high volume office equipment must include at least the following:

- one fault in a high-volume printing device
- one fault in a high-volume imaging device

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH121A Fault find and repair high volume office

equipment.

Assessment Requirements for UEEEC0032 Fault find and repair high-volume office equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of work
- efficiently finding faults
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs and obtaining acceptance of repairs
- removing/adjusting/replacing components without damage
- testing equipment operation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- business machine transducers
- colour photocopier operating principles
- printing and imaging devices software functions and configuration
- imaging operating principles
- high-volume business machine functions and faults
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation

processes

- relevant industry standards, codes and regulations
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in high-volume office equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEEEC0034 Fault find and repair radar apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- radar apparatus and system fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - electronic communications, secondary radar and related systems:
 - secondary radar principles encompassing:
 - role of secondary radar
 - transponder operation

- operating principles
- signal processing
- pulse generation, transmission and detection
- mode generation, detection and response
- display symbol generation
- synchronisation with primary radar
- advantages over primary radar with respect to clutter
- signal/noise ratio; transmit power required for operation
- interfaces to other systems providing information for transmission of mode data encompassing:
 - slaving/synchronisation to primary radar
 - clutter reduction/elimination
 - defruiting
 - degarbling
 - interfaces to other systems
 - range/ducting effects
 - advantages over primary radar
 - power supplies and uninterrupted power supplies (UPS)
 - international standards
 - national curriculum
 - hot standby, cold standby
- application of secondary radar systems - traffic collision avoidance system (TCAS), selective identification system (SIF), air traffic control radar beacon system (ATCRBS), instrument landing system (ILS), tactical air navigation (TACAN), navigation systems (VOR, GPS and DME), radar altimeter, jamming, electronic warfare, second time round returns (STRR), and identification–friend or foe radar (IFF)
- electronic communications, radar and sonar displays devices:
 - types and their applications – cathode-ray tube (CRT), plasma, liquid-crystal display (LCD), monochrome, colour and touch screen
 - sub-system components (i.e. functional blocks) and their operating parameters encompassing:
 - extra high tension (EHT) transformers
 - detectors
 - video distribution
 - time base generators
 - phase locked loops
 - microprocessors
 - memory devices
 - demodulators
 - focusing/deflection devices

- delay lines
- bleed resistors
- high voltage (HV) generation
- calibration testing and maintenance procedures:
- typical fault finding, their symptoms and cause
- electronic communications, radar fundamentals:
 - hazards and risk control measures
 - purpose and uses of radar
 - environmental conditions affecting radar
 - design factors which affect performance
 - propagation of electromagnetic waves
 - pulse forming circuits
 - typical radar transmitter encompassing:
 - limitations and applications of each type
 - typical radar receivers encompassing:
 - sub-system components (i.e. functional blocks) and their operating parameters
 - limitations and applications
 - radar antennae encompassing:
 - types, application and radiation patterns - parabolic, phased array, log periodic, and cos q
 - antenna gain
 - efficiency
 - length and height factors
 - microwave techniques, devices and applications encompassing:
 - oscillators
 - amplifiers
 - modulators and demodulators
 - mixers and detectors
 - types and characteristics of various radar systems
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in radar apparatus and systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0035 Fault find and repair satellite-based surveillance and observation systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair satellite-based surveillance and observation systems.

It includes preparing to find and repair faults, finding and repairing faults, and completing and reporting fault-finding and repair activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

UEEEEC0067 Troubleshoot basic amplifier circuits

UEEEEC0063 Solve fundamental electronic communications system problems

UEEEEC0068 Troubleshoot communication systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEECD0074 Troubleshoot resonance circuits in an electronic apparatus

UEEECD0065 Solve problems in basic electronic circuits

or

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4 Extent of faults is determined from reports, other relevant documentation and discussions with relevant person/s
- 1.5 Relevant person/s is consulted to ensure the work is

coordinated effectively with others

1.6 Tools, equipment and testing devices required to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

2.1 Workplace risk control measures and procedures are applied

2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures

2.3 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures

2.4 Logical diagnostic methods are applied to diagnose satellite-based surveillance and observation system faults employing measurements and estimations of system operating parameters referenced to system operational requirements in accordance with workplace procedures and relevant industry standards

2.5 Suspected fault scenarios are tested as being the source of system problems

2.6 Source of the fault is identified and relevant person/s engaged to rectify the fault where it is outside the scope of capability in accordance with workplace procedures and relevant industry standards

2.7 Faults in the electronic components of the system are rectified to raise satellite-based surveillance and observation system to its operation standard

2.8 System is tested to verify that the system operates as intended and to specified requirements in accordance with workplace procedures and job specifications

2.9 Decisions for dealing with unplanned situations are made in accordance with relevant industry standards, job specifications and discussions with relevant person/s

2.10 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes

- 3 Complete and report fault-finding and repair activities**
- 2.11** Diagnosis and rectification activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
 - 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is made safe in accordance with workplace procedures
 - 3.3** Rectification of faults is reported in accordance with workplace procedures
 - 3.4** Relevant person/s is notified that the system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and repairing faults in satellite-based surveillance and observation systems must include at least the following:

- two system faults of electronic satellite-based surveillance and observation systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH130A Fault find and repair satellite-based surveillance and observation systems.

Assessment Requirements for UEEEC0035 Fault find and repair satellite-based surveillance and observation systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing with unplanned events
- determining live testing/measurement requirements
- determining scope of work
- documenting fault rectification
- identifying and accessing materials, tools, apparatus and testing devices
- identifying faults and competency needed to rectify them
- isolating circuits/machines/system.
- rectifying faults in system electronics
- using fault scenarios to test the source of system faults
- verifying that the system operates correctly.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- satellite-based surveillance and observation systems, fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - types of satellite systems and sub-systems
 - earth station locality and antenna parameters
 - link specifications and link calculations
 - base band signalling processes

- modulation and system access
- sub-system components (i.e. functional blocks) and their operating parameters
- environment factors effecting system performance
- typical faults, their symptoms and cause
- fault diagnosis procedures and testing
- component replacement
- sub-system adjustments
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in satellite-based surveillance and observation systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0036 Fault find and repair sonar apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair sonar apparatus and systems.

It includes safe working practices, interpreting diagrams, applying logical diagnostic methods and knowledge of sonar system components, rectifying faults, safety and functional testing, and completing service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0019 Develop software solutions for microcontroller-based systems

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

UEEEEC0068 Troubleshoot communication systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

Assessment Requirements for UEEEC0036 Fault find and repair sonar apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- sonar apparatus and system fault finding and repair, safe working practices and relevant standards codes and regulations, including:
 - electronic communications, sonar system operating principles:
 - the purpose and application of sonar systems
 - sonar equipment encompassing:
 - types and their applications

- sub-system components (i.e. functional blocks) and their function encompassing:
 - transducer
 - input amplifier
 - sonar interface unit
 - beam forming network (transmit/receive)
 - signal processing
 - own Doppler nullification
 - display system
 - headset
 - interfaces
 - transmitter
 - T/R switch
 - timer/timing
- sonar operating parameters
- sonar transmission characteristics
- electronic communications, sonar transducers and arrays:
 - hazards and risk control measures
 - transducer types, their operating principles and parameters
 - transducer array encompassing:
 - types and their construction
 - applications
 - transducer hull outfits
 - beam forming principles and requirements
 - transducer installation and operational maintenance
- electronic communications, sonar measurement and set-up:
 - sonar parameters and measurements
 - sonar physical parameters
 - constraints and consequences
- electronic communications, radar and sonar displays devices:
 - types and their applications – cathode-ray tube (CRT), plasma, liquid-crystal display (LCD), monochrome, colour and touch screen
 - sub-system components (i.e. functional blocks) and their operating parameters encompassing:
 - extra high tension (EHT) transformers
 - detectors
 - video distribution
 - time base generators
 - phase locked loops
 - microprocessors
 - memory devices

- demodulators
- focusing/deflection devices
- delay lines
- bleed resistors
- high voltage (HV) generation
- calibration testing and maintenance procedures
- typical fault finding, their symptoms and cause
- advanced electronic (sonar) testing and measuring devices and techniques:
 - test/measuring devices and their application - frequency counters, and synthesisers, spectrum analysers, noise and distortion meters and radio frequency (RF) communications service monitor
 - connection of test/measuring devices into a circuit encompassing:
 - safety procedures
 - loading and matching
 - storage and delay
 - circuit arrangement of test/measuring devices
 - taking and interpreting readings
 - notion of decibels, including dBm, dBr, dBu and dBo
- fault finding and repair:
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing
 - component replacement
 - equipment adjustments
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in sonar apparatus and systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0037 Fault find and repair telecommunication apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair telecommunication apparatus and systems.

It includes preparing to find and repair faults, finding and repairing faults, and completing and reporting on fault-finding and repair activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0019 Develop software solutions for microcontroller-based systems

UEEEEC0028 Fault find and repair complex power supplies

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0065 Solve problems in basic electronic circuits

or

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair fault

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s and control measures implemented
- 1.4 Extent of faults is determined from reports, other relevant documentation and discussions with relevant person/s
- 1.5 Relevant person/s is consulted to ensure the work is

coordinated effectively with others

1.6 Tools, equipment and testing devices required to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair fault

2.1 Workplace risk control measures and procedures are applied

2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures

2.3 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures

2.4 Logical diagnostic methods are applied to diagnose telecommunication apparatus and system faults employing measurements and estimations of system operating parameters referenced to system operational requirements in accordance with workplace procedures and relevant industry standards

2.5 Suspected fault scenarios are tested in accordance with workplace procedures and relevant industry standards

2.6 Source of the fault is identified and relevant person/s engaged to rectify the fault in accordance with workplace procedures and relevant industry standards

2.7 Faults in electronic components are rectified to raise telecommunication apparatus and system to its operation standard

2.8 System is tested to verify that the system operates as intended and to specified requirements

2.9 Decisions for dealing with unplanned situations are made based on job specifications, work requirements and discussions with relevant person/s

2.10 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes

2.11 Diagnosis and rectification activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services

- applying sustainable energy practices
- 3 Complete and report fault-finding and repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is made safe in accordance with workplace procedures
- 3.3** Rectification of faults is reported in accordance with workplace procedures
- 3.4** Relevant person/s is notified that the system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fault finding and repairing faults in electronic telecommunication apparatus and systems must include at least the following:

- two system faults

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH133A Fault find and repair telecommunication apparatus and systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0037 Fault find and repair telecommunication apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the source of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system electronics
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- telecommunication apparatus and system fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - telephone system fundamentals:
 - the transmission of sound in a telephone system encompassing:
 - function of telephone transmitters and receivers
 - components and functions of the telephone

- purpose of earthing and protection in a telephone system
- customer switching systems encompassing:
 - basic function
 - difference between a key system and a private automatic branch exchange (PABX)
 - advanced features
- basic operations of system distribution frames (SDF)/test point frames (TPF), power fail and line interface requirements (e.g. indial, rotary groups, ISDN, extension and tie-line circuits)
- types, purpose, use, and requirements of metering devices
- metering and installation arrangements of public/pay phones
- installation methods and requirements encompassing:
 - customer switching systems (CSS)
 - interfacing equipment
 - termination of CSS equipment
- requirements for programming of CSS
- hazard associated the electronic components of CSS encompassing:
 - static discharge
 - chemical damage
 - mechanical damage
 - electromagnetic Interference
- telephone network facilities:
 - network subsystems (i.e. functional blocks) components and operating parameters
 - switches within the network
 - customer accesses infrastructure
 - system security
- telecommunication earthing and protection:
 - telecommunication overvoltage protection system:
 - operating principles
 - overvoltage and surge/spike suppression protection techniques
 - overvoltage protection devices
 - installation of overvoltage protection systems
 - earthing protection system encompassing:
 - components and arrangement of the multiple earth network (MEN) system
 - TELEX functional earth system
 - telecommunication system earthing single and multi-storey
 - communication earth system
 - protective earth barriers for segregation, cable tray, duct and metal equipment enclosures
 - electrical interference encompassing:
 - types – radio frequency interference (RFI) and electro-magnetic interference

(EMI)

- sources of interference
- techniques in reducing interference
- earthing cable shields
- earth testing instruments and procedures
- safety issues to be considered with earthing and bonding
- PABX fundamentals:
 - programming methods
 - configuration options
 - programming options
- switches, hubs and routers:
 - purpose and function
 - circuit configurations
 - connection arrangements
 - system protocols
- decoders:
 - purpose and function
 - circuit configurations
 - connection arrangements
 - system protocols
- fault finding and repair:
 - typical faults, their symptoms and cause
 - fault diagnosis procedures and testing
 - component replacement
 - system adjustments
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace

operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in telecommunication apparatus and systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and repair microwave amplifier section faults in electronic apparatus.

It includes preparing to find and repair faults, finding faults, repairing faults, and completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0067 Troubleshoot basic amplifier circuits

UEEEEC0063 Solve fundamental electronic communications system problems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and repair faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Nature of the fault is identified from documentation or from relevant person/s to determine the scope of work
- 1.4 Instructions for coordinating work with others is obtained from relevant person/s and applied
- 1.5 Materials required for the work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find faults

- 2.1 WHS/OHS risk control measures and procedures are applied
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Apparatus is checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding is undertaken methodically applying principles of microwave amplifier sections and circuits using measured and calculated values of apparatus parameters

- 2.5 Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6 Faulty components are rechecked and their fault status confirmed
- 2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.8 Fault finding is conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

3 Repair fault

- 3.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 3.2 Apparatus is checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 3.3 Materials required for repair work are sourced and obtained in accordance with workplace procedures
- 3.4 Repairs are conducted efficiently without damage to other components, apparatus or circuits
- 3.5 Effectiveness of repair is tested in accordance with workplace procedures
- 3.6 Apparatus is reassembled, tested and prepared for return to customer

4 Complete and report repair activities

- 4.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2 Work area is cleaned and made safe in accordance with workplace procedures
- 4.3 Justification is provided for repairs to apparatus in the required format
- 4.4 Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and repairing faults in microwave amplifier sections must include the following:

- at least two types of electronic apparatus

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH116A Find and repair microwave amplifier section faults in electronic apparatus.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0038 Find and repair microwave amplifier section faults in electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- efficiently finding faults
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic microwave communications systems, including:
 - advanced electronic (communication systems) testing and measuring devices and techniques
 - electronic (communication systems) fault finding
 - electronic communications, microwave antennae and waveguide fundamentals
 - microwave amplifiers, including:
 - amplifier components and circuit configuration

- amplifier faults, symptoms and causes
- applications and operational constraints
- operating principles and parameters
- relevant industry standards, codes and regulations
- software programming fundamentals
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in the microwave amplifier sections in electronic apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0039 Install and test microwave antennae and waveguides

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and test microwave antennae and waveguides.

It includes preparing to install and test microwave antennae and waveguides, installing microwave antennae and waveguides, testing microwave antennae and waveguides, and reporting outcomes.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to install and test microwave antennae and waveguides**
 - 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
 - 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3** Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
 - 1.4** Nature and location of the work is obtained from relevant person/s to determine scope of work
 - 1.5** Instructions for coordinating work with others are obtained from relevant person/s and applied
 - 1.6** Materials required for the work are determined in accordance with workplace procedures
 - 1.7** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Install microwave antennae and waveguides**
 - 2.1** Workplace risk control measures and procedures are applied
 - 2.2** Circuits/components are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Antennas are installed in specified locations and within limitations imposed by regulations
 - 2.4** Hardware and accessories are installed straight and square in the required locations and within acceptable tolerances
 - 2.5** Cables and conductors are terminated at accessories in accordance with relevant industry standards, manufacturer instructions and job specifications
 - 2.6** Unplanned events are referred to relevant person/s in accordance with workplace procedures
 - 2.7** Installation is conducted efficiently, without waste of materials, damage to apparatus circuits or the surrounding environment applying sustainable energy practices

- 3 Test microwave antennae and waveguides and report**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Pre-commissioning adjustments are made to the installation and the system to optimise performance in accordance with system specifications
 - 3.3** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.4** Relevant person/s is notified of installation completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, connecting and adjusting any microwave antennae and waveguides must include at least the following:

- antennas
- rectangular sections
- curved sections
- T sections
- joints and couplers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH128A Install and test microwave antennae and waveguides.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0039 Install and test microwave antennae and waveguides

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- accurately installing and securing antenna, waveguide hardware and accessories
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- correctly terminating cable and conductors
- dealing effectively with unplanned events
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/components
- pre-commission adjusting for optimum performance
- reading and interpreting drawings of circuit arrangements and component locations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- antenna and wave guide principles and components
- electronic communications, microwave antennas and waveguide fundamentals
- installation techniques for microwave communication systems
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures
- setting up and testing techniques for microwave communication systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to installing microwave and antennae and waveguides
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0040 Install commercial video/audio system components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install commercial video/audio system components.

It includes preparing to install audio/video components and systems, installing audio/video system components, completing installation work and reporting.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to install audio/video system components

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4 Nature and location of the work is obtained from relevant person/s to determine the scope of work
- 1.5 Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.6 Materials required for work are determined in accordance with workplace procedures
- 1.7 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Install audio/video system components

- 2.1 Workplace risk control measures and procedures are applied
- 2.2 Circuits/equipment are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Audio/video components are installed in accordance with relevant industry standards and job specifications with sufficient excess to effect terminations
- 2.4 Accessories are installed straight and square in the required locations in accordance with relevant industry standards and job specifications
- 2.5 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and relevant industry standards
- 2.6 Unplanned events are reported to relevant person/s in accordance with workplace procedures
- 2.7 Installation is conducted efficiently without waste of materials, damage to apparatus, circuits or the surrounding environment applying sustainable energy

practices

3 Complete installation work and report

- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Relevant person/s is notified of installation completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing commercial video/audio system components must include at least the following:

- installing and connecting one commercial audio/video system components in one building or premise, examples include:
 - dedicated audio and video facilities in meeting rooms
 - video conferencing facilities
 - centrally controlled audio/video facilities

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH110A Install commercial video/audio system components.

Links

Companion Volume implementation guides are found in VETNet - - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEC0040 Install commercial video/audio system components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- accurately placing and securing components and accessories
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- connecting apparatus and associated components to comply with requirements
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- reading and interpreting drawings of system arrangements and component locations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commercial audio/video system installation, including:
 - audio reproduction electronic components:
 - graphic equalisers
 - power and integrated amplifiers
 - preamplifiers
 - audio reproduction
 - audio/video control equipment
 - audio/video recording and replay components basic faults and repairs
 - fundamentals of:
 - sound reproduction

- speakers
- loudspeakers and microphones
- professional audio electronics
- relevant industry standards, codes and regulations
- specialist audio/video cabling installation and termination
- video and display set-up
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective (PPE) equipment currently used in industry
- resources that reflect current industry practices in relation to installing commercial audio/video system components
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0041 Install fire detection and warning system apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install fire detection and warning system apparatus.

It includes installing electronic fire detection and warning systems in buildings and premises. It also includes working safely and to industry standards, following oral and written instructions and workplace procedures, and securely placing and connecting fire detection system and warning components.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to assemble fire

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and

- detection and warning apparatus**
- safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures are followed in preparation for work
- 1.3** Safety hazards that have not previously been identified are reported and advice on risk control measures sought from the work supervisor
- 1.4** Nature and location of the work is obtained from work supervisor or appropriate person/s to determine the scope of work to be undertaken
- 1.5** Advice is sought from work supervisor or other relevant person/s to ensure the work is coordinated effectively with others
- 1.6** Sources of materials required for work activities are determined in accordance with workplace procedures
- 1.7** Tools, equipment and testing devices needed to carry out work activities are obtained and checked for correct operation and safety
- 2 Assemble and set up fire detection and warning system**
- 2.1** WHS/OHS risk control measures for carrying out the work are followed
- 2.2** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Fire protection controller and detection and warning devices are located for optimum performance in accordance with customer requirements, industry standards and regulations
- 2.4** Accessories are installed straight and square in the required locations and within acceptable tolerances
- 2.5** Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
- 2.6** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 2.7** Fire protection installation is carried out efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Complete fire detection and warning system apparatus installation**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with established procedures
- 3.3** Fire protection system is documented in accordance with regulatory requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing fire detection and warning system apparatus must include at least the following:

- two fire alarms and warning systems, including:
 - one fire alarm system with at least one control and indicating panel, 50 input devices, five output devices and two system interface controls on at least one of the following:
 - analogue addressable system
 - addressable system
 - conventional system
 - one fire warning system with at least one control and indicating panel, 50 speakers, five interface communication devices and two warning indicators on at least one of the following:
 - analogue addressable system
 - addressable system

- conventional system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH161A Install fire detection and warning system apparatus.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0041 Install fire detection and warning system apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- apply sustainable energy principles and practices
- applying industry standards and codes of practice for fire protection systems and equipment
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using of risk control measures
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting installation
- maintaining fire integrity
- placing and securing devices and accessories accurately
- reading and interpreting relevant documents with apparatus/device locations and connection arrangements
- terminating cable and conductors correctly.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- common operation and interface connections to other systems
- common operation and types of field data gathering equipment
- common operational requirements and types of control and indicating equipment
- effective and ineffective locations for fire detection devices and common causes of false alarms
- fire protection and warning system installations regulations
- fire protection technologies, fire detection and warning systems, technical industry standards and regulations
- hazards associated with low voltage (LV), extra-low voltage (ELV) and high currents
- input devices, including conventional alarm zones, analogue or analogue addressable fire

- detectors, flow switch connections or switch connections
- interface communication devices, including warden in communication phones and remote public address (PA) inputs
- operating principles and characteristic of the various warning system components
- operating principles and characteristic of types of fire alarm detectors
- output devices, including shutdown signal, door or system release controls and solenoid valve controls
- purpose and interface requirements of smoke hazard management system
- purpose and operating principles of fire detection and warning systems
- purpose of fire alarm and warning systems
- relevant job safety assessments or risk mitigation processes, including:
 - relevant risk control measures used for dealing with the hazards related to fire protection systems
 - risks and control measures associated with fire protection equipment
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures, including:
 - interface procedures to isolate control functions between different fire protection building service systems
 - procedures for isolating/reinstating fire protection systems to inhibit back-to-base signals to monitoring station
 - procedures for isolating/reinstating fire protection systems to inhibit alarms operating fire protection suppression equipment
 - procedures for isolating/reinstating sections or parts of a fire protection system to inhibit alarms during building maintenance or system testing
 - relevant workplace procedures for isolating/reinstating and disconnection and reconnection of supplies in excess of ELV
- system interface controls, including communication signals to remote control and indicating equipment, building monitoring systems, paging system and colour graphics
- warning devices and their operating parameters
- warning indicators, including flashing lights for hearing impaired persons and fire brigade building indication.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace

operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to positioning and terminating fire detection and warning system apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0042 Install large security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install security systems.

It includes installing, entering instructions, inspecting and testing of electronic wired and wireless security systems with over 50 connected devices in buildings, premises and precincts. It also includes working safely and to industry standards, following job specifications, securely placing and connecting security system components, and documenting service installation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0003 Assemble and set up basic security systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install and set up wired and wireless security system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied

1.2 WHS/OHS risk control measures are followed in preparation for security system work

1.3 Safety hazards not previously identified are risk assessed, reported and advice on risk control measures sought from work supervisor

1.4 Nature and apparatus location of the security system work is determined from work supervisor or other appropriate person/s and drawings related to cable layouts and locations to establish the scope of work to be undertaken are identified

1.5 Advice is sought from the work supervisor or other appropriate person/s to ensure the security system work is coordinated effectively with others

1.6 Sources of materials required for the security system work are determined in accordance with workplace routines

1.7 Tools, equipment and testing devices needed to carry out the security system work are obtained and checked for correct operation and safety

2 Install wired and wireless security system

2.1 WHS/OHS risk control measures for carrying out security system work are followed

2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.3 Security controllers and devices are located for optimum performance within limitations imposed by customers,

industry standards and regulations

- | | |
|---|--|
| 2.4 | Accessories and devices are installed, straight and square, in the required locations and within acceptable tolerances |
| 2.5 | Cables and conductors are terminated at accessories and devices in accordance with manufacturer specifications, industry standards and regulatory requirements |
| 2.6 | Methods for dealing with unplanned situations are discussed with appropriate person/s and documented |
| 2.7 | Unplanned situations are dealt with in accordance with workplace procedures safely and with the approval of authorised person/s in a manner that minimises risk to personnel and equipment |
| 2.8 | Security installation is carried out efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices |
| 3 Set up wired and wireless security system and document work activity | 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed |
| | 3.2 Worksite is cleaned and made safe in accordance with workplace procedures |
| | 3.3 Security system installation is documented in accordance with regulatory requirement and workplace procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installation of security system must have

- two large wired and wireless security

controllers and include at least the following: systems with more than 50 connected devices of five different types

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH151A Install large security systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0042 Install large security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting installation
- maintaining fire integrity
- placing and securing devices and accessories accurately
- reading and interpreting drawings related to cable layouts and apparatus locations
- terminating cable and conductors correctly.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- advanced electronic security systems, including connection of input/output (I/O) devices to detectors and control panels
- biometric devices, including biometrics techniques and processes
- camera lens, including types of lenses and their characteristics
- closed-circuit television (CCTV) cameras, including types of cameras and sub-system components (functional blocks) and their operating parameters
- CCTV systems application, including sub-system components (functional blocks) and their function
- installation and mounting, including consideration in locating and mounting CCTV camera and auxiliary equipment
- monitors and recording devices, including types, analogue and digital recording devices and their application

- relevant biometrics security and privacy regulations and legislation
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant security devices
- relevant security industry standards
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- security systems
- security video monitoring and recording
- television principles, including sub-system components (functional blocks) and video signals.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to installing wired and wireless security systems with more than 50 connected devices in buildings, premises or precincts
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0043 Manage computer systems/electronics projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to manage computer systems/electronics projects.

It includes establishing project scope, managing computer systems/electronics projects, and completing and reporting on projects.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Establish the scope of the projects

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Project deliverables and objectives are determined from project planning, other relevant documentation and/or

discussions with appropriate person/s

- 1.3 Work breakdown structure (WBS) is developed to identify component parts of the project in accordance with workplace procedures
 - 1.4 Major milestones and deliverables are identified
 - 1.5 Resources needed to meet project outcome are determined
 - 1.6 Processes and procedures to manage the project scope are developed from discussions with relevant person/s and in accordance with project requirements
 - 1.7 Risks are identified and strategies developed to ensure project outcomes are achieved to the required quality standards specified in the project requirements
 - 1.8 Project plan is developed which meets project requirements and is in accordance with workplace standards and procedures
- 2 Manage computer systems/electronics projects**
- 2.1 WHS/OHS programs are implemented and monitored in accordance with workplace procedures
 - 2.2 Achievement of project outcomes is delegated to relevant person/s in accordance with project deliverables and objectives
 - 2.3 Risk events are monitored and project plan strategies implemented to ensure that outcomes are achieved to the required quality standards specified in the project requirements
 - 2.4 Procurement processes and procedures are monitored to ensure on-time supply of equipment and materials and in accordance with organisation policy
 - 2.5 Verification of the project technical design modification, installation and/or maintenance of system and equipment parameters is frequently made against specifications and workplace procedures
 - 2.6 Project progress is monitored against schedule, quality requirements and budget
 - 2.7 Conflict/s at worksite and/or between stakeholders, clients and regulators are identified and managed in

- accordance with workplace procedures
- 2.8** Variations are managed in accordance with agreed processes and project requirements
- 2.9** Project records are maintained and progress reports prepared and forwarded to all relevant person/s
- 3 Complete projects and document**
- 3.1** Project outcomes are reviewed against original plan, implemented risk strategies, project requirements, safety record and budget
- 3.2** Project completion acceptance is sought from relevant person/s and handed over in accordance with organisation policy and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Managing computer systems/electronics projects must include at least the following:

- one medium-sized electronics/computer systems project (recognised by a representative peer group of industry experts as medium sized), including:
 - design
 - modifications
 - installation and/or maintenance of systems and equipment
 - attributes that include management of:
 - safety
 - budget variation
 - personnel
 - resources
 - critical path timelines
 - completion documentation

WBS must include the following:

- identifying manageable components of a project, including their hierarchical structure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH141A Manage computer systems/electronics projects.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0043 Manage computer systems/electronics projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- accurately establishing the scope of the project
- coordinating work with relevant personnel
- dealing effectively with unplanned events
- developing project plans
- developing work breakdown structure (WBS)
- effectively managing resources and variations
- implementing relevant risk identification, assessment, reporting and control strategies
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- maintaining records and submitting progress reports
- managing time effectively
- meeting project outcomes
- resolving conflicts
- verifying the project technical design, modification, installation and/or maintenance of system and equipment parameters.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- computer systems/electronics project management, including:
 - concepts and practices of managing:
 - communication
 - contracts
 - customer/client relations
 - human and physical resources

- procurement
- quality
- risk
- electronic/computer systems industry sector customs and practices
- financial management:
 - costs, variations and estimations
 - project budgets
- performance assessment and continuous improvement
- principles of project planning and management:
 - defining project parameters
 - project phases and the relationship between phases
 - project scope
 - project stakeholders and clients
 - quality requirements and limitations
 - resource requirements and limitations
 - time requirements and limitations
- relevant industry standards, codes and regulations
- time management
- relevant manufacturer specifications
- job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- WBS.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE)

currently used in industry

- resources that reflect current industry practices in relation to managing electronic/computer systems projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0044 Modify - redesign electronics and communications systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to modify and redesign electronics and communications systems.

It includes modification and redesign of electronics and communications system to augment existing systems for clients. It also includes safe working practices, system parameter reconfiguration, analysis to assure optimum performance, following procedures, and documenting final modifications and settings.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to modify/redesign

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- electronics and communications system**
- for a given work area are obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures in preparation for work activity are followed
 - 1.3** Safety hazards that have not previously been identified are noted on job safety assessment, assessed and risk control measures implemented
 - 1.4** Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 1.5** System operating parameters are identified by reviewing system specifications and component technical data
 - 1.6** Limitations, use and operation of the electronics and communication system to be modified are determined from original specifications, manufacturer data and industry standards
 - 1.7** Extent of modification is determined from measurements, tests, inspections, system limitations and other relevant requirements
 - 1.8** Specifications and instructions for the modifications are documented in accordance with job requirements and workplace procedures
 - 1.9** Tools, equipment, applications and devices needed for the electronics work are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.10** Preparatory work is checked to ensure no unnecessary damage has occurred and complies with job requirements and specifications
- 2 Generate modification and redesign of electronics and communications system**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Alternative modification is considered and discussed with appropriate person/s
 - 2.3** Safety, functionality and economic considerations are incorporated in the proposed modification design

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Modifying/redesigning electronics and communications systems must include at least the following:

- two different and representative types of electronics and communications systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH168A Modify - redesign of electronics and communications systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0044 Modify - redesign electronics and communications systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative redesigns
- developing the modified/redesigned system within the safety and functional requirements and budget limitations
- documenting and presenting modifications/redesigns effectively
- successfully negotiating system alteration requests
- obtaining approval for final modified/redesigned system
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic and communications engineering design processes
- functional and non-functional requirements of a customer encompassing:
 - scope of the project
 - non-functional requirements, including:
 - economics (time and cost), including total life cycle costs
 - design
 - implementation (construction)
 - maintenance (operation)
 - decommissioning (recycling)
 - aesthetics (quality)
 - design objectives (specifications)

- specifications by defining the problem and producing a solution to satisfy the customer
- creation of the design plan through solution synthesis by selecting or creating the solution
- analysis
- optimisation of the proposed solution
- validations of the resulting design against the customer's needs
- implementation of the selected design
- project to be carried out in accordance with current WHS/OHS procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to modifying and redesigning electronics and communications systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0045 Modify digital signal processing (DSP) based sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to modify electronic digital signal processing (DSP) based sub-systems.

It includes following design brief, applying knowledge of digital and analogue devices, interpreting device specifications, constructing prototypes, testing developed sub-system prototype operation, and documenting design and development work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify DSP based system modification requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks are assessed,

and control measures and workplace procedures are implemented in preparation for work

- 1.3** Scope of proposed electronic DSP based sub-system is determined from design brief in consultation with relevant person/s
 - 1.4** Design development work is planned to meet scheduled timelines in consultation with persons/s involved on the worksite
 - 1.5** Materials and devices/components required to modify sub-system are determined on compatibility of design specifications with DSP based sub-system requirements and project budget constraints
- 2 Modify DSP based sub-system prototype**
- 2.1** WHS/OHS risk control measures and workplace procedures are followed
 - 2.2** Digital and analogue elements used in DSP based systems and industry compliance standards are applied to the sub-system design
 - 2.3** Alternative design modifications are considered based on the design brief
 - 2.4** Safety, functional and budget considerations are incorporated in the design
 - 2.5** Prototype devices and circuits are constructed, programmed and tested for compliance with the design brief and regulatory requirements
 - 2.6** Prototype faults are rectified and retested to ensure effective operation of design
 - 2.7** DSP based system modification is documented for submission to appropriate person/s for approval
 - 2.8** Solutions to unplanned situations are implemented in accordance with workplace policy
- 3 Obtain design approval for electronic DSP based sub-system modification**
- 3.1** DSP based sub-system modification is presented and explained to client representative and/or relevant person/s
 - 3.2** Alterations to the design are negotiated with relevant person/s within the constraints of workplace policy, as required

- 3.3 Final sub-system design is documented and approval obtained from appropriate person/s
- 3.4 Quality of work is monitored against performance agreement and/or workplace or relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH184A Modify digital signal processing (DSP) based sub-systems.

Links

Companion Volume implementation guides are found in VETNet - -
<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEC0045 Modify digital signal processing (DSP) based sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- constructing digital signal processing (DSP) based sub-system prototypes
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- obtaining design approval for final modification
- developing the DSP sub-system design modification within the safety and functional requirements and budget limitations
- documenting action/s justification to be implemented in accordance with relevant industry standards
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- planning to modify DSP based system
- reading and interpreting design brief.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- design brief specifications and work requirements
- digital and analogue devices
- digital processing steps in practical DSP applications
- DSP requirements
- DSP current industry practices and technologies, including:
 - currently available DSP support chips
 - relevant materials and devices/components

- DSP development technologies, including:
 - concept of complex signals
 - data-rate conversion
 - discrete Fourier transform (DFT) to a signal
 - DSP system
 - fast Fourier transform (FFT)
 - finite impulse response (FIR) filtering using FFT
 - high-order infinite impulse response (IIR) filter
 - IIR filter
 - modulation and de-modulation techniques
- prototype devices and circuit construction/build requirements
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant industry standards, regulations, codes of practice and WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in similar workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated similar workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to modifying DSP based systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0046 Operate and maintain amateur radio communication stations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to operate and maintain amateur radio communication stations.

It includes applying correct operating procedures, using safe working practices and testing techniques, dismantling and assembling apparatus, disconnecting and reconnecting components, and operating to the relevant industry standard.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to operate an amateur radio communication station

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for amateur radio activities
 - 1.3 Scope of operation of activity is identified in accordance with relevant industry standards
 - 1.4 Sources of materials required for the amateur radio activities are identified and utilised in accordance with manufacturer specifications and workplace procedures
 - 1.5 Interference with other services is recognised and maintained in accordance with operating practices and advice is sought from relevant person/s
 - 1.6 Resources, tools, apparatus and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 2 Operate an amateur radio communication station**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test and measure equipment is determined in accordance with WHS/OHS and workplace procedures
 - 2.3 Circuits/apparatus are checked and isolated in accordance with WHS/OHS and workplace procedures
 - 2.4 Radio communications operating practices are demonstrated in accordance with workplace procedures and applicable radio spectrum regulations
 - 2.5 Amateur radio communication station is operated in accordance with relevant industry standards
 - 2.6 Methods for dealing with unplanned situations are selected on the basis of safety discussions with relevant person/s and/or specified work outcomes
 - 2.7 Set-up is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Maintain an amateur radio communication station**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Dismantled modules/sub-assemblies are tagged for

reassembly and stored to protect them against loss or damage

- 3.3 Apparatus is dismantled and assembled in accordance with manufacturer guidelines
- 3.4 Repairs are conducted without damage to other components, apparatus or circuits in accordance with workplace procedures
- 3.5 Repairs are carried out efficiently without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3.6 Apparatus is assembled in an appropriate sequence with all modules/sub-assemblies and parts correctly placed, secured and connected in accordance with manufacturer guidelines and relevant industry standards
- 3.7 Repaired radio equipment is inspected, tested and returned to service to ensure operating parameters are in accordance with relevant industry standards and applicable radio spectrum regulations
- 3.8 Workplace procedures for referring unplanned events to relevant authorities are followed
- 3.9 Work and operating area is cleaned and made safe in accordance with workplace procedures

4 Identify and assemble amateur radio communication equipment

- 4.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 4.2 Items are identified for assembly
- 4.3 Item is assembled in accordance with workplace procedures and relevant engineering standards
- 4.4 Assembled unit is tested and operating parameters of the station are in accordance with workplace procedures, relevant industry standards and applicable radio spectrum regulations
- 4.5 Adjustments are made to equipment, as required, for optimise reception
- 4.6 Equipment is commissioned as constructed for on-air

performance

5 Complete work and maintain reports

- 5.1** WHS/OHS work completion risk control measures and procedures are followed
- 5.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 5.3** Adjustment settings are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEB101A Operate and maintain amateur radio communication stations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0046 Operate and maintain amateur radio communication stations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including risk control measures
- assembling apparatus in an appropriate sequence with all modules/sub-assemblies and parts correctly placed
- carrying out set-up efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- completing work and maintaining reports
- connecting and disconnecting components to radio equipment manufacturer requirements and appropriate engineering requirements
- correctly using an amateur radio in accordance with relevant industry standards and workplace procedures
- dealing with unplanned events in accordance with WHS/OHS and workplace procedures
- dismantling and assembling apparatus in accordance with manufacture guidelines
- following manufacturer service instructions for radio station assembly and dismantling, including transmitter, power, measurement and adjustment
- identifying and assembling amateur radio communication equipment
- maintaining an amateur radio communication station
- operating an amateur radio communication station
- preparing to operate an amateur radio communication station
- testing and measuring equipment
- testing and operating parameters of the station in accordance with workplace procedures and relevant industry standards
- using testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- amateur radio communication principles, operation and maintenance including:
 - amateur radio technical basics
 - interference and electromagnetic compatibility (EMC) overview
 - licence conditions
 - mathematics used for amateur radio operation
 - measurements
 - nature of amateur radio
 - operating practices and procedures overview
 - propagation overview
 - safety overview
 - transmission lines and antennas overview
 - transmitters and receivers
- problem-solving techniques
- relevant industry standards, including:
 - Standard Licence Operator's level as prescribed by the Australian Communication Media Authority (ACMA)
- relevant manufacturer specifications and operating instructions
- relevant radio spectrum regulations
- relevant resources, tools, apparatus and testing devices
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- relevant Australian and international standards for the assembly and operation of an amateur

radio station

- resources that reflect current industry practices in relation to assembling, dismantling and operating an amateur radio station, including the assembly of an antenna, power supply unit or an equivalent circuit
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0047 Plan large electronic projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan large electronic projects.

It includes developing and documenting electronics project proposals, milestones and completions. It also includes establishing budgets; applying critical path analysis; developing workflow strategies; and documenting, presenting and negotiating budgets and timelines.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify electronic project requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Techniques for electronic project planning are reviewed and adopted in accordance with workplace procedures

- 1.3 Extent of the electronic project is determined from design brief specifications and/or other relevant documentation and from discussions with appropriate person/s
 - 2 **Develop electronic project plan proposal**
 - 2.1 Plant, material, labour and relevant costs are sought and obtained from relevant person/s in accordance with workplace policies and procedures
 - 2.2 Project budget is determined from estimated plant, material, labour and other costs in accordance with workplace policies and procedures
 - 2.3 Critical path analysis is applied to developing workflow strategies
 - 2.4 Sources and availability of physical materials and human resources needed for the project are determined in accordance with workplace policies and procedures
 - 2.5 Risk management strategies are sought and applied in the project plan
 - 2.6 Project plan is reviewed in accordance with all inputs and adjusted to rectify any anomalies
 - 2.7 Project plan proposal is documented in accordance with workplace policies and procedures
 - 3 **Obtain approval for project plan**
 - 3.1 Project plan is presented and discussed with relevant person/s
 - 3.2 Alterations to project plan resulting from the presentation/discussion are negotiated with relevant person/s in accordance with constraints of workplace policies
 - 3.3 Final project plan is documented and approval obtained from appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Planning an industry-accepted medium-sized electronic project must include at least the following attributes:

- budgets and timelines
- critical path analysis
- documentation
- plan presentation
- workflow strategies development

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH160A Plan large electronic projects.

Assessment Requirements for UEEEC0047 Plan large electronic projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the project requirements accurately
- establishing a project budget
- developing effective workflow strategies
- documenting project plan proposal
- negotiating alterations to the proposed project plan successfully
- obtaining approval of the final plan
- dealing with unplanned events
- apply sustainable energy principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using of risk control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- large electronic project planning, including:
 - purpose of project planning
 - documents needed to plan a project
 - factors influencing sequence and restraints of project activities
- critical path analysis encompassing:
 - graphical representation methods
 - methods of representing time/rates
- customer/client relations, including:
 - purpose of critical path analysis
 - essential data
 - relational sequence of work activities

- graphical representation methods
- methods of representing time/rates
- monitoring methods
- electronic industry sector customs and practices, including:
 - technical aspects of project planning and management encompassing:
 - method of ensuring equipment meets specified performance requirements
 - performance/cost-benefit analysis
 - equipment procurement
 - typical approaches to planning and management
 - successful planning techniques
 - best practice management methods and styles
- WHS/OHS enterprise responsibilities, including:
 - provisions of relevant WHS/OHS legislation
 - principles and practice of effective WHS/OHS management
 - management arrangements relating to regulatory compliance
 - enterprise hazards and risks, control measures and relevant expertise required
 - characteristics and composition of workforce and their impact on WHS/OHS management
 - relevance of enterprise management systems to WHS/OHS management
 - analysis of working environment and design of appropriate WHS/OHS management systems
 - analysis of relevant data and evaluation of WHS/OHS system effectiveness
 - assess resources to establish and maintain WHS/OHS management systems
 - relevant risk mitigation processes
 - relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to planning electronic projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0048 Program and commission commercial access control security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to program and commission commercial access control security systems.

It includes programming and testing of security access control system typically used in commercial buildings and premises. It also includes working safely, following specifications, programming security functions, communicating access control system information to the end user/s and providing 'as-programmed' documents.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0003 Assemble and set up basic security systems

UEEEEC0027 Enter instructions and test wired and wireless security systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to program commercial access control security system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified obtained and understood

1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for commercial access control security system work

1.3 Safety hazards not previously identified are risk assessed, documented and risk control measures devised and implemented in consultation with appropriate person/s

1.4 Extent of programming and commissioning is determined from reports, documentation and from discussions with relevant person/s

1.5 Appropriate person/s is consulted to ensure commercial access control security system work is coordinated effectively with others involved on the worksite

1.6 Tools, equipment and testing devices needed to program and commission systems are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Program and commission commercial access control security system

2.1 WHS/OHS risk control measures and workplace procedures for carrying out commercial access control security system work are followed

2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace

safety procedures

- 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Security access control instructions and functions are entered into the system in accordance with design specifications
- 2.5 Security access control devices are checked for correct location and alignment
- 2.6 Security access controls are inspected and tested in accordance with commercial access control security system commissioning requirements
- 2.7 Sources of access control anomalies are identified and corrected
- 2.8 Unplanned situations are responded to in accordance with workplace procedures, discussions with appropriate person/s and job specifications and requirements in a manner that minimises risk to personnel and equipment
- 2.9 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
- 2.10 Programming and commissioning activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

3 Complete and report programming and commissioning activities

- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2 Worksite is made safe in accordance with workplace safety procedures
- 3.3 Access control system operating documentation and explanation of system features is communicated to appropriate person/s
- 3.4 'As-installed' security access control system is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Programming and commissioning must include at least the following:

- two different commercial security access control systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH155A Program and commission commercial access control security systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0048 Program and commission commercial access control security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- communicating access control system to appropriate person/s
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting 'as-installed' system correctly
- entering system functions using relevant information technology
- identifying and correcting function anomalies
- testing access control functions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- program loading methods, including relevant information technology
- program testing methods
- relevant job safety assessments or risk mitigation processes
- relevant security systems access control manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- security systems access control programming
- vender programming codes and functions, including:
 - input/output (I/O) instructions
 - variables
 - timers

- limitations of vendor software.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to programming and commissioning commercial security access control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0049 Program and commission commercial security closed-circuit television systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to program and commission commercial security closed-circuit television (CCTV) systems.

It includes programming and testing security CCTV systems typically used in commercial buildings and premises. It also includes working safely, following commercial security CCTV system specifications, programming security functions and schedules, and providing 'as-programmed' documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEEEEC0051 Program and commission commercial video/audio systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to program and commission commercial video/audio systems.

It includes preparing to commission commercial video/audio systems, commissioning commercial video/audio systems, and completing and reporting on commissioning activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

UEEEEC0040 Install commercial video/audio system components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to commission commercial video/audio systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for relevant work area are identified, obtained and applied

1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work

1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented

1.4 Extent of programming and commissioning is determined from reports, other relevant documentation and discussions with relevant person/s

1.5 Relevant person/s is consulted to ensure the work is coordinated effectively with others

1.6 Tools, equipment and testing devices required to program and commission video/audio systems are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Commission commercial video/audio systems

2.1 Workplace risk control measures and procedures are applied

2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures

2.3 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures

- 2.4 Audio/video devices are checked for correct location and alignment in accordance with workplace procedures and job specifications
 - 2.5 Functional settings are made for each audio/video apparatus in accordance with design specifications
 - 2.6 Audio/video system functions are tested in accordance with commissioning requirements
 - 2.7 Sources of audio/video system anomalies are identified and corrected
 - 2.8 Decisions for dealing with unexpected situations are made based on job specifications, work requirements and discussions with relevant person/s
 - 2.9 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.10 Commissioning activities are carried out efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report commissioning activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is made safe in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning commercial audio/video systems must include at least the following:

- two different commercial audio/video systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH137A Program and commission commercial video/audio systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0051 Program and commission commercial video/audio systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- setting apparatus functions
- testing system functions
- identifying and correcting function anomalies
- documenting 'as-installed' system correctly
- dealing with unplanned events
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- determining scope of work
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commercial video/audio programming and commissioning, safe working practices and relevant standards, codes and regulations, including:
 - purpose of commissioning
 - commissioning planning and documentation
 - initial tests and adjustments
 - commissioning procedures and documentation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation

processes

- relevant WHS/OHS legislated requirements
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to programming and commissioning commercial audio/video systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0052 Program and test large security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to program and test large security systems.

It includes programming functions and testing electronic security system with over 50 connected devices in buildings, premises and precincts. It also includes working safely, programming and adjusting security devices, system testing and following written and oral instructions and procedures.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0003 Assemble and set up basic security systems

UEEEEC0050 Program and commission commercial security systems

UEEEEC0048 Program and commission commercial access control security systems

UEEEEC0049 Program and commission commercial security closed-circuit television systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- workplace procedures
- 2.3 Security devices are checked for correct location and alignment
 - 2.4 Security function codes are entered into the electronic security system in accordance with manufacturer instructions
 - 2.5 Security system is inspected and tested in accordance with manufacturer instructions
 - 2.6 Security system operational defects are identified and corrected
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures and the approval of authorised person/s in a manner that minimises risk to personnel and equipment
 - 2.8 Security programming and testing is carried out efficiently without waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Complete and document security system programming and testing**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Security system is documented in accordance with regulatory requirement and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Security systems must have controllers and more than 50 connected devices of five different types and include at least the following:

- programming and testing of large wired and wireless security systems on two large security systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH153A Program and test large security systems.

Assessment Requirements for UEEEC0052 Program and test large security systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- entering system instructions
- testing system functions
- identifying and correcting operational malfunctions
- documenting 'as-installed' system correctly
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- security systems programming methods, including:
 - vender programming codes and functions encompassing:
 - input/output (I/O) instruction
 - variable
 - timers
 - limitations of vender software
 - program loading methods using a personal computer (PC)
 - program testing methods
 - relevant manufacturer specifications
 - relevant job safety assessments or risk mitigation processes
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation
 - relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to programming and testing large wired and wireless security systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0053 Provide engineering solutions to air traffic control system problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide engineering solutions to air traffic control (ATC) system problems in compliance with relevant regulatory requirements of the Civil Aviation Safety Authority (CASA) and national operating standards.

It includes determining and providing solutions to ATC system by interpreting diagrams, using effective problem-solving techniques and reporting work activities and outcomes.

Typical systems could be air traffic management (ATM), voice switching and control system (VSCS), data and communications networks, aeronautical fixed telecommunications network (AFTN), control maintenance monitoring (CMM), operational display suite (ODS), air situation display (ASD), tower situational awareness display (TSAD), aeronautical reference data display and distribution system (ARDDDS), backup to the above systems, buildings and services and navigational aids.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Determine solutions to ATC system

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given aviation work area are identified and applied
- 1.2 Aviation operational safety procedures for a given work area are obtained and applied
- 1.3 WHS/OHS risk control measures and workplace procedures are followed in preparation for aviation work activity
- 1.4 Extent of problems within the ATC system are determined from diagrams, performance specifications and situation reports, and in consultation with relevant person/s
- 1.5 Activities are planned to meet scheduled timelines in consultation with others involved in the work
- 1.6 Tools, equipment and testing devices needed are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Provide solutions to problems within ATC system

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 ATC system operation, characteristics and applications are applied to developing engineering solutions to aviation control problems
- 2.3 Parameters, specifications and performance requirements in relation to ATC system problems are obtained in accordance with workplace procedures
- 2.4 Approaches to resolving ATC system problems are evaluated to provide most effective solution/s
- 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.6 Problems are solved efficiently without waste of materials or damage to apparatus, the surrounding environment or aviation services using sustainable energy practices

3 Inspect, test and document solution to problems within ATC system

- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 3.2** Engineering solutions to ATC system problems are tested to determine their effectiveness and modified, as required
- 3.3** Adopted solutions are documented, including instructions for implementation, that incorporates risk control measures to be followed
- 3.4** Justification for solutions used to solve ATC system problems are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Providing solutions to ATC system problems must include at least four of the following:

- aeronautical fixed telecommunications network (AFTN)
- aeronautical reference data display and distribution system (ARDDDS)
- air situation display (ASD)
- air traffic management (ATM)
- control maintenance monitoring (CMM)
- data and communications networks
- operational display suite (ODS)
- tower situational awareness display (TSAD)
- voice switching and control system (VSCS)
- backup to the above systems
- buildings and services and navigational aids

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH190A Provide engineering solutions to air traffic control system problems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0053 Provide engineering solutions to air traffic control system problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the air traffic control (ATC) system problem
- obtaining air traffic control systems specifications and performance requirements appropriate to each problem
- testing and solutions to ATC system problems
- documenting justification of solutions implemented in accordance with established procedures
- dealing with unplanned events
- applying sustainable energy principles and practices
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- providing engineering solutions to ATC systems problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- ATC systems technology, including:
 - regulatory bodies encompassing:
 - structure and function of each of the regulatory bodies:
 - International Civil Aviation Organisation (ICAO)
 - Australian Transport Safety Bureau (ATSB)
 - Civil Aviation Safety Authority (CASA)
 - standards and recommended practices issued by the regulatory bodies
 - relationship between the regulatory bodies and a provider of air traffic services
 - air traffic services encompassing:

- services provided by air traffic services
- objectives of air traffic services
- ATC awareness encompassing:
 - process of maintaining an orderly flow of air traffic
 - different states of an aircraft flight
 - need and purpose of flight data regions
 - enroute airspace and sectors
 - airspace and sectors around ATC facilities
 - instructions and information exchanged between controllers and pilots
 - information exchanged between air traffic controllers
- the components of an ATC system encompassing:
 - air traffic management (ATM), voice switching and control system (VSCS), data and communications networks, aeronautical fixed telecommunications network (AFTN), control maintenance monitoring (CMM), and buildings and services
 - purpose and function of each of the components of an ATC system
- inputs to the ATM system encompassing:
 - messages and information received by the ATM system such as surveillance, time, metrological, flight plans and controller input
- ATM system architecture encompassing:
 - the various hardware configuration items (HWCI)
 - operating system and other layers of software installed on the ATM system
 - basic block diagram of the ATM system indicating the network topology, data processing sub-system and data presentation processing
 - requirement for redundancy and the master/slave relationship
 - the different partitions, connections and dependencies within the ATM system
 - functions that can be performed from the control maintenance and monitoring workstation
- outputs from the ATM system encompassing:
 - the operation display suites (ODS) and positions where they are used
 - block diagram of the display suites indicating peripherals and connections
 - different aircraft tracks generated by the ATM system
 - other information shown on an air situation display (ASD)
 - requirement for and use of the recording and playback facility
 - block diagram of the recording and playback facilities showing media devices and connections to the replay position
 - requirement for and use of the trace collection facility
 - block diagram of the trace collection facility showing media devices
 - data and information provided to other systems by the ATM system
- the fallback system for ATM encompassing:
 - purpose of the ultimate fallback (UFB) system
 - block diagram of UFB indicating peripherals and connections

- operating system and application software installed on the UFB computers
- information used by UFB
- how the information is presented to the air traffic controllers
- actions required by an air traffic controller to access UFB system
- VSCS encompassing:
 - purpose of the VSCS
 - top level block diagram of the VSCS
 - top level operation and protocols used by the VSCS
 - various VSCS interfaces and functionality they provide
 - basic operation of an air-to-ground communication facility
 - need for and basic operation of air-to-ground retransmission
 - requirement for and use of the audio recording and replay facility
 - block diagram of the audio recording and replay facilities showing the media access devices and connection to the VSCS
 - functionality provided by the system management system (SMS)
- fallback for the VSCS encompassing:
 - purpose and functionality provided by the air ground air (AGA) bypass facility
 - purpose and functionality provided by the ground ground (GG) bypass facility
 - block diagram of the VSCS and AGA bypass connections
 - block diagram of the VSCS and GG bypass connections
 - how an air traffic controller would access the AGA or GG bypass facility if required
- data and communication networks encompassing:
 - purpose and primary use of the networks used by the ATC system
 - systems and end users of each of the networks
 - block diagram to show the high-level architecture of each of the networks
 - function of the networking devices used by the networks
 - technologies and protocols used by the networks
- AFTN encompassing:
 - function of the AFTN
 - structure and type of message carried by the traditional AFTN
 - type of messages that can be distributed by more contemporary message systems
 - services provided by contemporary message systems
 - basic block diagram of a contemporary message system
- buildings and services encompassing:
 - building layout and format of an ATC centre
 - building layout and format of an ATC tower
 - services required to support an ATC centre
 - block diagram of the ATC centre electrical power system, including main power, standby generator, uninterrupted power supply (UPS), batteries and switching equipment

- block diagram of the ATC centre air conditioning system, including the major components and the primary and secondary loops
- basic flow chart to show the interaction between the fire system and other services in the ATC centre
- physical security requirements of an ATC centre
- components and operation of the security system used in an ATC centre
- tower situational awareness display (TSAD) encompassing:
 - need for and functionality provided by the TSAD system
 - block diagram of a TSAD installation
 - the source of and the information used by the TSAD system
 - operating system and application software installed on the TSAD computers
- aeronautical reference data display and distribution system (ARDDDS) encompassing:
 - functionality provided by ARDDDS
 - block diagram of an ARDDDS installation
 - information used by the ARDDDS
 - operating system and application software installed on the ARDDDS computers
- navigational aids encompassing:
 - purpose and functionality provided the navigational aids
 - location of navigational aids
 - basic principle of operation of the navigational aids
- relevant air control system manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant workplace documentation
- relevant CASA national operating standards, and workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE)

currently used in industry

- resources that reflect current industry practices in relation to providing solutions to ATC systems problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0054 Provide gate array solutions for complex electronics systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design and develop electronic systems using gate array technology.

It includes working safely, following gate array design brief and interpreting device specifications, using appropriate development software, testing operation and verifying compliance of the of the design against the final brief, and documenting design and development work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design gate array system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

- 1.2 Operational safety procedures for a given work area are obtained and understood
 - 1.3 Extent of the proposed gate array system design and circuit development is determined from design brief or in consultation with appropriate person/s
 - 1.4 Design and circuit development work is planned to meet scheduled timelines in consultation with others involved
 - 1.5 Materials and devices/components required for the design work are selected on compatibility of their specifications with system requirements and project budget constraints
 - 1.6 Tools, equipment, software and testing devices needed to carry out the work are obtained and checked for correct operation and safety
- 2 Design and develop circuit gate array system**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the design work are followed
 - 2.2 Gate array system and industry compliance standards are applied to the design
 - 2.3 Alternative arrangements for the design and circuit development are considered in accordance with the requirements outlined in the design brief
 - 2.4 Safety, functional and budget considerations are incorporated in the design
 - 2.5 Circuit device and circuits are constructed and tested for compliance with the design brief and regulatory requirements
 - 2.6 Circuit malfunctions are rectified and retested to ensure effective operation with the design
 - 2.7 Gate array system design and development is documented for submission to appropriate person/s for approval
 - 2.8 Solutions to unplanned situations are provided in accordance with workplace policies
- 3 Obtain approval for design and circuit**
- 3.1 Gate array system design is presented and explained to client representative and/or relevant person/s

development of gate array system and documentation

- 3.2 Requests for design modifications are negotiated with relevant person/s within the constraints of workplace policies
- 3.3 Final design and circuit development are documented and approval obtained from appropriate person/s
- 3.4 Quality of work is monitored against design brief, performance agreement and/or workplace procedures or industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing and developing a gate array system must include at least the following:

- three input/output (I/O) devices or functions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH189A Provide Gate Array solutions for complex electronics systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0054 Provide gate array solutions for complex electronics systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- constructing, inspecting and testing circuit gate array device and circuits in accordance with design brief and regulatory requirements
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- designing gate array system in accordance with workplace procedures
- developing outlines of alternative designs and comparing advantages and disadvantages on each
- developing the gate array design within the safety and functional requirements and budget limitations
- documenting and presenting design effectively
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- negotiating design alteration requests and obtaining approval for final gate array design system
- verifying compliance of the design against the final brief.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- gate array fundamentals
- hardware design language
- programmable logic device (PLD), including:
 - types of PLDs
 - features of complex programmable logic device (CPLD) devices
 - features of field programmable gate array (FPGA) devices
 - input/output (I/O) logic family assignment for FPGA

- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to designing and developing gate array systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEECD0046 Solve problems in single path circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to repair computer equipment

2 Repair computer equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work area are identified and applied in accordance with workplace procedures
- 1.2** WHS/OHS risk control measures and workplace procedures are followed
- 1.3** Nature of the repair is obtained from documentation or supervisor to determine the scope of work to be undertaken
- 1.4** Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5** Sources of materials required for work are determined in accordance with workplace procedures
- 1.6** Tools, apparatus and testing devices needed to carry out work are obtained and checked for correct operation in accordance with workplace procedures and safe work practices
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out computer repair work are followed
- 2.2** Need to inspect, test and measure live electrical work is determined in accordance with WHS/OHS requirements, safe work practices and workplace procedures
- 2.3** Circuits/apparatus are checked and isolated in accordance with WHS/OHS requirements and

workplace procedures

- 2.4 Apparatus is dismantled in accordance with manufacturer guidelines and supervisor's instructions
 - 2.5 Modules/sub-assemblies are tagged during the dismantling for correct and efficient reassembly and stored to protect components against loss or damage
 - 2.6 Repairs are undertaken without damage to other components, apparatus or circuits
 - 2.7 Apparatus is assembled in an appropriate sequence with all modules/sub-assemblies and parts correctly placed, secured and connected in accordance with manufacturer guidelines and industry standards
 - 2.8 Unplanned events are referred to supervisor for directions in accordance with workplace procedures
 - 2.9 Repairs are carried out efficiently without waste of materials, damage to apparatus or environment using sustainable energy practices
- 3 Complete and report repair work activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Computer equipment is inspected, prepared and forwarded to appropriate person/s for testing
 - 3.3 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.4 Work supervisor is notified of the completion of the repair work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Carrying out repairs to computers and servers must include the following:

- replacement of at least three slot/plug connected modules/sub-assemblies having different functions and in which the fault has been previously established

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH101A Repair basic computer equipment faults by replacement of modules/sub-assemblies.

Assessment Requirements for UEEEC0055 Repair basic computer equipment faults by replacement of modules/sub-assemblies

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least three separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- communicating effectively
- completing report repair work activities
- connecting computer to a network
- dealing with unplanned events in accordance with problem-solving techniques and workplace procedures
- following computer repair procedures, including control measures for static electricity
- preparing and repairing computer equipment, including:
 - detecting faulty components
 - reassembling the computer equipment correctly
 - repairing computers without damage to other equipment, environment and services
 - replacing modules/sub-assemblies to manufacturer guidelines
 - testing computer equipment operation, including repaired faulty components
 - using components, apparatus or circuits
- reading and interpreting system specifications and workplace procedures
- using operating system tools to configure a peripheral.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- personal computers structure and components and their function, including motherboards, memory modules, video modules, connecting buses, storage devices and the like
- personal computers assembling and dismantling techniques
- personal computers hardware faults

- basic network hardware and components
- connection of network media
- set-up of standard network configuration, including:
 - cable anchoring and support methods
 - termination methods
- basic repairs to computer equipment by replacing modules/sub-assemblies
- basic set-up of network configuration including hardware and components
- problem-solving techniques
- relevant computer structure and components repairs, including:
 - computer assembly and dismantle techniques
 - computer system inspection and testing techniques
 - static electricity control measures
 - three slot/plug connected modules/sub-assemblies, including:
 - modules, including self-contained hardware components, such as motherboards, memory cards, video modules, connecting buses and storage devices
 - sub-assemblies, including collections of integrated components that may form part of a module that are designed to be replaceable for servicing, such as the component part of a hard drive module or motherboard
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instruction for tools, equipment, components, apparatus and circuits
- relevant testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions, including repair and quality workplace procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEEC0056 Repair predictable faults in audio components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair predictable faults in audio components.

It includes preparing to repair audio components, finding and repairing faults, and completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0028 Fault find and repair complex power supplies

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to repair audio components

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Nature of the fault is obtained from documentation or from relevant person/s to determine scope of work
- 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5** Materials required for work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Apparatus is checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding is approached methodically applying principles of audio components and circuits using measured and calculated values of apparatus parameters and/or with reference to manufacturer service manuals
- 2.5** Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6** Faulty components are rechecked and their fault status confirmed
- 2.7** Repairs are made in accordance with manufacturer instructions and approval of relevant person/s

- 2.8** Apparatus is reassembled and tested for safety and functionality in preparation for return to the customer
- 2.9** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.10** Repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification is provided in the required format for repairs to apparatus
- 3.4** Reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Repairing faults in audio components must include at least the following:

- two different audio components each with any two predictable faults

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH124A Repair predictable faults in audio components.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0056 Repair predictable faults in audio components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- efficiently finding faults
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- audio component functional controls
- audio component repair basics
- audio reproduction and electronic components
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements

- relevant workplace documentation
- relevant workplace policies and procedures
- technical manuals and catalogues.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to carrying out repairs of predictable faults in audio components
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0057 Repair predictable faults in general electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair predictable faults in general electronic apparatus.

It includes preparing to repair electronic apparatus, finding and repairing faults, and completing and reporting on repair activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0028 Fault find and repair complex power supplies

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to repair electronic apparatus

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Nature of the fault is obtained from documentation or relevant person/s to determine scope of work
- 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5** Materials required for the work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Apparatus is checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding is undertaken methodically applying electronic apparatus and circuit principles using measured and calculated values of apparatus parameters in accordance with manufacturer instructions, including block and schematic diagrams
- 2.5** Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6** Faulty components are rechecked and their fault status confirmed
- 2.7** Repairs are undertaken in accordance with manufacturer instructions and instructions from relevant person/s
- 2.8** Apparatus is reassembled and tested for safety and

functionality in preparation for return to the customer

- 2.9** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.10** Repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair activities**
- 3.1** Workplace risk control measures and procedures are applied
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification is provided for repairs to apparatus in the required format
- 3.4** Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Carrying out repairs of predictable faults must include at least the following:
- two different general electronic apparatus for a given representative range, examples of which include:
 - data capture devices
 - security panels
 - fire protection panels
 - industrial control apparatus
 - instrumentation electronics

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH107A Repair predictable faults in general electronic apparatus.

Assessment Requirements for UEEEC0057 Repair predictable faults in general electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- finding faults efficiently
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- carrying out repairs of predictable faults in general electronic apparatus, including:
 - general electronic apparatus fault finding and repair:
 - block and schematic diagram sub-system components (i.e. functional blocks) and their operating parameters
 - common faults, their symptoms and cause
 - fault location procedures and testing points
 - component repair/replacement

- device adjustments
- technical manuals and catalogues:
 - how to read and apply information
 - typical format
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant industry standards, codes and regulations
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to carrying out repairs of predictable faults in general electronic apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0058 Repair predictable faults in television receivers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair predictable faults in television receivers.

It includes preparing to repair televisions, finding and repairing faults, completing and reporting on repair activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0075 Troubleshoot single phase input d.c power supplies

UEEEEC0069 Troubleshoot digital sub-systems

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

UEEEEC0028 Fault find and repair complex power supplies

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to repair televisions

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Nature of the fault is obtained from documentation or from relevant person/s to determine scope of work
- 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5** Materials required for the work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1** Workplace risk control measures and workplace procedures are applied
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Apparatus is checked and isolated as required in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding is undertaken methodically applying principles of televisions and circuits using measured and calculated values of apparatus parameters in accordance with manufacturer instructions and workplace procedures
- 2.5** Apparatus components are dismantled, where necessary, and parts stored to protect against loss or damage
- 2.6** Faulty components are rechecked and their fault status confirmed
- 2.7** Repairs are undertaken in accordance with manufacturer instructions and relevant person/s instructions

- 2.8** Apparatus is reassembled and tested for safety and functionality in preparation for return to the customer
- 2.9** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.10** Repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification is provided for repairs to apparatus in the required format
- 3.4** Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Repairing faults in television receivers must include at least the following:

- two predictable faults in cathode ray tube (CRT) television receivers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH119A Repair predictable faults in television receivers.

Assessment Requirements for UEEEC0058 Repair predictable faults in television receivers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- efficiently finding faults
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the repairs
- replacing components without damage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- technical manuals and catalogues

- television chrominance and luminance
- television fundamentals
- television receiver repair basics
- television scanning and deflection.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to carrying out repairs of predictable faults in television receivers
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0059 Repair routine business equipment faults

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair routine business equipment faults. It includes preparing to repair business equipment, repairing business equipment, and completing and reporting on repair work activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to repair business equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied

- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3 Nature of the repair is obtained from documentation or from relevant person/s to determine the scope of work
 - 1.4 Instructions for coordinating work with others is obtained from relevant person/s and applied
 - 1.5 Materials required for the work are determined in accordance with workplace procedures
 - 1.6 Tools, apparatus and testing devices required for work are obtained and checked for correct operation and safety
- 2 Repair business equipment**
- 2.1 Workplace risk control measures and procedures are applied
 - 2.2 The need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/equipment are isolated, where necessary, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Predictable faults are confirmed in accordance with testing procedures
 - 2.5 Apparatus is dismantled in accordance with manufacturer service guides and instructions from relevant person/s
 - 2.6 Component parts are tagged and stored during dismantling to protect against damage and loss and to ensure correct and efficient reassembly
 - 2.7 Repairs are made in accordance with manufacturer service guides and instructions from relevant person/s
 - 2.8 Apparatus is assembled in correct sequence with all components parts placed, secured and connected in accordance with manufacturer guides or industry practice
 - 2.9 Repaired equipment is tested in accordance with workplace procedures to verify it functions correctly

- 2.10** Unplanned events are reported to relevant person/s in accordance with workplace procedures
- 2.11** Repairs are conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete and report repair work activities**
- 3.1** Workplace risk control measures and workplace procedures are applied
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures
- 3.3** Equipment is placed into service and relevant person/s notified of repair work completion in accordance with workplace procedures
- 3.4** Relevant reporting is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Carrying out routine repairs to business equipment must include at least the following:

- confirming at least two predictable faults in low volume (up to 40 ppm) different types of equipment
- following routine procedures to repair faults

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH103A Repair routine business equipment faults.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0059 Repair routine business equipment faults

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- accurately completing service reporting
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- carrying out routine repairs to business equipment
- coordinating work with relevant person/s
- correctly dismantling and reassembling business equipment
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- determining scope of repair work
- following service instructions to access components
- following service instructions to confirm reported fault
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system
- removing and replacing electrical/electronic components
- removing and replacing mechanical components
- testing equipment operation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- component replacement and repair
- electromechanics of business machines
- electronic cable and conductor terminations
- fault finding tables, charts and procedures

- operational concepts of business machines
- relevant business equipment software
- relevant testing procedures
- relevant manufacturer specifications and service guides
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- workplace communication methods.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to carrying out routine repairs to business equipment.
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to replace electronic components, cabling and sub-systems of electronic apparatus.

It includes safe working practices, testing, dismantling and assembling apparatus, using equipment and tools correctly (including soldering equipment) and disconnecting and reconnecting components to repair electronic apparatus faults.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to repair electronic apparatus

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

- 1.2 Hazards are identified, risks are assessed and control measures and workplace procedures are implemented
 - 1.3 Nature of the repair is obtained from relevant documentation or work supervisor to determine the scope of work to be undertaken
 - 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
 - 1.5 Materials required for work are obtained in accordance with workplace procedures
 - 1.6 Tools, apparatus, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Repair electronic apparatus**
- 2.1 WHS/OHS risk control measures and workplace procedures are followed
 - 2.2 Need to inspect, test or measure live work is determined and conducted in accordance with WHS/OHS workplace procedures and regulatory requirements
 - 2.3 Circuits/apparatus are checked as being isolated as required in accordance with WHS/OHS workplace procedures and regulatory requirements
 - 2.4 Apparatus is dismantled in accordance with manufacturer specifications and supervisor instructions
 - 2.5 Apparatus component parts are correctly tagged during dismantling to ensure correct and efficient reassembly and stored to protect against loss or damage in accordance with workplace procedures
 - 2.6 Repairs are conducted using the correct tools/soldering equipment and without damage to other components, sub-systems, apparatus or circuits in accordance with workplace procedures, industry standards and regulatory requirements
 - 2.7 Apparatus is re-assembled in correct sequence, with all components and parts replaced, secured and connected in accordance with manufacturer specifications, industry standards and workplace procedures
 - 2.8 Unplanned events are referred to supervisor for

directions in accordance with workplace procedures

2.9 Apparatus repairs are completed without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

3 Complete and report repair work activities

3.1 WHS/OHS work completion risk control measures and workplace procedures are followed

3.2 Repaired apparatus is inspected, prepared in accordance with workplace procedures and forwarded to relevant person/s for testing

3.3 Work area is cleaned and made safe in accordance with workplace procedures

3.4 Work supervisor is notified of the completion of the repair work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Repairing basic electronic apparatus faults must be demonstrated in relation to:

- carrying out repair on electronic apparatus, limited to replacement or repair of components, including sub-systems in which the fault has been previously established
- a cable to be correctly terminated using a solderless termination technique
- soldering and de-soldering

Repairs must include at least two of the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH102A Repairs basic electronic apparatus faults by replacement of components.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0060 Repairs basic electronic apparatus faults by replacement of components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - using risk control measures
 - checking tools, equipment and testing devices for correct operation and safety
 - checking circuits/apparatus are isolated
- carry out basic repairs to electronic apparatus, including:
 - following work instructions and manufacturer instructions for access to components
 - removing at least three different types of components specified in the work instructions
 - replacing components to manufacturer specifications
 - terminating electronic cables using solderless termination techniques
 - de-soldering and soldering without damage to components
 - reassembling the apparatus correctly
 - dealing with unplanned events in accordance with workplace procedures
- communicating effectively with others
- completing and reporting repair work activities
- complying with relevant electrical regulations and industry standards
- consulting work supervisor as required
- maintaining a clean worksite and equipment
- reading, interpreting and completing workplace documentation
- reassembling the apparatus correctly
- correctly tagging, inspecting and storing components during dismantling.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of

the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic soldering equipment and techniques, including:
 - workshop hazards and safety associated with soldering
 - quality concepts
 - electronic soldering equipment
 - the soldering process
 - lead-free solder
- printed circuit board soldering techniques, including:
 - electronic component mounting
 - solder rework of printed circuit boards
 - faulty solder joints
- soldering electronic cables, including:
 - effects and prevention of electrostatic discharge (ESD)
- electronic component basics, including:
 - types of components
 - the physical features and primary characteristic of components
 - marking and codes on components
 - handling static sensitive components
- electronic cable overview and coaxial cable, including:
 - coaxial cables types and characteristics
 - coaxial cable termination
- performance copper cables, including:
 - twisted pair voice and data cables
 - insulation displacement connector
 - colour codes
 - terminating performance cables
- electronic apparatus components, including:
 - fault finding
 - testing
 - replacement
- relevant electronic cables, electronic apparatus and components, including:
 - fault-finding techniques
 - safe storage of dismantled components and parts
 - techniques to dismantle and re-assemble
 - techniques to safely and correctly identify, replace and repair
 - techniques to tag components during dismantling process
- relevant electrical regulations, industry standards and codes of practice
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements

- relevant work instructions
- relevant workplace documentation
- relevant workplace policies and procedures
- risk mitigation processes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0061 Set up and adjust commercial radio frequency (RF) transmission and reception systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and adjust commercial radio frequency (RF) transmission and reception systems for optimum performance. It includes preparing for, setting up and adjusting commercial RF transmission and reception systems, signal testing and analysis, and completing reports on set-up and adjustment activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0063 Solve fundamental electronic communications system problems

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

AND

UEECD0043 Solve problems in direct current circuits

OR

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to set up and adjust commercial RF transmission and reception systems

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4** Relevant person/s is consulted to ensure the work is coordinated effectively with others
- 1.5** Measurement parameters are identified by reviewing transmission/reception requirements and manufacturer instructions
- 1.6** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7** Preparatory work is checked to ensure no damage has occurred in accordance with workplace procedures and relevant industry standards
- 1.8** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 1.9** Circuits are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures

2 Set up and adjust commercial RF transmission and reception systems

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Testing/measuring devices are connected and set up in accordance with requirements for relevant control system

- 2.3 Measuring instruments are set up and adjusted in accordance with transmission/reception requirements and manufacturer instructions
 - 2.4 Measurement results are analysed to determine the type and nature of adjustments required in accordance with relevant industry standards and job specifications
 - 2.5 Adjustments are made to provide optimum transmission/reception performance in accordance with relevant industry standards
 - 2.6 Decisions for dealing with unexpected situations are made from discussions with relevant person/s in accordance with relevant industry standards and job specifications
 - 2.7 Methods for dealing with unexpected situations are selected on the basis of safety, specified outcomes and workplace procedures
 - 2.8 Setting-up is conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy principles
- 3 Complete and report set-up and adjustment activities**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Adjustment settings are recorded and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package

Companion Volume Implementation Guide.

Setting-up and adjusting commercial radio frequency (RF) transmission and reception systems must include at least the following

- two different types of commercial radio RF transmission and reception systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH127A Set up and adjust commercial radio frequency (RF) transmission and reception systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0061 Set up and adjust commercial radio frequency (RF) transmission and reception systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- demonstrating signal testing and signal analysis
- demonstrating the making of relevant adjustments
- determining live testing/measurement requirements
- identifying and accessing materials, tools, apparatus and testing devices
- identifying measurement parameters
- isolating circuits/machines/systems
- recording adjustment settings in accordance with workplace procedures
- selecting and terminating correct connectors to coaxial cable
- selecting and using appropriate test equipment to make measurements
- setting up and adjusting in accordance with transmission/reception requirements and manufacturer instructions
- using measurement results to inform system adjustments.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- advanced electronic radio frequency (RF) testing and measuring devices and techniques
- antenna fundamentals, including selection and location of receiving and transmitting antennas, and test techniques

- antenna system measurements, including standing wave ratio (SWR), return loss and reflection coefficient
- antenna types, features and characteristics, including reciprocity, impedance matching, polarisation, gain, directivity and bandwidth
- calculation of path loss and received power
- electronic communications fundamentals
- fundamentals of cavity filters, ferrite isolators and their application to multiple-transmitter or multiple-receiver systems
- fundamentals of half-wave dipole and quarter-wave ground plane antennas
- impedance calculations, including the use of Smith charts
- impedance matching techniques, including the use of resonant lines, including $\frac{1}{4}$ wave stubs
- notion of decibel ratio (dB), including relative measurements (dBr), dB referenced to power (dBm) and voltage (dBuV) measurements
- radio wave propagation characteristics and modes of propagation in free space, including multiple-path effects
- relevant industry standards, codes and regulations
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- RF connector fundamentals and common types
- RF measurement techniques, including time and frequency domain measurements
- transmission line fundamentals, including characteristic impedance (Z_0) line velocity, impedance matching, loss characteristics, line and waveguide types and line test/measurement techniques.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE)

currently used in industry

- resources that reflect current industry practices in relation to commissioning commercial RF transmission and reception systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0062 Set up and test residential video/audio equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and test residential video/audio equipment.

It includes preparing to set up audio/video equipment, setting up audio/video equipment, completing system set-up and reporting.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to set up audio/video equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures and are applied in accordance with workplace procedures prior to commencing work

- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
 - 1.4 System details are obtained from purchase documentation or relevant person/s to determine scope of work
 - 1.5 Instructions for coordinating work with others is obtained from relevant person/s and applied
 - 1.6 Materials required for work are obtained and checked in accordance with workplace procedures
 - 1.7 Tools and testing devices required for work are obtained and checked for correct operation and safety
- 2 Set up audio/video equipment**
- 2.1 Workplace risk control measures and workplace procedures are applied
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/components are isolated, where necessary, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 System components are unpacked, checked for damage and meet requirements for scope of work
 - 2.5 System components are placed for optimum performance within constraints imposed by the area and customer
 - 2.6 Systems components are connected in accordance with manufacturer instructions
 - 2.7 System functions are set to customer's requirements and tested for correct operation
 - 2.8 Unplanned events are reported to relevant person/s in accordance with workplace procedures
 - 2.9 System set-up is conducted efficiently without waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete system set-up**
- 3.1 Workplace risk control measures and workplace

and report

procedures are applied

- 3.2 Work area is cleaned and made safe in accordance with workplace routines
- 3.3 System/component documentation is handed over to the customer
- 3.4 Relevant person/s is notified of work completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and testing residential audio/video equipment must include at least the following:

- an audio system consisting of at least two speakers, with two different audio sources and a preamplifier/power amplifier; or an integrated amplifier/tuner/player
- an audio/video system consisting of television receiver, 5-channel amplifier, five speakers and an audio/video player

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH104A Set up and test residential video/audio equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0062 Set up and test residential video/audio equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- completing relevant documentation and handing over to the customer
- connecting components in accordance with manufacturer instructions
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system
- placing components for optimum performance within constraints imposed by the area and customer
- setting functional controls in accordance with customer's requirements
- testing functional operation
- unpacking and checking system components against purchase documents and manufacturer content list.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures
- residential video/audio equipment, including:
 - audio and video component functional controls
 - audio and video component set-up
 - audio and video component testing
 - cable and conductor types, characteristics and installation
 - component connection options and arrangements
 - electronic cable and conductor termination methods
 - electronic safe working practices
 - types of audio and video components.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to setting up and testing residential audio/video equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0063 Solve fundamental electronic communications system problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve fundamental electronic communications system problems.

It includes ascertaining correct operation of communications system and solving fundamental system problems as met in engineering support work functions. It also includes working safely, applying problem-solving techniques, using a range of measuring devices, and providing solutions derived from measurements to predictable problems in an electronic communications system.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to solve fundamental problems in electronic communications system**
 - 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
 - 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for electronic communications system work
 - 1.3 Safety hazards not previously identified are risk assessed, noted on job safety assessments and established risk control measures implemented
 - 1.4 Nature of the communications system problem is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
 - 1.5 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
 - 1.6 Tools, testing devices and materials needed to carry out the electronic work are obtained and checked for correct operation and safety
- 2 Solve fundamental problems in electronic communications system**
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the electronic work are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fundamental of communication system characteristics, components and transmission media is applied to resolving system problem/s
 - 2.5 Logical approaches are used to solve system problems from measured and calculated values as they apply to communication system configuration
 - 2.6 Unplanned situations are dealt with safely and with the approval of authorised person/s in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 2.7** Electronic problems are resolved without unnecessary damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete electronic work and document problem-solving activities**
- 3.1** WHS/OHS risk control work completion measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Reports are written outlining electronic system problem and justifying solutions used

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH146A Solve fundamental electronic communications system problems.

Links

Assessment Requirements for UEEEC0063 Solve fundamental electronic communications system problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying fundamental knowledge of communication system characteristics, components and transmission media to resolving system problems
- applying measured values in verifying system operation and determining any corrective actions required
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- providing written justification for solutions used
- solving predictable system problems
- using logical and methodical approaches to solving system problems
- using test equipment to measure communication system parameters and modulated signal characteristics.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- analogue and digital modulation applications
- communications system principles
- notion and application of the decibel ratio (dB)
- optical communications system elements and transmission media characteristics
- principles of amplitude based (AM), frequency based (FM) and phase based (PM) modulation
- radio spectrum fundamentals, including signal and noise considerations
- radio frequency (RF) communications system elements and basic antenna principles
- relevant manufacturer specifications

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedure
- safety considerations for optical and RF communications systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to solving fundamental problems in electronic communications systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0064 Solve oscillator problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve oscillator problems.

It includes preparing to work on oscillator sections, solving oscillator section problems, completing work and reporting problem-solving activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0067 Troubleshoot basic amplifier circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on oscillator sections

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied

- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
 - 1.3 Nature of oscillator problems is obtained from documentation or relevant person/s to determine the scope of work
 - 1.4 Instructions for coordinating work with others are obtained from relevant person/s and applied
 - 1.5 Materials required for work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety
- 2 Solve oscillator section problems**
- 2.1 Workplace risk control measures and procedures are applied
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Appropriate methods are used to solve problems from measured and calculated values as they apply to oscillator sections in an electronic apparatus
 - 2.5 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.6 Problems are solved without unnecessary damage to apparatus circuits, the surrounding environment or services applying sustainable energy practices
- 3 Complete work and report problem-solving activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to solve circuit problems is reported in accordance with workplace procedures and job specifications

- 3.4** Work completion reporting is completed and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving oscillator problems must include at least the following:

- three problems in typical oscillator sections of electronic apparatus

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH142A Solve oscillator problems.

Assessment Requirements for UEEEC0064 Solve oscillator problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- coordinating work with relevant person/s
- correctly and accurately calculating parameters
- correctly and accurately taking measurements
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/systems
- providing justification for the solutions to problems
- providing solution to oscillator component/circuit problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- oscillator problem solving, including:
 - relevant industry standards, codes and regulations
 - requirements for oscillation
 - Wien bridge oscillators
 - phase shift oscillators
 - Colpitts oscillators and Hartley oscillators
 - crystal oscillators

- astable oscillators
- 555 timer circuit and applications
- voltage-controlled oscillator (VCO) circuits
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to troubleshooting oscillators
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0065 Solve problems in basic electronic circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve electronic circuit problems.

It includes determining correct operation of single source parallel and series-parallel circuits and providing electronic solutions. It also includes working safely; applying problem-solving procedures, including the use of voltage, current and resistance measuring devices; and providing solutions derived from measurements and calculations to predictable problems in multiple path circuits.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to work on electronic circuits

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed
- 1.3 Nature of the circuit/s problem is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
- 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with relevant person/s
- 1.5 Sources of materials required for work are established in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices needed to carry out the electronic work are obtained and checked for correct operation and safety

2 Solve electronic circuit problem

- 2.1 WHS/OHS risk control measures and workplace procedures are followed
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 2.3 Electronic circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Problem solving is approached methodically applying principles of electronic circuits using measured and calculated values
- 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.6 Electronic circuit problems are solved without unnecessary damage to apparatus, circuits, the surrounding environment or services using sustainable

- energy practices
- 3 Complete work and document problem-solving activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification for electronic circuit solutions used to resolve circuit problems is documented
- 3.4** Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in basic electronic circuits must include at least the following:

- two types of circuit problems in single source parallel and series-parallel electronic circuits

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH169A Solve problems in basic electronic circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0065 Solve problems in basic electronic circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- determining the operating parameters of an existing circuit
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with a specified function and operating parameters
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- behaviour of electrical/electronic circuits for various values of voltage, current, resistance, impedance, inductance, capacitance and reactance and variable parameters, including:
 - single source circuits
 - series circuit configurations
 - parallel circuit configurations
 - series-parallel circuit configurations
- circuit configurations, including:
 - circuit configurations are single source alternating current (a.c.) and direct current (d.c.) circuits
 - series circuits
 - parallel circuits
 - series-parallel circuits
- connection of test/measuring devices into a circuit, including safety procedures and circuit arrangement of test/measuring devices
- electronics circuit principles

- features of testing/measuring devices, including safety, user calibration and parameter and range settings
- power supplies for electronics circuit principles
- relationship between variable parameter in electrical/electronic circuits, including:
 - variable parameters
 - voltage
 - current
 - resistance
 - impedance
 - inductance
 - capacitance
 - reactance
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes, including safe working practices and solving problems in electronic circuits
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- types of voltage testers, multimeters, clamp meters, continuity testers and insulation resistance testers and their application.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to solving problems in electronic circuits
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0066 Troubleshoot amplifiers in an electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot amplifiers in an electronic apparatus.

It includes preparing to troubleshoot amplifiers, troubleshooting amplifiers, completing work and documenting troubleshooting activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0067 Troubleshoot basic amplifier circuits

AND

UEECD0043 Solve problems in direct current circuits

OR

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to troubleshoot amplifiers

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2** Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3** Nature of amplifier fault is obtained from documentation or from relevant person/s to determine the scope of work
- 1.4** Instructions for coordinating work with others are obtained from relevant person/s and applied
- 1.5** Materials required for work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Troubleshoot amplifiers

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** The need to test or measure live work is determined, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Circuits are isolated where necessary in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding is undertaken methodically using measured and calculated values of parameters relevant to amplifiers
- 2.5** Unexpected situations are dealt with safely and with the approval of relevant person/s
- 2.6** Fault finding is conducted efficiently minimising waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

3 Complete work and document troubleshooting

- 3.1** Workplace risk control measures and procedures are applied

activities

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Justification for troubleshooting solutions is provided in the required format
- 3.4 Work completion is documented in accordance with workplace procedures and relevant person/s notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting amplifiers must include at least the following:

- troubleshooting the amplifier stages of two types of electronic apparatus
- two different types of amplifier faults.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH113A Troubleshoot amplifiers in an electronic apparatus.

Assessment Requirements for UEEEC0066 Troubleshoot amplifiers in an electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying sustainable energy principles and practices
- applying the principles of amplifiers
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- determining live testing/measurement requirements
- methodically fault finding using measured and calculated values of parameters
- identifying and accessing materials, tools, apparatus and testing devices
- isolating circuits/machines/system
- troubleshooting amplifiers, including:
 - applying methodical problem-solving methods
 - calculating parameters correctly and accurately
 - correctly and accurately taking measurements
 - providing solutions to amplifier problems
 - providing written justification for the solutions to problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- amplifier troubleshooting, including:
 - fundamentals of amplifiers
 - classes of power amplifier operation (basics)
 - complementary-symmetry power amplifiers

- differential amplifiers
- multistage amplifier coupling methods
- negative feedback
- other solid-state power amplifier design
- relevant standards, codes and regulations
- single stage discrete amplifier:
 - direct current (d.c.) characteristics
 - small signal characteristics
 - capacitive coupling
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to troubleshooting amplifiers
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0067 Troubleshoot basic amplifier circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot basic amplifier circuits.

It includes preparing to troubleshoot basic amplifiers, solving basic amplifier circuit problems, completing work and reporting on problem-solving activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to troubleshoot basic amplifiers

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures are applied in

- accordance with workplace procedures prior to commencing work
- 1.3 Scope of the fault is obtained from documentation or discussions with relevant person/s to determine scope of work
 - 1.4 Instructions for coordinating work with others are obtained from relevant person/s and applied
 - 1.5 Materials required for work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety
- 2 Solve basic amplifier circuit problems**
- 2.1 WHS/OHS risk control measures and workplace procedures are applied
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits are isolated, as necessary, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fault finding is undertaken methodically applying principles of basic amplifiers and using measured and calculated values of parameters
 - 2.5 Unexpected situations are dealt with safely and with the approval of relevant person/s
 - 2.6 Fault-finding activities are conducted efficiently minimising unnecessary waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices
- 3 Complete work and report on problem-solving activities**
- 3.1 WHS/OHS risk control measures and procedures are applied
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for troubleshooting solutions is provided in the required format
 - 3.4 Work completion is reported and relevant person/s

notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting basic amplifier circuit problems must include at least the following:

- two faults on at least two different types of operational amplifier configurations

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH139A Troubleshoot basic amplifier circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0067 Troubleshoot basic amplifier circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying sustainable energy principles and practices
- isolating circuits/machines/systems
- coordinating work with relevant person/s
- determining live testing/measurement requirements
- dealing effectively with unplanned events
- identifying and accessing materials, tools, apparatus and testing devices
- accurately taking measurements and calculating parameters
- applying methodical problem-solving techniques
- providing justification for the solutions to problems
- providing solutions to amplifier circuit problems
- using of engineering terms and formulae
- calculating of gain bandwidth product
- calculating of gain and frequency response
- using engineering formulas for calculating gain and bandwidth
- using and verifying operation of an operational amplifier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- amplifier terminal characteristics
- basic amplifier principles, including:
 - amplifier types
 - gain bandwidth product

- decibels, engineering terms and formulae
- calculation of gain and frequency response
- measurement of gain and frequency response
- amplifier configurations - inverting, non-inverting; differential; comparator and summing; need for, and effects of, positive and negative feedback in an amplifier circuit
- practical amplifiers
- negative feedback
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant standards, codes and regulations
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to troubleshooting basic amplifiers
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0068 Troubleshoot communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot communications systems.

It includes fault finding and repairing communications systems. It also includes working safely, interpreting circuit diagrams, applying logical fault-finding procedures, conducting repairs, safety and functional testing, and completing the necessary service documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0043 Solve problems in direct current circuits

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0063 Solve fundamental electronic communications system problems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair communications system faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified obtained

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
 - 1.3 Nature of the communications system fault is obtained from relevant documentation or from work supervisor to determine the scope of work to be undertaken
 - 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with relevant person/s
 - 1.5 Sources of materials required for work are established in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out the work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find communications system faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out communications systems work are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and conducted within workplace safety procedures
 - 2.3 Communications system apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Communications system fault finding is approached methodically using measured and calculated values of apparatus parameters
 - 2.5 Apparatus components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.6 Faulty components are rechecked and their fault status confirmed
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8 Fault-finding activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

- | | |
|--|--|
| 3 Repair communications system fault | 3.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed |
| | 3.2 Apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures |
| | 3.3 Materials required for the repair work are sourced and obtained in accordance with workplace procedures |
| | 3.4 Repairs are affected efficiently without damage to other components apparatus or circuits |
| | 3.5 Effectiveness of the repair is inspected and tested in accordance with workplace procedures |
| | 3.6 Apparatus is reassembled, inspected, finally tested and prepared for return to customer |
| 4 Complete and report repair activities | 4.1 WHS/OHS work completion risk control measures and workplace procedures are followed |
| | 4.2 Work area is cleaned and made safe in accordance with workplace procedures |
| | 4.3 Written justification is documented for repairs to communications system apparatus |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH172A Troubleshoot communication systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0068 Troubleshoot communication systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- analysing and interpreting measurement results
- applying fundamental knowledge in finding faults efficiently
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- checking tools and test equipment for correct operation and safety
- consulting with relevant stakeholders regarding the nature of the problem and impacts of work to diagnose and repair
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- demonstrating signal testing and signal analysis
- demonstrating the making of relevant adjustments
- dismantling and reassembling equipment as required
- finding and repairing faults in communications system
- identifying faulty components and replacing components without damage
- making relevant measurements and calculations
- providing written justification for the repairs
- selecting and using relevant radio frequency (RF) test equipment
- selecting appropriate components and/or materials for the repairs
- using methodical fault-finding techniques.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- measurement techniques to verify system performance and signal quality of analogue and digital signals, including parameters such as bit error rate and inter-symbol interference.
- methods to reduce effects of spurious emissions, harmonics, over-modulation and

- intermodulation distortion (IMD) on the radio frequency (RF) spectrum
- modulation and demodulation techniques, including complex modulation schemes, e.g. multiple-input/multiple-output (MiMo) and spread-spectrum
 - RF and intermediate frequency (IF) amplifier principles
 - RF filtering principles, including quality (Q), bandwidth and typical filter types
 - RF safety precautions
 - RF signal generation and conversion principles
 - receiver operating principles and characteristics, including practical troubleshooting and test techniques
 - regulatory and technical requirements for efficient RF spectrum access
 - relevant industry standards, codes of practice and regulations
 - relevant job safety assessments or risk mitigation processes
 - relevant manufacturer specifications
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation
 - relevant workplace policies and procedures
 - transmitter operating principles and characteristics, including practical troubleshooting and test techniques.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or suitable simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in communication systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0069 Troubleshoot digital sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot digital sub-systems.

It includes working safely, applying problem-solving procedures, using measuring devices, and providing solutions from measurements and calculations to provide solutions in digital components circuits.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to troubleshoot digital sub-systems

- 1.1 WHS/OHS processes and workplace procedures for a given work area are obtained and applied
- 1.2 WHS/OHS risk control work preparation measures and workplace procedures are followed
- 1.3 Scope of fault is obtained from documentation and/or work supervisor to determine work to be undertaken
- 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.5 Sources of materials required for work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Troubleshoot digital sub-systems

- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding of digital components is conducted using measured and calculated values of parameters in accordance with workplace procedures
- 2.5 Unplanned situations are dealt with safely and with approval of relevant person/s
- 2.6 Fault-finding activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

3 Complete work and document troubleshooting

- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed

activities

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting a digital sub-system must include the following:

- at least three digital components/circuits or functions
- at least three faults

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH112A Troubleshoot digital sub-systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0069 Troubleshoot digital sub-systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- calculating parameters correctly and accurately
- carrying out fault-finding activities without waste and damage to materials, apparatus, environment or services
- checking and isolating circuits
- dealing with unplanned situations safely and with approval of relevant person/s
- determining sources of material required for work
- measuring and calculating values of parameters in fault finding
- obtaining and checking tools, equipment and testing devices for correct operation and safety
- obtaining scope of fault from documentation and/or work supervisor
- preparing to troubleshoot digital sub-systems
- seeking advice from work supervisor to ensure work is coordinated
- testing and measuring live circuits
- troubleshooting digital sub-systems
- using sustainable energy practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- analogue and digital signals
- binary addition and subtraction
- combinational logic circuits, including logic gate types and characteristics, truth tables and logic gate operation
- digital building blocks, including clocks, multiplexers and demultiplexers, encoders and

- decoders, counters, flip-flops, latches and registers
- digital displays, including liquid-crystal display (LCD) and 7-segment
- digital fault-finding principles
- digital numbering schemes, including binary, hexadecimal, binary-coded decimal (BCD), American Standard Code for Information Interchange (ASCII) and Unicode
- digital sub-system building blocks
- electrostatic precautions when handling devices,
- logic families (CMOS and transistor-transistor logic (TTL)), including comparisons, input and output types, unit load and noise margin
- numbering systems, including conversions
- principles of analogue-to-digital and digital-to-analogue conversion
- problem-solving techniques
- relevant checking and isolating circuit methods
- relevant circuit measurements and parameter values calculations
- relevant digital sub-systems
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant materials, tools, equipment and testing devices
- relevant testing and measuring methods
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures, including handling sensitive electronic components
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and relevant industry standards currently used in industry

- resources that reflect current industry practices in relation to troubleshooting digital sub-systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0070 Troubleshoot faults in television receivers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair of faults in signal processing and scanning and deflection sections of television receivers.

It includes working safely, applying logical fault-finding workplace procedures, conducting repairs, safety and functional testing, and completing the necessary service documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0058 Repair predictable faults in television receivers

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to identify television receiver faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work activity

- 1.3 Nature of the television receiver fault is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
 - 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with relevant person/s
 - 1.5 Materials required for the work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find television receiver faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work activities are followed
 - 2.2 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
 - 2.3 Apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fault finding is approached methodically, using measured and calculated values of apparatus parameters, chrominance and luminance signal processing and scanning and deflection sections of television receivers
 - 2.5 Apparatus components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.6 Faulty components are identified, rechecked and fault status confirmed
 - 2.7 Materials/replacement parts required to rectify faults are sourced and obtained in accordance with workplace procedures
 - 2.8 Effectiveness of the repair is tested in accordance with workplace procedures
 - 2.9 Apparatus is reassembled, finally tested and prepared for return to service
 - 2.10 Unplanned situations are dealt with safely and with the approval of an authorised person/s

- 2.11** Fault-finding activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Repair television receiver fault**
- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out repair work are followed
- 3.2** Apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 3.3** Materials required for repair work are sourced and obtained in accordance with workplace procedures
- 3.4** Repairs are affected efficiently without damage to other components, apparatus or circuits
- 3.5** Effectiveness of the repair is inspected and tested in accordance with workplace procedures
- 3.6** Apparatus is reassembled, inspected and final functional test completed in preparation for return to customer
- 4 Complete and report television receiver fault-finding and repair activities**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2** Work area is cleaned and made safe in accordance with workplace procedures
- 4.3** Written justification is recorded for television receiver repairs to apparatus
- 4.4** Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting faults in television receivers must include at least the following:

- two television receiver faults in signal processing and scanning and deflection sections of television receivers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH171A Troubleshoot faults in television receivers.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0070 Troubleshoot faults in television receivers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying sustainable energy principles and practices
- completing and reporting television receiver fault-finding and repair activities
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- finding and repairing faults in television receiver
- finding television receiver faults efficiently
- implementing relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including the use of risk control measures
- providing written justification for television receiver repairs
- replacing television receiver components without damage
- using methodical television receiver fault-finding techniques.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- automatic gain control (AGC) circuits in typical television receivers, including operation and fault-finding techniques
- components providing radio frequency (RF) interference suppression protection, rectification and filtering in a typical television receiver power supply
- operation of a typical television synchronous demodulator circuit
- operation of series regulated power supplies as used in typical television receiver/monitors and recording device
- operation of the switched-mode power supply (SMPS) control circuits in a television/video cassette recorder (VCR)
- operation of tuners found in typical television receivers
- operation of typical self-oscillating television/VCR/switched-mode power supply (SMPS)

circuits

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- safe working procedures to test power supply circuitry of a typical 'hot chassis' television receiver
- sub-system arrangements and the operating principles of series and shunt type television receiver/VCR/SMPS
- techniques for locating and repairing faults in a defective SMPS in a typical television monitor or VCR
- techniques for locating and repairing faults in typical vision intermediate frequency (IF) circuits
- techniques for locating and repairing faulty components.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in television receivers
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0071 Troubleshoot fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot fire protection systems.

It includes finding and repairing fire protection system faults that include multiple connected detection, warning and fire control devices; and remote monitoring to the sub-assembly level. It also includes working safely, applying logical fault-finding workplace procedures, conducting repairs, safety and functional testing, and completing the necessary service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0041 Install fire detection and warning system apparatus

UEEEEC0076 Verify compliance and functionality of fire protection system installations

UEEEEC0026 Enter and verify programs for fire protection systems

UEEEEC0008 Commission large fire protection systems

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and rectify fire protection system faults

2 Find and repair fire protection system faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----|--|
| 1.1 | WHS/OHS requirements and workplace procedures for a given work area are identified and applied |
| 1.2 | WHS/OHS risk control measures and workplace procedures are followed in preparation for work activities |
| 1.3 | Extent of work to be undertaken is confirmed from fault/breakdown reports and/or discussions with appropriate person/s |
| 1.4 | Advice is sought from the work supervisor to ensure the work is coordinated effectively with others |
| 1.5 | Sources of materials required for fault-finding work are determined in accordance with workplace procedures |
| 1.6 | Tools, equipment and testing devices needed to locate faults are obtained in accordance with workplace procedures and checked for correct operation and safety |
| 2.1 | WHS/OHS risk control measures and workplace procedures for carrying out work are followed |
| 2.2 | Need to test and measure live work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures |
| 2.3 | Circuits/machines/plant/system interfaces are checked and isolated in accordance with WHS/OHS |

requirements and workplace procedures

- 2.4 Safety hazards resulting from the fault or breakdown are documented, assessed and risk control measures devised and implemented in consultation with appropriate person/s
 - 2.5 Fault finding is approached methodically using fire protection system and components and measured values of system parameters
 - 2.6 System components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.7 Faulty system/components are inspected, rechecked and their fault status confirmed
 - 2.8 Materials/replacement parts required to rectify faults are sourced and obtained in accordance with workplace procedures
 - 2.9 Effectiveness of the fire protection system repair is tested in accordance with workplace procedures
 - 2.10 Apparatus is reassembled, inspected, tested and prepared for return to service
 - 2.11 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.12 Fault-finding and repair activities are carried out without unnecessary damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault-finding and repair activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Reusable, faulty or worn components are tagged and despatched for repair
 - 3.3 Fault-finding and repair work activities are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting fire protection systems must include at least the following:

- two fire alarm and warning systems, including:
 - one fire alarm system with at least 50 input devices, 20 output devices and two system interface controls
 - one fire warning system with at least 50 speakers, five interface communication devices and two warning indicators
 - voice message facilities

Finding and repairing must include at least six of the following faults in fire alarm and warning systems:

- open circuit
- short circuit
- incorrect connections
- insulation failure
- program failure
- apparatus/component failure
- related mechanical failure
- electrical induced interference

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH165A Troubleshoot fire protection systems.

Assessment Requirements for UEEEC0071 Troubleshoot fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing documentation and reports correctly
- dealing with intermittent faults
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining scope of work from fault/breakdown reports and discussions with appropriate person/s
- finding and repairing faults in fire protection system
- finding fire protection system faults efficiently
- inspecting and testing fire protection system in accordance with workplace procedures and industry standards
- rectifying fire protection system faults effectively
- using methodical or analytical techniques in fault-finding techniques.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- common fire protection systems faults
- effect-to-cause reasoning and assumptions of possible causes
- factors to consider in clarifying the nature of a fire protection system fault
- fire protection system fault-finding techniques
- fire protection technologies
- input devices, including conventional, analogue or analogue addressable fire detectors, flow switch connections or switch connections

- interface communication devices can be warden in communication phones and remote public address (PA) inputs
- methods for testing assumptions
- output devices, including shutdown signal, door or system release controls and solenoid valve controls
- problem-solving concepts and techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system interface controls, including communication signals to remote control and indicating equipment, building monitoring systems, paging system and colour graphics
- types of fire protection systems and the difference between automatic and passive systems and wet and dry systems
- typical causes of intermittent faults, including vibration, shock, changes in temperature and electromagnetic interference
- warning indicators, including flashing lights for hearing impaired persons and fire brigade building indication.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in fire protection systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0072 Troubleshoot microcontroller-based hardware systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot microcontroller-based hardware systems.

It includes solving microcontroller hardware and firmware problems by determining correct operation of microcontroller system, and providing solutions derived from measurements and calculations to predictable faults in microcontroller hardware.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on microcontroller hardware

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied

1.2 WHS/OHS risk control work preparation measures and

procedures are followed

- 1.3** Nature of microcontroller hardware problems is obtained from documentation or from work supervisor to establish the scope of work to be undertaken
 - 1.4** Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 1.5** Sources of materials required for the work are established in accordance with workplace procedures
 - 1.6** Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety
- 2 Solve microcontroller hardware and firmware problems**
- 2.1** WHS/OHS risk control work measures and procedures are followed
 - 2.2** Need to test or measure live work is determined in strict accordance with WHS/OHS requirements and, as required, conducted within established safety procedures
 - 2.3** Circuits are checked as being isolated, as necessary, in strict accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Established methods are used to solve problems from measured and calculated values as they apply to microcontroller hardware
 - 2.5** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6** Problems are solved without unnecessary damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete work and document problem-solving activities**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with established procedures
 - 3.3** Justification for solutions used to solve circuit problems are documented

- 3.4** Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting must include at least two of the following types of microcontroller hardware problems:

- determining the operating parameters of an existing circuit
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with a specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH166A Troubleshoot microcontroller based hardware systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0072 Troubleshoot microcontroller-based hardware systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- calculating parameters correctly and accurately
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- providing solutions to microcontroller component/circuit problems
- providing written justification for the solutions to problems
- taking measurements correctly and accurately
- using an industry standard programming environment to load, test and debug code
- using methodical problem-solving methods
- using a microcontroller's internal communications peripherals to communicate with a secondary device, including microcontroller, computer and/or sensor.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- dealing with intermittent faults
- electronic fault-finding techniques and fault identification techniques
- fault-finding methods, including visual inspection, sectional testing, split-half tests and component isolation
- input/output (I/O) ports: analogue/digital
- integrated peripherals, including timers, interrupts, hardware multiplier, internal oscillators, comparators, analogue to digital converter's (ADC's) and digital to analogue converter's (DAC's), pulse width modulation (PWM) modules and serial ports
- interfacing different logic level voltages in a microcontroller circuit

- microcontroller-based systems troubleshooting
- microcontroller internal peripheral communication circuitry and associated hardware and protocols (examples include but not limited to recommended standard 232 (RS-232), I²C, SPI, and 1 wire)
- microcontroller systems, including:
 - digital systems concepts associated with microcontroller-based systems
 - microcontroller architecture
 - microcontroller instruction set
 - microcontroller manufacturers
 - microcontroller system block diagram
- relevant data storage types
- relevant job safety assessments or risk mitigation processes
- relevant logic level standards
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- reset circuit
- system clock circuitry.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to fault finding microcontroller-based hardware
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0073 Troubleshoot professional audio reproduction components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot professional audio reproduction components.

It includes fault finding and repairing professional and high-end audio amplifiers, preamplifiers, receivers, graphic equalisers and speakers. It also includes working safely, applying logical fault-finding procedures, conducting repairs, safety and functional testing, and completing the necessary service documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEEC0056 Repair predictable faults in audio components

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and repair audio reproduction component faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied

- 1.2 WHS/OHS risk control measures and procedures are followed in preparation for the work
 - 1.3 Nature of the audio reproduction component fault is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
 - 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with relevant person/s
 - 1.5 Sources of materials required for audio component work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out audio component work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find audio reproduction component faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out audio component work are followed
 - 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
 - 2.3 Audio reproduction apparatus component is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fault finding is approached methodically using measured and calculated values of apparatus parameters of audio reproduction components and circuits
 - 2.5 Apparatus components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.6 Faulty audio components are rechecked and fault status confirmed
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8 Fault-finding activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable

- energy practices
- 3 Repair audio reproduction component fault**
- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out audio reproduction component work are followed
- 3.2** Audio reproduction apparatus component is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 3.3** Materials required for the repair work are sourced and obtained in accordance with workplace procedures
- 3.4** Repairs are affected efficiently without damage to audio components apparatus or circuits
- 3.5** Effectiveness of the repair is tested in accordance with workplace procedures
- 3.6** Apparatus is reassembled, inspected, finally tested and prepared for return to customer
- 4 Complete and report repair activities**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 4.2** Work area is cleaned and made safe in accordance with workplace procedures
- 4.3** Written justification is made for repairs to audio reproduction apparatus component/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting professional audio reproduction components must include at least the following:

- two different faults in two different components of audio equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH173A Troubleshoot professional audio reproduction components.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0073 Troubleshoot professional audio reproduction components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- finding faults efficiently
- providing written justification for the repairs
- replacing components without damage
- using methodical fault-finding techniques.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant audio electronics
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sound reproduction equipment
- troubleshooting techniques
- sound reproduction fundamentals.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in professional audio reproduction components
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot resonance circuits in an electronic apparatus.

It includes working safely, applying problem-solving procedures, and providing solutions derived from measurements and calculations to problems in resonance circuits.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to troubleshoot resonance circuits

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control work preparation measures and workplace procedures are followed
- 1.3** Scope of fault is obtained from documentation and/or work supervisor to determine work to be undertaken
- 1.4** Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.5** Sources of materials required for work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Solve problems in resonance circuits

- 2.1** WHS/OHS risk control work measures and workplace procedures are followed
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Fault finding of resonance circuits is conducted using measured and calculated values of parameters in accordance with workplace procedures
- 2.5** Unplanned situations are dealt with safely and with the approval of relevant person/s in accordance with workplace procedures
- 2.6** Fault-finding activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

3 Complete work and document troubleshooting activities

- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving resonance circuit problems must include at least two of the following:

- determining the operating parameters of an existing circuit
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH114A Troubleshoot resonance circuits in an electronic apparatus.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- carrying out fault-finding activities without waste and damage to materials, apparatus, the environment or services
- checking and isolating circuits
- completing work and documenting troubleshooting activities
- dealing with unplanned situations safely and with the approval of relevant person/s
- demonstrating correct set-up and usage of oscilloscope for alternating current (a.c.) measurements
- obtaining and checking tools, equipment and testing devices for correct operation and safety
- obtaining scope of the fault from documentation and/or work supervisor
- preparing to troubleshoot resonance circuits
- seeking advice from work supervisor to ensure work is coordinated effectively
- solving problems in resonance circuits
- testing and measuring live circuits
- using sustainable energy practices
- calculating resonance parameters, including reactance and resonant frequency from supplied or measured values
- making measurements on resonance circuits
- making adjustments to resonance circuits.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- filter characteristics, including bandwidth, roll off, attenuation and response curves

- filter principles and types, including high pass, low pass, bandpass and band-reject
- principles of inductance and inductive reactance
- impedance, voltage and current characteristics of parallel-resonant circuits
- impedance, voltage and current characteristics of series-resonant circuits
- measuring equipment for a.c. circuits
- Ohm's law for a.c. circuits
- power factor principles
- problem-solving techniques
- quality factor (Q) principles
- relevant checking and isolation methods for circuits
- relevant circuit measurements and parameter values calculations
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant materials, tools, equipment and testing devices
- relevant resonance circuits
- relevant resonance formulae and definitions
- relevant testing and measuring methods
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- series, parallel and series-parallel a.c. circuits
- sinusoidal alternating voltage and current principles
- sustainable energy principles
- transformer principles and construction.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to troubleshooting frequency

dependent circuits

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0075 Troubleshoot single phase input d.c power supplies

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine the correct operation of independent power supplies and power supply sections of electronic apparatus.

It includes troubleshooting and applying problem-solving procedures; working safely; using voltage, current and resistance measuring devices to measure and calculate; and providing solutions to predictable problems in direct current (d.c.) power supplies with single phase inputs.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components
and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

OR

UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits

OR

UEEEEC0065 Solve problems in basic electronic circuits

OR

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Troubleshoot d.c. power supplies

2 Solve d.c. power supply problems

3 Complete work and document problem-solving

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----|---|
| 1.1 | Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work area are obtained and applied |
| 1.2 | Nature of d.c. power supplies fault is obtained from documentation or from work supervisor to determine the scope of work to be undertaken |
| 1.3 | Advice is sought from work supervisor to ensure work is coordinated effectively with others |
| 1.4 | Materials required for the work are determined in accordance with workplace procedures |
| 1.5 | Tools, equipment and testing devices required to carry out the work are obtained in accordance with workplace procedures and checked for correct operation and safety |
| 2.1 | WHS/OHS risk control work measures and workplace procedures are followed |
| 2.2 | Power supply fault finding is approached methodically in accordance with workplace procedures, drawing on knowledge of d.c. power supplies and using measured and calculated values of parameters |
| 2.3 | Fault-finding activities are carried out efficiently without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices |
| 3.1 | WHS/OHS risk control measures and workplace |

activities

procedures for work completion are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Justification for solutions used to resolve single phase input d.c. power supply problems are documented in accordance with workplace procedures
- 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Troubleshooting d.c. power supply problems must include:

- single phase input on the rectification section
- filtering section of a half wave and full wave rectifiers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH111A Troubleshoot single phase input d.c power supplies.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0075 Troubleshoot single phase input d.c power supplies

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- checking tools, materials, equipment and testing devices for correct operation and safety
- testing or measuring on live and operating system safely
- ensuring circuits are isolated
- communicating effectively with relevant stakeholders
- completing work and required documentation
- maintaining a clean worksite and equipment
- referring to relevant documentation to determine the fault
- solving direct current (d.c.) power supply problems
- troubleshooting d.c. power supplies with single phase input, including:
 - using methodical problem-solving methods
 - providing written justification for the solutions to d.c. power supplies problems
 - dealing with unplanned events in accordance with workplace procedures
 - taking measurements correctly and accurately
 - calculating parameters correctly and accurately
 - providing solution to power supply problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- power supplies operating principles and applications, including:
 - block diagram identifying each sub-system
 - constant voltage and current

- expected waveforms in a power supply
- power supply function
- d.c. rectification circuits, including:
 - dual rail supply
 - half wave and full wave rectifiers
 - junction diode characteristics
 - transformer turns ratio and losses
- filter circuits, including:
 - capacitive and inductive filters
 - ripple
- zener diode regulator, including:
 - load and line regulation definitions
 - operating parameters and data sheets
 - zener shunt regulator circuit
- three terminal regulator circuits, including:
 - line and load regulation
 - need for regulation
 - regulated power efficiency
 - remote voltage sensing
 - short circuit protection
 - three terminal regulator characteristics and faults
- electronic testing and measuring devices and techniques, including:
 - test/measuring devices and their application, including:
 - multimeters
 - signal generators and oscilloscopes
 - voltage and digital testers
 - connection of test/measuring devices into a circuit, including:
 - circuit arrangement of test/measuring devices
 - safety procedures
 - taking readings
 - storage, maintenance and care of test/measuring devices
- d.c. power supply testing and fault-finding including:
 - rectifier diode faults
 - zener diode faults
 - three terminal regulator faults
 - capacitor faults
- safe working practices and relevant standards, codes and regulations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0076 Verify compliance and functionality of fire protection system installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify compliance and functionality of fire protection system installations.

It includes testing and visual inspection for verifying that a fire protection system and components are safe and comply with requirements and functions. It also includes working safely, conducting compliance tests, conducting visual inspections, identifying non-compliance defects and mandatory reporting requirements.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEEC0041 Install fire detection and warning system apparatus

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to verify fire protection installation

2 Visually inspect fire protection installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work activities
- 1.3 Safety hazards that have not previously been identified are assessed, noted and job safety assessments and risk control measures determined and implemented
- 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.5 Location of fire protection system components is determined from job specifications and diagrams
- 1.6 Inspection and tests are appropriately sequenced in accordance with job schedule and workplace procedures
- 1.7 Materials needed for the fire protection system tests and verification are obtained in accordance with workplace procedures and checked against job requirements
- 1.8 Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out verification work activities are followed
- 2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

- 2.3 Cabling/wiring is checked for appropriate type and size
 - 2.4 Cabling/wiring accessories and fire alarm warning components are validated as being suitably located, securely fixed and suitably protected from damage or corrosion
 - 2.5 Accessories and components are validated as being appropriately rated and meeting functional requirements
 - 2.6 Fire protection equipment compliance is verified in accordance with safety and functional requirements
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.9 Inspection is carried out efficiently without waste of materials or damage to fire protection apparatus, the surrounding environment or services using sustainable energy practices
- 3 Conduct fire protection compliance tests**
- 3.1 WHS/OHS risk control measures and workplace procedures for carrying out fire protection testing are followed
 - 3.2 Back-to-base facilities and system interfaces are isolated in accordance with workplace procedures
 - 3.3 Testing and measuring of live work and operating system is conducted in accordance with WHS/OHS requirements and within workplace safety procedures
 - 3.4 Circuits/machines/plant/other system interfaces are checked and isolated to ensure the system is not activated during testing in accordance with WHS/OHS requirements and workplace procedures
 - 3.5 Electrical inspections and tests are conducted to verify the electrical circuit within the fire installation is safe and functional in accordance with job specifications
 - 3.6 System tests are conducted to verify that the fire protection equipment and cabling/wiring within the fire protection installation is safe and functions as intended

- 3.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 3.8 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 3.9 Testing is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 4 Report inspection and verification findings**
- 4.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 4.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 4.3 Non-compliance defects are identified and reported in accordance with workplace procedures
 - 4.4 Recommendations for rectifying defects are made in accordance with workplace procedures
 - 4.5 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Verifying compliance and functionality of fire protection system installations must include at least the following:
- two different new or existing fire protection installations, including:
 - one fire alarm system with at least 50 input devices, 20 output devices and two system interface controls
 - one fire warning system with at least five

- speakers, five interface communication devices and two warning indicators
- voice message facilities

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH162A Verify compliance and functionality of fire protection system installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0076 Verify compliance and functionality of fire protection system installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- acting within regulatory limits
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- conducting electrical tests safely and correctly
- conducting fire alarms and warning tests safely and correctly
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying non-compliant defects from test results
- identifying visual defects
- recommending appropriate corrective actions
- reporting legibly and accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- features of fire protection installations that can be visually inspected
- fire alarm and warning system routine testing
- fire protection installations, testing and verification methods
- relevant inspection and testing techniques
- relevant job safety assessments or risk mitigation processes
- relevant mandatory and optional testing and verification requirements applicable to fire protection installations
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to verifying compliance and functionality of fire protection installations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEEC0077 Verify functionality and compliance of custom electronic installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify functionality and compliance of custom electronic installations. It includes preparing to verify custom electronic installations, visually inspecting the installation, conducting tests, reporting inspection and verifying findings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0025 Lay wiring/cablings and terminate accessories for extra-low voltage (ELV) circuits

UEEEEC0004 Assemble and set up fixed video/audio components and systems in buildings and premises

Competency Field

Electronics and Communications

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to verify custom electronic installations

2 Visually inspect the installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for relevant work area are identified, obtained and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed and reported to relevant person/s, and control measures implemented
- 1.4 Relevant person/s is consulted to ensure the work is coordinated effectively with others on worksite
- 1.5 Location of system components is determined from specifications and diagrams
- 1.6 Inspection and tests are sequenced in accordance with job schedule
- 1.7 Materials required for tests and verification are obtained in accordance with workplace procedures and checked against job requirements
- 1.8 Tools, equipment and testing devices required to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 Workplace risk control measures and workplace procedures are applied
- 2.2 Circuits/machines/plant are isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Cabling is checked for appropriate type and size
- 2.4 Cabling accessories and components are checked as being suitably located, securely fixed and suitably protected from damage or corrosion

- 2.5 Accessories and components are checked as being appropriately rated and meeting functional requirements
- 2.6 Evidence that equipment complies with safety and functional requirements is confirmed in accordance with relevant industry standards
- 2.7 Unplanned situations are dealt with in accordance with workplace procedures, discussed with relevant person/s and documented
- 2.8 Unexpected situations are dealt with safely and with the approval of relevant person/s
- 2.9 Inspection is conducted efficiently minimising waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

3 Conduct tests

- 3.1 Workplace risk control measures and workplace procedures are applied
- 3.2 Testing or measuring on a live and operating system is conducted in accordance with WHS/OHS requirements and workplace procedures
- 3.3 Circuits/machines/plant are isolated in strict accordance with WHS/OHS requirements and workplace procedures
- 3.4 Tests are conducted to verify that cabling is safe, meets specified standards and any relevant regulatory requirements
- 3.5 Custom electronic apparatus and devices are tested to ensure safe installation and intended functionality
- 3.6 Unexpected situations are dealt with in accordance with workplace procedures, discussed with relevant person/s and documented
- 3.7 Unexpected situations are dealt with safely and with the approval of relevant person/s
- 3.8 Testing is conducted efficiently, minimising waste of materials, damage to apparatus, the surrounding environment or services applying sustainable energy practices

4 Report inspection and

- 4.1 WHS/OHS work completion risk control measures and

verification findings

procedures are applied

- 4.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
- 4.3 Non-compliance defects are identified and reported in accordance with workplace procedures
- 4.4 Recommendations for rectifying defects are made in accordance with workplace procedures
- 4.5 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Verifying compliance and functionality of custom electronic installations must include at least the following:

- two different new or existing custom electronic installations
- one installation, including a basic integrated system

Verification must include at least the following:

- visual inspection of cabling, accessories, apparatus and controls
- conducting all safety and compliance tests

Testing must include at least the following:

- isolation testing
- insulation resistance
- cable tests to specified standard (e.g. Category 5 standard)
- polarity tests
- continuity of earthing
- correct connections performance tests

Unit Mapping Information

This unit replaces and is equivalent to UEENEEH105A Verify functionality and compliance of custom electronic installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEC0077 Verify functionality and compliance of custom electronic installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant risk identification, assessment, reporting and control requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- completing reporting in accordance with workplace procedures
- complying with relevant regulations
- conducting all tests safely and correctly
- coordinating work with relevant person/s
- dealing effectively with unplanned events
- identifying and accessing materials, tools, apparatus and testing devices
- identifying non-compliant defects from test results
- identifying visual defects
- isolating circuits/machines/system
- recommending appropriate corrective actions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- custom electronic installations, testing and verification methods, including:
 - audio reproduction, electronic components:
 - preamplifiers amplifier
 - power and integrated amplifiers
 - graphic equalisers
 - audio reproduction and speaker fundamentals
 - audio/video recording and replay components repair basics

- audio/video control equipment
- electronic safe working practices
- relevant standards, codes and regulations
- sound reproduction fundamentals
- video systems installation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to verifying compliance and functionality of custom electronic installations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0001 Apply compliance requirements to all aspects of electrical work

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply compliance requirements to aspects of electrical work.

It includes applying work health and safety (WHS)/occupational health and safety (OHS) requirements for preparing and inspecting electrical installations, and documenting activities and outcomes.

This unit is intended for electrical licence holders who, according to the regulatory authority, have exhibited recalcitrance in their licence and/or WHS/OHS duty of care obligations.

Competency in this unit can only be gained by persons who hold a current 'Unrestricted Electrician's Licence' issued in an Australian state or territory.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Apply risk management **1.1** Access to worksite is obtained in accordance with

requirements	WHS/OHS requirements and relevant industry standards
	1.2 WHS/OHS risk control measures and workplace procedures given in safe work method statements (SWMS) and/or job safety analysis (JSA) documents are identified, followed and applied
	1.3 WHS/OHS hazards not previously identified are noted, risk assessed and risk control measures implemented in accordance with WHS/OHS procedures
	1.4 Risk and control measures for a new or changed hazard are documented in accordance with WHS/OHS requirements and workplace procedures
	1.5 Hazards created by other site activities are referred to appropriate person/s in accordance with workplace procedures
	1.6 WHS/OHS documents for incidents reports are maintained in accordance with workplace procedures and relevant industry standards
2 Ensure electrical installations are safe for use	2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
	2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
	2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
	2.4 Compliance of an installation is confirmed in accordance with relevant industry standards
3 Document risk management activities	3.1 Non-compliance defects are identified and reported in accordance with workplace procedures
	3.2 Recommendations for rectifying defects are made in accordance with workplace procedures
	3.3 Documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG198A Apply compliance requirements to all aspects of electrical work.

Assessment Requirements for UEEEL0001 Apply compliance requirements to all aspects of electrical work

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- following requirements to gain entry to a worksite
- following work health and safety (WHS)/occupational health and safety (OHS) compliance requirements, control measures and procedures
- identifying new and changed hazards, assigning a realist level of risk and establishing appropriate control measures
- maintaining WHS/OHS documents and incidents and issues reports in accordance with requirements
- determining whether an electrical installation is compliant in accordance with regulations
- documenting installation compliance verification activities and outcomes
- dealing with unplanned events
- ensuring electrical installations are safe for use.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical work compliance requirements of electrical work testing and verification, including:
 - WHS/OHS requirements encompassing:
 - legislated regulations
 - responsibilities of employers and employees
 - hazards and risks and control measures
 - safe work method statements (SWMS)/job safety analysis (JSA)
 - identifying potential workplace hazards and establishing control measures
 - maintaining WHS/OHS documents
 - electrical installation safety requirements encompassing:
 - legislated regulations
 - visual inspecting of installations

- testing installations
- documentation
- safety requirements, including local service rules and application of current editions AS/NZS 3000 following AS/NZS 3017 Electrical installations - Verification guidelines
- problem-solving techniques
- relevant industry standards
- relevant manufacturer specifications
- relevant quality workplace procedures
- relevant testing devices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0002 Apply currency of safe working practices and compliance verification of electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply currency of safe working practices and compliance verification of an electrical installation.

It includes preparing, following and applying safe work practices for a work area to verify compliance of an electrical installation.

The licensing regulator may require a holder of Unrestricted Electrician's Licence or Qualified Electrical Contracting Licence to undertake this unit periodically to demonstrate currency in safe working, electrical rescue practices and compliance verification of electrical installations.

A person competent in this unit will hold an Unrestricted Electrical Licence issued in an Australian state or territory and be able to apply compliance requirements to all aspects of electrical work in accordance to relevant industry standards and regulations.

Competency in this unit can only be gained by persons who hold a current 'Unrestricted Electrician's Licence' issued in an Australian state or territory.

This unit is subject to the following requirements:

- legislation, regulations, relevant industry standards and codes of practice for electrical work, including specific work health and safety (WHS)/occupational health and safety (OHS) legislation and regulatory requirements
- electrical licensing requirements – Unrestricted Electrical Work
- legislation, regulations, relevant industry standards and codes of practice for renewable energy (RE).
- Note: there may be variations in these requirements across jurisdictions.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to enter a work area and verify compliance of an electrical installation

2 Follow workplace procedures for hazard identification

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work area access permits are obtained from appropriate person/s in accordance with workplace procedures
- 1.2** Safe work practices for controlling risk are obtained and applied prior to undertaking a work activity
- 1.3** Preparations for electrical and non-electrical isolation are carried out to prevent hazards from loss of machine/system/process control in accordance with workplace procedures
- 1.4** Installation documentation is reviewed and applied in accordance with relevant industry standards
- 1.5** Appropriate person/s is consulted to ensure work is coordinated effectively with others
- 1.6** Tools and equipment needed for the work are checked for safety and functionality in accordance with workplace procedures and relevant industry standards
- 2.1** WHS/OHS hazards are identified, risks are assessed, and control measures implemented and monitored
- 2.2** Hazards in the work area are identified and reported to appropriate person/s in accordance with workplace procedures
- 2.3** WHS/OHS incident reporting is completed in accordance with workplace procedures
- 2.4** Workplace instructions and workplace training are followed in accordance with workplace procedures

- 3 Apply safe work practices to verifying an electrical installation**
 - 3.1** Safe work practices for controlling risks are followed
 - 3.2** Workplace procedures for accidents, fires and emergencies are followed in accordance with workplace procedures and appropriate person/s identified
 - 3.3** Need to test and measure live electrical work is identified in accordance with WHS/OHS requirements and workplace procedures
 - 3.4** Compliance of electrical equipment and installation is assessed by inspection in accordance with relevant industry standards
 - 3.5** Tests are conducted for compliance and safety parameters of installed circuits, switchgear protection and earthing in accordance with industry standards and workplace procedures
- 4 Report compliance findings**
 - 4.1** WHS/OHS risk control measures and workplace procedures are followed
 - 4.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 4.3** Defects are identified and reported in accordance with relevant industry standards and workplace procedures
 - 4.4** Recommendations for rectifying defects are made in accordance with workplace procedures
 - 4.5** Documentation is completed in accordance with industry standards and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package

Companion Volume Implementation Guide.

Verifying compliance of an electrical installation must include at least two circuit supplying fixed appliances, including one three phase, from the following:

- a main switchboard
- supplying more than one circuit each for lighting and socket outlets
- a distribution board separate from the main switchboard

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG197A Apply currency of safe working practices and compliance verification of electrical installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0002 Apply currency of safe working practices and compliance verification of electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- preparing to enter a workplace
- identifying work safety hazards
- applying current safe working practices
- identifying visual non-compliance defects
- using effective methods for conducting mandatory and optional tests
- identifying non-compliance from test results
- identifying causes of non-compliance
- completing mandatory reporting
- dealing with unplanned events
- applying industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures and instructions
- obtaining and checking tools and equipment
- assessing risks
- implementing and monitoring control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- current requirements of safe working practices and WHS/OHS, including:
 - the current legal requirements covering WHS/OHS in the workplace
 - the current work environment in relation to safety signage, emergencies, fire protection, ensuring personal safety, industrial housekeeping and pollution sources and controls

- hazards and risks and control measures in working on construction sites:
 - hazards, including (not limited to) manual and mechanical handling, working at heights, working in confined spaces, noise and dusts
- workplace safety check, identifying potential workplace hazards and suggested measures for accident prevention
- working safely with electrical tools or equipment
- current procedure for safe isolation of an electrical supply
- hazards associated with, extra-low voltage (ELV), low voltage (LV), high voltage (HV) and high currents
- hazards and control measures associated with electrical work
- emergency procedures and equipment for the rescue of an electric shock victim
- emergency first aid for an electric shock victim:
 - emergency first aid is limited to first-on-the scene assistance to a victim of electric shock, and basics of cardiopulmonary resuscitation (CPR)
- electrical installations testing and verification, including:
 - current electrical installations legislated regulations and responsibilities of a licensed electrician
 - current compliance standards and regulatory requirement of electrical equipment and how and where it is installed
 - current compliance standards and regulatory requirement for testing safety parameters of installed circuits, switchgear, protection and earthing
 - current compliance standards and regulatory requirement for documenting and reporting compliance inspection and testing outcomes
- relevant industry standards
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation including access permits and incident reporting
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0003 Arrange circuits, control and protection for electrical installations

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select, arrange and terminate circuits, control and protection devices and systems for electrical installations operating at low voltage (LV).

It includes protection of persons and property, correct functioning, ensuring compatibility with the supply, arranging installation into circuits, selecting and arranging switchgear/control gear and protective devices to meet compliance requirements, and documenting arrangement decisions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare electrical circuits, control and protection installation

2 Arrange electrical circuits, control and protection

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------|--|
| <p>1.1</p> | <p>The extent and nature of the electrical installation is determined from job specifications</p> |
| <p>1.2</p> | <p>Hazards are identified, risks are assessed and control measures are implemented</p> |
| <p>1.3</p> | <p>Load requirements for individual current-using equipment is determined from job specifications and/or consultation with appropriate persons</p> |
| <p>2.1</p> | <p>Circuits, control and protective devices are arranged to ensure safe and functional operation of the installation and to comply with relevant industry technical standards and job specification requirements</p> |
| <p>2.2</p> | <p>Earthing is arranged and terminated to comply with the multiple earthed neutral (MEN) system requirements</p> |

- 2.3 Protective devices are selected to meet the required switching and tripping currents coordination and discrimination for overload and short circuit protection in accordance with relevant industry technical standards
 - 2.4 Residual current devices (RCDs) are selected to meet the required circuit switching and tripping currents, in accordance with relevant industry technical standards
 - 2.5 Switchgear/control gear is selected to meet current and voltage requirements and confirmed suitable for environmental conditions (ingress protection (IP) ratings) and functional requirements
 - 2.6 Switchboards are arranged to accommodate control and protective devices, links, safety services and other distributor equipment in accordance with relevant industry technical standards
- 3 **Document electrical installation circuits, control and protection arrangements**
 - 3.1 Evidence is obtained from manufacturer/suppliers that electrical equipment selected complies with safety requirements in accordance with workplace procedures
 - 3.2 Device selection/s rationale and calculations are documented in accordance with workplace procedures
 - 3.3 Electrical installation and specifications for selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Arranging circuits for control and protection must include at least two electrical installations comprising:

- a main switchboard, supplying more than one circuit each for:
 - lighting

- socket outlets
- fixed appliances
- one installation must include a circuit supplying a three-phase load
- one installation must include a distribution board separate from the main switchboard.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG063A Arrange circuits, control and protection for electrical installations.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEEL0003 Arrange circuits, control and protection for electrical installations

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # determining the extent and nature of the installation from job specifications
- # arranging the control and protection for electrical installations with and without safety services
- arranging, testing and terminating a multiple earthed neutral (MEN) earthing system
- # applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices
- # applying safety principles for electrical systems in buildings and premises
- # applying sustainable energy principles and practices
- calculating prospective fault current in accordance with minimum fault levels specified by local supply authority
- calculating earth fault-loop impedance
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining requirements for discrimination and back-up protection for coordination of protection devices
- # determining individual load requirements
- # arranging and terminating circuits, control and protective devices to comply with requirements
- # selecting circuit protective devices and residual current devices (RCDs) that comply with all requirements
- # selecting minimum size-earthing conductors in accordance with relevant industry standards
- selecting circuit breakers to operate when installation is in island mode
- selecting RCDs/residual-current circuit breaker with overcurrent protection (RCBO) to operate when installation is in island mode

- drawing arrangements of 2-pole RCDs, 4-pole RCDs and combination RCDs
- obtaining evidence of compliance for the equipment selected
- # dividing installation into circuits
- selecting equipment for damp situations
- # coordination of protection devices and circuit wiring
- # selecting overcurrent protection devices, circuit breakers and RCDs/RCBOs
- selecting fuses, emergency controls, isolation devices, functional controls and shutdown devices
- selecting a device for fault current limiting protection
- documenting installation arrangement, specification for items selected and reasons for the selections made.

Knowledge Evidence

- AS/NZS 3000 safety principles and deemed to comply requirements including:
 - definition of terms
 - direct contact with live parts
 - indirect contact with live parts
 - thermal effects of current
 - overcurrent
 - earth faults
 - abnormal voltages
 - spread of fire
 - mechanical injury
 - external influences
 - fundamental principles of; installation design; selection and installation of equipment; means of compliance (including alterations, additions and repairs), and verification of compliance
 - methods and devices that comply with industry standards for providing protection against indirect contact
 - requirements for installation design and selection of equipment, including:
 - compliant protection arrangements
 - correct functioning
 - compatibility with supply
 - arrangement of circuits
- circuit and control arrangements, including:
 - reason for dividing electrical installations into circuits
 - factors to be considered in determining the number and type of circuits required for an installation
 - daily and seasonal demand for lighting, power, heating and other loads in a given installation
 - number and types of circuits required for a particular installation

- diagrams/schedules of circuits for given installations
- application and arrangements of separated extra-low voltage (SELV) and protected extra-low voltage (PELV) circuits, including earthing requirements and testing
- application and arrangement of an isolated supply
- hazards and risks in an electrical installation, including:
 - effects on the human body of various levels of alternating current (a.c.) and direct current (d.c.) current and duration of current flow for various current paths
 - risk of ignition of flammable materials due to the thermal effects of current or electric arcs in normal service of an electrical installation
 - risk of injury from mechanical movement of electrically actuated equipment
 - protection against direct contact (basic protection)
 - acceptable methods
 - use of ELV
- protection against indirect contact, including:
 - indirect contact with live parts of an electrical installation may occur
 - components of the ‘automatic disconnection of supply’ method of protection against indirect contact
 - the terms ‘touch voltage’ and ‘touch current’
 - the current path when a short circuit fault to exposed conductive parts of an appliance occurs
 - protection against indirect contact is by the use of Class II equipment and by electrical separation
 - additional protection by use of RCDs
 - protection against indirect contact by use of ELV and electrical separation
 - protection requirements for damp situations
- earthing, including:
 - parts of an earthing system and the purpose of each, including the terms:
 - earthed
 - earthed situation
 - earth electrode
 - equipotential bonding
 - MEN system
 - protective earth-neutral (PEN) conductor
 - main earthing conductor
 - protective earthing (PE) conductor
 - functional earthing
 - MEN link
 - typical arrangement for a MEN system and for a range of installation arrangements of PE conductors
 - typical earthing arrangements for outbuildings
 - alternate earthing systems only when required by local Regulatory Authorities (e.g. TT)

low voltage supply earthing system in dairy sheds in New Zealand)

- requirements for equipotential bonding in a range of installation situations
- protection against overload and short circuit current, including:
 - overload current or fault currents in an electrical installation
 - limitations of the use of overcurrent protection on current limited sources
 - equivalent circuit of an earth fault-loop
 - level of fault current possible at a given point in an installation from the fault-loop impedance and data from the local supply authority
 - requirements for coordination of protection devices for discrimination and back-up protection, and between protective devices and conductors of an installation
 - methods and devices that comply with industry standards for providing protection against the damaging effects of overload and fault current
- devices for automatic disconnection of supply, including:
 - operating principles of thermal/magnet circuit breakers, common types of fuses and RCDs
 - tripping characteristics of various types of circuit breakers
 - time/current curves and fusing characteristics of various types of fuses
 - tripping characteristics of various types of RCDs
 - factors in a fault-loop that will affect the impedance of the circuit
 - maximum impedance of an earth fault-loop to ensure operation of a protection device
- protection against over voltage and under voltage, including:
 - causes of over and under voltage and how this may affect the electrical system
 - methods for protection against over and under voltage
- control of an electrical installation and circuits, including:
 - switch types, current and voltage ratings and ingress protection (IP) rating and where these apply
 - switching requirements for isolation, emergency, mechanical maintenance and functional control
 - control arrangement for complete installations with and without safety services and an alternative supply, including:
 - d.c. polarity requirements
 - correct rating of d.c. switches
- switchboards/distribution boards including:
 - purpose, types and applications
 - physical and circuit arrangements for whole current and current transformer metering
 - physical and circuit arrangements of main switches, circuit protection devices, fault current limiters and metering equipment, and other distributor equipment
 - switchgear types, ratings, characteristics and applications related to alternate supplies
 - compliance requirements, including:
 - location and access
 - arc-fault protection

- identification
- construction suitability
- equipment marking
- wiring
- fire protection
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective (PPE) equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0004 Carry out basic repairs to electrical components and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and/or replace mechanical and electrical components of electrical apparatus.

It includes working safely, following written and oral instructions and workplace procedures, basic testing and techniques for dismantling and assembling apparatus, and disconnecting and reconnecting components

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to repair electrical apparatus

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

- 1.2 Existing WHS/OHS risk control measures and workplace procedures in preparation for work are followed
 - 1.3 Nature of electrical components and equipment repair is obtained from documentation and work supervisor to determine the scope of work to be undertaken
 - 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 1.5 Sources of materials required for the electrical components and equipment work are determined in accordance with workplace routines and procedures
 - 1.6 Tools, apparatus and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 2 Repair electrical apparatus**
- 2.1 Existing WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and, as required, conducted within workplace safety procedures
 - 2.3 Circuits/apparatus are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Apparatus is dismantled in accordance with manufacturer guidelines and supervisor instructions
 - 2.5 Component parts are tagged during dismantling to ensure correct and efficient reassembly and are stored to protect against loss or damage
 - 2.6 Repairs are completed efficiently without damage to other components, electrical apparatus or circuits
 - 2.7 Apparatus is assembled in sequence with components parts placed, secured and connected in accordance with manufacturer guidelines and/or industry standard practices
 - 2.8 Referring unplanned events to supervisor for direction are followed in accordance with workplace procedures

- 3 Complete and report electrical repair work activities**
- 2.9** Repairs are carried out efficiently without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
 - 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Repaired electrical apparatus is prepared for inspection and testing by appropriate person/s in accordance with workplace procedures
 - 3.3** Work area is cleaned and made safe in accordance with workplace procedures
 - 3.4** Work supervisor is notified of repair work completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Carrying out basic electrical apparatus repairs must include at least the following:
- two different electrical apparatus, in which three different types of components are faulty:
 - one of which requires disconnecting and reconnecting internal wiring to affect repairs

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG111A Carry out basic repairs to electrical components and equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0004 Carry out basic repairs to electrical components and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using of risk control measures
- applying sustainable energy principles and practices
- carrying out basic repairs to electrical apparatus, including:
 - following manufacturer service instructions for access to components
 - removing at least three different types of components specified in the work instructions
 - replacing components to manufacturer requirements
 - terminating internal wiring correctly
 - reassembling the apparatus correctly
 - testing apparatus operation
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- completing and reporting repair work activities
- implementing WHS/OHS workplace procedures and practices
- preparing to test and repair electrical apparatus
- repairing electrical apparatus in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- basic cable and conductor terminations, including:
 - application of connecting devices for conductors and terminals
 - continuity through connections and insulation resistance testing
 - general aspects and soldering involving pins on electronic components and stranded conductors carrying current up to 25 amperes (A)

- insulation removal and replacement
- stress release on cables/conductors
- electrical workshop and metal cutting
- electrical workshop machines, including:
 - drilling operations
 - fixed position power tools
 - off-hand grinding safety and machine set-up
 - tooling used on drilling machines
 - twist drills features, sharpening and faults
- principles of metal cutting, including:
 - effects of coolants and cutting fluids
 - effects of cutting tool geometry
 - factors influencing the action of cutting tools
 - principles of chip formation
- selection of cutting tools, including:
 - cutting tool materials
 - factors influencing tool selection
 - identification and selection of carbides
 - milling cutting tool design
 - principles of chip control
 - turning cutting tool design
- metal cutting conditions, including:
 - conditions under which tools cut best
 - determining cutting data
- cutting tool defects, including:
 - causes of tool failure
 - identification of types of tool failures
- overcoming causes of tool failure
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- selection of cutting tools.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory

requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0005 Develop and connect electrical control circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop, connect and functionally test electrical power and control circuits that perform specific control functions.

It includes working safely, developing schematic diagrams and converting them to wiring diagrams, selecting and connecting contactors and control devices to perform a specific function. It also includes testing electrical control circuits and completing circuit development activities documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Develop electrical control circuits

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified obtained and applied
- 1.2 Control circuit/s requirements are determined from discussions with relevant person/s and documented in accordance with workplace procedures
- 1.3 Agreement for the control circuit/s requirement is sought from appropriate person/s and documented in accordance with workplace procedures
- 1.4 Schematic arrangement of control circuits that complies with agreed requirement is documented in accordance with workplace procedures
- 1.5 Wiring diagram of control circuits is developed from schematic diagram in accordance with workplace

procedures

- 1.6** Materials needed to connect control circuit/s are obtained in accordance with workplace procedures and checked against job requirements
 - 1.7** Tools, equipment and testing devices needed to connect control circuit/s are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.8** Preparatory work is checked to ensure no damage has occurred and complies with control circuit/s application requirements
- 2 Connect and test electrical control circuits**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted within established safety workplace procedures
 - 2.3** Circuits/machines/plant are checked and isolated as required in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Control circuit component/s are connected to comply with the agreed control requirements
 - 2.5** Control circuit operation is tested for functionality and in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.6** Non-compliant control functions are rectified
 - 2.7** Unplanned situations are dealt with safely and with the approval of an authorised person in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8** Control circuits are connected, inspected and tested without unnecessary waste of materials or damage to apparatus, circuits, the surrounding environment or services using sustainable energy practice
- 3 Complete and document circuit development activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 'As-connected' control circuits are documented using standard drawing conventions and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing, connecting and functional testing must include at least four of the following electrical control circuits:

- machine interlocked circuit
- machine safety circuit
- motor jogging circuit
- multiple stop-start circuit
- single stop-start circuit
- time controlled circuit

Developing, connecting and functional testing must include at least three of the following components and electrical devices:

- contactors
- electromechanical relays
- programmable relays
- push buttons
- reduced voltage starters
- soft starters
- three phase starters
- variable speed drives

Developing, connecting and functional testing must include at least two of the following transducers/sensors:

- float switches
- light sensors
- limit switches
- photoelectric cells
- pressure switches
- proximity switches
- temperature sensors
- timers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG109A Develop and connect electrical control circuits.

Assessment Requirements for UEEEL0005 Develop and connect electrical control circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- # applying sustainable energy principles and practices
- using manufacturers' catalogues to select:
 - circuit components for appropriate duty ratings
 - control devices for specified requirements
 - pushbuttons/pilot lamps for specific requirements
 - relays for specified requirements
 - the most suitable motor starter for a given situation
 - timers for specified functions
- # labelling wires and terminals
- converting circuit (schematic) diagrams to wiring diagrams
- # developing forward reverse circuit requiring interlocking from a description of the circuit operation, including jog and interlock functions
- developing:
 - electrical control circuit in accordance with a written description (specification) and listing the sequence of operation of the circuit
 - control circuit incorporating local and remote start and stop buttons and electrical interlocking
 - simple stop-start control circuit that incorporates pilot lights and latching circuit
 - timer controlled circuits from a written description and listing the sequence of circuit operation
- measuring starting current and torque of selected motor starters

- connecting and testing:
 - circuit with a braking feature to operate a three phase motor
 - control devices into control circuits
 - direct-on-line (DOL) motor starter and testing the operation of the power and control circuits
 - variable speed drive (VSD)
 - electronic (soft) starter
 - electrical circuits with local and remote start-stop control
 - input and output devices to a programmable relay using a diagram
 - motor starter power and control circuits for correct operation
 - multiple motor starting circuit which incorporates start, stop and jog control
 - simple electrical control circuit from circuit diagrams
 - timer controlled circuit using a circuit diagram as a guide
- completing and documenting circuit development activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating principles, basic contact configurations and identification and common applications of:
 - control relays
 - timers
 - contactors
 - thermal overloads
- control circuits, including:
 - converting circuit (schematic) diagrams to wiring diagrams
 - identification of circuit diagrams (schematic) symbols and explain the operation of components represented
 - switching configurations and common applications of push buttons
 - control circuit drawing conventions
- remote stop-start control and electrical interlocking, including:
 - operation of:
 - local and remote start-stop control of relays
 - operation of an electrically interlocked control circuit
 - applying circuit checking and testing techniques to an electrical control circuit
- time delay relays, including timer circuit checking and testing procedures
- circuits using contactors, including:
 - circuit diagram symbols

- circuit development using a contactor
- using contactors for motor control
- jogging and interlocking, including:
 - purpose and application of:
 - jogging control of motors
 - electrical/mechanical interlocking
 - operation of motor control using start, stop and jog buttons
- control devices, including:
 - common control devices used in automatic control circuits: limit switches, proximity switches, photoelectric cells, pressure switches, float switches, light sensors and temperature sensors
 - basic operating principles of common control devices
 - advantages and disadvantages of common control devices
 - applications for common control devices
- programmable relays, including:
 - advantages of programmable relays over electromagnetic control circuit control
 - typical applications of programmable relays
 - block diagram representation and basic operating principles
 - input and output parameters, listing, connections and output types
 - basic programming of ladder circuits consisting of inputs, outputs i.e. stop-start circuit
 - using the monitoring facility of the programmable relay to verify each ladder circuit operation
 - programming timers and using the monitoring facility of the programmable relay to check the values of the timer
 - external devices
 - implications of programming normally closed field devices
 - conversion of control circuits
 - common faults and their symptoms
- three phase induction motor starters, including:
 - reasons for limiting the starting current of large motors
 - requirements of AS/NZS 3000 and the local supply authority requirements, with regard to starting and control of motors
 - operating principles, applications and circuits for:
 - direct on line (DOL) starter
 - variable speed drive (VSD)
 - variable frequency drive (VFD)
 - electronic (soft) starter
- three phase induction motor starters - reduced voltage, including:
 - operating principles and circuits for reduced voltage starters
 - common applications for starter types

- comparison of motor starters basic characteristics
- three phase induction motor reversal and braking, including:
 - operating principles and control circuits for reversal and braking methods
 - comparison of the different braking methods used
 - typical applications for braking methods
- three phase induction motor speed control, including:
 - operating principles and circuits for motor speed control
- relevant manufacturer specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0006 Develop detailed and complex drawings for electrical systems using CAD systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop detailed and complex drawings for electrical systems using computer-aided design (CAD) systems.

It includes 2-D and 3-D drawing formats covering a representative range of electrical systems, such as installations with alternative supplies, installations over 400 ampere (A) per phase at low voltage (LV) and/or high voltage (HV), single or multi-tenancies, heavy plant, switchgear, protection systems, earthing, power factor correction, control equipment, and energy monitoring and management.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECS0033 Use engineering applications software on personal computers

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0007 Develop detailed electrical drawings

UEECD0031 Prepare engineering drawings using manual drafting and CAD for electrotechnology applications

UEECD0030 Prepare electrotechnology/utilities drawings using manual drafting and CAD equipment and software

UEECD0032 Produce detailed electrotechnology/utilities drawings using CAD equipment and software

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop detailed and complex drawings for electrical systems

2 Develop detailed and complex drawings for electrical systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3** The scope of detailed and complex electrical drawings is interpreted from workplace documentation and/or work instructions
- 1.4** Electrical drawing details required for work are identified in accordance with project specifications and workplace procedures
- 1.5** Relevant personnel are consulted to ensure the work is coordinated effectively with others
- 1.6** Relevant software tools, components, materials and equipment needed for the work are selected in accordance with workplace procedures
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Design layouts and detailed and complex electrical drawings are determined from project specifications for the electrical systems
- 2.3** Technical data of electrical system component/s are identified to determine parameters to be detailed in

electrical drawings

- 2.4 Relevant software tools are used to produce detailed and complex electrical drawings in accordance with workplace procedures
 - 2.5 Detailed and complex electrical drawings are checked for accuracy in accordance with project specifications and workplace procedures
 - 2.6 Unplanned situations are dealt with safely and in accordance with workplace procedures
- 3 **Complete detailed and complex drawings for electrical systems**
 - 3.1 Completed detailed and complex electrical drawings are submitted to relevant person/s to be checked for accuracy in accordance with project specifications and workplace procedures
 - 3.2 Alterations, additions or correction instructions are followed and detailed and complex electrical drawings re-submitted for final approval
 - 3.3 Completed detailed and complex electrical drawings are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG180A Develop detailed and complex drawings for electrical systems using CAD systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0006 Develop detailed and complex drawings for electrical systems using CAD systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying graphical techniques to produce products, processes, systems or services design representations
- applying knowledge of complex electrical equipment design drawing methods, techniques, procedures and protocols and documenting design
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- developing a variety of detailed and complex electrical drawings
- incorporating feedback into final products
- interpreting and using technical data and specifications
- preparing to develop detailed and complex drawings for electrical systems
- presenting designs of electrical engineering products, processes, systems or services
- producing drafting documentation
- producing drawing sets
- selecting relevant computer-aided design (CAD) software tools, components, materials and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- managing resources
- relevant advanced CAD systems
- relevant CAD modelling techniques
- relevant computer-based modelling, design, drafting and application systems
- relevant graphical engineering design techniques for products, processes, systems or services representation
- relevant manufacturer specifications and operating instruction

- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing detailed and complex drawings for electrical systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0007 Develop detailed electrical drawings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop detailed electrical drawings and documentation.

It includes preparing and developing detailed electrical drawing, and following documentation and workplace procedures.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0031 Prepare engineering drawings using manual drafting and CAD for electrotechnology applications

UEECD0030 Prepare electrotechnology/utilities drawings using manual drafting and CAD equipment and software

UEECD0032 Produce detailed electrotechnology/utilities drawings using CAD equipment and software

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work area are

detailed electrical drawing	identified, obtained and applied
1.2	WHS/OHS risk control measures and procedures in preparation for the work are followed
1.3	Detailed electrical drawings are determined from the scope of work to be undertaken
1.4	Electrical drawing details required for work to be undertaken are obtained from project specifications and in accordance with workplace procedures
1.5	Appropriate person/s is consulted to ensure the work is coordinated effectively with others
1.6	Software, tools and equipment for work are obtained in accordance with workplace procedures
2 Develop detailed electrical drawing	2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
	2.2 Detailed electrical drawings design and layout requirements are determined from project specifications
	2.3 Technical data of electrical system components are interpreted to determine parameters included in the detailed electrical drawings
	2.4 Appropriate software tools are used to produce detailed electrical drawings based on workplace procedures
	2.5 Detailed electrical drawings are checked for accuracy in accordance with workplace procedures and project specifications
	2.6 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
3 Complete detailed electrical drawing documentation	3.1 Completed detailed electrical drawings are submitted to appropriate person/s to be checked for accuracy in accordance with workplace procedures and project specifications
	3.2 Alterations, additions or correction instructions are followed and detailed electrical drawings are re-submitted for final approval
	3.3 Completed detailed electrical drawings are filed securely in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG179A Develop detailed electrical drawings.

Assessment Requirements for UEEEL0007 Develop detailed electrical drawings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- completing detailed electrical drawings documentation and presenting preliminary and final drafts for verification, including:
 - applying, storing and retrieving data related requirements
 - digitising and scanning drafting/drawings products
 - producing related documentation for presentations
- preparing and developing detailed electrical drawings, including:
 - applying electrical equipment design drawing methods, techniques, procedures and protocols and documenting design
 - applying project specifications
 - interpreting and using technical data and specifications
 - producing drafting documentation
 - producing drawing sets
 - using advanced computer-aided design (CAD) systems and commands
 - using relevant drafting peripheral systems, equipment and tools to develop detailed drawings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- project specifications
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant software tools and equipment

- relevant WHS/OHS legislated requirements
- relevant workplace documentation and file storage, including digitising and scanning
- relevant workplace policies, procedures and instructions
- producing final drafts for verification, including:
 - principles, purpose and concept of verification of drafting products encompassing:
 - production of electrical drawings for verification by authorised persons, production of drawing sets, production of related documentation and presentations of final drafts
 - processes and procedures related to the verification of final drafts by authorised persons encompassing accuracy
 - publication of verified electrical drawings
- detailed electrical drawing production, including:
 - distribution branch circuits and boards, services and load calculations encompassing panels (high voltage (HV)/low voltage (LV))/switchboards/motor control centres/final
 - conductor/cable selection and calculations encompassing:
 - electrical, data and communications
 - overcurrent and overvoltage protection
 - cable support systems encompassing:
 - cable trays, trunking, conduits, ducts, guards, saddles, carriers, raceways/cavities and poles
 - box and fitting fill requirements
 - wiring devices and terminations
 - distribution equipment encompassing:
 - power circuit devices
 - distribution system transformers encompassing:
 - specialty transformers and power circuit devices
 - lighting applications encompassing:
 - lamps, ballasts and components
 - motors encompassing:
 - functional controls, advanced motor controls, motor calculations and motor maintenance arrangements
 - hazardous areas encompassing electrical equipment; classification of emergency standby systems encompassing uninterrupted power supply (UPS)/inverter and battery banks
 - fire alarm systems
 - HV terminations/splices
 - cable size selection for installation cable run
 - cable sizes, voltage drops, conduit sizes, fault levels, fuse/circuit breaker sizes and working temperatures
 - short circuit calculations
 - earth-loop impedance compliance test arrangements on the completed design
 - touch potentials calculations
 - cable schedules creation

- single line and as built drawings encompassing:
 - three phase schematic colour diagrams, marked up cable calculations, short circuit results and earth-loop impedance results
- quantities parts list and drawings for tender drawings issued by electrical consultants/engineers
- coordination and discrimination studies
- building management systems (BMS), including:
 - building information modelling and sustainable design
- fuse and circuit breaker trip curves, plots and displays
- troubleshooting/fault finding
- detailed panel layouts, including:
 - detailed panel layouts creation
 - din rail tool
 - terminal strip editor
 - detailed panel layout annotation
 - detailed reports
- schematic component commands, including:
 - schematic symbols editor
 - schematic editor
 - components from lists
 - connectors
 - terminals: multiple level and jumpers
 - circuits
 - multiple phase circuits
- schematic editing, including:
 - advanced utilities
 - copy catalogue and location
 - values
 - swapping and updating blocks
 - using the auditing tools
 - update and retag drawings
- digitising and scanning, including:
 - drawings: digitisation - tablet and software configuration, tablet and puck, grids set-up and alignment marks for various size drawings, software parameters setting, and hard copy drawings digitisation to tablet parameters
 - digitised drawing editor, manipulation and save
 - digitise and grid set-ups and alignment marks on a hard copy of a large drawing (e.g. A1)
 - scanning devices and peripherals set-up encompassing associated software usage, save (e.g. file formats for use other software applications) and management
 - drawing hard copy scan
 - scanned image conversion to vector format, edit and save in file formats for use in CAD

encompassing:

- importation of scanned images into CAD drawings in image formats for editing.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Performance criteria numbering error corrected in element 3.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate and modify low voltage (LV) heating equipment and controls.

It includes working safely, identifying faults in heating equipment, repairing heating equipment, ensuring all work complies with relevant Australian Standards and legislation, and completing work and documenting activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
and

UEECD0043 Solve problems in direct current circuits
or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes

1 Prepare to work on heating equipment

2 Evaluate and modify

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element

- 1.1 Scope of work is obtained from relevant documentation, electrical drawings or relevant person/s
 - 1.2 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
 - 1.3 Hazards are identified, risks are assessed and control measures are implemented
 - 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
 - 1.5 Sources of materials required for work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required to carry out work are obtained and checked for correct operation and safety
- 2.1 Equipment and circuits are checked and arrangement

- heating equipment** identified
- 2.2 Circuits are checked and isolated in accordance with workplace procedures and regulatory requirements
 - 2.3 The need to test or measure live work is determined in accordance with WHS/OHS requirements and, as necessary, conducted in accordance with workplace procedures
 - 2.4 Fault/s and probable cause/s are identified from measured and calculated values as they apply to heating equipment
 - 2.5 Required components are identified and replaced in accordance with manufacturer specifications and industry standards
 - 2.6 Unexpected situations are dealt with safely and with the approval of relevant person/s
- 3 Complete work and document activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to modify circuits and equipment is documented
 - 3.4 Work completion is documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating and modifying LV heating

- one single phase and one multi-phase from

equipment and controls must include two of the following types of heating equipment and their controls:

the following:

- space heating
- cooking
- water heating
- industrial process heaters

Unit Mapping Information

No equivalent unit

Assessment Requirements for UEEEL0008 Evaluate and modify low voltage heating equipment and controls

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Performance criteria numbering error corrected in element 3.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures, including identifying hazards, assessing risks and implementing control measures
- # checking circuits are isolated in accordance with workplace procedures and regulatory requirements
- determining the operating parameters of existing heating circuits and equipment
- testing the function of a thermostat
- calculating the heat energy in a simple heating process
- testing the operation of an over temperature cut-out of the safety thermostat
- altering existing heating circuits and equipment to comply with specified operating parameters
- selecting heating circuits and equipment to comply with a specified function and operating parameters
- determining the cause of low efficiency in existing heating circuit and equipment
- determining conditions causing an existing heating circuits and equipment to be unsafe
- # connecting heating equipment and appliances
- identifying faulty components in heating appliances and controls from test results
- testing heating appliances and controls for serviceability
- ensuring all work complies with relevant Australian Standards and legislation
- completing work and documenting activities
- dealing with unplanned events/situations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical heating control devices, including:
 - methods of manual heat control
 - methods of automatic heat control
 - types and application for common thermostats
 - operation of common thermostats, thermal cut-outs and pressure relief valves, flow switches and checking sacrificial anodes
 - sensitivity and differential of thermostats
 - techniques for testing a thermostat, including differential and correct operation
 - applications and operation of simmerstats
 - electronic heat control
- fixed electrical heating appliances, including:
 - terminology: heat energy, temperature, specific heat capacity, thermal conductivity and thermal stability
 - methods to test the heat energy in a simple heating process
 - methods of heat transfer
 - connections to a two phase stove
 - operation of reverse cycle air conditioning
- electrical water heater operation, including:
 - types of water heaters (instantaneous and storage) and their methods of control
 - intrinsic safety (pressure relief and thermal cut-out)
 - techniques for testing of over temperature cut-out of a thermostat
 - switchboard requirements to supply a controlled load water heater
 - internal circuit of a twin element water heater and supply connections
 - solar heating system and its integration into an electrical installation
 - heat pump
- faults in heating equipment and controls, including:
 - circuit diagrams of common heating equipment and controls
 - single phase and three phase element resistance values
 - techniques for testing single and three phase elements for correct insulation resistance and continuity
 - equipment replacement techniques
 - techniques for identifying and locating faulty components in heating equipment/controls
 - common types of faults
 - techniques for repairing/replacing faulty heating equipment components
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- relevant industry standards.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

Assessment Requirements for UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Error in Knowledge Evidence corrected.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures, including:
 - # identifying and assessing hazards and risks, and implementing control measures
- # checking circuits are isolated in accordance with workplace procedures and regulatory requirements
- # determining the operating parameters of existing lighting circuits and equipment
- modifying existing lighting circuits and their controls to comply with specified operating parameters, including drawing and connecting lighting circuits that incorporate:
 - one-way
 - two-way
 - # intermediate switching of light points using the loop at the light/switch methods of thermoplastic sheathed (TPS) wiring
- # developing lighting circuits and equipment to comply with a specified function and operating parameters
- # determining the cause of low illuminance level in existing lighting circuits and equipment
- determining conditions causing existing lighting circuits and equipment to be unsafe
- # connecting lighting equipment and controls
- # identifying faulty components in luminaires and auxiliary/control equipment from test results
- # testing luminaires and auxiliary/control equipment for serviceability
- ensuring all work complies with relevant Australian Standards and legislation
- completing work and documenting activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- loop at the light method of wiring lighting circuits
- loop at the switch method of wiring lighting circuits
- installation methods of accessories and wiring for a lighting circuit incorporating one-way, two-way and intermediate switching of lighting points using the loop at the light/switch method of TPS wiring
- TPS cabling requirement for the loop at the light/switch circuit
- correct operation of the installed circuits including testing for compliance with industry standards
- emergency and evacuation lighting and lighting control, including:
 - factors and requirements of emergency and evacuation lighting concerning illumination levels, luminaire positioning and operating period
 - characteristics of maintained, non-maintained and sustained emergency lighting systems
 - arrangement of batteries in point and central bank emergency lighting supply systems
 - lighting control methods
- principles of lighting technology, including:
 - basic electrical terminology
 - colour theory
 - lighting techniques
- local Supply Authority requirements for maintaining high power factor
- terminology, principles and standards relevant to lighting (energy efficiency as per National Construction Code (NCC))
- types of luminaires:
 - different types of luminaires, their features and purpose
 - operation of different types of luminaires
 - expected lamp life, colour rendering and efficacy for typical types of different types of luminaires
- lighting circuits, equipment and controls used for the following applications:
 - commercial
 - industrial
 - domestic
- lighting layout in terms of visual comfort and relevant Australian Standards
- Australian Standards and local requirements for lighting
- light-emitting diode (LED) lighting and its applications
- Neon, Argon and Xenon lighting and their applications
- comparison of incandescent, low intensity discharge, high intensity discharge, LED and other types of lighting
- fire protection – residential fire and smoke alarms, including:

- types of fire and smoke alarms
- regulations and standards requirements regarding residential fire and smoke alarms
- locations for residential fire and smoke alarms
- wiring methods for residential fire and smoke alarms
- operation of typical residential fire and smoke alarms
- identifying faults in luminaires and auxiliary/control equipment, including circuit and wiring diagrams of common lighting circuits, including:
 - common fault symptoms and associated causes
 - common faults in luminaires and auxiliary/control equipment
 - techniques for repairing/replacing faulty lighting components
- input and output parameters of equipment incorporating electronic components for; controlling/switching lighting, auxiliary control equipment, energy measurement and control, rectifying and inverting electrical supplies
- hazards and safety requirements related to equipment incorporating electronic components used in electrical systems
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

Assessment Requirements for UEEEL0010 Evaluate and modify low voltage socket outlets circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error fixed in Application

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures, including:
 - # identifying hazards, assessing risks and implementing control measures
- # checking circuits are isolated in accordance with workplace procedures and regulatory requirements
- determining the operating parameters of existing socket outlets circuits
- # altering existing socket outlets circuits to comply with specified operating parameters
- # developing socket outlets circuits to comply with a specified function and operating parameters
- # determining conditions causing existing socket outlets circuits to be unsafe
- installing circuits supplying a combination of socket outlets and equipment
- installing, terminating and testing of supported pendant outlets
- # verifying correct operation of the installed circuits, including dead testing to comply with industry standards
- # verifying the polarity of switched socket outlets
- # identifying faulty socket outlets from visual inspection and/or test results
- ensuring all work complies with relevant Australian Standards and legislation
- completing work and documenting activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of

the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- circuits for socket outlets, including:
 - different types of socket outlets and their purpose
 - requirements concerning the polarity of switched socket outlets
 - techniques for checking for phase rotation for three phase outlets
 - correct cable size to supply 10 ampere (A), 15 A, 20 A and 32 A socket outlets (single and three phase) for given installation conditions
 - verifying number of socket outlets connected to a 16 A and 20 A circuit breaker in accordance with industry standards
 - installation methods of single phase socket outlet circuits
 - correct operation of the installed circuits, including dead testing for correct in accordance with industry standards
 - circuit protection and residual current device (RCD) requirements for socket outlets circuits
 - use of cable support systems for pendant outlets
 - socket outlets for vehicle charging
- final sub-circuits and segregation, including:
 - purpose of mixed circuits
 - circuit loading for a mixed circuit
 - purpose of segregation of circuits and the AS/NZS 3000 requirements
 - installation methods a single phase mixed circuit
 - verifying correct operation of the installed circuits, including testing for correct compliance with industry standards
- identifying faults in socket outlets circuits including:
 - circuit diagrams, wiring diagrams, cable schedules and specifications of socket outlets circuits
 - common fault symptoms and associated causes
 - common faults in socket outlets circuits
 - techniques for locating and repairing/replacing faulty socket outlets
 - methods to determine the cause of RCD operation in a socket outlets circuits
- hazards and safety requirements related to equipment incorporating electronic components used in electrical systems
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0011 Evaluate performance of low voltage electrical apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate performance of low voltage (LV) electrical apparatus.

It includes preparing evaluations, determining performance requirements, inspecting and setting up performance tests, evaluating inspection and test results and documenting test outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical devices and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to evaluate electrical apparatus

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3 Inspection and testing area are checked for safety hazards and risk control measures implemented in accordance with WHS/OHS and workplace procedures
- 1.4 Relevant documentation is obtained and interpreted to identify the certification/approval specifications of the electrical apparatus to be assessed.
- 1.5 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.6 Tools, testing devices and materials required for work are obtained and checked for correct operation and safety

2 Evaluate electrical apparatus

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 The need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Circuits/apparatus/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Assessment process of electrical apparatus performance requirements and testing methods applied are in accordance with relevant industry standards and workplace procedures
- 2.5 Apparatus inspection and test methods for relevant parameter/s are prepared in accordance with workplace procedures and relevant person/s advised
- 2.6 Apparatus inspection and tests are carried out in accordance with workplace procedures and results

- documented
- 2.7** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.8** Assessment is carried out without damage to systems circuits, environment and/or services using sustainable energy practices
- 3 Complete work and document evaluated results**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Inspection and test results are evaluated and non-compliance issues identified in accordance with workplace procedures
- 3.4** Inspection and test results and comments on non-compliance issues are documented and reported to relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Reporting performance of two different electrical apparatus must include at least the following:

- WHS/OHS
- electrical safety
- ergonomic operation
- testing against specification
- fit for purpose
- sustainable energy principles

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG131A Evaluate performance of low voltage electrical apparatus.

Assessment Requirements for UEEEL0011 Evaluate performance of low voltage electrical apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- checking and isolating circuits/machines/plant
- dealing with unplanned situations in accordance with workplace procedures and safe work practices
- evaluating electrical apparatus
- identifying non-compliance defects
- interpreting compliance documents of equipment for assessments
- obtaining and checking tools, testing devices and materials required for work
- preparing to evaluate electrical apparatus
- reporting inspection and test results and non-compliance issues
- requesting advice and coordinating work with relevant person/s
- setting up and conducting appropriate inspections and tests of electrical apparatus
- testing and measuring live work environments
- using sustainable energy practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques
- relevant electrical machines and performance monitoring
- relevant machine inspection and test methods
- relevant manufacturer specifications and operating instructions
- relevant performance standards and regulatory requirements for electrical equipment
- relevant job safety assessments or risk mitigation processes

- relevant tools, testing devices and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to evaluating performance of electrical apparatus
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit includes the installation of wiring enclosures, cable support systems, cables, protection devices, switchgear, control gear, switchboards, and accessories designed to operate at voltages up to 1,000 volt (V) alternating current (a.c.) or 1,500 V direct current (d.c.).

It covers working safely and to installation standards, routing cables to specified locations, terminating cables and connecting wiring at accessories, matching appliances and accessories with that specified, making required circuit connections and completing the necessary installation documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

- UEEEL0003 Arrange circuits, control and protection for electrical installations
 - UEEEL0020 Solve problems in low voltage a.c. circuits
 - UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
 - UEEEL0018 Select wiring systems and select cables for low voltage electrical installations
 - UEEEL0005 Develop and connect electrical control circuits
 - UEEEL0019 Solve problems in direct current (d.c.) machines
 - UEEEL0021 Solve problems in magnetic and electromagnetic devices
 - UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
 - UEEEL0008 Evaluate and modify low voltage heating equipment and controls
 - UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls
 - UEEEL0010 Evaluate and modify low voltage socket outlets circuits
 - UEEEL0024 Test and connect alternating current (a.c.) rotating machines
 - UEEEL0025 Test and connect transformers
- and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multiple path circuits
 - UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

- 1 Prepare to install low voltage (LV) wiring, appliances, switchgear and associated accessories**

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Nature and location of work is determined from workplace documentation, drawings or relevant person/s to determine the scope of work

- 1.2 WHS/OHS requirements and workplace procedures are applied
 - 1.3 Risks are identified and control measures implemented in accordance with workplace procedures
 - 1.4 Need to test or measure live work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
 - 1.5 Circuits/machines/plant are checked as being isolated, where necessary, in strict accordance with WHS/OHS requirements and procedures.
 - 1.6 Installation of wiring, appliances, switchgear, control gear and associated accessories is planned and appropriately sequenced in consultation with relevant person/s
 - 1.7 Locations of appliances, switchgear, accessories and cable routes are planned within the constraints of building structure, other services, specifications and regulatory requirements
 - 1.8 Material required for installation work is obtained in accordance with workplace procedures and checked against job specifications
 - 1.9 Tools, equipment and measuring devices required for the installation and work environment are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.10 Preparatory work is inspected and checked to ensure no damage has occurred and compliance with job specifications
- 2 Install LV wiring and associated accessories**
- 2.1 Wiring and accessories are installed and terminated to comply with technical standards and job specifications and requirements
 - 2.2 Accessories are installed straight and square in the required locations and within acceptable tolerances
 - 2.3 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements

- 2.4 Ongoing compliance and safety inspection of installed wiring systems and testing of installed circuits is undertaken
 - 2.5 Defects revealed through on-going compliance and safety inspection and tests are rectified
 - 2.6 Cable installation and termination is carried out efficiently without unnecessary waste of materials or damage to apparatus, circuits, the surrounding environment using sustainable energy practices
 - 2.7 Unexpected situations are dealt with safely and with the approval of an authorised person
- 3 Install and connect LV appliances, switchgear and associated accessories**
 - 3.1 Appliances, switchgear and accessories are installed to comply with technical standards and job specifications and requirements with sufficient access to affect terminations, adjustment and maintenance
 - 3.2 Accessories are installed straight and square in the required locations and within acceptable tolerances
 - 3.3 Wiring is terminated at appliances, switchgear and accessories in accordance with manufacturer specifications and functional and regulatory requirements
 - 3.4 Ongoing compliance and safety inspections of the installed appliances, switchgear and accessories are undertaken
 - 3.5 Defects revealed through on-going compliance and safety inspection are rectified
 - 3.6 Installation is carried out efficiently without unnecessary waste of materials or damage to apparatus, circuits, the surrounding environment or services using sustainable energy principles
 - 3.7 Unexpected situations are dealt with safely and with the approval of an authorised person
- 4 Complete work and document activities**
 - 4.1 WHS/OHS work completion risk control measures and procedures are followed
 - 4.2 Worksite is cleaned and made safe in accordance with workplace procedures

- 4.3** 'As-installed' cables/wiring, appliances, switchgear and accessories are documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing LV wiring, appliances, switchgear and associate accessories must include:

- installing and connecting main switches, protective devices and links on a main switchboard and preparing the switchboard for the installation of metering
- installing, modifying and testing electrical installations and equipment for construction and demolition sites
- installing and connecting a switchboard
- socket outlets
- lighting equipment and accessories
- luminaires

Installing LV wiring, appliances, switchgear and associate accessories must also include least four of the following:

- cooking appliances
- smoke and fire detectors
- water heaters and controls
- three phase motor starter and control switches
- fixed electric heating system (room heaters)
- transformers
- appliances producing hot water or steam
- electric heating cables for floors and ceilings
- trace heating
- duct heaters
- electricity converters
- capacitors
- batteries
- gas appliances and equipment
- air conditioning and heat pump systems
- lifts

Wiring systems, enclosures

- metallic conduit

and supports must include at least three of the following:

- non-metallic conduit
- trunking
- duct
- cable tray/ladder
- catenary
- posts/poles/struts
- thermoplastic insulated (TPI) cable
- flat thermoplastic sheathed (TPS)
- circular TPS
- steel wire armoured
- fire rated cable
- flexible cables
- consumer mains
- sub-mains
- single phase final sub-circuit
- three phase final sub-circuit

Cable types used for wiring systems must include at least four of the following:

Purpose of wiring system circuits must include:

Unit Mapping Information

No equivalent unit

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # reading and interpreting drawings and schedules related to cable layouts, apparatus locations and circuit connections
- # planning cable routes and installation of appliances, switchgear and accessories and obtaining installation materials
- # identifying underground services
- selecting underground consumers mains in accordance with AS/NZS 3000 and local supply authority requirements
- sequencing the installation effectively with other relevant people
- installing and terminating consumer mains for connection via overhead terminals and underground
- # installing of conduit, cable ladder/tray
- # installing wiring systems for low voltage (LV) circuits
- routing, placing and securing cables in accordance with industry standards
- # installing LV electrical apparatus and associated equipment
- selecting equipment suitable for installation in given damp situations
- # placing and securing appliances, switchgear and accessories accurately in their planned location
- terminating cables and conductors, including aerial types in accordance with industry standards
- # terminating subcircuit cabling at switchboards and connecting components including:
 - correct interconnection between switchgear, protection devices and links'
 - use of adequately sized cables
 - correct marking of equipment

- clear identification of circuit neutral conductors
- # terminating and connecting appliances, switchgear and accessories in accordance with industry standards
- # conducting safety inspection, testing and documentation of installed circuits, including verification of earth continuity, insulation resistance, polarity, circuit connections and protection arrangements
- # maintaining fire integrity.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- standards, codes and requirements applicable to the installation of wiring systems and electrical equipment, including:
 - cables and methods of mechanical protection and support
 - techniques for protection against and from other services
 - identifying prohibited cable locations
 - identifying systems with alternate supplies
 - building codes affecting the installation of cables and current-carrying equipment and accessories in buildings, structures and premises, including limitation on penetration of structural elements, maintenance of fire protection integrity, requirements for emergency/safety services and wiring above suspected ceilings
 - issues affecting electrical installations in heritage buildings and premises (limitation on penetration of structural and finished elements, accessing cable routes, types and colour of exposed accessories)
 - techniques for protection against thermal effects
 - required and permitted locations of current-carrying equipment and accessories
 - control, switching, overcurrent and residual current device (RCD) protection
 - equipotential bonding in accordance with AS/NZS 3000 and local supply authority requirements
 - sizing of wiring enclosures based on space factor recommendations of AS/NZS 3000 Wiring Rules
- techniques for installing cables and wiring systems, including:
 - typical cable routes through buildings, structures and premises
 - application of wiring accessories
 - drawing-in, placing and fixing of cables
 - cable and conductor terminations
 - methods of maintaining fire rating integrity
 - techniques for inspecting and testing installed and terminated cables to ensure they comply with continuity and insulation resistance and are safe to connect to the supply
 - connection of electrical equipment and terminal configuration for connection of phase,

neutral and protective earthing conductors for the following types of equipment:

- heating
 - lighting and smoke detectors
 - motors
 - transformers
 - switchgear and accessories pendant socket outlets
 - appliances.
- termination of subcircuit cabling at switchboards and connection to components including:
 - correct interconnection between switchgear, protection devices and links'
 - correct preparation for fitting and connection of local supply authority equipment
 - use of adequately sized cables
 - correct marking of equipment
 - clear identification of circuit neutral conductors
 - correct polarity
 - safe removal of equipment and termination of unused cable
 - varied and additional standards and requirements for special situations, including:
 - patient treatment areas
 - marinas and boats at LV
 - transportable structures and vehicles and their site supplies
 - shows and carnivals
 - systems with alternate supplies
 - methods for the installation, modification and testing of electrical installations and equipment for construction and demolition sites, complying with AS/NZS 3012 and applicable workplace safety legislation including:
 - supply requirements
 - switchboards for the purpose of construction and demolition
 - protection of circuits
 - construction wiring
 - lighting
 - socket outlets
 - circuits for lifts
 - calibration of instruments
 - inspection and testing methods
 - initial and periodic inspection and testing
 - identifying hazardous areas, including:
 - additional training required to work competently with electrical equipment for hazardous areas
 - nature of areas classified as a hazardous area
 - responsibility for classifying a hazardous area
 - awareness of standards called up by the Wiring Rules for selection, installation,

- inspection and maintenance of electrical equipment and installations in hazardous areas
AS/NZS 3000 requirements for hazardous areas
- requirements for the installation of cables and accessories in damp situations and extra-low voltage (ELV) installations, including:
 - restricted zones around baths, showers, fixed water containers, pools, sauna heaters and fountains/water features for given installations
 - techniques for selecting equipment suitable for installation in given damp situations
 - voltage range that defines ELV
 - use of RCDs for damp situations
 - separated extra-low voltage (SELV) system and a protected extra-low voltage (PELV) system
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements for selecting ELV systems and devices for a range of installations and conditions
 - equipotential bonding in showers, bathrooms, swimming and spa pools
 - installation of aerial conductors and underground wiring including:
 - AS/NZS 3000 requirements
 - types and application of aerial conductors
 - aerial span limitations and required clearances
 - selection of aerial supporting poles/post and struts for a given application
 - use and requirements of catenary support systems
 - acceptable cable types and protection for underground wiring categories
 - underground wiring depth and protection
 - underground wiring clearances from other services
 - techniques for termination of aerial cables
 - techniques for testing of installed cables in compliance with Australian Standards
 - install unprotected consumer's mains to reduce the risk of short-circuit to a minimum
 - hazards and safety requirements related to equipment incorporating electronic components used in electrical systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic errors fixed in Performance Evidence

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to isolate, test and troubleshoot electrical circuits operating at voltages up to 1,000 volts (V) alternating current (a.c.) or 1,500 V direct current (d.c.).

It includes working safely, isolating electrical circuits, evaluating low voltage (LV) electrical circuits, applying systematic fault-finding procedures, conducting repairs and completing the necessary documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical circuits and equipment which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for electrical installations

- UEEEL0020 Solve problems in low voltage a.c. circuits
- UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in magnetic and electromagnetic devices
- UEEEL0024 Test and connect alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- UEEEL0047 Identify, shut down and restart systems with alternate supplies
and
- UEECD0043 Solve problems in direct current circuits
or
- UEECD0044 Solve problems in multiple path circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to isolate, test and troubleshoot electrical circuits

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Scope of work to be undertaken is determined from relevant documentation, electrical drawings or relevant person/s
- 1.2** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.3** Electrical hazards are identified, risks are assessed, and control measures are implemented
- 1.4** Relevant industry standards, regulation, legislation and workplace procedures are identified and applied

- 2 Apply safe isolation, lock-out and tag-out procedures**
 - 1.5 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 2.1 Electrical circuits and conductors, all of their energy sources, and isolation points are identified
 - 2.2 Electrical circuits are isolated from all energy sources and secured in accordance with industry and regulatory standards
 - 2.3 Safe isolation from all sources of energy is confirmed
 - 2.4 Isolation is secured using appropriate devices, tags, lock-out or permit system
 - 2.5 Any stored energy is discharged and deenergisation proved
 - 2.6 Unused conductors and equipment are dealt with in accordance with regulatory requirements
- 3 Conduct compliance inspection and testing on electrical circuits**
 - 3.1 Electrical circuits are visually inspected for compliance with regulatory requirements
 - 3.2 Mandatory tests are identified, including sequence of tests and equipment required
 - 3.3 Continuity of the earthing system is tested for compliance with regulatory requirements
 - 3.4 Insulation resistance of the circuit is tested for compliance with regulatory requirements
 - 3.5 Polarity of the circuit is tested for compliance with regulatory requirements
 - 3.6 Correct circuit connections is tested for compliance with regulatory requirements
 - 3.7 Alternative supply systems are inspected and tested for compliance with industry and regulatory standards
 - 3.8 Earth fault loop impedance is verified for compliance with regulatory requirements
 - 3.9 Operation of residual current devices (RCDs) is tested for compliance with regulatory requirements

- 5.2 Work area is cleaned and made safe in accordance with workplace procedures
- 5.3 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit must be demonstrated with circuits and equipment operating at voltages up to 1,000 volts (V) alternating current (a.c.) or 1,500 V direct current (d.c.) and must include:

- Isolating, testing and troubleshooting LV electrical circuits and equipment must include safe isolation, visual inspection and mandatory testing of the following in accordance with industry standards, including one equipment type that has a dual supply, one circuit breaker and one high rupturing capacity (HRC) fuse:
- at least one of the following:
 - main switchboard
 - distribution board
- and
- at least three of the following:
 - motor
 - space heater
 - water heater
 - lights
 - socket outlets
- Locating and diagnosing LV electrical circuit and equipment faults must include at least four of the following common faults in electrical circuits:
- open circuit
 - short circuit
 - incorrect connections
 - insulation failure
 - unsafe condition
 - equipment/component failure
 - related mechanical failure

Unit Mapping Information

No equivalent unit

Assessment Requirements for UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic errors fixed in Performance Evidence

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures, including:
 - # identifying and assessing hazards and risks, and implementing control measures
- # selecting and using correct tools and equipment to isolate, test and troubleshoot electrical circuits
- # performing safe isolation of equipment, including:
 - # preparing a safe work method statement (SWMS) or job safety analysis (JSA) for effective and safe isolation
 - # applying safe methods to identify sources of supply to be isolated
 - # identifying appropriate points of isolation
 - # isolating equipment from all sources of supply by safely switching off switches or circuit breakers, removing fuses or links, or removing circuit connections
 - # securely isolating devices by applying an isolation securing device which requires a deliberate action to engage or disengage
 - # applying a personal danger tag, lock-out or permit system
 - # applying safe methods to confirm effective and safe isolation from all sources of supply
 - identifying the limits of the safe work area
 - discharging any stored energy
 - # proving de-energisation of all relevant electrical equipment and conductors, including:
 - # testing the voltage tester on a known live source
 - # testing between all conductors and a known earth

- # testing between conductors
- # retesting the voltage tester on a known live source for correct operation
- # correctly using personal protective equipment (PPE) whilst performing effective isolation and operation of low voltage (LV) equipment
- # completing visual inspection of the electrical installation for compliance with regulatory requirements including:
 - # protection requirements
 - # general condition
 - # mains/sub-mains
 - # switchboards
 - # wiring systems
 - # equipment and accessories
 - # earthing
- # conducting mandatory testing to ensure:
 - # compliance with AS/NZS 3000 mandatory test requirements and the application of mandatory tests following guidance of AS/NZS 3017
 - # insulation resistance of mains, sub-mains and final sub-circuits meets the regulatory requirements
 - # earth continuity of the main earthing conductor, protective earthing conductors, combined protective earthing and neutral (PEN) conductors and bonding conductors meet the regulatory requirements
 - # polarity of active, neutral and earth conductors including phase sequence and rotation meet the regulatory requirements
 - # correct connections of active, neutral and protective earthing conductors are tested to ensure no short circuits between conductors, no transposition of conductors that could result in the earthing system or exposed conductive parts becoming energised, and no interconnection of conductors between different circuits, in accordance with regulatory requirements
 - # verification that earth fault-loop impedance limitations are not exceeded in accordance with regulatory requirements
 - # residual current devices (RCDs) have been correctly installed, their function verified, and the isolation of all switched poles verified, in accordance with regulatory requirements
- testing and verifying alternate supplies, including:
 - completing continuity and voltage testing, including output voltage of device/s
 - earth resistance testing, including:
 - continuity of main earthing conductor
 - checking earth bonding integrity and equipotential bonded parts
 - insulation resistance test
 - polarity and checking operation of control device/s
- verifying records for the date of initial certification are completed in accordance with regulatory requirements

- # locating and diagnosing common faults in electrical circuits
- testing and diagnosing high impedance or open circuit neutral fault
- # repairing and/or replacing parts to rectify faults in accordance with AS/NZS 3000
- # applying steps required to ensure the fault does not re-occur
- # completing final testing and re-commissioning
- completing work and documenting activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- safety procedures for working on electrical systems, circuits and equipment
- safe working practices as a normal part of carrying out electrical installation work
- tools and equipment needed to conduct electrical installation compliance inspection and testing
- legislation and regulations that require circuits and equipment to be inspected and tested to ensure they are safe
- the person/bodies responsible for the various aspects of ensuring electrical installations are safe
- results of periodic inspection and tests that show construction site wiring and equipment is safe to use
- results of periodic inspection and tests that show electrical equipment are safe to use
- visual inspection of the electrical installation for compliance with regulatory requirements, including:
 - protection requirements
 - general condition
 - mains/submains
 - switchboards
 - wiring systems
 - equipment and accessories
 - earthing
- regulatory requirements related to compliance testing, including:
 - insulation resistance of mains, sub-mains and final sub-circuits
 - earth continuity of the main earthing conductor, protective earthing conductors, combined protective earthing and neutral (PEN) conductors, and bonding conductors
 - polarity of active, neutral and earth conductors including phase sequence and rotation
 - correct connections of active, neutral and protective earthing conductors are tested to ensure no short circuits between conductors, no transposition of conductors that could result in the earthing system or exposed conductive parts becoming energised, and no interconnection of conductors between different circuits
 - earth fault-loop impedance in both 'supply available' and 'no supply available' scenarios

- correct installation of RCDs, verification of their function, and verification of isolation of all switched poles
- testing requirements where multiple/alternate supplies are present, including anti-islanding
- AS/NZS 3000 requirements for dealing with unused conductors and equipment
- importance of the MEN link when a fault occurs.
- likely consequences of the absence of the MEN link or high impedance in the PEN conductor when a fault occurs
- requirements for installation of an MEN link in an installation and an outbuilding
- safety implications of high impedance or open circuit neutral faults
- ensure active/s and neutral for the same circuit are clearly identified with their circuit protection device
- tests that show all circuits and equipment operate as intended
- results of tests conducted on an installation to comply with requirements and ensure the installation is safe
- documentation of periodic testing and inspection of electrical equipment, including tagging requirements in accordance with AS/NZS 3760
- techniques and procedures for the effective safe isolation of any equipment, including:
 - preparation of a SWMS or JSA for effective safe isolation
 - safe methods for identifying source of supply to be isolated, including alternate supplies
 - switching-off, lock-out and tagging procedures
 - safe methods for confirming effective and safe isolation of all energy sources
 - industry standards related to isolation
- techniques and procedures for testing and verification of alternate supplies, including:
 - purpose of tests, testing methods and equipment
 - use of continuity and voltage testing meters
 - direct current (d.c.) polarity, including switching and protection equipment
 - earthing arrangements
- troubleshooting concepts, including:
 - need to understand the correct operation of a circuit or equipment, switching and control circuit arrangements
 - common faults with circuits and equipment, including:
 - operator faults
 - incorrect connections
 - open circuits
 - short circuits
 - device faults (mechanical)
 - equipment/component failure
 - supply faults
 - insulation failure
 - unsafe conditions

- earth leakage
- typical fault symptoms and their causes, including:
 - operation of circuit protective device
 - appliance does not operate
- factors to consider in clarifying the nature of a fault, including:
 - initial fault report
 - confirmation of symptoms of the fault
 - comparison of symptoms with normal operation
- methods for testing, including:
 - visual inspection
 - component isolation
 - test equipment
 - sectional testing
- dealing with intermittent faults (vibration, shock, changes in temperature and electromagnetic interference)
- final testing and recommissioning
- hazards and safety requirements related to equipment incorporating electronic components used in electrical systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination

of competence in this unit can be made.

UEEEL0015 Manage large electrical projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to manage large electrical projects.

It includes identifying the scope of the project; managing safety, budget variation, personnel, resources and critical path timelines; and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify the scope of the project

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Project deliverables and budget are identified from project planning, relevant documentation and discussions with relevant person/s

- 1.3 Measurable outcomes are identified to evaluate the project on completion from project planning and relevant documentation
 - 1.4 Plant, materials and skills required to meet project outcome are identified from project planning and relevant documentation
 - 1.5 Processes and workplace procedures are developed for managing contract variations from discussions with relevant person/s and in accordance with contractual agreement
- 2 Manage project within scope**
 - 2.1 WHS/OHS requirements, workplace procedures and programs are implemented and monitored
 - 2.2 Achievement of project outcomes is delegated to relevant person/s involved in the project
 - 2.3 Risk events are identified and project plan strategies implemented to ensure the outcomes are achieved to a safety and quality standard in accordance with contractual agreement and workplace procedures
 - 2.4 Procurement processes are monitored to ensure supply of plant and materials in accordance with workplace procedures
 - 2.5 Project progress is monitored in accordance with schedule, quality requirements and budget
 - 2.6 Conflict issues on worksite, between stakeholders, clients and regulators are identified and managed in accordance with workplace procedures
 - 2.7 Variations are managed in accordance with workplace procedures and contractual agreement
 - 2.8 Project records are maintained and progress reports written and forwarded to all relevant person/s
- 3 Complete project and relevant documentation**
 - 3.1 Project outcomes, plan, implemented risk strategies, contract variations, safety record and budget are evaluated in accordance with contractual agreement and workplace procedures
 - 3.2 Project completion and acceptance is sought from relevant person/s with relevant documentation in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG169A Manage large electrical projects.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0015 Manage large electrical projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- establishing the scope of the project accurately
- ascertaining the input of a project
- developing effective management processes
- managing resources and variations effectively
- resolving conflicts
- adopting risk management strategies
- maintaining records and submitting progress reports
- meeting project outcomes
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- completing project
- identifying plant, materials and skills for project.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical project management, including:
 - defining project parameters encompassing:
 - project scope
 - project stakeholders and clients
 - project phases and the relationship between phases
 - time requirements and limitations
 - resource requirements and limitations
 - quality requirements and limitations
 - time-management concepts and standard practices
 - financial management encompassing:

- financial management concepts
- standard practices for managing project finances
- project budgets
- costs
- variations and estimations
- invoicing against project phases/deliverables
- acquittals
- quality management concepts and practices
- human resource management concepts and practices within a project
- communication management concepts and practices within a project
- risk management and contingencies encompassing:
 - risk management concepts, including:
 - internal risks
 - external risks
 - contingencies
 - standard practices for managing risk within a project
 - risk minimisation
 - risk removal
- procurement management concepts and practices
- physical resource management concepts and practices relating to equipment, technology, information and facilities
- contracts encompassing:
 - contract format
 - contract content
 - interpreting contract clauses
 - legal obligations of contract parties
 - working to contract specifications
 - documentation accompanying contracts, such as schedules
- performance assessment and continuous improvement
- engineering ethics principles
- customer/client relations encompassing:
 - importance of customer/client relations
 - interpersonal skills that enhance customer/client relationships
 - dispute resolution
 - customer/client relations strategies
- electrical industry sector customs and practice encompassing:
 - equipment procurement, cost-benefit analysis and performance testing
 - typical approaches to planning and management
 - successful planning techniques
 - best practice management methods and styles

- problem-solving techniques
- relevant manufacturer specifications and operation instructions
- relevant plant, materials and skills
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to managing electrical projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0016 Provide advice on effective and energy efficient lighting products

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to advise customers on effective and energy efficient lighting products within the scope of manufacturer product information.

It includes planning and providing lighting principles, light source types and typical lighting applications advice. It also includes interpreting manufacturer technical information and documenting advice given.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to advise on effective and efficient lighting products

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Appropriate questioning and active listening are used to clarify and respond to lighting product enquiry
 - 1.3 Lighting documentations/files that will assist in providing necessary advice are read, reviewed and understood
- 2 Provide advice on effective and efficient lighting products**
- 2.1 WHS/OHS risk control measures and workplace procedures are followed
 - 2.2 Lighting product information is identified, and manufacturer product data is read and applied to provide relevant product advice
 - 2.3 Technical or costing inquiries are referred to appropriate person/s in accordance with workplace procedures
 - 2.4 Inquiries and response are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Providing advice on lighting products must include the following:

- three different lamp types
- three optical functions and fitting design of the following luminaires:
 - light distribution
 - luminaires for indoor and outdoor use
 - modern technology applied to luminaries
 - mounting techniques

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG181A Provide advice on effective and energy

efficient lighting products.

Assessment Requirements for UEEEL0016 Provide advice on effective and energy efficient lighting products

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- planning and providing advice on lighting products, including:
 - determining the nature and scope of the advice required
 - documenting inquiries and responses in accordance with workplace procedures
 - referring technical and costing inquiries to appropriate person/s
 - reviewing relevant lighting product documentation and providing appropriate product advice
- using oral communication skills/language, including:
 - active listening
 - asking for clarification/feedback
 - questioning
 - seeking advice from supervisor/appropriate person/s.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- current industry standards, practices and technologies, including:
 - classification of light distribution and beam spread
 - electrical function and components appropriate for the insulation class or extra-low voltage (ELV) fault protection, including supply terminals, lamp holder(s), electrical ancillaries when needed and appropriated internal wiring
 - fluorescent lamps types and principles

- high intensity discharge (HID) lamps
- illumination and lighting principles
- incandescent lamp types and principles
- ingress protection (IP) ratings and examples of their application to luminaires
- light-emitting diode (LED) lamps types and principles
- light distribution and reading a polar luminance distribution curve
- light output ratio of common typical luminaires without and with reflector and diffuser mechanisms
- lighting technology
- luminaires (light fittings) types and principles
- mechanical function and components (including IP rated enclosure with suitable mounting arrangement, mechanisms to accommodate lamp(s), electrical ancillaries when needed, optical system and excessive temperature rise)
- technology of light, including:
 - electromagnetic spectrum and visible (frequency/wavelength) range
 - light output from a source, including luminous flux, and efficacy of different types of lamps
 - terms, units, definitions, and symbols used for:
 - light intensity and the relationship with luminous flux
 - illuminance and the relationship with luminous flux and environmental factors
 - luminance and the relationship with luminous intensity and illuminance
 - significance of inverse square law on illuminance
 - vision and illuminance standards for particular environments and activities
- nature of light, including:
 - colour rendering, colour distortion, colour temperature scale and the perceived colour of a light source
 - comparison of the colour spectrum of sunlight and light generated from different lamp types
 - frequency and colour that light is perceived, including primary and additive colours
- incandescent lamps, including:
 - application, types, principles, common power ratings and features, including envelope, filament type and temperature (K), fill gas and cap
 - effect of filament evaporation over time and parameters (ϕ , η , P, hr) with variations in rated voltage
- fluorescent lamps, including:
 - application
 - compact fluorescent (CFL) types, including integrated and non-integrated ballasts, form, and rating for equivalent light out of general lighting service (GLS) lamp
 - expectations (efficacy [l/w]; visual ambience [K]; visual satisfaction [CRI] and life [hr])
 - type T accessories, including the basic operation, features and advantage of the electromagnetic ballast; and starter capacitor

- type T series, including the basic principle, double and single phosphor coating and colour rendering index (CRI)
- high-intensity discharge (HID) lamps, including:
 - application
 - mercury lamp types, including blended and high-pressure (HP)
 - metal halide lamp, including principles, structural features, lamp forms, spectral intensity and CRI
 - structural features and spectral intensity
- LED lamps, including applications, types, structural features, spectral intensity and CRI
- optical function and components, including a variety of mechanism to distribute light, direct light, filter light and/or limit glare; and maximum possible light output ratio
- relevant luminaires for indoor and outdoor applications
- types and features of indoor luminaires, including light distribution, symmetry, screening and utilisation factor
- luminaires - light fittings, including:
 - classification of light distribution and beam spread
 - electrical ancillaries when needed, including optical system and excessive temperature rise
 - electrical function and components that must be appropriate for the insulation class or ELV fault protection, including supply terminals, lamp holders, electrical ancillaries when needed, and appropriated internal wiring
 - examples of currently available luminaires for indoor and outdoor applications
 - IP ratings and examples of their application to luminaires
 - light distribution and reading a polar luminance distribution curve
 - light output ratio of common typical luminaires without and with reflector and diffuser mechanisms
 - mechanical function and components for IP rated enclosure with suitable mounting arrangement; mechanisms to accommodate lamps
 - optical function and components, including a variety of mechanisms to distribute, direct, and filter light and/or limit glare to achieve the maximum possible light output ratio
 - types and features of indoor luminaires, including light distribution, symmetry, screening and utilisation factor
 - types and features of outdoor luminaires, including types of light distribution and reflector control
- interpersonal and communication skills, including listening, questioning and receiving feedback
- relevant job safety assessments or risk mitigation processes, including safe working practices
- relevant lighting manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0017 Repair and maintain mechanical components of electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and maintain mechanical components of electrical machine.

It includes working safely to industry standards in planning and repairing/maintaining mechanical components of electrical machines and documenting workplace activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0004 Carry out basic repairs to electrical components and equipment

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to repair mechanical components

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures and workplace procedures are followed in preparation for the repair work
- 1.3 Safety hazards not previously identified are reported on job safety assessments, risks assessed and risk control measures sought from work supervisor
- 1.4 Nature of repair work is obtained from workplace documentation or from work supervisor to determine scope of work to be undertaken
- 1.5 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 1.6 Sources of materials required for work are determined in accordance with workplace instructions and procedures
- 1.7 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 1.8 Appropriate machine is selected, checked for safety and prepared for any necessary machining operation
- 1.9 Cutting tools are selected, sharpened and set-up for each machining operation

2 Repair mechanical components

- 2.1 Existing WHS/OHS risk control measures and workplace procedures are followed
- 2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Component being machined is positioned and clamped in accordance with workplace procedures
- 2.4 Machining is carried out safely and to suit the mechanical component and material being machined in accordance with safe work practices and workplace procedures
- 2.5 Measurements are taken and confirmed to ensure repairs comply with technical industry standards, job

specifications and workplace requirements

- 2.6 Mechanical components are repaired in accordance with technical industry standards, job specifications and workplace requirements
- 2.7 Existing safe work methods for dealing with unplanned situations are discussed with appropriate person/s and documented
- 2.8 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment and with the approval of an authorised person
- 2.9 Ongoing checks of the quality of repair work are undertaken in accordance with workplace procedures
- 2.10 Repairs are carried out efficiently without unnecessary waste of materials and energy and damage to apparatus circuits, the surrounding environment or services

3 Complete work and report

- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2 Work area is cleaned and made safe in accordance with workplace procedures
- 3.3 Component fittings are aligned to verify repaired component/s conform to industry standards, job specifications and requirements
- 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Repairing and maintaining electrical machine components must include at least two of the following:

- shaft
- bearing housing
- end shield
- fan
- coupling
- machine housing

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG164A Repair and maintain mechanical components of electrical machines.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0017 Repair and maintain mechanical components of electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing workplace documentation and reports
- inspecting and testing completed mechanical maintenance work
- machining mechanical components in accordance with safe working practices and workplace procedures
- maintaining mechanical components of electrical machines
- planning to repair/maintain mechanical components of electrical machines
- repairing mechanical component/s of electrical machines, including:
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - documenting repairs in accordance with workplace procedures and instructions
 - establishing the scope of the repair work
 - repairing component to relevant industry standards
 - securing work piece/parts/components correctly
 - selecting appropriate repair method
 - sharpening cutting tools/twist drills correctly, as required.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- dangers and safety precautions, including hazardous dust, cleaning material and safe working practices
- current industry practices and technologies
- machining industry practices and technologies

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements including relevant safe working practices
- relevant workplace documentation
- relevant workplace policies, procedures and instructions
- repairing mechanical components of electrical machines, including:
 - hazards and safety precautions
 - safe working practices
 - electrical machine bearings requirements, including:
 - bearing damage and remedial action
 - handling and storage of bearings
 - lubrication and calculation of bearing life
 - types, clearances, and techniques for removing and fitting bearings
 - machines couplings, including:
 - fitting and aligning couplings
 - fitting and aligning pulleys
 - types of belts and their applications
 - types of couplings and applications
 - machine components of electrical machines
 - machine faults, inspection and testing procedures
 - dismantling/assembling and repairing workplace procedures/instructions, including marking of electrical connections, recording positions of gears/pulleys/couplings, dismantle procedures, bearing removal/replacement and test run
 - brushes, including characteristics, types, selection and components
 - mechanical components removal and installation, including:
 - marking of winding connections
 - motor alignment
 - alignment workplace procedures/instructions
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources should reflect current industry practices in relation to repairing mechanical components of electrical machines
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

Links

Companion Volume implementation guides are found in VETNet - -

UEEEL0018 Select wiring systems and select cables for low voltage electrical installations

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select wiring systems and cables for electrical installations operating at voltages up to 1,000 volt (V) alternating current (a.c.) or 1,500 V direct current (d.c.).

It includes application of wiring systems and cable types, selecting wiring system compatible with the installation conditions, selecting cables that comply with required current-carrying capacity and voltage drop and earth fault-loop impedance limitations, coordinating between protective devices and conductors, and documenting selection decisions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c..

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Plan wiring systems for general electrical installations

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Scope and nature of the electrical installation is determined from job specifications
- 1.2** WHS/OHS requirements and workplace procedures and other regulatory requirements are identified and applied
- 1.3** Cable routes, the route lengths of cable, and the conditions in which the wiring system is to operate is determined from job specifications or from consultation

- with appropriate person/s
- 2 Select wiring systems and cables for general electrical installations**
- 2.1** Wiring system is selected and suitable for the environments in which it will operate
- 2.2** Cable conductor sizes are selected to meet current-carrying capacity requirements and voltage-drop and earth fault-loop impedance limitations in accordance with relevant industry standards
- 2.3** Circuit protective devices are selected to meet requirement for co-ordination with conductor current-carrying capacity in accordance with relevant industry standards
- 2.4** Earthing system components are selected to meet multiple earthed neutral (MEN) system in accordance with relevant industry standards
- 3 Document electrical installation**
- 3.1** Manufacturer data is referenced in selection of equipment to ensure materials comply with safety requirements and relevant industry standards
- 3.2** Rationale for wiring system selections and calculations are documented in accordance with workplace procedures
- 3.3** Electrical installation arrangement and specifications for all selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting wiring systems and cables for at least two general electrical installations,

- a main switchboard, supplying more than one circuit each for:

including:

- lighting
- socket outlets
- fixed appliances
- one installation must include a circuit supplying a three phase load
- one installation must include a safety service or alternate supply
- one installation must include a distribution board separate from the main switchboard.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG107A Select wiring systems and select cables for low voltage electrical installations.

Assessment Requirements for UEEEL0018 Select wiring systems and select cables for low voltage electrical installations

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- # applying sustainable energy principles and practices
- calculating the expected voltage drop in a given circuit
- calculating the expected fault-loop impedance for a given circuit arrangement
- selecting cables to satisfy voltage-drop requirements in addition to current-carrying capacity requirements
- selecting cables to satisfy fault-loop impedance requirements in addition to current-carrying capacity requirements and voltage drop requirements
- # selecting conductor size based on the maximum current requirement for a given installation condition
- # determining the extent and nature of the installation for job specifications
- # determining cable routes, the route lengths of cables and the conditions in which the wiring system is to operate
- determining the number and types of circuits required for a particular installation
- # determining current requirements for given final sub-circuits
- determining layout/schedule of circuits for given installations
- # selecting wiring system suitable for the installation environment
- # selecting cables, including voltage-drop, fault-loop impedance and minimum conductor size to satisfy current-carrying capacity
- # selecting compliant earthing system components
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel, equipment

- determining maximum demand for consumer mains and sub-mains final for an installation in accordance with industry and regulatory standards
- # determining maximum demand for final sub-circuits for an installation in accordance with industry and regulatory standards
- documenting electrical installation design
- identifying and applying installation requirements for switchboards in accordance with industry and regulatory requirements
- identifying layout/schedule of circuits for low voltage (LV) electrical installation
- # arranging installation loads onto separate circuits
- identifying performance requirements for an electrical installation to comply with safety and regulatory requirements
- selecting cables for consumer mains, sub-mains and to meet maximum demand and installation conditions, including any derating factors
- #selecting cables for final sub-circuits to meet maximum demand and installation conditions, including any derating factors
- determining suitability of the cable insulation
- # selecting circuit protection devices to satisfy maximum demand and coordination in accordance with industry and regulatory requirements
- # selecting circuit protection devices to satisfy requirements for discrimination, fault protection and overcurrent
- selecting control and isolation devices to satisfy AS/NZS 3000 requirements for a range of loads and environmental conditions
- selecting isolation and control devices as required by the designed installation and in accordance with industry and regulatory requirements
- applying the requirements of the relevant industry standards, including AS/NZS 3000, to all work tasks.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- design and safety performance requirements, including:
 - harmful effects against which the electrical installation design must provide protection
 - electrical installation performance standards
 - supply characteristic considerations when designing an electrical installation
 - methods to determine maximum demand in consumer mains, sub-mains and final subcircuits
- reason for dividing electrical installations into circuits and the factors that determine their number and type
- external factors that may damage an electrical installation
- methods for protecting persons and livestock against direct and indirect contact with conductive parts and the typical application of each

- methods to protect against risk of ignition of flammable materials and injury by burns from the thermal effects of current in normal service
- likely sources of unwanted voltages and the methods for dealing with this potential hazard
- methods for protecting persons and livestock against injury and property against damage from the effects of overcurrent
- requirements for protection against fault current
- requirements for protection against the harmful effects of faults between live parts of circuits supplied at different voltages
- need for protection against injury from mechanical movement and how this may be achieved
- features of ‘fire rated construction’ and how the integrity of the fire rating can be maintained in relation to electrical installation
- final sub-circuit arrangements including:
 - considerations when determining the number and type of circuits for an installation
 - daily and seasonal demand for lighting, power, heating and other loads in an installation
 - number and types of circuits required for a particular installation
 - current requirements for given final sub-circuits
 - layout/schedule of circuits for given installations
- factors effecting the suitability of wiring systems, including:
 - wiring systems used for particular construction methods and environments
 - installation conditions that may affect the current-carrying capacity of cables
 - external influences that may affect the current-carrying capacity and/or may cause damage to the wiring system
 - AS/NZS 3000 requirements for selecting wiring systems for a range of circuits, installation conditions and construction methods into which the wiring system is to be installed. Note: Wiring systems include cable enclosures, underground wiring, aerial wiring, catenary support, emergency systems, busbar trunking and earth sheath return
- maximum demand on consumer mains/sub-mains, including:
 - methods for determining the maximum demand on an installation’s consumer mains and sub-mains
 - maximum demand for the consumer mains for given installations up to 400 ampere (A) per phase
 - maximum demand for given sub-mains
- cable selection based on current-carrying capacity requirements, including:
 - installation conditions for a range of wiring systems and applications
 - external influences that require the use of a derating factor
 - suitability of the cable insulation
 - AS/NZS 3000 requirements for coordination of cables and protection devices
 - AS/NZS 3008 Electrical installations - Selection of cables, used to select conductor size based on the maximum current requirement for a given installation condition, including any applicable derating factors
- cable selection based on voltage-drop requirements including:

- AS/NZS 3000 requirements for maximum voltage-drop in an installation
- relevant tables in AS/NZS 3008 Electrical installations - Selection of cables, for unit values of voltage-drop
- cable selection based on fault-loop impedance requirements, including:
 - AS/NZS 3000 requirements for maximum fault-loop impedance in an installation
 - relevant tables in AS/NZS 3008 Electrical installations - Selection of cables, to determine cable impedances
- selecting protection devices, including:
 - acceptable methods of protection against indirect contact
 - AS/NZS 3000 requirements for selecting methods and devices to protect against indirect contact for a range of installation types and conditions
 - coordination between conductors and protection devices to ensure the protection of cables from overheating due to overcurrent
 - possible injuries to persons and livestock from hazards due to a short circuit
 - AS/NZS 3000 requirements for selecting devices to protect against overload current for a range of circuits and loads
 - AS/NZS 3000 requirements for selecting devices to protect against short circuit current for a range of installation conditions
- selecting devices for isolation and switching, including:
 - requirements for the provision of the isolation of every circuit in an electrical installation
 - need for protection against mechanical movement of electrically activated equipment
 - AS/NZS 3000 requirements for selecting devices for isolation and switching for a range of installations and conditions
- switchboards, including:
 - AS/NZS 3000 and local supply authority requirements for switchboards
 - tariff structures for the supply of electricity
 - equipment installed at the main switchboards with capacities up to 400 A per phase
 - layout of a main switchboard for an installation supplied with:
 - single phase single tariff whole current metering
 - single phase multiple tariff whole current metering
 - multi-phase single tariff whole current metering
 - multi-phase multiple tariff whole current metering
 - layout of a main switchboard for a multiple tenancy installation with whole current metering
 - layout of a main switchboard, including metering, for an installation supplied with three phase current transformer metering
 - local supply authority requirements for connection of an electrical installation to electrical supply system
- relevant manufacturer specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0019 Solve problems in direct current (d.c.) machines

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine correct operation of direct current (d.c.) machines and provide solutions as they apply to electrical installations and equipment.

It includes working safely, the use of testing and measuring devices, and providing solutions derived from measurements and calculations to predictable problems in d.c. machines.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEL0021 Solve problems in magnetic and electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work with d.c. machines

2 Solve d.c. machine problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Device/s and/or circuit/s problems are identified from documentation or work supervisor to determine scope of work
- 1.2 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.3 Hazards are identified, risks are assessed and control measures are implemented
- 1.4 Tools, equipment and testing devices to carry out work are obtained and checked for correct operation and safety
- 1.5 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Need to test or measure live work is determined in accordance with WHS/OHS job safety assessment requirements and work is conducted using safety control measures workplace procedures
- 2.3 Relevant circuits, machines and/or plant are checked as being isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Operating parameters of a machine are determined from nameplate details

- 2.5 Electrical measurements are completed and readings compared with nameplate ratings
 - 2.6 Methodical techniques are used to identify and resolve problems from measured and calculated values as they apply to machines
 - 2.7 Machine is connected and tested to determine correct operation
 - 2.8 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.9 Problems are resolved without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices
- 3 Complete work and documentation**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to resolve problems is documented in accordance with established workplace procedures
 - 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in d.c. machines must include at least two of the following:

- shunt generator
- series generator
- compound generator

- permanent magnet d.c. motor
- separately excited d.c. motor
- shunt d.c. motor
- series d.c. motor
- compound motor
- printed circuit motor
- brushless motor
- stepped motor

Unit Mapping Information

No equivalent unit

Assessment Requirements for UEEEL0019 Solve problems in direct current (d.c.) machines

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- complying work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - identifying safety risks associated with using generators, motors, rotating machinery and inductive loads
 - confirming isolation of circuits
- connecting and testing a direct current (d.c.) machine
- identifying of faults in a machine from electrical measurements
- recording electrical measurements and comparing with nameplate ratings
- reversing the direction of rotation of a d.c motor
- ensuring all work complies with relevant industry standards and legislation
- completing required documentation and reporting.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- rotating machine construction, testing and maintenance, including:
 - care, maintenance and testing processes for rotating machines
 - components of a d.c. machine
 - difference between a generator and a motor in terms of energy conversion
 - nameplate of a machine
 - safety risks associated with using rotating machinery
 - types of faults in electric machines
- generators, including:
 - basic operation of a d.c. generator
 - equivalent circuit for a d.c. generator
 - importance of residual magnetism for a self-excited generator
 - load characteristics of a d.c. generator
 - methods of excitation used for d.c. generators
 - open circuit characteristics of d.c. generators
 - prime movers, energy sources and energy flow used to generate electricity
 - reversing the polarity of a d.c. generator
 - types of d.c. generators and their applications
 - calculating generated and terminal voltage of a d.c. shunt generator
 - applying Fleming's left-hand rule for motors and right-hand rule for generators
- motors, including:
 - basic operation of a motor
 - circuit diagrams and characteristics of the different types of d.c. motors
 - effect of back emf in d.c. motors
 - equivalent circuit for the types of d.c. motors
 - operation of a motor and its energy flow
 - safety risks associated with using motors (including risks of series d.c. motors)
 - torque as the product of the force on the conductors and the radius of the armature/rotor
 - calculating force and torque developed by a motor
 - types of d.c. motors and their applications
- machine efficiency, including:
 - efficiency characteristic of a d.c. machine and the conditions for maximum efficiency
 - losses that occur in a d.c. machine
 - methods used to determine the losses in a d.c. machine
 - calculating losses and efficiency of a d.c. machine
 - methods used to maintain high efficiency
- safety considerations for inductive loads
- relevant manufacturer specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0020 Solve problems in low voltage a.c. circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to ascertain correct operation of single and three phase alternating current (a.c.) circuits and solving circuit problems as they apply to servicing, fault finding, installation and compliance work functions.

It includes safe working practices, multi-phase circuit arrangements, issues related to fault protection, power factor and multiple earthed neutral (MEN) systems and solutions to circuit problems derived from calculated and measured parameters.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) a.c. or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEL0021 Solve problems in magnetic and electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify low voltage (LV) a.c. circuit problem

2 Solve LV a.c. circuit problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for work area are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures and workplace procedures are implemented
- 1.3 Safety hazards which have not previously been identified are noted on job safety assessments and existing risk control measures are implemented
- 1.4 Circuit problems are identified from documentation or work supervisor to determine the scope of work
- 1.5 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 1.6 Sources of materials required for work are identified in accordance with workplace procedures
- 1.7 Tools, equipment and testing devices to carry out work are obtained and checked for correct operation and safety
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Need to test or measure live work is determined in accordance with WHS/OHS requirements and, as required, conducted in accordance with workplace safety procedures
- 2.3 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements

and workplace procedures

- 2.4 Methodical techniques are used to resolve circuit problems from measured and calculated values as they apply to single and three phase LV circuits in accordance with workplace procedures
 - 2.5 Existing circuits are altered to comply with power factor correction in compliance with industry standards
 - 2.6 Power factor of a circuit is calculated from given measurements
 - 2.7 Low power factor is improved by altering the reactive power of a circuit
 - 2.8 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.9 Problems are resolved without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete work and document activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to resolve circuit problems is documented in accordance with workplace procedures
 - 3.4 Work completion is documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in a.c. circuits must include:

- determining the operating parameters of existing circuits
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with a specified function and operating parameters of voltage, current, impedance, power and power factor
- determining the cause of low power factor in an existing circuit
- determining conditions causing an existing circuit to be unsafe, including electric shock hazard from indirect contact with conductive parts.

Solving problems in single phase circuits must include:

- connecting single phase circuits
- choosing correct instruments
- taking measurements correctly and accurately.

Solving problems in three phase circuits must include:

- connecting three phase circuits
- choosing correct instruments
- taking measurements correctly and accurately.

Solving problems in LV a.c. circuits must include at least four of the following applications:

- series a.c. circuits
- parallel a.c. circuits
- series/parallel a.c. circuits
- single phase motors/controls
- three phase motors/controls
- synchronous machines
- transformers/auxiliary components
- star connected circuits
- delta connected circuits
- star-delta interconnected circuits
- open delta circuits.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG102A Solve problems in low voltage a.c. circuits.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0020 Solve problems in low voltage a.c. circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements Including:
 - implementing OHS/WHS workplace procedures and practices, including risk control measures
 - safely measuring the parameters for the whole or any part of a circuit
- measuring:
 - instantaneous, peak, peak-to-peak values and the period of a sinusoidal waveform
 - the phase angle between two or more alternating quantities from a given sinusoidal waveform diagram
 - the fault-loop impedance of typical circuits
 - the branch currents and voltages in a series and parallel resistance inductance capacitance (RLC) circuit and use a phasor diagram to determine the total current and phase angle between circuit voltage and circuit current
- determining:
 - phase relationship between two or more sinusoidal waveforms from a given diagram
 - the impedance, current and voltages and phase angles for a series and parallel resistance capacitance (RC), resistance inductance (RL), and RLC circuit given the resistance, capacitance, inductance and supply voltage
 - comparison of current limiting characteristics of inductors and resistors
 - the relationship between inductive reactance and capacitive reactance and frequency
 - difference between true power, apparent power and reactive power and the units in which these quantities are measured
 - the root-mean-square (rms) value of line and phase, voltage and current given any one of these quantities

- the effects of a high impedance in the neutral conductor of a three phase four wire system supplying an unbalanced load where multiple earthed neutral (MEN) earthing is employed
- the value of neutral current in an unbalanced three phase four wire systems given line currents and power factors
- how the power factor of a three phase installation can be improved
- fault loop impedance using resistance and reactance values from relevant industry standards
- voltage, current and resistance from measured or given values of any two of these qualities
- the phase sequence of a three phase supply
- drawing and labelling the following:
 - the power triangle to show the relationships between true power, apparent power and reactive power
 - the typical combinations of three phase interconnected systems using star and delta connection
 - the impedance triangle for a series RC, RL and RLC circuit
 - the equivalent circuit of a practical inductor
 - phasor diagrams to show:
 - the relationship between two or more alternating current (a.c.) values of voltage and/or current, including 'in-phase', 'out-of-phase', 'phase angle', 'lead' and 'lag'
 - a series and parallel RC, RL, and RLC circuits
- calculating:
 - rms value of voltage generated in each phase given the maximum value
 - terms in relation to a sinusoidal waveform from values of root-mean-square (rms) value, frequency, peak voltage, period and instantaneous value
 - capacitive reactance and inductive reactance for a given capacitor and inductor
 - total impedance for a series and parallel RLC circuit
- connecting a three-phase star and delta load
- setting up and connecting a single-source resistive a.c. circuit and taking voltage and current measurements to determine the resistance
- applying sustainable energy principles and practices
- completing workplace documentation
- voltage, current and reactance of inductive and capacitive reactance by applying Ohm's law in purely inductive and capacitive a.c. circuits given any two quantities
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with a specified function and operating parameters
- determining conditions causing an existing circuit to be unsafe
- dealing with unplanned events.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- a.c. quantities, including:
 - Pythagoras theorem to a right-angle triangle
 - sine, cosine and tangent ratios of a right-angle triangle
 - sinusoidal voltage generated by a single turn coil rotated in a uniform magnetic field and resulting current
 - terms in relation to a sinusoidal waveform involving:
 - period
 - maximum value
 - peak-to-peak value
 - instantaneous value
 - average value
 - rms value
 - use of a cathode-ray oscilloscope (CRO) to measure d.c. and a.c. voltage levels
- phasor diagrams, including:
 - convention for representing voltage, current and the reference quantity in a phasor diagram
 - purpose of phasor diagrams
- single element a.c. circuits, including:
 - applications of capacitive, inductive and resistive a.c. circuits
 - defining inductive and capacitive reactance
 - relationship between voltage drops and current in resistive a.c. circuit
 - arrangement, characteristics of single item inductive and capacitive circuits
- RC and RL series a.c. circuits, including:
 - capacitive and inductive components in power circuits and systems and the effect on the phase relationship between voltage and current
 - impedance and impedance triangle
 - voltage triangle
 - arrangement, characteristics, and relationship between resistance, capacitance and inductance in RL, RC, and LC series circuits
- RLC series and parallel a.c. circuits, including:
 - practical examples of RLC series and parallel circuits
 - voltage and current triangle
 - relationship between resistance, capacitance and inductance in RLC parallel circuits
- power in an a.c. circuit, including:
 - definition of power factor and phase angle
 - methods used to measure single phase power, energy and demand

- effects of low power factor
- power factor improvement, including:
 - requirements for power factor improvement
 - methods used to improve low power factor of an installation
 - local supply authority and AS/NZS 3000 requirements regarding the power factor of an installation and power factor improvement equipment
 - local supply authority and AS/NZS 3000 requirements for installation of capacitors including safety considerations
 - using manufacturer catalogues to select power factor equipment for a particular installation
- harmonics and resonance effect in a.c. systems, including:
 - conditions in a series and parallel a.c. circuit that produce resonance
 - dangers of series and parallel resonance circuits
 - methods and test equipment used to test for harmonics
 - methods used to reduce harmonics in a.c. power system
 - problems that may arise in a.c. circuits as a result of harmonics and how these are overcome
 - sources in a.c. systems that produce harmonics
 - term harmonic in relation to the sinusoidal waveform of an a.c. power system
- three phase systems, including:
 - features of a multi-phase system
 - comparison of voltages generated by single and multi-phase alternators
 - how three phase is generated in a single alternator
 - advantages of three phase for power systems
 - relationship between the phase voltages generated in a three phase alternator and the conventions for identifying each
 - method of determining the phase sequence or phase rotation of a three-phase supply
- three phase star connections, including:
 - arrangement and characteristics of a three phase star connection
 - effect of a reversed phase winding of a star connected alternator
 - examples of balanced and unbalanced loads in typical power systems
 - terms balanced load and unbalanced load
- three phase four wire systems, including:
 - purpose of the neutral conductor in three phase four wire systems
 - AS/NZS 3000 requirements regarding neutral conductors
 - AS/NZS 3008.1.1 Electrical installations - Selection of cables - Cables for alternating voltages up to and including 0.6/1 kV - Typical Australian installation conditions method for determining voltage drop in unbalanced three phase circuits
- three phase delta connections and interconnected systems, including:
 - arrangement and characteristics of a three phase delta connection
 - effect of a reversed phase winding of a delta connected transformer

- examples of loads in typical power systems
- limitations and uses of open delta connections
- energy and power requirements of ac systems, including:
 - purposes for measuring power, energy, power factor and maximum demand of a.c. power systems and loads
 - difference between true power, apparent power and reactive power and the units in which these quantities are measured in a three phase system
 - methods used to measure three phase power, energy, power factor and demand
 - using manufacturers catalogues to select measurement equipment for a particular installation
- fault-loop impedance, including:
 - procedures for testing fault-loop impedance
 - term fault-loop impedance of an a.c. power system
- local requirements and relevant industry standards relating to:
 - the installation of capacitors
 - the power factor of an installation and power factor improvement equipment
 - harmonics and resonance effect in a.c. power systems
 - neutral conductors
- phase relationship between line and phase voltages and line and phase currents of star, delta, and typical interconnected systems using star connections and delta connections
- relevant manufacturers' specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications,

regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0021 Solve problems in magnetic and electromagnetic devices

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine correct operation of electromagnetic devices and related circuits and provide solutions as they apply to electrical installations and equipment.

It includes working safely; applying power circuit problem-solving processes, including the use of testing and measuring devices; and providing solutions derived from measurements and calculations to predictable problems in electromagnetic devices and related circuits.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work with electromagnetic devices and circuits

2 Solve electromagnetic device and/or circuit problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 Device/s and/or circuit/s problems are identified from documentation or work supervisor to determine scope of work
- 1.3 Hazards are identified, risks are assessed and control measures are implemented
- 1.4 Tools, equipment and testing devices to carry out work are obtained and checked for correct operation and safety
- 1.5 Circuits are checked and isolated in accordance with workplace procedures and regulatory requirements
- 1.6 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Need to test or measure live work is determined in accordance with WHS/OHS job safety assessment requirements and work is conducted using safety control measures workplace procedures
- 2.3 Relevant circuits and devices are checked as being isolated, as required, in accordance with WHS/OHS

requirements and workplace procedures

- 2.4 Operating parameters of an existing circuit with an electromagnetic device are determined
 - 2.5 Methodical techniques are used to resolve circuit problems from measured and calculated values as they apply to electromagnetic devices/circuits
 - 2.6 Existing circuit with an electromagnetic device is altered to comply with specified operating parameters
 - 2.7 Circuit with electromagnetic device is developed to comply with a specified function and operating parameters
 - 2.8 Electrical equipment is connected and tested to determine correct operation
 - 2.9 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.10 Problems are resolved without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete work and documentation**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Justification for solutions used to resolve problems is documented in accordance with established workplace procedures
 - 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Electromagnetic devices must include at least three of the following devices:

- reed switches
- solenoids
- relays
- contactors
- inductive limit switches
- lifting magnets
- core balance devices
- magnetic overloads
- magnetic brakes
- magnetic circuit breakers.

Unit Mapping Information

No equivalent unit

Assessment Requirements for UEEEL0021 Solve problems in magnetic and electromagnetic devices

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - identifying hazards and assessing risks and applying control measures
 - confirming isolation of circuits
- using methodological techniques to solve problems in circuits with an electromagnetic device from measured and calculated values
- determining the operating parameters of an existing circuit with an electromagnetic device, including:
 - the direction of magnetic field around a current-carrying conductor and a coil
 - a current-carrying conductor under the influence of a magnetic field
- modifying an existing circuit with an electromagnetic device to comply with specified operating parameters
- connecting electromagnetic devices to comply with a specified function and operating parameters
- completing work and documenting activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- magnetism, including:
 - common magnetic and non-magnetic materials
 - magnetic field patterns of magnets

- magnets attraction and repulsion when brought in contact with each other
- practical applications of magnets
- principle of magnetic screening (shielding) and its applications
- electromagnetism, including:
 - conventions representing direction of current flow in a conductor
 - direction of force between adjacent current-carrying conductors
 - effect of current, length and distance apart on the force between conductors
 - magnetic field around an electromagnet, a single conductor and two adjacent conductors carrying current
 - magnetomotive force (mmf) and its relationship to the number of turns in a coil and the current flowing in the coil
 - practical applications of electromagnets
- magnetic circuit types and associated terminology
- methods used to reduce electrical losses in a magnetic circuit
- electromagnetic induction, including:
 - principle of electromagnetic induction
 - applications of electromagnetic induction
 - Lenz's law
- inductance, including:
 - applications of the different types of inductors
 - industry standard symbols for inductors
 - types of inductor cores
 - construction of an inductor
 - definition of terms: self-induction, inductance and mutual inductance, and time constants
 - effect of physical parameters on the inductance of an inductor
 - relationship between load voltage, current and self-induced electromagnetic force in a direct current (d.c.) circuit having inductance
 - practical applications for the effects of self and mutual induction
 - undesirable effects of self and mutual induction
- magnetic principles in measurement instruments
- magnetic devices, including:
 - operation and application of:
 - magnetic sensing devices
 - contactors and relays
 - solenoids
 - magnetic methods used to extinguish the arc between opening contacts
- relevant manufacturer specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0022 Supply effective and efficient lighting products for domestic and small commercial applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to respond to customer requests for the supply of effective and efficient luminaries and associated control and mounting apparatus for domestic and commercial applications.

It includes engaging and clarifying customer requirements for domestic and commercial lighting products and supplying the most appropriate and compliant fittings.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0016 Provide advice on effective and energy efficient lighting products

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Engage with customer

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied

1.2 Communication with customers is conducted in a

professional and courteous manner in accordance with workplace procedures

1.3 Customer enquiries are responded to promptly and politely and in accordance with workplace policies and procedures

1.4 Appropriate interpersonal and communication skills are used to facilitate accurate and relevant exchange of information with customers

2 Clarify customer request

2.1 Appropriate questioning and active listening are used to determine customer needs

2.2 Customer requests are interrogated to clearly ascertain the most suitable lighting products

2.3 Customers are advised of technical and compliance specifications that need to be considered when choosing lighting products

2.4 Customers are provided with product information, available lighting options and assisted to identify preferred option/s

2.5 Product information to address customer lighting needs are identified and, as required, assistance sought from appropriate person/s

3 Supply lighting product

3.1 Lighting products are supplied as agreed with customer in accordance with workplace policy and procedures

3.2 Own work is monitored and adjusted in accordance with requirements for job quality, customer service and efficient resource use

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Engaging with customers to supply domestic lighting products must include at least one of the following:

Engaging with customers to supply commercial lighting products must include at least one of the following:

- a new three-bedroom domestic dwelling
- an addition/renovation of an indoor/outdoor entertainment and garden area to an existing domestic dwelling
- a commercial building of less than 200 m², half on which will be used as a small appliance service area
- a café or restaurant having a kitchen, restroom and dining area
- a small medical centre having a doctor's surgery, preparation room, waiting room, service desk and bathroom and kitchen facilities

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG182A Supply effective and efficient lighting products for domestic and small commercial applications.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0022 Supply effective and efficient lighting products for domestic and small commercial applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- clarifying customer requests
- engaging with customer
- engaging with customers to supply appropriate lighting products for domestic and small commercial applications, including:
 - advising customers of technical and compliance aspects that need to be considered when choosing lighting products
 - ascertaining the most suitable lighting products
 - communicating with customers in a professional manner and responding promptly to enquiries
 - dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - providing customers with information about available options and assisted to identify their preferred option
 - supplying lighting products as agreed with the customer and in accordance with workplace policy and procedures
- using effective communication skills/language, including:
 - active listening
 - asking for clarification/feedback
 - questioning
 - seeking advice from supervisor/appropriate person/s.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- current industry standards, practices and technologies
- interpersonal and communication skills, including listening, questioning and receiving feedback
- lighting applications for domestic and small commercial premises, including:
 - criteria for recommending the most appropriate light fittings (luminaires)
 - dealing with customer requests
 - lamp types, where colour is important for functional or safety reasons
 - lighting and energy conservation practices and technologies
 - luminaire types, where glare or illumination level gradients may cause difficulty for vision or introduce safety problems
 - manufacturer information, catalogues and other technical information/specifications
 - relevant regulatory requirements, including;
 - Building Code of Australia (BCA) requirements for lighting energy input/metre² for domestic dwellings
 - state/territory-based energy sustainability requirements (e.g. BASIX in NSW)
 - compliance requirements and marking (as per AS/NZS 4417 Regulatory compliance mark for electrical and electronic equipment) of products
 - electrical installation work to be carried out/supervised by a licensed electrician under a licensed electrical contractor
- relevant job safety assessments or risk mitigation processes, including safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources used should reflect current industry practices in relation to supplying effective and efficient lighting products for domestic and small commercial applications
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to terminate cables, cords and their conductors at accessories and current-using devices, designed to operate at voltages up to 1,000 volts (V) alternating current (a.c.) or 1,500 V direct current (d.c.).

It includes working safely to industry standards, wiring systems, cable types and applications; selecting appropriate termination accessories; preparing and terminating cables and cords; terminating cables/cord conductors; and ensuring completed termination complies with industry standard requirements.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to terminate cables, cords and conductors

2 Terminate cables, cords and conductors

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 Hazards are identified, risks assessed and risk control measures and workplace procedures implemented in accordance with workplace procedures
- 1.3 Safety hazards that have not previously been identified are noted on job safety assessments and existing risk control measures are implemented
- 1.4 Junction box/terminal enclosures and terminal types are inspected to determine the type and size of cable and conductor termination devices needed
- 1.5 Tools, materials and testing devices needed for terminating cables and cords are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
- 2.2 Circuits/machines/plant are checked as isolated, as

required, in accordance with WHS/OHS requirements and workplace procedures

- 2.3 Cable/cord ends are cut and sheath/insulation stripped with sufficient length to prevent strain on terminations and without undue waste
 - 2.4 Cable glands/retaining devices are fitted and secured to ensure cable/cord cannot be pulled out of entry into junction box/terminal enclosure
 - 2.5 Conductors are prepared to suit the terminal type they are to be connected to
 - 2.6 Conductors are terminated to ensure continuity across the terminal
 - 2.7 Methodology for dealing with unplanned situations are discussed with appropriate person/s and documented
 - 2.8 Unplanned situations are responded to safely in accordance with workplace procedures, in a manner that minimises risk to personnel, equipment and with the approval of an authorised person
- 3 Test terminated cables and cords**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Terminated cables are tested to ensure continuity and insulation resistance comply with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Terminating cables, cords and accessories must include at least five of the following types of cables each at a junction box and a

- circular thermoplastic sheathed (TPS)
- flat TPS
- flexible cables

device terminal enclosure:

- flexible cords
- fire protection cables
- steel wire armoured (SWA) cables
- thermoplastic insulated (TPI) cables.

Terminating conductors must include the following terminal types:

- screw terminal
- stud terminal
- tunnel terminal.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG106A Terminate cables, cords and accessories for low voltage circuits.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.
Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- # applying sustainable energy principles and practices
- # confirming relevant circuits are isolated
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- # terminating wiring and accessories for low voltage circuits, including:
 - # cutting cable ends and stripping sheath/insulation to a sufficient length
 - # fitting and securing cable glands/retaining devices correctly
 - # preparing and terminating conductors to suit the type of terminal at which they are to be connected
 - # selecting appropriate cable/cord and conductor devices
 - # testing completed cables to ensure compliant continuity and insulation resistance
- # inspecting junction box/terminal enclosures and determining the type and size of required cable and conductor termination devices
- # testing terminated cables and cords.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- cable types and terminations, including:

- application of various cords and cables types, as defined by the properties of their insulation, sheathing, armouring and/or screening
- Australian and international colour standards for cords and cables
- single cables, flexible cables, flexible cords, screened cables, armoured cables, other similar and like cables
- construction of common cables
- identification of cords and cables by conductor size, type and rating
- identification of hardware used in terminating cords and cables
- requirements to protect and support cables adequately (protection against mechanical damage, protection from adverse temperatures and corrosion and protection from magnetic field that may affect the performance of the cable)
- structural components of cables and their purpose (conductor material, stranding, insulation type, voltage rating, screening, sheathing, armour and serving)
- techniques for termination of cords and cables using crimp lugs, tunnel connectors, soldering and solderless lugs
- cords, cables and plugs, including:
 - techniques for selection of flexible cords for given applications
 - preparation of cord ends for connection
 - fitting standard three pin plug tops and extension sockets to flexible cords
 - connecting a variety of plug tops and extension sockets to different flexible cord types
- flat thermoplastic sheathed (TPS) wiring systems, including techniques for:
 - installation of flat TPS cable in trunking and duct for the supply of socket outlets
 - using flat TPS cable for lighting looms
- circular TPS wiring systems, including techniques for:
 - installation of circular TPS cables on cable ladder/tray
 - installation of circular TPS cable
- thermoplastic insulated (TPI) cables in non-metallic enclosures, including techniques for:
 - cutting and setting rigid non-metallic ducting, trunking and conduit and accessories
 - installation of circuits using TPI cables in non-metallic enclosures
- TPI cables in metallic enclosures, including techniques for:
 - fitting metallic conduit to metallic trunking and accessories
 - cutting, threading and setting metallic conduit
 - installation of circuits using TPI cables in metallic conduit, ducting and trunking
- fire protection cabling and systems encompassing:
 - requirements when passing a wiring system through a fire rated wall or floor
 - techniques for recognising different fire protection cable types
 - techniques for installation and termination of fire protection cable
- steel wire armoured (SWA) cables, including techniques for:
 - identifying accessories used with SWA cables
 - installation of circuits using SWA cables
- trailing cables and catenary systems, including techniques for:

- identifying equipment used with trailing cable and catenary systems
- installation of catenary wiring systems
- installation of trailing cable systems supplying pendant sockets
- relevant industry standards and testing requirements for safe operation relating to:
 - cords, cables and plugs
 - circular and flat TPS wiring systems
 - TPI cables in non-metallic enclosures
 - TPI cables
 - fire protection cabling
 - SWA cables
 - trailing cables and catenary systems
- relevant manufacturer specifications

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographical error fixed in performance criteria 2.5

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to test and connect alternating current (a.c.) rotating machines. It includes safe working practices, ascertaining correct operation of a.c. machines and solving problems as they apply to servicing, fault finding, installation and compliance work functions

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) a.c. or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to test and connect a.c. rotating machines

2 Test and connect a.c. rotating machines

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Nature of machine/s problem is obtained from relevant documentation or work supervisor to determine scope of work
- 1.2** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.3** Hazards are identified, risks are assessed, and control measures are implemented
- 1.4** Materials required for work are determined in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices required for work are obtained and confirmed fit for purpose and serviceable in accordance with workplace procedures
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2** Need to test or measure live work is determined in accordance with WHS/OHS job safety assessment

requirements and work is conducted using safety control measures and workplace procedures

- 2.3 Relevant circuits, machines and/or plant are checked as being isolated, as required in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Problem-solving techniques are used to resolve problems from measured and calculated values as they apply to a.c. rotating machines
- 2.5 Machine is verified as electrically safe and connected to electrical supply and commissioned in accordance with workplace procedures and industry standards
- 2.6 Unplanned situations are dealt with safely and with the approval of an authorised person/s
- 2.7 Problems dealt with safely and without damage to machines, the surrounding environment or services using sustainable energy practices

3 Complete work and document activities

- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Justification for solutions used to solve problems is documented in accordance with workplace procedures
- 3.4 Work completion is documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Testing and connecting a.c. rotating machines must include at least three of the following types of motor (must include at least one single phase and one three phase):

- capacitor start capacitor run motors
- capacitor start motors
- permanent magnet motor
- permanently split capacitor motor
- portable generator
- shaded pole motor
- split phase motors
- standby generator
- three phase squirrel-cage motor
- three phase synchronous generator
- three phase synchronous motor
- three phase wound rotor motor
- universal motor.

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEEEL0024 Test and connect alternating current (a.c.) rotating machines

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographical error fixed in performance criteria 2.5

Workplace evidence requirements updated in Performance Evidence and Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- # applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures, including:
 - # identifying and assessing hazards and risks, and implementing control measures
 - # checking circuits are isolated in accordance with workplace procedures and regulatory requirements
- # applying testing and connecting techniques in alternating current (a.c.) rotating machines, including:
 - # connecting, running and reversing the direction of a single phase motor
- applying testing and connecting techniques in alternating current (a.c.) rotating machines, including:
 - connecting three phase induction motor in both star and delta connections
 - connecting, running and reversing the direction of a three phase motor
 - determining the operating parameters of existing machines
 - altering an existing machine connection or circuit to comply with specified operating parameters
 - developing machines/circuits to comply with a specified function and operating parameters
 - determining the cause of low efficiency in an existing machine
 - performing insulation resistance, continuity and winding identification tests
 - identifying faults/faulty components in single and three phase motors
 - testing insulation resistance of a three phase induction motor prior to connection to the

supply

- testing winding resistance (ohmic value and continuity) of a three phase induction motor prior to connection to the supply
- # applying sustainable energy principles and practices
- completing problem-solving activities documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating principles of three phase induction motors, including:
 - speed of rotation of a rotating magnetic field
 - relationship between the rotor speed, slip and rotor frequency
 - basic principle of operation of an induction motor
 - motor action in a generator and generator action in a motor
- three phase induction motor construction, including:
 - basic component parts of a three phase induction motor
 - types of rotors (standard and wound) used in three phase induction motors
 - connections for three phase induction motor in both star and delta
- three phase induction motor characteristics, including:
 - relationship between torque, speed, and power and interpretation of speed/torque curves of induction motors
 - squirrel cage motors operating characteristics conditions necessary for an induction motor to produce maximum torque
 - operating characteristics of an induction motor from nameplate information and by measurement
 - induction motors efficiency and minimum energy performance standards (MEPS)
 - full load efficiency and power factor of induction motors
- split phase - single phase motors, including:
 - identification of split phase induction motors
 - principles of operation of a split phase induction motor
 - construction and basic characteristics of a split phase induction motor
 - applications of split phase induction motors
- single phase motors – capacitor and shaded pole types, including identification of single phase induction motors, including:
 - capacitor start
 - capacitor start/capacitor run, permanent split capacitor (PSC) and shaded pole
 - principles of operation of each motor type listed above
 - operating characteristics and typical applications of each motor type listed above
 - reversing the direction of rotation of each of the motors listed above

- single phase motors – series universal, including:
 - principles of operation of a series universal motor
 - identification and functions of each of the basic parts of a series universal motor
 - operating characteristics and typical uses for a series universal motor
- motor protection, including:
 - reasons why motor protection is required
 - requirements of the AS/NZS 3000 with regards to motor protection
 - types of motor overload protection
 - operating principles of thermal cut-out devices, thermal and magnetic motor protection devices for single and three phase motors
 - electrical features of motor protection high rupturing capacity (HRC) fuses
 - effects of undervoltage and overvoltage on motors and motor circuits
 - effects of repetitive starting and/or reversing on motors
 - special requirements for motor protection in high humidity or moist environments, high temperature areas and corrosive atmospheres
 - operating principles of phase failure protection
 - selecting suitable protective devices for a given motor and starter combination
- three phase synchronous machines- operation principles and construction, including:
 - power transfer diagram of an a.c. synchronous machine
 - generation of a sinusoidal waveform
 - operation of a synchronous alternator
 - operation of a synchronous motor
 - principles of operation of an asynchronous generator (induction generator)
 - identification of main parts of a synchronous alternator/motor
 - methods used to provide the excitation of a synchronous alternator/motor
 - block diagram of an alternator voltage regulator
 - advantages gained by the parallel operation of alternators
 - starting methods of synchronous motors
- alternators and generators, including:
 - effects on the generated voltage of variations in excitation
 - effects on generated voltage of variations in load current and power factor
 - identification of characteristic curves of an alternator
 - types of prime movers used with single and three phase portable/standby alternators
 - manual operation of single and three phase portable/standby alternators
 - ratings of single and three phase portable/standby alternators
 - applications of single and three phase portable/standby alternators
 - construction details of single and three phase portable/standby alternators
 - common faults found in portable/standby alternators
 - parallel connection
 - load sharing

- standby generators and associated arrangements
- safe testing methods for locating faults in low voltage (LV) a.c machines, including:
 - insulation resistance
 - coil resistance
 - centrifugal switch
 - capacitor
 - bearing wear
 - locked rotor
 - load
 - thermal overload
 - machine controls
- mechanical faults and associated symptoms that occur in LV a.c rotating machines, including:
 - bearings
 - fans
 - bent shaft
 - locked rotor
 - blocked air vents
 - centrifugal switches
 - environmental factors
- faults on driven loads and couplings and their consequences, including:
 - slipping belts
 - poorly aligned coupling (shims)
 - vibration
 - loads bearing failing
 - load stalling
- electrical faults and associated symptoms that occur in LV a.c rotating machines, including:
 - open and partially open circuit winding
 - short and partially short circuit winding
 - open circuit rotor
 - burnt out winding
 - coil shorted to frame
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

In addition, evidence of Performance Evidence items of this unit marked with a hash (#) must be gathered in authentic workplace operational conditions (not simulated) before final determination of competence in this unit can be made.

UEEEL0025 Test and connect transformers

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Performance criteria numbering corrected in element 2

Typographic error fixed in performance criteria 2.5

Workplace evidence requirements removed from Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in transformers. It includes safe working practices, ascertaining correct operation of transformers and solving problems as they apply to servicing, fault finding, installation and compliance work functions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to test and connect transformers

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2** Hazards are identified, risk are assessed and control measures and workplace procedures are implemented
- 1.3** Safety hazards which have not previously been identified are noted on job safety assessments and existing risk control measures are implemented
- 1.4** Nature of transformer problem is obtained from documentation, service manual or work supervisor to determine scope of work
- 1.5** Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.6** Materials required for work are determined in accordance with workplace procedures
- 1.7** Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation

- and safety
- 2 Solve problems in transformers**
 - 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2** Need to test or measure live work is determined in accordance with WHS/OHS job safety assessment requirements and work is conducted using safety control measures workplace procedures
 - 2.3** Relevant circuits, machines and/or plant are checked as being isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Problem-solving methods are used to resolve problems from measured and calculated values as they apply to transformers
 - 2.5** Transformer is verified as electrically safe and connected to electrical supply and commissioned in accordance with workplace procedures and industry standards
 - 2.6** Problems are resolved without damage to circuits, the surrounding environment or services using sustainable energy practices
 - 3 Complete work and document activities**
 - 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Justification for solutions used to solve machine problems is documented in accordance with workplace procedures
 - 3.4** Work completion is documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training package Companion Volume Implementation Guide.

Testing and connecting transformers must be demonstrated in relation to solving problems in any three of the following transformers:

- power transformers
- current transformers
- voltage transformers
- auto-transformers
- isolation transformers
- welding transformers
- step-up and step-down transformers

Unit Mapping Information

No equivalent unit.

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0025 Test and connect transformers

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Performance criteria numbering corrected in element 2

Typographic error fixed in performance criteria 2.5

Workplace evidence requirements removed from Assessment Conditions.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures, including:
 - identifying and assessing hazards and risks, and implementing control measures
 - applying safe working procedures when connecting and testing transformers
 - checking circuits are isolated in accordance with workplace procedures and regulatory requirements
- solving problems with transformers, including:
 - determining the operating parameters of an existing transformer
 - altering an existing transformer circuit to comply with specified operating parameters
 - developing transformer circuits to comply with a specified function and operating parameters
 - determining the cause of low efficiency in an existing transformer
 - determining conditions causing an existing circuit to be unsafe
- determine polarity markings for an unidentified single phase double wound transformer
- determining the value of a transformers secondary voltage and current from nameplate data when solving problems in transformer operations
- determining voltage and current in the windings of an auto-transformer by calculation
- selecting transformers for specific application
- testing serviceability of transformers
- applying sustainable energy principles and practices

- completing problem-solving activities documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- AS/NZS 3000 Electrical installations requirements and restrictions on the installation and use of transformers
- methods used to insulate low voltage (LV) and high voltage (HV) transformers
- types of information stated on transformer nameplates
- types of lamination style and core construction used in transformers
- relevant industry standards relating to transformers
- application of transformers
- transmission and distribution transformers
- construction of voltage transformers
- ratings of voltage transformers
- auto-transformers and instrument transformers, including:
 - advantages and disadvantages of an auto-transformer
 - risks and safety control measures associated with connection and disconnection of instrument transformers
 - connection diagrams for instrument transformers
 - applications for auto-transformers and instrument transformers
 - construction of current transformers
 - ratings of current transformers
- transformer operation, including:
 - principles of mutual induction of a transformer
 - factors that determine the induced voltage in a transformer winding
 - determining the value of a transformer's secondary voltage and current given one winding's electrical details and turns ratio
 - identification of voltage and current components of a phasor diagram for a transformer on no-load
 - principles of power transferred from the primary to secondary when a load is connected using a phasor diagram neglecting impedance drops
 - safety features specified in relevant industry standards with respect to transformers and isolating transformers
 - determining circuit operating characteristics when solving problems in LV transformers
- transformer losses, efficiency and cooling, including:
 - methods used for natural and forced cooling of transformers
 - power losses which occur in a transformer
 - tests which allow the power losses of a transformer to be determined

- relationship between transformer cooling and rating
- transformer voltage regulation including:
 - reasons for voltage variation in the output of a transformer
 - voltage regulation as applicable to a transformer
- percentage impedance, including:
 - as applied to transformers
 - techniques for determining percentage impedance of a transformer by relevant calculation
- parallel operation of transformers, including:
 - need for parallel operation of transformers
 - techniques for connecting in parallel to supply a single load (loading on transformers operating in parallel)
 - conditions/restrictions required before two transformers can be connected in parallel
 - the consequences/effect of an incorrect connection
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so, where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0026 Align and install traction lift equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to align and install traction lift mechanical and electrical equipment.

It includes planning, aligning and installing lift mechanical and electrical equipment by working safely in alignment of lift structures such as measuring, marking out and aligning of lift installations, including machine room equipment, lift well equipment, the lift car and associated equipment and landing door frames and doors. It also includes setting out of multiple lift wells in varying configurations and the installations of well and pit equipment, lift car equipment, superstructure and counterweights, machine room equipment, landing, door frames and door, landing buttons and indicator boxes; and completing workplace reporting activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0045 Diagnose and rectify faults in traction lift systems

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0046 Solve problems in single path circuits

UEECD0044 Solve problems in multiple path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install lift equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3 Scope of work to be undertaken is identified from site plans, drawings, specifications and/or discussions with appropriate person/s
- 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others

- 1.5** Tools, equipment and alignment devices needed to carry out work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Align and install lift equipment**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Equipment is installed straight and square in the required locations and within acceptable tolerances
- 2.5** Equipment is aligned and installed in accordance with manufacturer specifications and regulatory requirements
- 2.6** Existing safe work methods for dealing with unplanned situations are discussed with appropriate person/s and documented in accordance with workplace procedures
- 2.7** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.8** Checks of the quality of installed equipment are undertaken in accordance with workplace procedures
- 2.9** Equipment installation is carried out efficiently without unnecessary waste of materials or damage to apparatus, circuits or the surrounding environment using sustainable energy practices
- 3 Complete and report alignment and installation activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Final checks are made to ensure that the installed equipment conforms to job specifications and workplace requirements

- 3.4** 'As-installed' equipment is documented and an appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Aligning and installing must include at least the following:

- two of the following alignments:
 - lift car alignment
 - lift well alignment
 - machine room alignment
- two of the following types of equipment:
 - lift cars
 - lift well equipment
 - machine room equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG167A Align and install traction lift equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0026 Align and install traction lift equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- aligning and installing traction lift equipment
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- carrying out alignment functions
- completing and reporting alignment and installation work activities
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- planning to align and install traction lift equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- alignment equipment, including rail gauges, straight edges, shims/packers and lasers
- car operating devices, including slowdown switch, limits, inductors, door locks, vanes and shaft information
- current industry practices, workplace procedures and technologies
- equipment layout, including specifications, clearances, 3-D impact on layout and lift code
- fixing devices and methods, including inserts and expansion and chemically bonded anchors
- installation and alignment of hydraulic equipment, including ram/cylinder, hydraulic lines and bleeding hydraulic system
- lift car alignment, including superstructure, frames and doors
- lift well alignment, including guides and brackets, trimmer beams, buffers, compensators, landing doors and locks
- lift well/s, including lift well alignment

- multiple lift wells, including:
 - corrective action and setting of well templates
 - plumb charts analysis for 3-D impact
 - use of theodolite, centre line/datum, survey information and layouts
- single lift wells, including:
 - purpose and need for accuracy, including identification of clearances
 - modification of errors, including adjustment and use of template
 - use of plumb lines and weights
 - measuring and marking out lift wells and machine room, where appropriate
 - plumbing chart and use of laser level
- machine room alignment, including machine and fixings, diverter, governor and tensioning sheaves, counterweight centre lines and roping system
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and relevant industry standards, including:
 - traction lift mechanical equipment
 - traction lift electrical equipment
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions
- running clearances requirements, including safety gear, car sill and door operator
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to aligning and installing lift equipment
- applicable documentation, including workplace procedures, equipment specifications,

regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0027 Carry out low voltage electrical field testing and report findings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to carry out low voltage (LV) electrical field testing and report findings.

It includes preparing, inspecting and testing of electrical field systems, documenting and reporting test results.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Verify compliance and functionality of low voltage general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multiple path circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to carry out electrical field inspection and testing

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3 Scope of work to be undertaken is determined from reports and/or discussions with appropriate person/s

- 1.4 Advice is sought from the work supervisor to ensure work activity is coordinated effectively with others
 - 1.5 Tools, equipment and testing devices required to locate faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Carry out electrical field inspection and testing**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Need to inspect, test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are isolated in accordance WHS/OHS requirements and workplace procedures
 - 2.4 Safety hazards from fault/s and/or breakdown are documented and risk control measures implemented in consultation with appropriate person/s
 - 2.5 Field testing and measuring techniques of electrical systems, circuits, and apparatus are conducted in accordance with workplace procedures
 - 2.6 Circuit/apparatus/components are dismantled as required to facilitate testing and parts stored for protection against loss or damage
 - 2.7 Tests are determined from report and appropriate testing/measuring instruments selected in accordance with manufacturer instructions and relevant industry standards
 - 2.8 Unplanned events are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.9 Testing activities are carried out without damage to apparatus, circuits, environment or services using sustainable energy practices
- 3 Complete electrical field testing and report findings**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Apparatus is reassembled after testing as required and work area is cleaned and made safe in accordance with workplace procedures

- 3.3** Test findings and recommendation for actions are reported in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Carrying out and reporting findings of electrical field tests must include the following:

- locating faults
- examining operating parameters
- accessing compliance with regulations
- evaluating quality compliance

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG132A Carry out low voltage electrical field testing and report findings.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0027 Carry out low voltage electrical field testing and report findings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- carrying out inspection and testing, including:
 - selecting and setting up relevant testing/measuring instruments
 - using relevant testing techniques
 - using testing and measuring instruments
- completing electrical field inspection, testing and report findings
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- following workplace procedures and instructions
- preparing electrical field testing, including:
 - identifying work from reports and/or discussion with appropriate person/s
 - locating tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- advanced electrical testing and measuring devices, including:
 - testing/measuring devices and their application
 - circuit arrangement and safety procedures for connection of testing/measuring devices into a circuit
 - taking readings
 - storage, maintenance and care of testing/measuring devices

- measurement concepts, including:
 - notion of error, accuracy and resolution
 - sources of measurement error and uncertainties
 - instrument specifications and calibration certificates
 - test and measuring instrument safety certification levels and their application
- types of field measuring instruments and their application, including:
 - instrument meter movements and readouts, including moving coil, moving iron and dynamometer meter movements, liquid crystal display (LCD) digital and screen readouts
 - role of a microprocessor/controller in measuring instrument
- measuring low voltages (LV) and direct currents (d.c.) and alternating currents (a.c.), including:
 - LV and current measurement techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set-up and safety procedures
 - interpreting test readings
- measuring high voltages (HV) and d.c. and a.c. including:
 - HV and current measurement techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set up and safety procedures
 - interpreting test readings
- measuring fault levels and (earth) fault-loop impedance, including:
 - fault and fault-loop impedance measurement techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set-up and safety procedures
 - interpreting test readings
- measuring power, energy, reactive power, power factor and maximum demand, including:
 - power measurement techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set-up and safety procedures
 - interpreting test readings
- measuring power quality, including:
 - power measurement techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set-up and safety procedures
 - interpreting test readings, including power quality measurement, including waveform distortion, harmonics, power factor and transients
- power cable faults and fault detection techniques, including:
 - poor connection (high resistance)
 - open circuit

- insulation breakdown and arcing
- Varley and Murray loop tests
- pulse test
- echo test
- radio-based tests
- application and limitations of the various cable fault detection techniques, including:
 - cable fault detection techniques embodied in microprocessor-based instruments
 - causes of inaccuracies and overcoming them
 - test instrument set-up and safety procedures
 - interpreting test readings
- problem-solving techniques
- relevant industry standards and codes of practice for electrical inspection and testing
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions for tools and equipment
- relevant quality workplace procedures
- relevant sustainable energy practices
- relevant tools, equipment, resources and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0028 Conduct compliance and functional verification of electrical apparatus and existing circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct compliance and functional verification of electrical apparatus and existing circuits.

It includes inspection and testing to verify electrical apparatus and/or existing circuits are safe and comply with all requirements. It covers working safely; visual inspections and mandatory, optional and functional testing following verification procedures; identifying non-compliance defects and mandatory reporting requirements.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Current Licence Holders:

Those holding an 'Electrical Fitter Occupational Licence' or equivalent issued in an Australian state or territory and are currently employed as an Electrical Fitter meet the requirements of this unit and its prerequisite requirements.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

- UEEEL0020 Solve problems in low voltage a.c. circuits
- UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
- UEEEL0005 Develop and connect electrical control circuits
- UEEEL0047 Identify, shut down and restart systems with alternate supplies
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multipath circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to inspect and test electrical apparatus and circuits

- 1.1** WHS/OHS measures for the site are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in preparation for the work are followed
- 1.3** WHS/OHS hazards not previously identified are noted and risk control measures implemented

- 1.4 Electrical apparatus, existing circuits documentation and relevant industry standards are reviewed and applied
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others
 - 1.6 Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.7 Preparatory work is checked to ensure no damage has occurred and complies with requirements
- 2 Inspect and conduct safety testing**
- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 2.2 Need to inspect, test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked as being isolated in accordance with WHS/OHS requirements and switch-off, lock out and tagging procedures
 - 2.4 Electrical apparatus/circuits are inspected to determine if they are compliant with industry standards, function safely and as intended
 - 2.5 Wiring is checked for suitability for the environments in which they are installed and suitably protected from damage or overheating
 - 2.6 Protection methods and devices are validated as meeting coordination requirements for overload and short circuit protection
 - 2.7 Switchgear and control gear are validated as being appropriately rated and meeting functional requirements
 - 2.8 Evidence that electrical equipment complies with safety requirements is cited
 - 2.9 Earthing system components are checked that they are correctly located and conductors correctly sized
 - 2.10 Mandatory tests are conducted on all connected electrical apparatus and existing circuits in accordance with industry standards

- 2.11** Testing is conducted to verify that fault-loop impedance is sufficiently low and residual current devices operates as intended
- 3 Report inspection and test findings**
- 3.1** WHS/OHS risk control work completion measures and procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Non-compliance defects are identified and reported in accordance with workplace procedures
- 3.4** Recommendations for rectifying defects are made in accordance with workplace procedures
- 3.5** Mandatory documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Verification and testing must include at least the following two different types of installations:

- electrical apparatus and existing circuits comprising an apparatus and existing circuit supplied by a single phase supply
- electrical apparatus and existing circuits supplied by a three phase supply

Unit Mapping Information

This unit replaces and is not equivalent to UEENEEG199A Conduct compliance and functional verification of electrical apparatus and existing circuits.

Assessment Requirements for UEEEL0028 Conduct compliance and functional verification of electrical apparatus and existing circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including risk control measures
- selecting correct tools and testing equipment
- confirming correct isolation in accordance with workplace procedures, industry and regulatory standards
- completing visual inspection and testing of electrical apparatus and circuits, including:
 - identifying visual non-compliance defects
 - using effective methods for conducting mandatory and optional tests
 - using testing devices
- reporting inspection and recommendations, including:
 - identifying non-compliance and functional defects from test results
 - identifying causes of non-compliance and functional defects
- dealing with unplanned events.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical safety, including:
 - safety procedures for working on electrical systems, circuits and apparatus
 - safe working practices as a normal part of carrying out electrical installation work
 - isolation and lockout procedures
 - tools and equipment needed to conduct electrical work compliance inspection and testing
- legislated regulations, including:

- legislation and regulations that require electrical apparatus and existing circuits to be inspected and tested to ensure they are safe
- the person/bodies responsible for the various aspects of ensuring electrical apparatus and existing circuits are safe
- results of tests that show an electrical apparatus and existing circuits is safe for connection to the supply
- results of periodic inspection and tests that show electrical equipment are safe to use
- visual inspection of electrical apparatus and existing circuits for compliance with relevant industry standards, including:
 - protection requirements
 - general condition
 - wiring systems
 - equipment and accessories
 - earthing
- testing electrical apparatus and existing circuits, including:
 - tests to ensure insulation resistance is adequate; earth continuity is such that it will ensure the operation of protection devices under earth fault conditions; polarity of active/s and neutral for final sub-circuits is correct; there is no transposition of earthing and neutral conductors; fault-loop impedance is sufficiently low; residual current device (RCD) use for correct operation and sensitivity
 - functional tests to ensure active/s and neutral for the same circuit are clearly identified with their circuit protection device
 - tests that show all circuits and devices operate as intended
 - tests to determine the fault level at a particular point in an installation
- documentation, including:
 - results of tests conducted on an electrical apparatus and existing circuits comply with requirements and ensure the installation is safe
 - documents of the results of testing electrical apparatus and existing circuits as required by the local supply authority
 - documents of periodic testing and inspection of electrical equipment, including tagging requirements
- effects of electric current, including:
 - physiological effects of current
 - basic principles by which an electric current can produce heat, light, motion and a chemical reaction
- single path practical circuit, including:
 - arrangement of energy source, protection device, switch and load in a circuit
 - the purpose of each component in the circuit
 - consequences of an open circuits, closed circuits and short circuits
- multiple path direct current (d.c.) circuits, including:
 - circuit configurations and connection
 - relationship between parameter of voltage, current, resistance power dissipation in the

- whole or any part of the circuit
- safely measuring the parameters for the whole or any part of the circuit
- methods of determining circuit behaviour for variation in any of the parameters from measured and calculated values
- alternating voltage and current generation, phase relationships, energy in an alternating current (a.c.) circuit, including:
 - sinusoidal voltage generation and resulting current
 - the terms period, maximum value, peak-to-peak value, instantaneous value, average value, root-mean-square (r.m.s.) value and frequency
 - three phase generation
 - relationship between the phase voltages generated in a three phase alternator and the conventions for identifying each
 - method of determining the phase sequence or phase rotation of a three phase supply
 - methods of determining power and energy supplied by three phase circuits
- fundamental safety principles of relevant industry standards, including:
 - definition of terms
 - fundamental safety principles of protection against direct and indirect contact with live parts; thermal effects; overcurrent; earth faults; abnormal voltages; spread of fire; mechanical injury and external influences
 - fundamental principles of installation design; selection and installation of equipment; means of compliance (including alterations, additions and repairs) and verification of compliance
- electric motor selection, starting method and overload protection, including:
 - types of motor enclosures suitable for given environmental conditions
 - criteria for selecting motor starters and overload protection
 - types and connection arrangements for direct-on-line and reduced voltage starters
 - thermal, magnetic and thermistor overload protection methods
- protective and functional earthing, including:
 - relevant industry standards requirements
 - purpose of protective and functional earthing
 - parts of the protective earthing systems
 - earthing arrangements, earthing of equipment and equipotential bonding
 - methods of determining the maximum fault-loop impedance for a circuit
 - selection of protective conductor and active conductor sizes for each circuit to ensure earth fault-loop impedance is sufficiently low to operate the circuit protective device
- multiple earth neutral (MEN) system and its application, including:
 - the roles of the protective earthing (PE) and neutral (N) conductors in a consumer's installation and their relationship to the protective earth neutral (PEN) conductor in the electricity distributor system or sub-main to an outbuilding
 - the importance of the MEN link when a fault occurs
 - the likely consequences of the absence of the MEN link or high impedance in the PEN conductor when a fault occurs

- the requirements for installation of a MEN link in an installation and an outbuilding
- application of transformers, including:
 - transformers used in distribution and transmission systems and large consumer installations
 - transformers used in welding machines
 - applications in appliances
 - risks and safety control measures associated with connection and disconnection of instrument transformers
 - safe working procedures when connecting and testing transformers
 - relevant industry standards requirements and restriction on the installation and use of transformers
- protection of circuit against overcurrent and abnormal voltages, including:
 - relevant industry standards requirements
 - minimum fault levels specified by electricity distributors
 - methods and arrangement for protection against short-circuit currents and overload currents
 - coordination of overload and short circuit protection devices
 - coordination between conductors and overload protection device
 - causes of over and undervoltage
 - device and requirements for protection against over and undervoltage
- use of RCDs and extra-low voltage (ELV) for fault protection, including:
 - limitation of an RCD to protect against contact with live parts
 - relevant industry standards requirements for use of RCDs
 - conditions for use of ELV to provide for basic and fault protection
 - relevant industry standards requirements for installation of separated extra-low voltage (SELV) and protected extra-low voltage (PELV) systems
- control and protection of electrical apparatus and existing circuits, including:
 - relevant industry standards requirements
 - devices for functions of isolation, emergency, mechanical maintenance and functional control
 - method for assessing prospective short circuit current
 - devices and arrangement for protection against overload and short circuit current
 - additional protection by RCD
 - protection against switchboard internal arc faults
- electrical apparatus and existing circuits in hazardous areas, including:
 - relevant industry standards requirements
 - types of areas classified as a hazardous area
 - standards to which the maintenance of electrical equipment shall comply
 - additional training required to work competently with electrical equipment for hazardous areas
- verification of compliance of electrical apparatus and existing circuits, including:

- relevant industry standards requirements
- visual inspection to determine if electrical apparatus and existing circuits complies with requirements of relevant industry standards and relevant specific installation standards
- mandatory tests in AS/NZS 3017 Electrical installations - Verification guidelines
- portable tool safety testing and tagging system in accordance with AS/NZS 3760 In-service safety inspection and testing of electrical equipment
- ability to perform effective safe isolation of any equipment, including:
 - preparation of a safe work method statement (SWMS) or job safety analysis (JSA) for effective safe isolation
 - safe methods for identifying source of supply to be isolated
 - switching-off, lock-out and tagging procedures
 - safe methods for confirming effective and safe isolation
- relevant industry standards requirements to carryout repairs and terminating thermoplastic insulated cables, elastomer sheathed cables, cross-linked polyethylene (XLPE) sheathed cables, high temperature cables, armoured cables and neutral screened cables in a wide range of applications
- circuit tests required for electrical cables in a range of installations and final sub-circuit, including:
 - following safe testing procedures
 - tests to show if the earth continuity and earth fault-loop impedance are sufficiently low
 - testing to show if insulation resistance is sufficiently high
 - testing to show if the polarity and circuit connections are correct
- techniques to read, sketch and interpret electrical diagrams including:
 - purpose and characteristics of schematic, block and wiring diagrams, plans and schedules
 - conventions used in documenting electrical information
 - read and interpret schematic, block and wiring diagrams, plans and schedules
 - sketch electrical diagrams using conventional symbols
- WHS/OHS, including:
 - WHS/OHS regulations
 - legal responsibilities for employers and employees
 - employer's and employee's own duty of care
 - safety committees and their role
- requirements for personal safety in the workplace including:
 - purpose and use of SWMS or JSA
 - purpose and process of reporting WHS/OHS incidents
 - safety procedures for working with electrical circuits and equipment
 - procedures for safe and effective isolation of electrical supply
 - regulations for the supervision of apprentices and trainees
- process to rescue a person in contact with live electrical conductors or equipment and the primary importance of the safety of the rescuer
- application of emergency first aid requirements for an electric shock victim, including:

- calling for help
- applying cardiopulmonary resuscitation (CPR)
- selection and use of fire extinguishers to control electrical fire at accident site
- dangers of high voltage (HV) equipment and distribution systems, including:
 - step and touch and induced voltages
 - sources of induced voltage and stored energy
 - creepage and clearance requirements
 - application of safe working procedures in the vicinity of HV equipment
- systematic method of commissioning and decommissioning electrical equipment and existing circuits, including:
 - commissioning safety procedures
 - circuit voltage testing
 - phase rotation checks
 - functional testing
 - instrument and control parameter settings
 - decommissioning safety procedures
 - identification of circuits with their control and protection devices
 - impact of isolation on other parts of an installation
 - tagging, testing and earthing
 - safe removal of equipment
- diagnosing and rectifying faults in electrical apparatus and existing circuits, including:
 - faults such as open circuit, short circuit, incorrect connections, insulation failure, unsafe condition, apparatus/component failure and related mechanical failure
 - apparatus such as control devices, fixed appliances/accessories, lighting, electrical machines motors and controls, socket outlets, transformers, protection and metering devices
 - circuits such as those supplying fixed appliances, lighting, socket outlets, motors and controls circuits, transformers, electronic or computer-based equipment.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0029 Conduct compliance inspection of LV electrical installations with demand exceeding 100 A per phase

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct compliance inspection of low voltage (LV) electrical installation with demand exceeding 100 ampere (A) per phase.

It includes preparing and conducting compliance inspection, and actioning and reporting on findings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Verify compliance and functionality of low voltage general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0030 Conduct compliance inspection of single phase LV electrical installations

- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multiple path circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct compliance inspection

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in preparation for the work are followed
- 1.3** WHS/OHS hazards not previously identified are noted and risk control measures are implemented in consultation with appropriate person/s

- 1.4 Installation documentation and relevant industry standards are reviewed and applied
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others
 - 1.6 Tools, equipment and testing devices to verify compliance are obtained and checked for operation and safety in accordance with workplace procedures
- 2 Conduct compliance inspection**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Need to test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Inspection of the mains and main switchboard is conducted of protection metering earthing circuit arrangements and markings in accordance with relevant industry standards
 - 2.5 Inspection of circuits is conducted for compliance of the installed wiring accessories switchgear/control gear and current-using devices in accordance with relevant industry standards
 - 2.6 Electrical equipment compliance with relevant safety requirements and industry standards is obtained from appropriate person/s
 - 2.7 Inspection is conducted to verify compliance of earthing insulation polarity circuit connections and operation of residual current devices (RCDs) in accordance with relevant industry standards
 - 2.8 Fault-loop impedance is determined as being sufficiently low by testing calculation and compliance with arrangement of the installation in accordance with relevant industry standards
 - 2.9 Unplanned events are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 3 Act and report on inspection findings**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed
 - 3.2** Non-compliance defects are identified and documented in accordance with relevant industry standards and workplace procedures
 - 3.3** Actions for non-compliance defects within the scope of inspection responsibilities are in accordance with workplace procedures and relevant industry standards
 - 3.4** Inspection report is completed and issued to appropriate person/s in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting compliance inspection must include at least two electrical installations comprising of the following:

- consumer mains
- distribution boards related to the control of an individual occupier's portion of a multiple installation
- earthing system
- final sub-circuits
- main earthing system
- main switchboard
- sub-mains

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG123A Conduct compliance inspection of LV electrical installations with demand exceeding 100 A per phase.

Assessment Requirements for UEEEL0029 Conduct compliance inspection of LV electrical installations with demand exceeding 100 A per phase

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- obtaining appropriate documentation and equipment in preparation for the inspection
- conducting detailed inspections and testing methodically
- identifying non-compliance defects
- relating non-compliance defects with appropriate clause in regulatory standards
- acting within the inspection authority when dealing with non-compliance defects
- documenting and reporting inspection findings
- dealing with unplanned events
- applying scope of inspection responsibilities
- completing inspection
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures
- preparing and conducting compliance inspection, including:
 - inspecting mains, circuits and electrical equipment
- obtaining and using tools, equipment and testing devices
- performing calculations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical installations, inspections and safety compliance audits and tests of installations with demand of over 100 amperes (A) per phase, including:
 - electrical installations, inspections and safety compliance audits encompassing:

- inspection types and their scope
 - inspection of general electrical installations, special electrical installations, hazardous areas installations, safety audits and investigations
 - inspection procedures
 - processes for confirming that performance standards have been met
 - actions and procedures for dealing with non-compliance defect
- problem-solving techniques
 - processes for inspection of single supply arrangements, main switchboard and earthing
 - relevant industry standards
 - relevant job safety assessments or risk mitigation processes
 - relevant manufacturer specifications
 - relevant tools, equipment and testing devices
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation
 - relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0030 Conduct compliance inspection of single phase LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct compliance inspection of single phase low voltage (LV) electrical installation.

It includes preparing and conducting compliance inspections, and actioning and reporting on inspection findings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating (a.c.) or 120 V direct current (d.c.)

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Verify compliance and functionality of low voltage general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct compliance inspection

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in preparation for the work are followed
- 1.3** WHS/OHS hazards not previously identified are noted, risks assessed, and risk control measures implemented in consultation with appropriate person/s

- 1.4 Installation documentation and/or relevant industry standard for the installation is reviewed and applied
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others
 - 1.6 Tools, equipment and testing devices to verify compliance are obtained in accordance with workplace procedures and checked for operation and safety
- 2 Conduct compliance inspection**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test and measure live electrical work is conducted in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Inspection of the mains and main switchboard is conducted for compliance of protection metering earthing circuit arrangements and markings in accordance with relevant industry standards
 - 2.5 Inspection of circuits is conducted for compliance of the installed wiring accessories switchgear/control gear and current-using devices in accordance with relevant industry standards
 - 2.6 Evidence electrical equipment complies with safety requirements is sought from appropriate person/s and sighted
 - 2.7 Inspection is conducted to verify compliance of earthing insulation polarity circuit connections and operation of residual current devices (RCDs) in accordance with relevant industry standards
 - 2.8 Fault-loop impedance is determined as being sufficiently low by testing calculation and compliance with arrangement of the installation in accordance with relevant industry standards
 - 2.9 Unplanned events are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 3 Act and report on inspection findings**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Non-compliance defects are identified and documented in accordance with relevant industry standards and workplace established procedures
 - 3.3** Actions are taken for non-compliance defects within the scope of inspection responsibilities in accordance with workplace procedures and relevant industry standards
 - 3.4** Inspection report is completed and issued to appropriate person/s in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting compliance inspection must include at least two domestic electrical installations comprising of the following:

- a single phase consumer mains, main earthing system and those parts of a main switchboard related to the control of the installation and protection against spread of fire
- two wire supply with a maximum demand not exceeding 100 amperes (A)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG122A Conduct compliance inspection of single phase LV electrical installations.

Assessment Requirements for UEEEL0030 Conduct compliance inspection of single phase LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- obtaining appropriate documentation and equipment in preparation for the inspection
- conducting detailed inspections and testing methodically
- identifying non-compliance defects
- relating non-compliance defects with appropriate clause in regulatory standards
- acting within the inspection authority when dealing with non-compliance defects
- documenting and reporting inspection findings
- dealing with unplanned events
- applying scope of inspection responsibilities
- completing inspection
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures
- preparing and conducting compliance inspection, including:
 - inspecting mains, circuits and electrical equipment
- obtaining and using tools, equipment and testing devices
- performing calculations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical installations, single phase inspections, including:
 - enterprise customer relations protocols encompassing:
 - purpose of customer relations
 - procedures for dealing with customers

- dealing with customer issues
- electricity regulatory safety requirements encompassing:
 - regulatory requirements for ensuring the safety and integrity of electrical installations
 - regulatory requirements are relative to the jurisdiction for which competency is sought
 - types and scope of electrical inspections and safety audits
 - authority of electrical inspectors
- electrical installations, single phase inspections encompassing:
 - scope of inspection of single phase installations
 - processes for inspection of single supply arrangements, main switchboard and earthing
 - actions and procedures for dealing with non-compliance defects
- problem-solving techniques
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0031 Conduct compliance inspection of special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct compliance inspection of special low voltage (LV) electrical installations.

It includes preparing and conducting compliance inspection, and actioning and reporting on inspection findings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Verify compliance and functionality of low voltage general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0069 Select and arrange equipment for special LV electrical installations

- UEEEL0073 Verify compliance and functionality of special LV electrical installations
- UEEEL0030 Conduct compliance inspection of single phase LV electrical installations
- UEEEL0029 Conduct compliance inspection of LV electrical installations with demand exceeding 100 A per phase
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multiple path circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct compliance inspection

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in

preparation for the work are followed

1.3 WHS/OHS hazards not previously identified are noted and risk control measures are implemented in consultation with appropriate person/s

1.4 Installation documentation and/or relevant industry standard for the installation is reviewed and applied

1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others

1.6 Tools, equipment and testing devices to verify compliance are obtained in accordance with workplace procedures and checked for operation and safety

2 Conduct compliance inspection

2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed

2.2 Need to inspect, test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures

2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.4 Inspection of the mains and main switchboard is conducted for compliance of protection metering earthing circuit arrangements and markings in accordance with relevant industry standard

2.5 Inspection of circuits is conducted for compliance of the installed wiring accessories switchgear/control gear and current-using devices in accordance with relevant industry standard

2.6 Electrical equipment complies with relevant safety requirements and industry standards and is obtained from appropriate person/s

2.7 Inspection is conducted to verify compliance of earthing insulation polarity circuit connections and operation of residual current devices (RCDs) in accordance with relevant industry standards

2.8 Fault-loop impedance is determined as being sufficiently low by testing calculation and compliance with arrangement of the installation in accordance with

- relevant industry standards
- 2.9** Unplanned events are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 3 Act and report on inspection findings**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Non-compliance defects are identified and documented in accordance with relevant industry standards and workplace procedures
- 3.3** Actions are taken for non-compliance defects within the scope of inspection responsibilities in accordance with workplace procedures and relevant industry standards
- 3.4** Inspection report is completed and issued to appropriate person/s in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting compliance inspection must include at least three types of installations from the following:

- caravan parks
- construction and demolition sites
- marinas
- medical treatment areas
- moveable premises

Electrical installations must include at least the following:

- consumer mains
- earthing system and distribution boards
- final sub-circuits and requirement to the installation type
- main earthing system and main switchboard and sub-mains

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG124A Conduct compliance inspection of special LV electrical installations.

Assessment Requirements for UEEEL0031 Conduct compliance inspection of special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- obtaining appropriate documentation and equipment in preparation for the inspection
- conducting detailed inspections and testing methodically
- identifying non-compliance defects
- relating non-compliance defects with appropriate clause in regulatory standards
- acting within the inspection authority when dealing with non-compliance defects
- documenting and reporting inspection findings
- dealing with unplanned events
- applying scope of inspection responsibilities
- completing inspection
- applying relevant industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures
- preparing and conducting compliance inspection, including:
 - inspecting mains, circuits, electrical equipment on at least three types of installations from the following:
 - caravan parks
 - construction and demolition sites
 - marinas
 - medical treatment areas
 - moveable premises
- obtaining and using tools, equipment and testing devices
- performing calculations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- compliance inspections of low voltage (LV) special electrical installations, including:
 - technical standards, regulations and codes for special electrical installations encompassing:
 - additional requirements for special installations
 - caravan parks
 - construction and demolition sites
 - marinas
 - medical treatment areas
 - moveable premises
 - high voltage (HV) installation in consumer's premises
- problem-solving techniques
- procedures for dealing with non-compliance defects
- processes for inspection of main switchboard and earthing
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant tool, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0032 Conduct electrical tests on HV electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct electrical tests on high voltage (HV) electrical machines.

It includes preparing and conducting electrical inspections and tests on a three phase induction machine and completing workplace documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0033 Conduct electrical tests on LV electrical machines

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0068 Rewind three phase low voltage induction machines

or

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct electrical tests on a three phase induction machine

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures for work preparation are followed
- 1.3** Scope of work is determined from job sheets, specifications and regulatory requirements

- 1.4 Advice is sought from work supervisor to ensure work activity is coordinated effectively with others
 - 1.5 Materials required for work are obtained in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required for work are obtained and checked for operation and safety
- 2 **Conduct electrical tests on a three phase induction machine**
 - 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Machines/equipment are isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 HV electrical inspection and tests are conducted to determine cause of faults and/or operational condition of the machine
 - 2.4 Status of the machine is determined from inspection and test results and recorded in accordance with workplace procedures
 - 2.5 Problem-solving techniques are used to resolve unplanned events
 - 2.6 Quality of work checks are conducted to ensure coils are correctly wound with correct wire, number of turns and shape in accordance with workplace procedures and work instructions
 - 2.7 Work is completed in accordance with given timeframe, environment and workplace procedures
- 3 **Complete work report**
 - 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Status of HV electrical machine is documented in accordance with workplace procedures and relevant person/s notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting electrical inspection and tests must include at least the following:

- two different HV electrical machines with one machine containing two winding faults

Purpose of tests must include at least the following:

- causes of faults
- the machine has been correctly repaired and complies with all requirements

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG158A Conduct electrical tests on HV electrical machines.

Assessment Requirements for UEEEL0032 Conduct electrical tests on HV electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- dismantling machine and storing parts securely
- setting up tests correctly
- taking test readings accurately
- determining the status of the machine correctly from test results
- documenting the status of the machine clearly
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- conducting inspection and electrical tests on three phase induction machines, including:
 - following winding specifications
 - preparing stator for winding
 - selecting correct coils
- following quality procedures, workplace procedures and instructions
- using tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- high voltage (HV) motor testing devices and techniques, including:
 - test/measuring devices and their application
 - connection of test/measuring devices into a circuit encompassing:
 - safety procedures
 - circuit arrangement of test/measuring devices
 - taking and interpreting readings
 - storage, maintenance and care of test/measuring devices

- problem-solving techniques
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions for tools and equipment
- relevant quality workplace procedures
- relevant testing methods
- relevant tools, equipment and materials
- relevant WHS/OHS legislated requirements
- relevant winding data
- relevant workplace documentation
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0033 Conduct electrical tests on LV electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct electrical safety and functional inspections and tests of electrical machines designed to operate at low voltage (LV).

It includes planning and conducting electrical inspections and tests on induction machines by working safely; setting up and conducting continuity, insulation and short circuit inspections and tests; and interpreting and documenting test results.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

- 1.2** Existing WHS/OHS risk control measures for work preparation are followed
- 1.3** Scope of work is determined from job specifications and regulatory requirements

- 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 1.5 Winding data is obtained from winding data records or directly from measurements of stator and recorded in accordance with workplace procedures
 - 1.6 Materials required for the work are obtained in accordance with workplace procedures
 - 1.7 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 2 Conduct electrical inspections and tests on induction machines**
- 2.1 Existing WHS/OHS risk control work measures are followed
 - 2.2 Machines/equipment are inspected, checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Electrical inspection and tests are conducted to establish operational condition of the machine in accordance with workplace procedures and instructions
 - 2.4 Serviceability status of the machine is determined from inspection and test results and recorded
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Electrical testing is completed within timeframe, environment and workplace conditions
- 3 Complete workplace reports**
- 3.1 WHS/OHS work completion risk controls measures are followed
 - 3.2 Serviceability status of the machine is documented in accordance with workplace procedures and appropriate person/s notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting LV electrical machine inspections and tests must include the following:

- inspection and testing of at least one machine prior to routine maintenance, overhaul or repair
- inspection and testing of at least one machine after routine maintenance, overhaul or repair

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG157A Conduct electrical tests on LV electrical machines.

Assessment Requirements for UEEEL0033 Conduct electrical tests on LV electrical machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including identifying safety requirements prior to undertaking electrical tests on low voltage (LV) electrical machines
- applying sustainable energy principles and practices
- completing workplace reports
- conducting electrical inspection and tests LV electrical machines, including:
 - conducting testing, including continuity, insulation resistance, short circuit and hi-pot on a magnetic circuit
 - connecting of test/measuring devices into the circuits of LV electrical machines
 - determining the status of the machine correctly from test results
 - documenting machine serviceability status clearly
 - setting up tests correctly
 - taking inspection and test readings accurately
- ensuring circuits are effectively isolated prior to undertaking tests on LV electrical machines
- identifying faults in LV machines from data recorded when testing LV electrical machines
- planning to conduct electrical inspection and tests on LV electrical machines
- taking and interpreting readings from test/measuring devices while undertaking tests on LV electrical machines
- using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- connection of test/measuring devices into a circuit, including safety procedures and circuit arrangement
- current industry practices and technologies

- electric motor/machine mechanical measuring, inspecting and testing devices and techniques, including:
 - LV motor/machine inspection and testing devices and techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant safe working practices, including safety procedures when using test/measuring devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- storage, maintenance and care of test/measuring devices
- sustainable energy principles and practices
- taking and interpreting readings for continuity, insulation resistance, and short circuit tests on a magnetic circuit
- test/measuring devices and their application, including a multimeter, growler, insulation resistance, continuity and short circuit testers.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that current industry practices in relation to conducting electrical inspection and tests on LV electrical machines
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0034 Conduct mechanical tests on electrical machines and components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct mechanical, safety and functional inspection and testing of electrical machines and their mechanical components.

It includes planning and conducting mechanical inspections and tests on electrical machines and components by working safely, setting up and conducting tests, taking measurements, interpreting and documenting test results, and completing workplace documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0033 Conduct electrical tests on LV electrical machines

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0068 Rewind three phase low voltage induction machines

or

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct mechanical tests on electrical machines and components

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures for work preparation are followed

- 1.3 Scope of work is determined from job sheets, specifications and regulatory requirements
 - 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 1.5 Machine data is obtained from data records or directly from measurements and recorded in accordance with workplace procedures
 - 1.6 Materials required for the work are obtained in accordance with workplace procedures
 - 1.7 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 2 Conduct mechanical tests on electrical machines and components**
- 2.1 Existing WHS/OHS risk control work measures are followed
 - 2.2 Machines/equipment are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Mechanical tests/measurements are conducted to establish operational condition of the machine
 - 2.4 Serviceability status of the machine is determined from test results and recorded
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Electrical coil work is completed within timeframe, environment and workplace conditions
- 3 Complete workplace report**
- 3.1 WHS/OHS work completion risk controls measures are followed
 - 3.2 Serviceability status of the machine, including specifications for any repair work required, is documented in accordance with workplace procedures and appropriate person/s notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting mechanical inspections and tests must include the following:

- at least one machine prior to routine maintenance, overhaul or repair
- at least one machine after routine maintenance, overhaul or repair

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG159A Conduct mechanical tests on electrical machines and components.

Assessment Requirements for UEEEL0034 Conduct mechanical tests on electrical machines and components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing workplace reports
- conducting mechanical inspections and tests on electrical machines and components, including:
 - determining the serviceability status of the machine correctly from inspection and test results
 - dismantling machine and storing parts securely
 - documenting the serviceability status of the machine clearly
 - setting up tests correctly
 - taking test and measurement readings accurately
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- planning to conduct mechanical inspection and tests on electrical machines and components
- using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- current industry practices and technologies
- electric motor mechanical measuring, inspection and testing devices and techniques
- devices and techniques for measuring geometric attributes, including a measuring device for geometric attributes, dynamic balancing and alignment of shafts
- operational inspection, test/measuring devices and their application
- set-up of test/measuring devices, including safety and set-up procedures

- storage, maintenance and care of test/measuring devices, including mechanical measuring and testing devices
- taking and interpreting readings, including taking and interpreting reading by the correct method, measuring roundness, dynamic balancing and aligning shafts
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

UEEEL0035 Design effective and efficient lighting for public, open and sports areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design effective and efficient lighting for public, open and sports areas.

It includes designing lighting for public, open areas, and indoor and outdoor sporting facilities and/or urban parks. It also includes adhering to compliance standards, energy management, lighting control and available lighting products appropriate to the design; and documenting completed design for approval

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0063 Provide photometric data for illumination system design

UEEEL0070 Select effective and efficient light sources and luminaries for given locations and designs

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design lighting for public, open

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a

- and sports areas** given work area are identified, obtained and applied
- 1.2** Scope of the lighting requirement is identified from design brief
 - 1.3** Safety and relevant conditions to the lighting design are identified, obtained and applied in accordance with relevant industry standards
 - 1.4** Design development work is planned in consultation with relevant person/s involved in accordance with scheduled timelines
- 2 Develop lighting design**
- 2.1** Relevant performance standards, compliance methods and lighting equipment is applied to lighting design in accordance with relevant industry standards
 - 2.2** Alternative lighting designs are reviewed in accordance with the design brief
 - 2.3** Safety, functionality, maintenance and budgetary considerations are incorporated in lighting design
 - 2.4** Lighting design draft is checked in accordance with design brief and relevant industry standards
 - 2.5** Lighting design is documented for submission to relevant person/s for acceptance and approval
 - 2.6** Unplanned situations are dealt with in accordance with workplace procedure
- 3 Obtain approval for lighting design**
- 3.1** Lighting design is documented and presented to client representative and/or relevant person/s
 - 3.2** Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3** Final design is documented and approval obtained from relevant person/s
 - 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing lighting for public and open areas must include at least two of the following:

- flood lighting of tennis courts
- flood lighting of netball or basketball courts
- flood lighting of football grounds
- lighting of squash courts
- lighting of indoor or outdoor bowling greens
- swimming pool lighting
- sporting spectator lighting
- other sporting applications
- stair lighting/passageway lighting
- park lighting
- mall lighting
- car park lighting

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG187A Design effective and efficient lighting for public, open and sports areas.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0035 Design effective and efficient lighting for public, open and sports areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent and nature of the lighting requirements from a design brief
- identifying and understanding safety and other requirements to which the lighting design shall comply
- planning to meet scheduled timelines
- applying appropriate knowledge of lighting performance compliance and lighting equipment in designing the lighting
- considering alternative arrangements for the lighting design, including safety, functional, maintenance and budgetary factors in the lighting design
- documenting and presenting the lighting design
- responding appropriately to requests to alter the design
- documenting and obtaining approval of the lighting design
- dealing appropriately with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing lighting design
- identifying and applying safety and relevant conditions in accordance with relevant industry standards
- monitoring quality of work
- preparing to design lighting for public, open and sports areas.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- open area and sports lighting design for outdoor and sports application lighting, including:
 - reasons for quality lighting in sport
 - key terms in open area and sports lighting encompassing:

- quantity of light required
- horizontal luminance
- vertical illuminance
- illuminance uniformity
- uniformity gradient
- modelling and shadows
- colour rendering
- colour temperature
- glare
- emergency escape lighting
- switching mode
- emergency (continuity) TV lighting
- obtrusive light
- the sports lighting design process encompassing:
 - project definition
 - lighting study
 - questions for indoor and outdoor venues
 - lamp selection
 - luminaire selection
 - arrangement of luminaires
 - cost of ownership
 - installation
 - aiming, measuring and commissioning
 - maintenance
- layout for lighting in multi-purpose halls and enclosed areas
- sports grounds and stadiums:
 - lighting configuration
 - sports grounds with no spectator stand
 - sports grounds and stadiums with a spectator stand
- swimming/diving areas
- other considerations:
 - theatrical lighting effects and dynamic lighting
- recommendations:
 - recommendations for non-televised events
 - classes of play
 - recommendations for televised events
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements

- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing effective and efficient lighting for public, open and sports areas
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0036 Design effective and efficient lighting for residential and commercial buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design effective and efficient lighting for residential and commercial buildings.

It includes preparing and developing lighting design for residential and commercial buildings, and obtaining approval of the design.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0063 Provide photometric data for illumination system design

UEEEL0070 Select effective and efficient light sources and luminaries for given locations and designs.

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design lighting

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and procedures for a given work area are identified, obtained and applied

- 1.2 Scope, extent and nature of the lighting work requirements are determined from design brief
 - 1.3 Safety and regulatory requirements for the lighting design are identified, obtained and applied in accordance with relevant industry standards
 - 1.4 Work is planned to meet scheduled timelines in consultation with others involved in the lighting installation or associated work
- 2 Develop lighting design**
 - 2.1 Lighting performance and equipment design is applied in accordance with relevant industry standards
 - 2.2 Alternative lighting design/s is considered based on the requirements outlined in the design brief
 - 2.3 Safety, functional and budgetary considerations are incorporated in the lighting design
 - 2.4 Lighting design draft is checked in accordance with relevant industry standards and design brief requirements
 - 2.5 Lighting design is documented for submission to appropriate person/s for acceptance and approval
 - 2.6 Solutions to unplanned events are identified in accordance with workplace procedures
- 3 Obtain approval for lighting design**
 - 3.1 Lighting design is presented and explained to client representative and/or relevant person/s
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final lighting design is documented and approval obtained from appropriate person/s in accordance with workplace procedures
 - 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Lighting design must be demonstrated in at least three of the following:

- large residential lighting design
- indoor area shop lighting
- stairway or stairwell lighting
- flood lighting
- amenities lighting
- lighting for specific commercial processes and tasks
- lighting for ambient and aesthetic effect
- display lighting
- security lighting

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG186A Design effective and efficient lighting for residential and commercial buildings.

Assessment Requirements for UEEEL0036 Design effective and efficient lighting for residential and commercial buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent and nature of the lighting requirements from a design brief
- identifying and understanding safety and other requirements to which the lighting design shall comply
- planning to meet scheduled timelines
- applying appropriate knowledge of lighting performance compliance and lighting equipment in designing the lighting
- considering alternative arrangements for the lighting design
- documenting and presenting the lighting design
- responding appropriately to requests to alter the design
- documenting and obtaining approval of the lighting design
- dealing appropriately with unplanned events
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- following quality and workplace procedures
- developing lighting design, including:
 - using lighting equipment
- updating work documents.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- lighting design, including:
 - lighting principles
 - lighting applications

- safety aspects of lighting
- energy efficiency
- integrating various lighting types into one application
- control and energy management
- interpreting and applying manufacturers' technical data
- architectural considerations
- utilising natural lighting
- use of computer programs for lighting design
- safety, functional, maintenance and budgetary factors in the lighting design
- problem-solving techniques
- relevant industry standards
- relevant manufacturer specifications and operating instructions
- relevant quality workplace procedures
- relevant job safety assessments or risk mitigation processes
- relevant sustainable energy practices
- relevant tools, equipment, resources and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0037 Design electrical installations with a low voltage demand greater than 400 A per phase

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design electrical installations with a low voltage (LV) demand greater than 400 ampere (A) per phase.

It includes preparing and developing designing schemes for the protection of persons and property, correct functioning, compatibility with the supply and arrangement of circuits. It also includes determination of fault levels, effective switchgear, control gear, and protection against over-current and over and under-voltage and wiring based on calculations to meet required safety and performance standards and functional requirements.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0057 Plan electrical installations with a low voltage demand up to 400 A per phase

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to design electrical installations

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

1.2 Scope of the electrical installation is identified from design brief

1.3 Electrical installation safety and regulatory requirements are identified, obtained and applied

1.4 Design development work is planned in consultation with relevant person/s involved with the work to meet scheduled timelines

2 Develop installation design

2.1 Relevant electrical installation performance standards, compliance methods and electrical equipment is applied to installation design in accordance with relevant industry standards

2.2 Alternative installation design/s is developed in accordance with the design brief

2.3 Safety, functional and budgetary considerations are

incorporated in installation design

- 2.4 Installation design draft is checked in accordance with design brief and relevant industry standards
 - 2.5 Installation design is documented for submission to relevant person/s for acceptance and approval
 - 2.6 Unplanned situations are dealt with in accordance with workplace procedures
- 3 Obtain approval for installation design**
- 3.1 Installation design is documented and presented to client representative and/or relevant person/s
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final design is documented and approval obtained from relevant person/s
 - 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing electrical installations with a LV demand in excess of 400 A per phase switchboard design installation must include at least the following:

- main switchboard
- multiple tenancies
- distribution boards
- single and three phase final sub-circuits

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG127A Design electrical installations with a low voltage demand greater than 400 A per phase.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying performance standards, compliance methods and lighting equipment to installation design
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- consulting with relevant person/s in planning design work
- identifying the scope of the installation design brief
- monitoring quality of work
- planning to meet scheduled timelines
- preparing to design electrical installations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- low voltage (LV) electrical installations with a demand greater than 400 ampere (A) per phase and advanced methods of cable and protection selection, including:
 - electrical installations, determination of demand encompassing:
 - acceptable methods for determining demand in mains and sub-mains
 - applying calculation and assessment methods of determining demand in mains and sub-mains

- electrical installations, over-current protection encompassing:
 - application of acceptable methods for determining prospective fault current
 - relationship between prospective fault current and characteristics of protective devices
 - relationship between over-current protections at various points in an electrical distribution system
- electrical installations, over-voltage and under-voltage protection encompassing:
 - application of acceptable methods for determining the need for over-voltage and under-voltage protection
 - methods and devices providing over-voltage and under-voltage protection
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing electrical installations with a LV demand greater than 400 A per phase.
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0038 Design switchboards rated for high fault levels (greater than 400 A)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design switchboards rated for high fault levels (greater than 400 ampere (A)).

It includes preparing and developing switchboard design and obtaining approval for switchboard design. It also includes designing schemes for protection of persons and property; correct functioning and compatibility with the supply; and arrangement of circuits. It also includes determination of fault levels, effective switchgear, control gear, and protection against over-current, over and under-voltage, and wiring based on calculations to meet required safety and performance standards and functional requirements.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0059 Plan low voltage switchboard and control panel layouts

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

and

UEEEL0062 Provide engineering solutions to problems in complex polyphase power circuits

UEECD0036 Provide engineering solutions for problems in complex multiple path circuit

UEECD0039 Provide solutions to basic engineering computational problems

and

UEECD0041 Solve electrotechnical engineering problems

or

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and

switchboards		safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
	1.2	Scope of the switchboard is identified from design brief
	1.3	Switchboard safety and regulatory requirements are identified, obtained and applied
	1.4	Design development work is planned in consultation with relevant person/s involved with the work to meet scheduled timelines
2 Develop switchboard design	2.1	Relevant performance standards, compliance methods and electrical equipment are applied to switchboard design in accordance with relevant industry standards
	2.2	Alternative switchboard design/s is developed in accordance with the design brief
	2.3	Safety, functional and budgetary considerations are incorporated in switchboard design
	2.4	Switchboard design draft is checked in accordance with design brief and relevant industry standards
	2.5	Switchboard design is documented for submission to relevant person/s for acceptance and approval
	2.6	Unplanned situations are dealt with in accordance with workplace procedures
3 Obtain approval for installation design	3.1	Switchboard design is documented and presented to client representative and/or relevant person/s
	3.2	Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
	3.3	Final design is documented and approval obtained from relevant person/s
	3.4	Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing a > (greater than) 400 A three phase, 20 kilowatt (kw) fault level switchboard must include at least the following:

- control for essential and general supply
- metering
- sub-main controls
- local final sub-circuit distribution board
- fault indicators

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG130A Design switchboards rated for high fault levels (greater than 400 A).

Assessment Requirements for UEEEL0038 Design switchboards rated for high fault levels (greater than 400 A)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying performance standards, compliance methods and electrical equipment to switchboard design
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- consulting with relevant person/s in planning design work
- identifying scope of switchboard design brief
- monitoring quality of work
- planning to meet scheduled timelines
- preparing to design switchboards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- switchboard design of low voltage (LV) switchboards rated for high fault currents, including:
 - trade calculations encompassing:
 - mathematical techniques
 - relevant calculations
 - linear measurement, areas, volumes and ratios
 - engineering mechanics encompassing:

- base physical quantities
- concepts, principles, International System of Units (SI) units, their applications in engineering calculations in relation to physical quantities and associated formulae
- mass, velocity, acceleration, force, weight, density and angles
- energy/work/power
- moments/torque
- centre of gravity
- mechanical advantage
- levers
- pulley blocks
- efficiency
- friction
- vectors
- resolution of forces
- forces in strung conductors
- forces on poles and towers
- determination of sag
- pressure/stress
- elementary fluid mechanics
- engineering materials encompassing:
 - classification
 - ferrous and non-ferrous metals
 - steels and alloys
 - properties
 - tensile strength
 - temperature and expansion in metals
 - stress and strain
 - ductility
 - applications
 - corrosion
 - galvanic corrosion
 - hardwoods and soft woods
- fault current calculations encompassing:
 - calculation of fault currents
 - calculation/determination of positive, negative and zero sequence impedances
 - determination of fault current breaking and let-through energy capacities of protection devices
 - the influence of fault/arc impedances
 - impedances operative for phase-to-phase and phase-to-earth faults
 - calculation of fault currents for phase-to-phase and phase-to-earth faults

- approximation calculations by selecting the components with the major impedance
- problem-solving techniques
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing switchboards rated for high fault levels
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Modification History

Release 2. Updated superseded imported Pre-Require units.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design, install, inspect and test to verify an electrical installation is safe and complies with regulatory requirements.

It includes working safely; designing, installing, commissioning and fault finding of electrical installations; visual inspections and mandatory testing; following workplace procedures; and completing mandatory reporting requirements.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Those holding an 'Unrestricted Electrician's Licence' or equivalent issued in an Australian state or territory meet the requirements of this unit and its prerequisite requirements.

A 'licensed electrician' who requires this unit to demonstrate currency for regulatory purposes may be required to undertake this unit to demonstrate their currency with verification of compliance requirements. In this case they are deemed to have met the prerequisites for this unit provided that they hold a current 'electricians licence' or its equivalent issued in an Australian state or territory; and, have recently been in employment as a licensed electrician sufficient to evidence current knowledge of applicable standards and regulations.

Pre-requisite Unit

HLTAID009 Provide cardiopulmonary resuscitation

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEECD0019 Fabricate, dismantle and assemble utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0020 Solve problems in low voltage a.c. circuit

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEEL0047 Identify, shut down and restart systems with alternate supplies

UETDRRF004 Perform rescue from a live LV panel
and

UEECD0043 Solve problems in direct current circuits
or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design, install, inspect and test an electrical installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS control measures for the site are identified and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3** Safety hazards, which have not previously been identified, are noted and risk control measures are implemented
- 1.4** Installation documentation and/or relevant industry standard are reviewed and applied
- 1.5** Appropriate person/s is consulted to ensure work is coordinated with others involved on the worksite
- 1.6** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 1.7** Circuits, machines and/or plant are isolated in accordance with WHS/OHS job requirements and workplace procedures
- 1.8** Installation of wiring, appliances, switchgear, control gear and associated accessories is planned and appropriately sequenced in consultation with relevant person/s
- 1.9** Locations of appliances, switchgear, accessories and cable routes are planned within the constraints of building structure, other services, specifications and regulatory requirements
- 1.10** Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.11** Preparatory work is checked to ensure it complies with planned specifications and no damage has occurred

- 2 Select wiring systems, cables, control and protection for general electrical installations**
 - 2.1** Wiring system is selected and suitable for the environments in which it will operate
 - 2.2** Cable conductor sizes are selected to meet current-carrying capacity requirements and voltage-drop and earth fault-loop impedance limitations in accordance with relevant industry standards
 - 2.3** Protective devices are selected to meet the required switching and tripping currents coordination and discrimination for overload and short circuit protection in accordance with relevant industry technical standards
 - 2.4** Earthing system components are selected to meet multiple earthed neutral (MEN) system in accordance with relevant industry standards
 - 2.5** Residual current devices (RCDs) are selected to meet the required circuit switching and tripping currents in accordance with relevant industry technical standards
 - 2.6** Switchgear/control gear is selected to meet current and voltage requirements and confirmed suitable for environmental conditions (ingress protection (IP) ratings) and functional requirements
 - 2.7** Switchboards are arranged to accommodate control and protective devices, links, safety services and other distributor equipment in accordance with relevant industry technical standards
- 3 Install low voltage (LV) wiring and associated accessories**
 - 3.1** Wiring and accessories are installed and terminated to comply with technical standards and job specifications and requirements
 - 3.2** Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
 - 3.3** Ongoing compliance and safety inspection of installed wiring systems and testing of installed circuits is undertaken
 - 3.4** Defects revealed through ongoing compliance and safety inspection and tests are rectified
- 4 Install and connect LV**
 - 4.1** Appliances, switchgear and accessories are installed to

appliances, switchgear and associated accessories	comply with technical standards and job specifications and requirements with sufficient access to affect terminations, adjustment and maintenance
	4.2 Wiring is terminated at appliances, switchgear and accessories in accordance with manufacturer specifications and functional and regulatory requirements
	4.3 Ongoing compliance and safety inspections of the installed appliances, switchgear and accessories are undertaken
	4.4 Defects revealed through ongoing compliance and safety inspection are rectified
5 Visually inspect and conduct safety testing on electrical installation	5.1 Wiring is checked for suitability within the environments in which it is installed to ensure it is suitably protected from damage or overheating in accordance with relevant industry standards
	5.2 Cable conductor sizes are compliant with current-carrying capacity, voltage-drop and fault-loop impedance limitations in accordance with relevant industry standards
	5.3 Protection methods and devices are verified as meeting coordination requirements for overload and short-circuit protection in accordance with relevant industry standards
	5.4 Switchgear and control gear rating is verified as being appropriate and meets functional requirements in accordance with relevant industry standards
	5.5 Electrical equipment inspection and testing evidence is cited and verified in accordance with WHS/OHS safety regulations
	5.6 Earthing system and components are located correctly, and conductor selection sizes are verified
	5.7 Markings on switchboards are checked for accuracy and clarity and comply with requirements
	5.8 Mandatory tests are conducted in accordance with relevant industry standards
	5.9 Testing is conducted to verify fault-loop impedance is sufficiently low and RCDs operate in accordance with

- relevant industry standards
- 6 Report inspection and test findings**
- 6.1** WHS/OHS risk control work completion measures and procedures are followed
 - 6.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 6.3** Non-compliance defects are identified and reported in accordance with workplace procedures
 - 6.4** Recommendations for rectifying defects are made in accordance with workplace procedures
 - 6.5** Mandatory documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Designing, installing and verifying compliance and functionality of at least two general electrical installations must include:
- a main switchboard supplying more than one circuit each for:
 - lighting
 - socket outlets
 - fixed appliances
 - one installation must include a circuit supplying a three phase load
 - one installation must include a safety service or alternate supply
 - one installation must include a distribution board separate from the main switchboard

Unit Mapping Information

This unit replaces and is not equivalent to UEENEEG105A Verify compliance and functionality of low voltage general electrical installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Modification History

Release 2. Updated superseded imported Pre-Require units.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- safely measuring the parameters for the whole or any part of a direct current (d.c.) circuit
- safely isolating circuits/equipment, including:
 - preparing a safe work method statement (SWMS) or job safety analysis (JSA) for effective safe isolation
 - identifying source of supply to be isolated
 - applying switching-off, lock-out and tagging procedures
 - applying safe methods for confirming isolation
- determining maximum demand and selecting cables for an installation, including mains, sub-mains and final sub-circuits
- selecting suitable equipment and switchgear for a particular installation or part of an installation for compliance with industry standards
- determining the maximum fault-loop impedance for a circuit
- determining protective conductor and active conductor sizes for each circuit to ensure earth fault-loop impedance is sufficiently low to operate the circuit protective device
- installing and terminating consumer's mains for an installation in accordance with AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) and local supply authority requirements, including:
 - unprotected consumers mains to minimise the risk of short circuit current
 - drawing-in, placing and fixing cables
 - cable and conductor terminations
 - correct preparation for fitting and connection of electricity network operator equipment
 - ensuring correct polarity
- selecting and installing control and protection devices in accordance with AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules)

- installing and terminating sub-circuit cabling at switchboards and connection to accessories, including:
 - drawing-in, placing and fixing cables
 - application of accessories
 - correct interconnection between switchgear, protection devices and links
 - use of adequately sized cables
 - correct marking of equipment
 - clear identification of circuit neutral conductors
 - correct polarity
- completing visual inspection of installations for compliance with industry standards
- conducting and reporting mandatory testing to ensure:
 - insulation resistance of mains, sub-mains and final sub-circuits in accordance with regulatory requirements
 - earth continuity of the main earthing conductor, protective earthing conductors, combined protective earthing and neutral (PEN) conductors, and bonding conductors in accordance with regulatory requirements
 - polarity of active, neutral and earth conductors in accordance with regulatory requirements
 - correct connections of active, neutral and protective earthing conductors are tested to ensure no short circuits between conductors, no transposition of conductors that could result in the earthing system or exposed conductive parts becoming energised, and no interconnection of conductors between different circuits, in accordance with regulatory requirements
 - verification that earth fault-loop impedance limitations are not exceeded in accordance with regulatory requirements
 - residual current devices (RCDs) have been correctly installed, their function verified, and the isolation of all switched poles verified in accordance with regulatory requirements
- identifying causes of non-compliance from test results
- identifying and rectifying faults in electrical circuits and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical safety, including:
 - safety workplace procedures for working on electrical systems, circuits and apparatus
 - safe working practices as a normal part of carrying out electrical installation work
 - isolation and lock-out workplace procedures
 - tools and equipment needed to conduct electrical installation compliance inspection and testing
 - relevant emergency response plan and first aid requirements

- selection and use of fire extinguishers to control an electrical fire at an accident site
- WHS/OHS, including:
 - legislation and regulations and the fundamental principles that apply
 - identifying potential workplace hazards
 - procedures for undertaking safety checks
 - working with a group to identify effective hazard control measures
 - working with a group to modify and/or develop safe work methods
 - techniques for the identification, control and reporting of hazardous substances/materials
 - awareness and reporting of asbestos, silica and hazardous gases
 - legal responsibilities for employers and employees
 - WHS/OHS practices
 - employers' and employees' own "duty of care"
 - safety committees and their role
 - development, modification and application of SWMS or JSA
 - purpose and process of reporting WHS/OHS incidents
 - safety procedures for working with electrical circuits and equipment
 - procedures for safe and effective isolation of electrical supply
 - regulations for the supervision of apprentices and trainees
 - selection and use of fire extinguishers to control electrical fire at an accident site
- methods to rescue a person in contact with live electrical conductors or equipment, including:
 - safety of the rescuer
 - establishing the source voltage level
 - rescue process 'dos' and 'don'ts'
- application of emergency first aid requirements for an electric shock victim, including:
 - calling for help
 - initiating first aid
 - applying cardiopulmonary resuscitation (CPR)
- dangers of high voltage (HV) equipment and distribution systems, including:
 - step, touch and induced voltages
 - sources of induced voltage and stored energy
 - creepage and clearance requirements
 - application of safe working procedures in the vicinity of HV equipment
- effects of electric current, including:
 - physiological effects of current
 - principles by which an electric current can produce heat, light, motion and a chemical reaction
- single path d.c. circuits including:
 - arrangement of energy source, protection device, switch and load in a circuit
 - purpose of each component in the circuit
 - consequences of open circuits, closed circuits and short circuits

- multiple path d.c. circuits, including:
 - circuit configurations and connection of energy source, protection device, switch and load in a circuit
 - relationship between the parameters of voltage, current, resistance and power dissipation in the whole or any part of the circuit
 - methods of determining circuit behaviour for variation in any of the parameters from measured and calculated values
- alternating voltage and current generation, phase relationships, energy in an alternating current (a.c.) circuit, including:
 - sinusoidal voltage generation and resulting current
 - terms: period, maximum value, peak-to-peak value, instantaneous value, average value, root-mean-square (RMS) value and frequency
 - three phase generation
 - relationship between the phase voltages generated in a three phase alternator and the conventions for identifying each
 - method of determining the phase sequence or phase rotation of a three phase supply
 - methods of determining power and energy supplied by three phase circuits
- techniques to read, sketch and interpret electrical diagrams, including:
 - conventions used in documenting electrical information
 - interpreting schematic, block and wiring diagrams, plans and schedules
 - sketching and marking up electrical drawings and diagrams
- safe isolation of equipment, including:
 - requirements and techniques for preparation of a SWMS or JSA for effective safe isolation
 - safe methods for identifying source of supply to be isolated
 - switching-off, lock-out and tagging procedures
 - safe methods for confirming effective and safe isolation
 - following safe testing procedures
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements for dealing with unused conductors and equipment
- fundamental safety principles of AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules), including:
 - definition of terms
 - direct contact with live parts
 - indirect contact with live parts
 - thermal effects of current
 - over-current
 - earth faults
 - abnormal voltages
 - spread of fire
 - mechanical injury

- external influences
- fundamental principles of installation design; selection and installation of equipment; means of compliance (including alterations, additions and repairs), and verification of compliance
- protective and functional earthing, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - purpose of protective and functional earthing
 - parts of a protective earthing system
 - earthing arrangements, earthing of equipment and equipotential bonding
 - methods of determining the earth fault-loop impedance for a circuit
 - alternate earthing systems only when required by local regulatory authorities (e.g. TT low voltage supply earthing system in dairy sheds in New Zealand)
- protective earthing conductor and active conductor sizes for each circuit to ensure earth fault-loop impedance is sufficiently low to operate the circuit protective device
- multiple earthed neutral (MEN) system and its application, including:
 - protective earthing (PE) and neutral (N) conductors in a consumer's installation and their relationship to the protective earth neutral (PEN) conductor in the electricity distributor's system or sub-main to an outbuilding
 - importance of the MEN link when a fault occurs
 - likely consequences of the absence of the MEN link or high impedance in the PEN conductor when a fault occurs
 - requirements for installation of a MEN link in an installation and an outbuilding
- control and protection requirements for installations and equipment, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - minimum fault levels specified by electricity distributors
 - method for assessing prospective short circuit current
 - devices for protection against overload and short circuit current
 - methods and arrangement for protection against short circuit currents, overload and earth leakage currents
 - coordination of overload and short circuit protection devices
 - coordination between conductors and overload protection devices
 - causes of over-voltage and under-voltage
 - device requirements for protection against over-voltage and under-voltage
 - selection and installation of RCDs
 - limitation of an RCD to protect against contact with live parts
 - devices for functions of isolation, emergency, mechanical maintenance and functional control
- AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements for installation of separated extra-low voltage (SELV) and protected extra-low voltage (PELV) systems, including:

- purpose and configuration of PELV and SELV
- earthing requirements and testing of SELV and PELV circuits
- cable selection for single and three phase mains and sub-mains for single and multiple installations including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - AS/NZS 3008.1.1 Electrical installations - Selection of cables - Cables for alternating voltages up to and including 0.6/1 kV - Typical Australian installation condition requirements for selection of cables
 - methods of determining maximum demand
 - selecting cables for a given situation based on:
 - suitability of the cable insulation
 - installation methods and external influences affecting cable current-carrying capacity
 - fault-loop impedance
 - effects of harmonic current on cable current-carrying capacity
 - installation methods and external influences affecting cable current-carrying capacity
 - voltage-drop limitation
 - short circuit performance consideration
- cable selection for final sub-circuits, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - AS/NZS 3008.1.1 Electrical installations - Selection of cables Cables for alternating voltages up to and including 0.6/1 kV - Typical Australian installation condition requirements for selection of cables
 - maximum demand on final sub-circuits
 - selecting cables for a given situation based on:
 - suitability of the cable insulation
 - installation methods and external influences effecting cable current-carrying capacity
 - effect of earth fault-loop impedance and voltage-drop limitations on circuit route length
- installation of electrical equipment in given damp situations, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - areas specified as damp situations
 - limitation on the installation of equipment in classified zones
 - selection and location of equipment suitable for installation in given classified zones
 - use of RCD, SELV and PELV for damp situations
 - equipotential bonding in showers and bathrooms and swimming and spa pools
- methods for the installation, modification and testing of electrical installations and equipment for construction and demolition sites, complying with AS/NZS 3012 Electrical installations - Construction and demolition sites and applicable workplace safety legislation, including:
 - supply requirements

- switchboards for the purpose of construction and demolition
- protection of circuits
- construction wiring
- lighting
- socket outlets
- circuits for lifts
- calibration of instruments
- inspection and testing methods
- initial and periodic inspection and testing
- installation of aerial conductors and underground wiring, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - types and application of aerial conductors
 - aerial span limitations and required clearances
 - selection of aerial supporting poles/post and struts for a given application
 - use and requirements of catenary support systems
 - acceptable cable types and protection for underground wiring categories
 - underground wiring depth and protection
 - underground wiring clearances from other services
- electrical installations in hazardous areas, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - types of areas classified as a hazardous area
 - standards to which the selection, installation, inspection and maintenance of electrical equipment shall comply
 - additional training required to work competently with electrical equipment for hazardous areas
- installation and termination requirements for electrical cables, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - typical cable routes through buildings, structures and premises
 - application of wiring accessories
 - drawing-in, placing and fixing of cables
 - cable and conductor terminations
 - maintaining fire rating integrity
 - application of flat thermoplastic sheathed (TPS), circular TPS, steel wire armoured (SWA), fire rated and flexible cables
- requirements for the installation and connection of consumers mains, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) and local supply authority requirements
 - underground and overhead consumers mains

- terminating consumers mains at pillars, pits, mains connection boxes and consumers switchboard
- unprotected consumers mains to minimise the risk of short circuit current
- bonding conductors where required
- ensuring correct polarity
- termination of sub-circuit cabling at switchboards and connection to components, including:
 - correct interconnection between switchgear, protection devices and links'
 - correct preparation for fitting and connection of local supply authority equipment
 - use of adequately sized cables
 - correct marking of equipment
 - clear identification of circuit neutral conductors
 - correct polarity
- AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements and supply authority requirements to install final sub-circuit wiring into switchboards and connection to switchboard equipment
- location of switchboards and arrangement of switchboard equipment in installations, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - accessibility and restricted locations of switchboards
 - identification of main switchboards
 - construction requirements of switchboards
 - arrangement and identification of switchboard equipment
 - arrangement and installation of metering equipment
 - switchboard wiring and fire-protective measures
 - protection against switchboard internal arc faults
- key safety issues of transformers and AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements, including:
 - risks and safety control measures associated with connection and disconnection of instrument transformers
 - safe working procedures when connecting and testing transformers
 - requirements and restrictions on the installation and use of transformers
- electric motor selection, starting method and overload protection, including:
 - types of motor enclosures suitable for given environmental conditions
 - criteria for selecting motor starters and overload protection
 - types and connection arrangements for direct-on-line, reduced voltage starters and variable speed drives
 - thermal, magnetic and thermistor overload protection methods
- legislated regulations, including:
 - legislation and regulations that require installations and equipment to be inspected and tested to ensure they are safe

- responsible persons/bodies for ensuring electrical installations are safe
- results of tests that show an electrical installation is safe for connection to supply
- verification of compliance of an electrical installation, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - requirements for visual inspection to determine installation compliance with relevant specific installation standards
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) mandatory test requirements and the application of mandatory tests following guidance of AS/NZS 3017 Electrical installations - Verification guidelines
- mandatory testing of an electrical installation including:
 - earth continuity, insulation resistance, polarity, sub-mains and final sub-circuits, correct circuit connections, earth fault-loop impedance and RCD operation
 - functional tests to ensure active/s and neutral for the same circuit are clearly identified with their circuit protection device
 - tests that show all circuits and devices operate as intended
 - techniques to determine fault level at a particular point in an installation
- documentation, including:
 - results of tests conducted on an installation to comply with requirements and ensure the installation is safe
 - documentation of the results of testing an installation as required by the electricity distributor
 - documentation of periodic inspection and testing of construction site wiring and equipment in accordance with requirement
 - documentation of periodic testing and inspection of electrical equipment, including tagging requirements
- systematic method of commissioning and decommissioning electrical equipment and installations, including:
 - commissioning, including:
 - circuit voltage testing
 - phase rotation and polarity checks
 - systematic loading up
 - correct installation functioning
 - instrument/control parameter checks
 - dangers of mechanical damage to cables and equipment
 - decommissioning, including:
 - identification of all circuits
 - impact on other equipment
 - isolation
 - tagging
 - testing

- securing and earthing where required
- safe removal of equipment and termination of unused cable
- dangers of mechanical damage to cables and equipment
- diagnosing and rectifying faults in electrical apparatus and associated circuits, including:
 - recognising symptoms of open circuit, short circuit, incorrect connections, insulation failure, unsafe condition, apparatus/component failure and related mechanical failure
 - methods and tests to identify faults in circuits and/or equipment
 - ensuring fault rectification/repair and/or equipment replacement complies with AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) and other relevant standards.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold a current 'Unrestricted Electricians Licence' issued in an Australian state or territory to assess the units of competency relating to the Electrical Regulatory Authorities Council (or their successor) Essential Performance Capabilities for licensing and that require a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0040 Develop compliance policies and plans to conduct an electrical contracting business

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop compliance policies and plans to conduct an electrical contracting business.

It includes the developing a business plan and workplace policies to ensure regulatory requirements are met in conducting a contracting electrical business.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare business plan and compliance policies

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Factors influencing the performance of a contracting business are investigated and evaluated
- 1.2 Information and advice are sought on the effects of legislated requirements on the operation

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG175A Develop compliance policies and plans to conduct a electrical contracting business.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0040 Develop compliance policies and plans to conduct an electrical contracting business

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- evaluating factors influencing the performance of a contracting business accurately
- identifying the formal processes for meeting legislated obligations
- establishing an appropriate focus for the business
- establishing policies to ensure all legislated requirements and standards are met
- developing procedures and processes to give effect to established policies
- giving written justification of solutions provided
- dealing with unplanned events
- applying relevant industry standards
- applying relevant legislation
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing business plan and compliance policies, including:
 - completing documentation
 - developing methods to maintain procedures
 - reviewing policies, plans and procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical contracting plans and compliance policies for a contracting business, including:
 - enterprise regulatory requirements and non-regulatory standards:
 - compliance regulations for businesses
 - methods of meeting compliance
 - non-regulatory standards and their effects on business
 - electricity distributors and supply requirements:
 - general requirements for the supply of electricity
 - supply and metering requirements

- acceptable arrangement of switchgear and control gear
- acceptable earthing methods and arrangements
- electricity regulatory safety requirements:
 - regulatory requirements for ensuring the safety and integrity of electrical installations
 - regulatory requirements relative to the jurisdiction for which competency is sought
 - types and scope of electrical inspections and safety audits
 - authority of electrical inspectors
- problem-solving techniques
- relevant industry standards
- relevant manufacturer specifications
- relevant quality workplace procedures
- relevant risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0041 Develop engineering solution for synchronous machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions for synchronous machine and control problems.

It includes applying safe working practices; determining problems; obtaining synchronous machine operation, construction and application; gathering and analysing solutions; applying problem-solving techniques; and developing and documenting solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0062 Provide engineering solutions to problems in complex polyphase power circuits

UEECD0036 Provide engineering solutions for problems in complex multiple path circuit

UEECD0039 Provide solutions to basic engineering computational problems

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace and

UEECD0041 Solve electrotechnical engineering problems

or

UEECD0043 Solve problems in direct current circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

or

UEEEEC0065 Solve problems in basic electronic circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to develop engineering solution for synchronous machine problems

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed

1.3 Scope of synchronous machine problem is determined from performance specifications and/or documentation and in consultation with relevant person/s

1.4 Activities are planned to meet scheduled timelines in consultation with others involved in the work

1.5 Effective strategies are formed to ensure solution development and implementation is carried out efficiently

2 Develop engineering

2.1 WHS/OHS risk control measures and workplace

- solution** procedures for carrying out the work are followed
- 2.2 Synchronous machine construction, operation, characteristics and applications are applied to developing solutions to synchronous machine problems
 - 2.3 Parameters, specifications and performance requirements for each machine problem are obtained in accordance with workplace procedures
 - 2.4 Approaches to resolving synchronous machine problems are analysed to provide most effective solutions in accordance with relevant industry standards and workplace procedures
 - 2.5 Unplanned events are dealt with safely and effectively in accordance with relevant industry standards and workplace procedures
 - 2.6 Quality of work is monitored in accordance with relevant industry standards and workplace procedures
- 3 Implement engineering solution and complete documentation**
- 3.1 Solutions to machine problems are tested to determine their effectiveness and modified as required
 - 3.2 Adopted solutions are documented, including instruction for their implementation with risk control measures
 - 3.3 Relevant person/s required to implement solutions to synchronous machine problems is coordinated in accordance with relevant industry standards and workplace procedures
 - 3.4 Justification for solutions used to solve synchronous machine problems is documented in work/project records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering solutions must include the following:

- at least four synchronous machine problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG143A Develop engineering solution for synchronous machine and control problems.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0041 Develop engineering solution for synchronous machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the machine problem
- forming effective strategies for solution development and implementation
- obtaining machine parameters, specifications and performance requirements appropriate to each problem
- testing and applying solutions to machine problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- analysing approaches to solutions
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying synchronous machine construction operation characteristics and applications to developing solutions
- determining the scope of synchronous machine problem
- monitoring quality of work
- planning activities to meet timelines.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- synchronous machine diagnostics and engineering solutions for synchronous machine problems, including:
 - alternating current (a.c.) generators – construction, types and cooling encompassing:
 - construction of stator and rotor windings

- rotor construction (cylindrical and salient pole)
- advantages of rotating field construction
- excitation methods
- cooling methods
- prime movers
- a.c. generators – operating principles and characteristics encompassing:
 - a.c. generator equivalent circuits (synchronous reactance and resistance components)
 - tests – open circuit, short circuit and stator impedance
 - voltage regulation, island generator's terminal voltage load power factor
 - determination of excitation voltage and load angle
- synchronising a.c. generators encompassing:
 - conditions for synchronising (infinite bus)
 - methods for synchronising (lamp methods and synchroscope)
 - alternator load sharing, parallel operation
- a.c. generators power, torque and efficiency encompassing:
 - power input, input torque and speed
 - power losses
 - output power, load power factor, rotor angle and pu power
 - efficiency
 - performance chart interpretation
- automatic voltage regulation (AVR) encompassing:
 - need for AVRs
 - features of AVRs
 - effects of rotor inductance
 - connections of AVRs
 - operation of AVRs
- a.c. generator operational stability encompassing:
 - power output, variance (VAR) effects, rotor angle and excitation
 - control of VAR (on-load tap-changers (OLTC) transformers)
 - voltage dependant nature of stability
 - critical clearance angle of a.c. generator
 - stability limits
- a.c. generator protection encompassing:
 - restricted, unrestricted primary, back up and duplicated protection
 - overcurrent, short circuit, differential, reverse power, load unbalance, rotor overload, loss-of-field, rotor earth fault, station earth-fault and under-frequency protection
 - external fault protection
- induction generator encompassing:
 - types operating principles and characteristics
 - excitation methods

- losses and efficiency
- synchronising and paralleling
- three phase synchronous motors encompassing:
 - construction – rotor, stator and windings
 - excitation methods
 - operating principles (equivalent circuits and synchronous impedance)
 - hunting and stability limits
 - power factor correction
 - paralleling and synchronisation techniques
 - starting methods
 - braking methods
- problem-solving techniques
- relevant machine parameters, specifications and performance requirements
- relevant manufacturer specifications and operating instructions/manuals
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing engineering solution for synchronous machine problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0042 Develop engineering solutions for d.c. machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions for direct current (d.c.) machine and control problems.

It includes working safely; determining problem; obtaining direct current d.c. machine operation, construction and application; gathering and analysing data; applying problem-solving techniques; and developing and documenting solutions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V d.c..

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0036 Provide engineering solutions for problems in complex multiple path circuit

UEECD0039 Provide solutions to basic engineering computational problems

and

UEECD0041 Solve electrotechnical engineering problems

or

UEECD0043 Solve problems in direct current circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

or

UEEEEC0065 Solve problems in basic electronic circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop engineering solution for d.c. machine problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3 Scope of d.c. machine problem is determined from performance specifications and/or documentation and in consultation with relevant person/s

- 1.4 Activities are planned to meet scheduled timelines in consultation with others involved in the work
 - 1.5 Strategies are formed to ensure solution development and implementation is carried out efficiently
 - 2 **Develop engineering solution for d.c. machine problems**
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant d.c. machine construction operation characteristics and applications are applied to developing solutions to d.c. machine problems
 - 2.3 Parameters, specifications and performance requirements to each machine problem are obtained in accordance with workplace procedures
 - 2.4 Approaches to resolving d.c. machine problems are analysed to provide most effective solutions
 - 2.5 Unplanned events are dealt with safely in accordance with relevant industry standards and workplace procedures
 - 2.6 Quality of work is monitored in accordance with relevant industry standards and workplace procedures
 - 3 **Implement engineering solution and complete documentation**
 - 3.1 Solutions to machine problems are tested to determine their effectiveness and modified as required
 - 3.2 Adopted solutions are documented and instructions for implementation with risk control measure developed
 - 3.3 Relevant person/s required to implement solutions to d.c. machine problems is coordinated in accordance with relevant industry standards and workplace procedures
 - 3.4 Justification for solutions used to solve d.c. machine problems is documented in work/project records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering solutions must include the following:

- at least two different d.c. machines using different control systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG144A Develop engineering solutions for d.c. machine and control problems.

Assessment Requirements for UEEEL0042 Develop engineering solutions for d.c. machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the machine problem
- forming effective strategies for solution development and implementation
- obtaining machine parameters, specifications and performance requirements appropriate to each problem
- testing and solutions to machine problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- determining the scope of direct current (d.c.) machine problems
- planning activities to meet timelines
- analysing approaches to solutions
- monitoring quality of work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- d.c. machine diagnostics and engineering solutions for d.c. machine problems, including:
 - basic d.c. machine construction and operation encompassing:
 - general principles of operation
 - applications of d.c. machines
 - construction of d.c. machines
 - d.c. machine configurations; series, shunt, compound long shunt and compound short

- shunt
- armature and field currents
- insulation
- ratings
- cooling paths
- bearings
- general maintenance of d.c. machines
- construction and use of lap and wave windings encompassing:
 - coils and elements
 - generated voltage equation for generator
 - generated voltage equation for motors
 - application of lap and wave windings
- commutation process encompassing:
 - use of interpoles
 - loading of machines
 - brush shifting
 - brush selection
 - classes of brush grades:
 - natural graphite, hard carbon, electrographite, metal-graphite and metal-carbon, "treated" grades
 - carbon brush contact characteristics:
 - specific resistance, thermal conductivity, density and porosity, elastic properties and contact properties
 - carbon brush factors:
 - pressure, current, polarity and speed
 - brush construction:
 - dimensions, tolerances, preferred sizes, surfaces, edges, bevels, flexible shunts, connection of flexible shunt to brush and insulation of flexible connections
 - brush holders:
 - types, brush angles, trailing holders, reaction holders, top bevel angles, reversible rotation, cantilever holders, effective arc of contact, construction of brush holders and pressure mechanism
 - mounting of brush holders and brushes:
 - clearances, brush angle, brush arm spacing, alignment, staggering, brush bedding and brush pressure
 - brush operation:
 - temperature rise, number and size of brushes, current distribution between brushes, slotting brushes, polarity effects, arc of contact, materials for commutators and mica
 - selection of brush grades:
 - machine data, current density, commutator peripheral speed, brush arc, pitch of

segments, number of segments covered by brush and cooling surface

- armature reaction in d.c. machines encompassing:
 - effect of armature reaction on d.c. machine characteristics
 - use of compensating winding
- d.c. generators encompassing:
 - relative advantages and disadvantages of the various d.c. generator configurations and their performance under various load conditions
 - voltage regulation as a percentage or per unit value
 - operation in parallel
- d.c. motors encompassing:
 - relative advantages and disadvantages of the various d.c. motor configurations and their performance under various load conditions
 - shape of motor speed/torque curves
 - reversal of rotation
- starting and protection of d.c. motors encompassing:
 - types of d.c. motor starters in use
 - d.c. motor protection
- speed regulation and speed control of d.c. motors encompassing:
 - methods in use
 - effect on motor design and operation caused by the use of SCR
 - speed control equipment
- braking of d.c. motors encompassing:
 - plugging
 - dynamic
 - regenerative
 - mechanical
- losses, heating and efficiency encompassing:
 - copper losses
 - iron losses
 - mechanical losses
 - efficiency
- acceleration of d.c. motors and loads encompassing:
 - characteristics of typical loads
 - matching a suitable motor to a given load
 - heating of windings
 - derating of motors
- special d.c. motors construction, operation and applications encompassing:
 - permanent-magnet motors
 - brushless motors (e.c. motors)
 - coreless and moving coil motors

- linear motors
- printed circuit motor
- stepping motors
- voice-coil motors
- maintenance of d.c. machines encompassing:
 - routine maintenance
 - breakdown repairs
- types of faults encompassing:
 - brushes/brush gear problems:
 - sparking, excessive heating, excessive wear of brushes, commutator or slip rings, bad surface conditions, excessive maintenance, flexible burning, flexible corrosion, separation or grooving, blackening, copper picking, copper dragging and brush noise
- adjustment of machines encompassing:
 - correct brush position
 - machining and finishing of commutators
- problem-solving techniques
- machine parameters, specifications and performance requirements
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing engineering solutions for d.c. machine problems

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0043 Develop engineering solutions for induction machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop engineering solutions for induction machine and control problems.

It includes working safely; determining problems; obtaining induction machine operation, construction and application; gathering and analysing solutions; applying problem-solving techniques; and developing and documenting solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEEL0062 Provide engineering solutions to problems in complex polyphase power circuits

UEECD0036 Provide engineering solutions for problems in complex multiple path circuit

UEECD0039 Provide solutions to basic engineering computational problems

and

UEECD0041 Solve electrotechnical engineering problems

or

UEECD0043 Solve problems in direct current circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

or

UEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0065 Solve problems in basic electronic circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop engineering solution for induction machine problems

2 Develop engineering solution

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3** Scope of induction machine problem is determined from performance specifications and/or documentation and in consultation with relevant person/s
- 1.4** Activities are planned to meet scheduled timelines in consultation with others involved in the work
- 1.5** Strategies are formed to ensure solution development and implementation is carried out efficiently
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Induction machine construction, operation, characteristics and applications are applied to developing solutions to induction machine problems
- 2.3** Parameters tested, data taken, specifications and performance requirements to each machine problem are obtained in accordance with workplace procedures

- 2.4 Approaches to resolving induction machine problems are analysed to provide most effective solutions
 - 2.5 Unplanned events are dealt with safely and effectively in accordance with relevant industry standards and workplace procedures
 - 2.6 Quality of work is monitored in accordance with relevant industry standards and workplace procedures
- 3 Implement engineering solution and complete documentation**
- 3.1 Solutions to machine problems are tested to determine their effectiveness and modified as required
 - 3.2 Adopted solutions are documented, including instruction for implementation with risk control measures
 - 3.3 Relevant person/s required to implement solutions to induction machine problems is coordinated in accordance with relevant industry standards and workplace procedures
 - 3.4 Justification for solutions used to solve induction machine problems is documented in work/project records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering solutions must include the following:

- at least two induction machine problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG145A Develop engineering solutions for induction machine and control problems.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0043 Develop engineering solutions for induction machine and control problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the machine problem
- forming effective strategies for solution development and implementation
- obtaining machine parameters, specifications and performance requirements appropriate to each problem
- testing and solutions to machine problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- analysing approaches to solutions
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- determining the scope of induction machine problems
- monitoring quality of work
- planning activities to meet timelines.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- induction machines diagnostics and engineering solutions for induction motor problems, including:
 - operating principles of polyphase induction motors encompassing:
 - rotating magnetic field torque slip
 - MMF relationships
 - leakage fluxes

- construction of polyphase induction motors encompassing:
 - squirrel cage motors
 - slip-ring motors
 - construction considerations in minimisation of tooth locking
- speed-torque relationships in induction motors encompassing:
 - maximum torque
 - torque – slip relationships
 - squirrel cage rotor types
 - power flow in the motors
 - power distribution
 - torque units
 - slip ring rotors
- induction motor performance testing encompassing:
 - no-load tests
 - locked rotor tests
 - development of motor equivalent circuit from test results
 - analysis of motor performance using circle diagrams
- induction motor starters encompassing:
 - starting requirements
 - type of starters
 - starting torque
 - starting dynamics
 - static friction
 - mechanical loads
 - starting duration
- reduced voltage starting encompassing:
 - starting dynamics
 - change over conditions
 - starting duration
 - acceleration curves
- speed control of induction motors encompassing:
 - constant torque, constant power concepts
 - torque-flux-voltage relationships
 - rotor resistance control
 - stator impedance control
 - variable frequency control (e.g. PAM, PWM and flux vector control)
- braking of induction motors encompassing:
 - electrical braking systems (plugging, direct current (d.c.) dynamic, regenerative and capacitor-magnetic)
 - mechanical braking systems (mechanical drum, demag and eddy current)

- motor protection encompassing:
 - overload
 - earth fault
 - phase failure
- motor selection criteria and RMS rating
- induction motor maintenance/repair encompassing:
 - routine maintenance schedules
 - type of repairs (mechanical and electrical)
- single phase induction motors encompassing:
 - operating principles (especially RMF)
 - construction types
 - speed-torque relationships
 - testing
- relevant induction machine construction, operation, characteristics and applications, including driven load and duty cycle
- relevant machine parameters, specifications and performance requirements
- relevant manufacturer specifications and operating instructions/manuals
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing engineering solutions for induction machine problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0044 Diagnose and rectify faults in complex lift systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in a lift system.

It includes diagnosing and rectifying faults in complex lift system and equipment, and completing reporting and rectification activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0045 Diagnose and rectify faults in traction lift systems

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0018 Diagnose and rectify faults in digital controls systems

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
 UEEEL0008 Evaluate and modify low voltage heating equipment and controls
 UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
 UEEEL0010 Evaluate and modify low voltage socket outlets circuits
 UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
 UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0046 Solve problems in single path circuits

UEECD0044 Solve problems in multiple path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to diagnose a lift system fault

- 1.1** WHS/OHS workplace procedures for a given work area are identified and applied
- 1.2** Scope of work to be undertaken is determined from maintenance procedures, fault/breakdown reports and/or discussions with appropriate person/s
- 1.3** Advice is sought from the work supervisor to ensure the work is coordinated effectively with relevant others
- 1.4** Tools, equipment and testing devices needed to carry out the work are obtained in accordance with workplace procedures and checked for correct operation and safety

- 2 Diagnose and rectify lift system faults**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work activities are followed
 - 2.2** Circuits/machines/plant are isolated in accordance with relevant industry standards and workplace procedures
 - 2.3** Safety hazards resulting from the fault and/or breakdown are documented and risk control measures implemented in consultation with appropriate person/s
 - 2.4** Diagnostics are applied to apparatus, equipment and systems to identify fault/s
 - 2.5** Suspected fault scenarios are tested as cause/s of system fault
 - 2.6** Cause of the fault is identified and appropriate person/s engaged to rectify the fault
 - 2.7** Faults in the lift components of the system are rectified in accordance with apparatus and system industry operational standards
 - 2.8** Apparatus, equipment and system/s are verified and tested to meet required industry standards
 - 2.9** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.10** Diagnosis and rectification activities are carried out efficiently without waste of materials or damage to apparatus, the environment or services using sustainable energy practices
- 3 Complete work and report fault diagnosis and rectification activities**
- 3.1** Reusable, faulty or worn components are tagged and despatched for repair in accordance with workplace procedures
 - 3.2** Rectification of faults is documented in accordance with workplace procedures
 - 3.3** Rectification of faults is reported and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG168A Diagnose and rectify faults in complex lift systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0044 Diagnose and rectify faults in complex lift systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- releasing passengers from a lift which has become immobilised
- diagnosing and repairing faults in lift circuits and associated components for at least three types of lift circuits/components, including:
 - governors
 - brakes
 - safety gear
 - safety devices
 - lift machines
 - door components
 - controllers
- replacing and/or adjusting lift equipment in at least three types of lift equipment as described below:
 - electro-hydraulic lift
 - electric traction lift
 - passenger lift
 - goods lift
- dealing with unplanned events
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- diagnosing and rectifying faults, including:
 - inspecting, testing and measuring live electrical work
 - obtaining and checking tools, equipment, resources and testing devices
 - using diagnostic methods
- following workplace procedures and instructions
- reporting fault diagnosis and rectification activities, including:
 - completing documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- lift components and systems - electrical/electronic, including:
 - traction lifts encompassing:
 - lift control circuits (relay logic only): floor selector circuitry
 - machine room control (selector) and well control (transducer) circuitry - direction slowing and stopping, re-levelling, door operator, acceleration, button, indicator/lantern, lights and emergency lights, travelling cables, key switch circuits, fans, main supply and power circuits
 - safety circuits encompassing:
 - type, operation and actuation
 - landing door locks, car door locks, emergency stop, pit switch, car trap-door switch, fire service, car top switch, tappet switch, governor switch, and safety gear switch, reverse phase relay, phase failure relay and limit switches
 - maintenance, replacement and adjustment encompassing:
 - electrical and electronic lift components - travelling cables, tachometers, selectors, encoders and transducers
 - safety devices: overloads, circuit breakers, limit switches, terminal stopping, door protection, governors and safety gear/switches
 - electrical layout/drawings and special requirements encompassing:
 - lift code and AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) requirements
 - specific lift symbols
 - conduits
 - trailing cable
 - troughing
 - colour coding and labelling
 - segregation low voltage (LV)/extra-low voltage (ELV)
 - telephone and communication cabling
 - regulatory requirements and door lock wiring
 - safety drive adjustment encompassing:
 - emergency stop button
 - speed governor
 - reverse phase protection
 - broken chain/step switch
 - broken main drive switch
 - drive access switch
 - start pressure switch and landing guards/barriers
 - lift components – electronic encompassing:

- encoders
- transducers
- electronic boards
- selectors
- rectifiers
- capacitors
- resistors
- processor board
- input/output (I/O) board
- drives - types, construction and operation encompassing:
 - traction
 - gearless types:
 - speed/load characteristics, efficiency, application, brakes and electric prime mover (motor types and control)
 - geared types:
 - speed/load characteristics, efficiency, application, brakes and electric prime mover (motor types and control)
 - other types of lifts (drum, rack and pinion, chain and screw)
- fault finding encompassing:
 - visual inspection
 - performance checks and application of fault-finding principles
- relevant diagnostic methods
- relevant fault scenarios
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions for tools and equipment
- relevant rectification activities and procedures
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including fault reports, test results, authorisations, permits, parts/components, despatch and store records
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do

so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0045 Diagnose and rectify faults in traction lift systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in traction lift systems and equipment.

It includes working safely; replacing and/or adjusting lift circuit and associated components; diagnosing and repairing faults in lift circuits and associated components, including governors, brakes, safety gear, safety devices, lift machines, door components and controllers.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify lift system faults

2 Diagnose and rectify lift system faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and, as required, conducted within workplace safety procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Safety hazards resulting from fault or breakdown are documented on job safety assessments, risks assessed and control measures implemented in consultation with appropriate person/s
 - 2.5 Logical diagnostic methods are applied to diagnose lift system apparatus faults employing measurements and estimations of system operating parameters referenced to system operational requirements
 - 2.6 Suspected fault-finding scenarios are tested as being possible cause/s of lift system fault in accordance with workplace procedures
 - 2.7 Cause of lift system fault/s is identified and appropriately competent person/s engaged to rectify the fault where it is outside the scope of the lift systems
 - 2.8 Fault/s in the lift components of the system is rectified to apparatus manufacturer specifications and lift system relevant operational standards
 - 2.9 System is inspected and tested to verify that the lift system operates as intended and to manufacturer specified requirements
 - 2.10 Control methods for dealing with unplanned situations are responded to on the basis of workplace safety and specified work outcomes
 - 2.11 Diagnosis and fault/s rectification activities are carried out efficiently without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete rectification activities and documentation**
- 3.1 WHS/OHS work rectification risk control measures and workplace procedures are followed
 - 3.2 Reusable, faulty or worn components are tagged and

despatched for repair in accordance with workplace procedures

- 3.3** Rectification of fault/s is documented in accordance with workplace procedures
- 3.4** Appropriate person/s is notified that the lift system fault/s has been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Replacing and/or adjusting of lift equipment must include at least three of the follow types of lift equipment:

- electric traction lift
- electro-hydraulic lift
- goods lift
- passenger lift

Diagnosing and rectifying faults in lift systems must include at least three the following:

- brakes
- controllers
- door components
- governors
- lift machines
- release passengers from a lift, which has become immobilised
- safety devices
- safety gear

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG116A Diagnose and rectify faults in traction lift systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0045 Diagnose and rectify faults in traction lift systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying sustainable energy principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- completing and reporting fault diagnosis and rectification activities
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- diagnosing and rectifying faults in traction lift systems, including:
 - brakes
 - door components
 - governors
 - lift machines
 - safety devices
 - safety gear
- preparing to diagnose and rectify faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- brake types, function, operation, inspection and adjustment, circuitry and manual release, including:
 - brake circuitry
 - electrical operations, including stall motor, solenoid and hydraulic
 - geared machine brakes
 - gearless machine brakes
 - inspection and adjustment of mechanical and electrical brakes

- internal and external mechanical brakes
- manual release devices and safety procedures
- communication at site
- electro-hydraulic lifts circuitry, controls and components, including:
 - electrical circuitry
 - faulty components diagnosis
 - governor switch
 - hydraulic circuitry
 - hydraulic components
 - levelling switch
 - over travel limits
 - pump motor and starter
 - servicing
 - stop button
 - up, down limit switches
 - up, down solenoids
- electro-hydraulic lifts - mechanical operation – fluid power principles and components, operation, arrangements, lift code and other requirements and emergency passenger release, including:
 - bleeding lines
 - control of hydraulic pressure
 - directional flow including pressure gauge
 - filters
 - fluids
 - general operation
 - hydraulics
 - oil cooler
 - oil reservoir
 - Pascal's Law
 - pump
 - ram/cylinders, including single and multi-stage
 - safety considerations of fluids under pressure
 - seals
 - solenoid valves
 - types of arrangements, including side acting, direct and suspended
- electric lifts – mechanics, including:
 - governor operation testing and rope tension testing
 - governor types, including vertical shaft, overspeed devices and horizontal shaft
 - governors
 - release procedures for each type of safety gear/governor combination

- safety gear types: A instantaneous, B flexible guide clamp, C wedge clamp and D oil buffer
- emergency release procedures - trapped passengers – WHS/OHS considerations and communication with passengers, including:
 - determining numbers and condition of passengers
 - direction of lift travel before stopping
 - emergency medical support
 - fault indication
 - hand winding
 - information related to impending movement and opening of doors
 - moving under power
 - passenger safety
 - reassurance as to safety of passengers
 - status of doors
 - warnings about standing near doors and using controls
- escalators and moving walks components, including:
 - balustrade lighting
 - controller
 - drive chain
 - handrail
 - handrail earthing
 - machine brakes
 - rollers and tension carriage
 - safety devices
 - step/pallet chains
 - steps/pallets/belts
 - track systems
 - truss
- geared types including rack and pinion and chain, including:
 - application
 - brakes
 - drum
 - efficiency
 - electric prime mover (motor types and control)
 - speed/load characteristics
- lift car, including:
 - access
 - buttons and indicators
 - communication devices
 - door operator

- frame
- safety gear
- superstructure
- travelling cable
- lift components - electro-mechanical employing relay logic components, including:
 - acceleration circuits
 - button circuit
 - directional circuitry
 - door operator circuitry
 - fans
 - floor selector circuitry
 - indicator/lantern circuit
 - key switch circuits
 - mains supply
 - motor room control (selector)
 - power circuits
 - re-levelling circuitry
 - slowing and stopping circuitry
 - well control (transducer)
- lift components - electro-mechanical safety circuits, including:
 - car door locks
 - car top switch
 - car trap-door limit switch
 - circuit switches are all highlighted
 - emergency stop
 - fire service
 - landing door locks
 - pit switch
 - safety gear switch
 - tappet switch
 - terminal stopping
- lift components – electrical, including:
 - brushes
 - fuses
 - lamps
 - limit switches
 - motor/generator
 - relays: reverse phase and phase failure
 - selectors

- tachos
- terminals
- transformers
- lift components - electronic, including:
 - capacitors
 - electronic boards
 - encoders
 - input/output (I/O) board
 - processor board
 - rectifiers
 - resistors
 - selectors
 - transducers
- lift control circuits using relay logic, including:
 - acceleration, button, indicator/lantern, key switch and power circuits
 - directional, door operator, floor selector, re-levelling and slowing and stopping circuitry
 - fans
 - mains supply
 - motor room control (selector)
 - well control (transducer)
- lift electrical layout and special requirements, including:
 - colour coding and labelling
 - communication cabling
 - conduits
 - segregation low voltage (LV)/extra-low voltage (ELV)
 - special lift symbols
 - travelling cable
 - troughing
- lift machine room, including:
 - access
 - controller
 - floor selector
 - governor
 - machine
- lift pit, including:
 - access
 - buffers
 - compensators
 - safety equipment
- lift safety circuits, including:

- car door locks
- car top switch
- car trap-door limit switch
- circuit breakers
- circuit switches
- door protection
- emergency stop
- fire service
- governor/switch
- landing door locks
- limit switches
- overloads
- phase failure relay
- pit switch
- reverse phase relay
- safety gear switch
- tappet switch
- terminal stopping
- lift systems - drive types, construction and operation of passenger, goods and service lifts, including:
 - drive constructions
 - drive types
 - emergency procedures
 - goods
 - passenger
 - rive operations
 - service
 - single and team manual handling
- lift well equipment, including:
 - counterweights
 - guide rails
 - landing doors and locks
 - limit switches/operating devices
 - ropes
 - roping systems
- maintenance, replacement and adjustment of mechanical lift components, including:
 - air cords
 - bearings: roller, sleeve, guide shoes and slipper
 - car doors
 - door guides

- landing doors
- selectors
- tapes/chains
- traction, including:
 - application
 - brakes
 - efficiency
 - electric prime mover (motor types and control)
 - speed/load characteristics
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- relevant technical industry standards, regulations, statutory requirements and codes for lifts systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0046 Find and repair faults in LV d.c. electrical apparatus and circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and repair faults in electrical apparatus and interconnecting circuits and equipment operating at voltages up to 1,500 volts (V) direct current (d.c.).

It includes working safely, finding faults in electrical apparatus, applying logical fault-finding workplace procedures, conducting repairs and completing the necessary service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to test and rectify faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS hazards are identified, risks assessed and control measures implemented in accordance with workplace procedures in preparation for work
- 1.3 Scope of work to be undertaken is determined from fault/breakdown reports and/or discussions with appropriate person/s
- 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5 Sources of materials required for work are established in accordance with workplace procedures

- 1.6** Tools, equipment and testing devices needed to locate faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find and repair faults**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and, as required, conducted within workplace safety procedures
- 2.3** Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Safety hazards resulting from the fault or breakdown are assessed, documented on job safety assessments and risk control measures implemented in consultation with appropriate person/s
- 2.5** Fault-finding analysis is approached methodically using measured and calculated values of electrical circuit/apparatus parameters
- 2.6** Electrical circuit/apparatus components are dismantled, as required, and parts stored to protect against loss or damage
- 2.7** Faulty circuits/components are rechecked and fault status identified
- 2.8** Materials/replacement parts required to rectify faults are sourced and obtained in accordance with workplace procedures
- 2.9** Effectiveness of repair/s is tested in accordance with workplace procedures
- 2.10** Electrical apparatus and circuits are inspected, reassembled, tested and prepared for return to service
- 2.11** Unplanned situations are responded to safely in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.12** Fault-finding and repair activities are carried out without damage to apparatus circuits, the surrounding environment or services using sustainable energy practices

- 3 Complete and document repair activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Reusable, faulty or worn components are tagged and despatched for repair to maintain adequate spares
 - 3.3** Maintenance work activities are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Finding and repairing fault types in electrical apparatus and interconnecting circuits and equipment operating at voltages up to 1,500 V d.c. must include at least five of the following:
- open circuit
 - short circuit
 - incorrect connections
 - insulation failure
 - unsafe condition
 - apparatus/component failure
 - related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG110A Find and repair faults in LV d.c. electrical apparatus and circuits.

Assessment Requirements for UEEEL0046 Find and repair faults in LV d.c. electrical apparatus and circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using of risk control measures
- applying sustainable energy principles and practices
- completing repairs, and reporting fault-finding and repair activities
- finding and repairing faults in direct current (d.c.) electrical apparatus and circuits, including:
 - determining the likely extent of work from fault/breakdown reports and discussions with appropriate person/s
 - using methodical fault-finding techniques
 - finding faults efficiently
 - rectifying faults effectively
 - completing documentation correctly
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- implementing WHS/OHS requirements and workplace procedures
- preparing to find and rectify faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- d.c. motor control methods
- d.c. machines, including:
 - connection arrangements
 - installation and starting/running requirements and limitations
 - operating principles
 - purpose, types and applications

- typical fault symptoms and related conditions
- d.c. motor starters and their operating principles, including:
 - back emf
 - electronic controllers
 - series-lockout
 - timed starters
- power and control connection arrangements, including:
 - built-in stop/start control
 - interlocking with other starters and controls
 - overload protection
 - remote stop/start control
- braking methods, including:
 - dynamic
 - plugging
 - electromechanical
 - regenerative
- speed control methods, including:
 - field control
 - rheostatic control
 - voltage control
- protection of d.c. motors
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0047 Identify, shut down and restart systems with alternate supplies

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to identify, shut down and restart systems with alternate supplies.

It includes identifying the system configuration, working safely with electricity generation systems and inverters, identifying hazards and controlling the associated risks, isolation and testing for de-energisation, reinstating the system after isolation, and completing relevant documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices
and

UEECD0043 Solve problems in direct current circuits
or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on systems with alternate supplies

2 Identify and isolate alternate supplies

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Nature of the installation is obtained from appropriate written documentation, electrical drawings and/or relevant person/s to determine the scope of work
- 1.2 WHS/OHS workplace procedures are obtained, interpreted and applied
- 1.3 Hazards are identified, risks are assessed, and control measures are implemented
- 1.4 Tools, equipment and circuit testing devices are obtained and checked for correct operation and safety in accordance with workplace procedures
- 1.5 Work supervisor is consulted to ensure work is coordinated effectively with others
- 2.1 Labelling indicating generation system/s connected on site is located, interpreted and checked against electrical diagrams

- 2.2 Switchboard, circuits and known supply are identified
 - 2.3 Site procedures for isolation and shutdown are obtained and interpreted
 - 2.4 Circuit to be isolated is identified and tested
 - 2.5 Shutdown procedures are completed in accordance with industry standards and workplace procedures
 - 2.6 Isolation of energy sources is completed and proved in accordance with workplace procedures, industry standards and regulatory requirements
 - 2.7 Systems are inspected and tested for compliance with industry and regulatory standards
 - 2.8 Battery storage system integrity is checked in accordance with industry standards and regulatory requirements
 - 2.9 System is re-instated after isolation
- 3 Complete work and document records**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Work completion is documented, electrical drawings are updated, and relevant personnel are notified in accordance with workplace procedures and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Identifying, shutting down and restarting

- one with an energy source that is still

systems must include electricity generation systems and electricity converters relevant to the installation type, including:

- available once turned off; and
- one inverter energy system
- AND, at least two of the following:
 - grid-connected inverter systems
 - photovoltaic (PV) array systems
 - micro-inverters
 - engine-driven generating sets
 - stand-alone power systems
 - battery systems

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEEEL0047 Identify, shut down and restart systems with alternate supplies

Modification History

Release 2. This is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Assessor requirements updated in Assessment Conditions.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying work health and safety (WHS)/occupational health and safety (OHS) workplace procedures
- identifying and assessing hazards and risks, including hazards based on supply system labelling, and implementing control measures
- obtaining and checking required tools, equipment and testing devices
- reading and interpreting electrical documentation, labelling and drawings
- identifying alternative supply arrangements and configurations
- applying safe shutdown procedures
- isolating energy sources in accordance with workplace procedures and regulatory requirements, including:
 - applying safe isolation practices
 - identifying correct isolation device
 - identifying and checking operation of control device/s
 - identifying live conductors
 - identifying known source of electromotive force (EMF) for testing purposes
 - correctly using a voltage tester
 - isolating multiple supplies, where required
 - isolating under no loads
 - ensuring all energy sources are isolated
 - de-energising charging sources, including:
 - solar charge controllers
 - battery chargers
 - proving systems are isolated

- tagging-out all supplies
- ensuring all installation work complies with relevant industry standards and legislation to which the selection, installation and control equipment of each type of system must comply
- checking battery storage system integrity is in accordance with industry standards and regulatory and manufacturer requirements, including ventilation, correct isolation devices and installation position
- safely re-instating generation system to operational mode according to site documentation and manufacturer instructions
- completing required documentation and forwarding to relevant parties.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- working safely with alternate supplies, including identifying hazards and controlling risks in compliance with regulatory and enterprise requirements
- main types, arrangements and configurations of alternative supplies (generating system), including renewable and non-renewable generating systems
- fundamental requirements, including:
 - connection methods of alternative supplies
 - local supply authority requirements
 - characteristics and operation of uninterruptable power supplies (UPS)
 - direct current (d.c.) polarity requirements, including switching, correct rating of d.c. switches and protection devices
 - importance of replacing components like-for-like
 - inverter principles, including operation and interaction with the installation, anti-islanding and islanding requirements and testing requirements
 - identification and labelling requirements and their purpose
 - arrangement for connecting an alternative supply to an installation, including automatic and manual changeover switches, multiple main switches and switchboard wiring
 - earthing arrangements, including equipotential bonding, and earthing methods and requirements for stand-alone systems and generators
- safe isolation of the generator/energy source, including:
 - anti-islanding
 - auto changeover/auto start
 - backup – external power supply (EPS)/UPS mode or backup mode
 - earth fault alarm
 - voltage rise
 - voltage parameters AS/NZS 4777 Grid connection of energy systems via inverters
 - no loads
 - deenergising charging sources such as solar charge controllers, and battery chargers

- AS/NZ 4836 Safe working on or near low-voltage electrical installations and equipment
- labelling and identification of alternate supply systems
- battery storage systems, including regulatory and manufacturer requirements
- relevant industry standards to which the selection, installation and control equipment of each type of system must comply, including:
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules) relating to the requirements for electricity generation systems installation and electricity converters
 - AS/NZS 4777(series) Grid connection of energy systems via inverters
 - AS/NZS 5033 Installation and safety requirements for photovoltaic (PV) arrays
 - AS/NZS 3010 Electrical installations - generating sets
 - AS/NZS 4509 (series) Stand-alone power systems
 - AS 3011 Electrical installations - Secondary batteries installed in buildings
 - AS/NZS 5139 Electrical installations - Safety of battery systems for use with power conversion equipment
- site and regulatory documentation requirements.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessors must also hold the occupational licence for the jurisdiction the assessment is occurring where the activity being assessed requires a licence to practice.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, manufacturer instructions, regulations, codes of practice and operation manuals.

UEEEL0049 Install and maintain emergency safety systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and maintain fire and smoke control, emergency power supplies and early warning systems in buildings and premises.

It includes working safely to install and maintain emergency safety systems to relevant industry standards, complying with maintenance schedules and completing documentation.

Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevated work platforms (EWPs), powder-operated fixing tools, power-operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to install and maintain emergency safety systems

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied

1.2 Hazards are identified, health and safety risks assessed and existing risk control measures and workplace procedures implemented

1.3 Installation and/or maintenance is prepared in consultation with others affected by the work and sequenced appropriately

- 1.4 Nature and location of work is determined from workplace documentation or appropriate person/s to determine the scope of work
 - 1.5 Location of apparatus and associated equipment is planned within the constraints of the building structure, significant and regulations
 - 1.6 Advice is sought from appropriate person/s to ensure work is coordinated effectively with others
 - 1.7 Material for the installation work is obtained in accordance with workplace procedures and checked against job requirements
 - 1.8 Tools, equipment and testing devices needed for installation work are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.9 Preparatory work is checked to ensure no damage has occurred and complies with job specifications
- 2 Install and maintain emergency safety systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Apparatus and associated equipment are installed or maintained to comply with relevant industry technical standards, job specifications and requirements with sufficient access to enable terminations for adjustment and maintenance
 - 2.5 Wiring is terminated at apparatus and associated equipment in accordance with manufacturer specifications and functional and regulatory requirements
 - 2.6 Methods for dealing with unplanned situations are discussed with appropriate person/s, documented and acted upon in a manner that minimises risk to personnel and equipment

- 2.7 Ongoing checks of the quality of installed apparatus are undertaken in accordance with workplace procedures
- 2.8 Apparatus installation is carried out efficiently without unnecessary waste of materials or damage to apparatus, circuits, the surrounding environment or services using sustainable energy principles
- 3 Complete and report on installation or maintenance activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Final inspections and tests are made to ensure the installed or maintained apparatus conforms to job requirements
- 3.4 'As-installed' emergency safety systems apparatus and associated equipment are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and maintaining emergency safety systems must include at least the following:

- fire and smoke control emergency safety systems
- warning and evacuation safety systems
- emergency power supplies

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG113A Install and maintain emergency safety systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0049 Install and maintain emergency safety systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- completing and reporting installation and maintenance activities
- installing electrical emergency safety systems
- maintaining electrical emergency safety systems, including:
 - determining the operating parameters of existing electrical safety systems
 - using established problem-solving methods
 - interpreting measured values appropriately
 - providing effective solutions to electrical safety system problems
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- preparing to install emergency safety systems
- preparing to maintain emergency safety systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- installing and maintaining electrical emergency safety systems, including:
 - cells and batteries in common use:
 - primary cells
 - secondary cells
 - discharging
 - recharging
 - terminal voltages

- capacity
- discharge and recharge characteristics
- battery configurations and applications
- cell and battery safety practices
- electrical installations and emergency systems, including:
 - principles and practices of electrical emergency safety systems for electrical installations as contained in relevant Australian Standards, Building Code of Australia (BCA) and associated hazards documentation
 - arrangement and requirements for fire and smoke control equipment
 - arrangement and requirements for emergency warning and intercommunications systems
 - arrangement and requirement for emergency power supplies
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0050 Install and replace low voltage current transformer metering

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and replace of low voltage (LV) current transformer (CT) metering.

It includes preparing, installing and replacing LV CT metering. It also includes setting meter parameters and completing documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Note: Those holding an 'Unrestricted Electrician's Licence' or equivalent issued in an Australian state or territory meet the prerequisite requirements of this unit.

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

- UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
- UEEEL0018 Select wiring systems and cables for low voltage general electrical installations
- UEEEL0005 Develop and connect electrical control circuits

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install and replace LV CT metering

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS hazards are identified, risks are assessed, and control measures are implemented for work

preparation

- 1.3 WHS/OHS hazards not previously identified are noted, risks assessed and risk control measures implemented
 - 1.4 Switchboard on which the meter/s and CTs are to be installed, inspected and tested are evaluated for compliance with safety and relevant industry standards
 - 1.5 Further work instructions for safety and/or functionality defects of the switchboard are sought from appropriate person/s in accordance with workplace procedures
 - 1.6 Installation of the meter, sequence and rectification work is prepared in consultation with relevant person/s
 - 1.7 Material needed for the work is obtained in accordance with workplace procedures and checked against work requirements
 - 1.8 Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Install and replace CT metering**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Existing metering is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Approved rectification work is carried out to comply with relevant industry standards and workplace procedures
 - 2.5 Meters and CTs are installed and replaced to comply with relevant industry standards and work specifications
 - 2.6 Metering power, functional requirements and communication connections, as required, are in accordance with manufacturer specifications and relevant industry standards
 - 2.7 Meter operating parameters and functional requirements are in accordance with manufacturer specifications and relevant industry standards

- 2.8** Unplanned situations are responded to in accordance with workplace procedures and with the approval of an authorised person in a manner that minimises risk to personnel and equipment
- 2.9** Quality checks of the installed apparatus are undertaken in accordance with workplace procedures
- 2.10** Metering and CT installation is carried out efficiently without unnecessary waste of materials, services, damage to apparatus, circuits or environment using sustainable energy principles
- 3 Complete and report metering installation activities**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed and supply is reinstated to the installation in accordance with workplace procedures
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Quality checks of the installed metering and CTs is in accordance with relevant industry standards
- 3.4** Metering and CT work is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and replacing LV CT must include at least two of the following different installations:

- LV CT installation using single phase meters
- LV CT installation using a polyphase meter
- metering installation where compliance rectification work is required

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG076A Install and replace low voltage current transformer metering.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0050 Install and replace low voltage current transformer metering

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- inspecting and evaluating safety and functionality compliance of the switchboard accurately
- following established procedures to obtain approval to rectify non-compliance aspects of the switchboard
- carrying out preparation work effectively
- rectifying compliance defects
- placing and securing metering correctly
- making power and communications connections in accordance with manufacturer specifications and functional and regulatory requirements
- setting meter parameters in accordance with manufacture's specifications and functional and regulatory requirements
- reinstating supply to the installation safely
- documenting current transformer (CT) metering and rectification work and notifying appropriate persons in accordance with established procedures
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- completing activities
- following quality, workplace procedures and instructions
- preparing, installing and replacing CT energy metering
- selecting metering and CT components
- using tools, equipment, personal protective equipment (PPE) and testing devices
- reporting work activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- low voltage (LV) CT metering, including:
 - CTs encompassing:
 - uses and functions
 - AS 60044.1-2007 Instrument transformers - Current transformers, requirements
 - characteristics and saturation
 - differences between metering and protection CTs
 - standard ratios and outputs
 - accurate range of loading
 - thermal current limit
 - burden and connecting cable length
 - short circuiting secondary as a safety issue
 - accuracy class
 - revenue meter types used with CTs:
 - CT installations encompassing:
 - uses in the regulated market and relevant regulations
 - types and mounting methods
 - switchboard layouts (various distributors)
 - minimum spacing of CTs
 - connections to single and polyphase revenue meters
 - consequence of polarity reversal in one phase of a polyphase meter
- problem-solving techniques
- relevant industry standards
- relevant quality workplace procedures
- relevant tools, equipment and testing devices
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant sustainable energy practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in similar workplace operational situations where it is appropriate to do

so; where this is not appropriate, assessment must occur in simulated similar workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0051 Investigate and report on electrical incidents and causes

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to investigate and report on electrical incidents and probable causes.

It includes investigating and reporting the possible electrical cause of incident/s resulting in electric shock, injury, fatality or property damage. It also includes working safely, gathering information from an incident site and from witnesses, conducting site tests, gathering and arranging for analysis of forensic evidence, documenting findings and presenting evidence in court.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to investigate electrical incident

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risks are identified and assessed, and risk control measures and workplace procedures implemented in preparation for electrical investigation
- 1.3 Safety hazards not previously identified are noted on risk assessment, risk assessed and risk control measures

identified and implemented

- 1.4 Notification of the electrical incident is reviewed in consultation with relevant person/s to establish the nature and extent of the electrical investigation
 - 1.5 Relevant person/s is consulted to ensure the investigation is coordinated effectively with others involved on the worksite
 - 1.6 Tools, equipment and testing devices needed for the electrical investigation are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Investigate electrical incident to determine cause**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out electrical investigation are followed
 - 2.2 Need to inspect, test or measure live electrical work is determined and conducted in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Cooperation of relevant person/s involved in the electrical investigation is sought and obtained
 - 2.4 Recreation of incident situation is undertaken and conducted in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.5 Witnesses to the incident are interviewed in accordance with privacy principles, workplace procedures and protocols to determine the circumstances of the incident
 - 2.6 Physical evidence of probable causes of the electrical incident are identified by way of inspection and testing, and evidence is documented in accordance with workplace procedures
 - 2.7 Forensic evidence gathered at the incident site is handled to avoid contamination or damage, permission is obtained to remove evidence from the site, documentation is completed, as required, and evidence is forwarded to the relevant person/s for analysis
 - 2.8 Witness statements and evidence gathered at the site are documented in accordance with workplace procedures
 - 2.9 Actions are taken to prevent any unsafe electrical hazards found on the site from posing a risk of further

- injury or damage in accordance with workplace procedures
- 3 Report electrical investigation findings**
- 3.1** Reports of forensic evidence analysis are obtained and reviewed for inclusion in the final investigation report
- 3.2** Cause/s of electrical incident is extrapolated from the evidence using acceptable deductive methods
- 3.3** Investigation procedures, finding, conclusions and recommendation are documented in accordance with workplace procedures
- 3.4** Investigation report is forwarded to relevant person/s in accordance with workplace procedures and regulatory requirements
- 3.5** Documented evidence in the investigation report is given in court, as required, honestly and without bias following court procedures and protocols

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Investigating and reporting on electrical incidents must include at least two of the following incidents:

- reported electric shock
- injury from a reported electrical source
- fatality from a reported electrical source
- property damage from a reported electrical source

Electrical incident investigation must occur in at least one of the following:

- domestic premises
- non-domestic premises
- construction site

Electrical incident investigation witness statements must include the following:

- workplace procedures and results of inspections and tests undertaken on site
- forensic evidence removed from site and for analysis

- aspects of the electrical installation that do not comply with relevant safety, industry standards and requirements

Unit Mapping Information

This unit replaces but is not equivalent to UEENEEG172A Investigate and report on electrical incidents and causes.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0051 Investigate and report on electrical incidents and causes

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- recreating incident situation as accurately as evidence indicates
- interviewing and taking witness statements in accordance with workplace procedures
- gathering relevant physical evidence and treating it in accordance with workplace procedures
- documenting evidence gathered at the site, including:
 - aspects of the electrical installation that do not comply with safety standards and requirements
 - forensic evidence removed for analysis
 - written and photographic evidence
 - workplace procedures and results of tests undertaken
- documenting electrical investigation procedures, findings and conclusions appropriately
- reviewing scope and extent of the investigation from initial notification of the electrical incident
- taking appropriate actions to prevent any unsafe electrical hazards found on the site from posing a risk of any further injury or damage
- using deductive methods to determine the cause or causes of the electrical incident.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical incidents - investigation and reporting
- procedures and protocols for giving evidence in court encompassing:
 - process for responding to a witness summons
 - requirements for preparing to appear in court to give evidence
 - court procedures and protocols for giving evidence
- procedures and processes for responding to reported electrical incidents encompassing:

- reporting requirements of the electricity legislation for electrical accidents on customer's premises
- responsibility for investigating electrical accidents on customer's premises
- reporting procedures of electrical accidents on consumer's premises and distributor's assets
- actions to be taken when an electrical incident causes loss of life, personal injury or property damage
- initial task of an investigator of an electrical incident
- extent of evidence needed to be gathered from the site of an electrical incident
- conditions and actions that could result in death, injury of property damage from an electrical cause encompassing:
 - non-compliance defects of an electrical installation
 - connection or use of unsuitable (not approved) electrical equipment and appliances
 - failure to follow safe working procedures
 - deliberate misuse
 - unacceptable rise in potential of exposed and extraneous conductive parts
- causes of rise in potential of exposed and extraneous conductive parts encompassing:
 - high impedance in the main or service neutral conductor of a multiple earthed neutral (MEN) system
 - earth faults
 - high impedance in the protective earthing under fault conditions
 - ineffective equipotential bonding under fault conditions
 - ineffective protective device under fault conditions
- effects and consequences of current through the human body
- electrical sources of fire in building and premises
- advanced electrical testing and measuring devices encompassing:
 - testing/measuring devices and their application
 - safe connection of testing/measuring devices into a circuit
 - taking readings
 - storage, maintenance and care of testing/measuring devices
- problem-solving techniques
- relevant industry standards
- relevant manufacturer specifications and operating instructions for tools and equipment
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment, resources and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions, including legal requirements for the removal of evidence from site.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0052 Maintain and service traction lift systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to maintain and service traction lift systems and equipment.

It includes planning, maintaining and servicing lift system and equipment by working safely; conducting site cleaning; lubricating and inspecting suspension, governors, compensators, floor selector and tappet switch ropes. It also includes carrying out periodic testing on lift safety gear, and completing and reporting service activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0045 Diagnose and rectify faults in traction lift systems

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare service lift equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3 Scope of work to be undertaken is identified from maintenance workplace procedures or fault/breakdown reports and/or discussions with appropriate person/s
- 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
- 1.5 Tools, equipment and testing devices needed to carry out service work are obtained in accordance with

- workplace procedures and checked for correct operation and safety
- 2 Service lift equipment**
- 2.1** WHS/OHS risk control measures and procedures for carrying out service work are followed
- 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Safety hazards resulting from fault/s or breakdown are documented on job safety assessments, risks assessed and risk control measures implemented in consultation with appropriate person/s
- 3 Complete and report service activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Reusable, faulty or worn components are inspected, tagged and despatched for repair to maintain adequate spares in accordance with workplace procedures
- 3.3** Maintenance work activities are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Maintaining and servicing lift systems must include at least the following:

- two of the following lift equipment:
 - geared traction drive
 - gearless traction drive
 - drum drive

- suspended electro-hydraulic drive
- two of the following roping systems:
 - single or double wrap
 - single or multiple fall
 - side slung or underslung
 - overhead or basement drive
 - drum drive
- two of the following components:
 - suspension ropes
 - governor ropes
 - tappet ropes
 - compensator ropes
 - floor selector tapes/ropes
- all of the following safety gear periodic tests:
 - governor type A
 - governor type B
 - governor type C

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG165A Maintain and service traction lifts systems and equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0052 Maintain and service traction lift systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- completing and reporting lift system servicing activities
- maintaining and servicing traction lift equipment, including:
 - carrying out lift safety gear periodic testing
 - conducting site cleaning and lubricating of lift equipment
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - inspecting lift ropes
 - maintaining electro-hydraulic lift equipment
- planning to maintain and service lift systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- lubricant selection for lift components, including:
 - cooling and viscosity
 - corrosion protection and friction reduction
 - lubricant loss and loss estimation
 - suitable oils, greases, coolants, rust preventatives and solvents for particular devices
- lubricant application for lift components, including hand grease guns, oil cans and misters, pressure and automatic lubricators, lubrication points, level indicators and estimating quantities
- lift systems: single and multiple wrap roping; types of ropes and their attachments, including

- hoisting, governor, tappet, compensator, selector, normal and Langs lay rope, standard ends attachments, splices, wedge sockets, Talurit fitting, Babbit sockets and Secon fitting
- lift system rope inspection, including:
 - corrosion, lubrication and tension
 - lift systems basic rope inspection
 - purpose
 - rope stretch
 - wear, broken strands, diameter and deformation
 - rope stretch, including counterweight clearance and compensatory equipment
 - inspection of rope attachments, including:
 - deformation and remedial action
 - rope anchor rods, castings and springs
 - wedges, swaging and checking for fracturing
 - inspection of sheaves, including groove condition, rifling, ropes down in sheaves and maintenance records
 - maintenance, replacement and adjustment of mechanical lift components, including:
 - air cords, selectors and tapes/chains
 - bearings: roller, sleeve, guide shoes and slipper
 - car and landing doors, locks and guides
 - well, pit and motor room equipment
 - relevant job safety assessments or risk mitigation processes
 - relevant manufacturer specifications
 - relevant requirements of lift code/enterprise
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation including authorisations permit parts/component, components fault report/s, despatch and store records, and test results
 - relevant workplace policies and procedures
 - sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to maintaining and servicing traction lifts
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0053 Maintain operation of electrical marine equipment and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service electrical systems and equipment on maritime vessels and ships.

It includes working safely, planning to maintain marine electrical systems and equipment, applying logical fault diagnosis procedures, following fault rectification workplace procedures and maintaining the necessary operational documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to maintain operation of electrical marine equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified and understood
- 1.2** WHS/OHS risk control measures and workplace procedures in preparation for the work are followed
- 1.3** Scope of electrical work to be undertaken is determined from fault/breakdown reports and/or discussions with appropriate person/s
- 1.4** Advice is sought from work supervisor to ensure work is coordinated effectively with others
- 1.5** Sources of materials required for the work are determined in accordance with workplace procedures

- 2 Maintain operation of electrical marine equipment**
- 1.6** Tools, equipment and testing devices needed to locate fault/s are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Electrical circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Safety hazards resulting from fault/s or breakdown are documented on job safety assessments, risks assessed and control measures implemented in consultation with appropriate person/s and workplace procedures
 - 2.5** Fault-finding analysis is approached methodically using measured and calculated values of electrical circuit/apparatus parameters
 - 2.6** Electrical circuit/apparatus components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.7** Faulty circuits/components are rechecked and fault status identified
 - 2.8** Materials/replacement parts required to rectify faults are sourced and obtained in accordance with workplace procedures
 - 2.9** Effectiveness of repair/s is tested in accordance with workplace procedures
 - 2.10** Electrical apparatus and circuits are inspected reassembled, tested and prepared for return to service
 - 2.11** Unplanned situations are responded to safely and in accordance with workplace procedures with the approval of an authorised person/s
 - 2.12** Fault-finding and repair activities are carried out without damage to apparatus, circuits, the surrounding environment or services using sustainable energy

practices

- 3 Complete work and report on operation of electrical marine equipment**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Reusable faulty or worn components are tagged and despatched for repair in accordance with workplace procedures
- 3.3** Maintenance work activities are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Maintaining operation of electrical marine equipment must include rectifying at least four of the following faults in marine equipment:
- open circuit
 - short circuit
 - incorrect connections
 - insulation failure
 - unsafe condition
 - apparatus/component failure
 - related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG119A Maintain operation of electrical marine equipment and systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0053 Maintain operation of electrical marine equipment and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- completing and reporting on maintaining operation of electrical marine equipment
- completing workplace documentation correctly
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining scope of work from fault/breakdown reports and discussions with appropriate person/s
- finding faults efficiently in accordance with workplace procedures and manufacturer specifications
- implementing WHS/OHS workplace procedures and practices
- maintaining operation of electrical marine equipment
- planning to maintain operation of electrical marine equipment
- rectifying faults effectively in accordance with workplace procedures and manufacturer specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- alternators, including construction, characteristics and synchronised operation
- apparatus, including:
 - switchboards/distribution boards
 - protective devices such as circuit breakers and earth leakage devices
 - control equipment

- socket outlets
- electric vehicles
- motor starters
- associated control devices
- cells and batteries in common use, including:
 - battery configurations and applications
 - capacity
 - cell and battery safety practices
 - discharge and recharge characteristics
 - discharging
 - primary cells
 - recharging
 - secondary cells
 - terminal voltages
- circuits, including:
 - circuits supplying fix equipment
 - lighting
 - motors
 - socket outlets
 - trailing cable and within electric vehicles
- electrical system commissioning requirements and surveys
- marine electrical systems, including switchboards, instrumentation and earthing
- power supplies, including uninterruptible power supply (UPS) systems, batteries, maintenance and battery bank safety procedures
- purpose and types of lighting systems
- purpose, operating parameters and corrosion factors of cathodic protection
- safety equipment and codes and regulations
- switchboards and protection, including purpose, testing and maintenance and equipment removal
- sustainable energy principles and practices
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory

requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0054 Maintain operation of electrical mining equipment and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service electrical systems and equipment in underground and open-cut mines.

It includes working safely, planning to maintain mining electrical systems and equipment, applying logical fault diagnosis procedures, following fault rectification workplace procedures and maintaining the service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Plan to maintain electrical mining equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures in preparation for work are followed
- 1.3 Scope of electrical work to be undertaken is determined from fault/breakdown reports and/or discussions with appropriate person/s
- 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
- 1.5 Sources of materials required for work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices needed to locate faults are obtained in accordance with workplace

- procedures and checked for correct operation and safety
- 2 Maintain operation of electrical mining equipment**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Safety hazards resulting from fault/s or breakdown are documented on job safety assessments, risks assessed and control measures implemented in consultation with appropriate person/s and workplace procedures
 - 2.5** Fault-finding analysis is approached methodically using measured and calculated values of electrical circuit/apparatus parameters
 - 2.6** Electrical circuit/apparatus components are dismantled, as required, and parts stored to protect against loss or damage
 - 2.7** Faulty circuits/components are rechecked and fault status identified
 - 2.8** Materials/replacement parts required to rectify fault/s are sourced and obtained in accordance with workplace procedures
 - 2.9** Effectiveness of repair/s is tested in accordance with workplace procedures
 - 2.10** Electrical apparatus and circuits are inspected, reassembled, tested and prepared for return to service
 - 2.11** Unplanned situations are responded to safely and in accordance with workplace procedures with the approval of an authorised person/s
 - 2.12** Fault-finding and repair activities are carried out without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices

- 3 Complete work and report on operation of electrical mining equipment**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Reusable, faulty or worn components are tagged and despatched for repair in accordance with workplace procedures
- 3.3** Maintenance work activities are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

maintaining operation of electrical mining equipment must include rectifying at least four of the following faults in mining equipment and circuits:

- apparatus/component failure
- incorrect connections
- insulation failure
- open circuit
- related mechanical failure
- short circuit
- unsafe condition

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG118A Maintain operation of electrical mining equipment and systems.

Assessment Requirements for UEEEL0054 Maintain operation of electrical mining equipment and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying methodical fault-finding techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- completing and reporting maintaining operation of electrical mining equipment
- completing workplace documentation correctly
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining scope of work from fault/breakdown reports and discussion with appropriate person/s
- finding faults efficiently in accordance with workplace procedures and manufacturer specifications
- implementing WHS/OHS workplace procedures and practices
- maintaining operation of electrical mining equipment
- planning to maintain operation of electrical mining equipment
- rectifying faults effectively in accordance with workplace procedures and manufacturer specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical apparatus, including:
 - switchboards/distribution boards
 - protective devices such as circuit breakers
 - earth leakage devices
 - control equipment

- socket outlets
- electric vehicles
- motor starters and associated control devices
- electrical circuits, including:
 - supplying fix equipment
 - lighting
 - motors
 - socket outlets
 - trailing cable
 - within electric vehicles
- electrical control and protection in mines, including:
 - types of protection
 - operation of protection devices and systems
 - prospective fault currents
 - discrimination
- electrical mining systems, including:
 - earthing
 - mine reticulation
 - substations
 - switchgear
 - transmission lines
- environmental monitoring and control, including:
 - basic principles
 - control methods
 - types and application of sensors
- equipment monitoring methods
- fire detection, warning and control systems
- handling, storage and testing of mining cables
- operation and safety of mining equipment, including:
 - battery charging
 - battery-operated vehicles
 - conveyors
 - mine winder and package systems
 - ore extraction machinery
 - shuttle cars
 - ventilation fans
- relevant industry technical standards, regulations and codes for mining, including:
 - certified/approved electrical equipment
 - codes applicable to electrical safe working practices
 - installation arrangements

- installation of electrical equipment
- protection for safety
- regulations governing mining and related activities
- standards mandated under regulation or by an authority, deemed-to-comply standard and local service requirements
- testing and verification
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including:
 - component faults reports
 - inspection and test results
 - authorisations and permits
 - parts/component despatch and stores records
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0055 Overhaul and repair major switchgear and control gear

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to overhaul and repair switchgear and control gear rated in excess of 20 kiloamps (kA).

It includes planning and documenting the scope of service work required, arranging for the overhaul and repair to be carried out, verifying compliance of overhauled/repared switchgear/control gear and completing the necessary service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for overhaul/repair of switchgear/control gear

2 Overhaul switchgear/control gear

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures and workplace procedures in preparation for work are followed
- 1.3 Safety hazards that have not previously been identified are noted on job safety assessments, risks assessed and risk control measures implemented
- 1.4 Workplace instructions on the scope of overhaul and/or repair work are received and expected outcomes of work discussed with appropriate person/s
- 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.6 Switchgear/control gear service and repair documentation is read and applied
- 1.7 Sources of materials required for work are determined in accordance with workplace procedures
- 1.8 Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out repair work are followed

- 2.2 Need to inspect, test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Switchgear and control gear are dismantled, parts tagged and stored to prevent loss or damage
 - 2.5 Serviceability of switchgear/control gear components is determined by measurement tests and inspections and results recorded in accordance with workplace procedures
 - 2.6 Materials/replacement parts required to complete repair work are sourced and obtained in accordance with workplace procedures
 - 2.7 Repairs are inspected and tested in accordance with workplace procedures
 - 2.8 Overhaul/repair specifications and work instructions are documented in accordance with workplace procedures
- 3 Document overhaul/repair work**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Reusable, faulty or worn components are tagged and despatched for repair in accordance with workplace procedures
 - 3.3 Repair work is documented in accordance with workplace requirements, stating whether the switchgear/control gear complies with the overhaul specifications and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

overhauling and repair majoring switchgear and control gear must include at least two types of the following switchgear and control gear:

- low voltage (LV) switchgear and control gear rated above 20 kA
- any high voltage (HV) switchgear and control gear

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG129A Overhaul and repair major switchgear and controlgear.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0055 Overhaul and repair major switchgear and control gear

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- documenting overhaul/repair work
- overhauling and repairing major switchgear/control gear, including:
 - completing service documentation correctly
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - determining the state/serviceability of switchgear/control gear correctly
 - interpreting service and repair documentation correctly
 - repairing switchgear/control gear in accordance with relevant industry standards
- preparing for overhaul/repair of switchgear/control gear.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- types and applications of switchgear and control gear
- operating principles of switchgear and control gear
- interlocking systems, including:
 - external interlocking systems such as Castell key systems
 - internal interlocking systems for either safety or that operate in conjunction with Castell key systems
- control and protection of switchgear and control gear
- installation requirements, including:

- operating specifications for equipment
- areas requiring repairs and maintenance
- determining if repairs/maintenance are to be carried in situ or in workshop environment
- relevant legislation and standards applicable to the installation
- WHS/OHS issues with regard to removing/re-installing heavy equipment
- electrical safety issues with regard to removing/re-installing equipment
- understanding of CFC units
- electrical switchgear and control gear protection methods, including:
 - the operation of switchgear when it opens under load
 - the settings and operation required for both magnetic short circuit and thermal overload with equipment
 - determining the earth fault-loop impedance requirements required to keep touch voltage values within requirements
 - thermal imaging techniques
 - time/current curves from manufacturer specifications
 - equipment to safely test switchgear after repairs or maintenance
 - effectiveness of arc suppression installed within the equipment
 - modern types of switchgear that are computer controlled and programmed
 - modern types of switchgear that are interconnected to other protective devices
 - certification process for any repair or maintenance work performed
 - phase-failure systems
 - verifying the correct fault-level for the installation is consistent with the kiloamp (kA) rating of the equipment
 - x-ray and ultrasonic detection systems with regard to metallurgy
 - different types of lubricants required for different locations, temperatures and humidity
- electrical safe working practices of working safely on or around electrical equipment, including:
 - determining safe working standards and codes of practice for equipment and installations over 20 kA
 - WHS/OHS requirements for equipment and installations over 20 kA
 - working knowledge of operating within the vicinity of live conductors, such as barriers
 - procedures for working on switchgear over 20 kA
 - risks and control measures associated with harmful dusts and airborne contaminants, including thermal insulation, fibrous cement materials and asbestos, and other fibre-reinforced switchboard materials
 - checks and storage methods for maintaining the safety of testing devices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources used reflect current industry practices in relation to overhauling and repairing major switchgear and control gear
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0056 Place and connect electrical coils

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to insulate, place and connect electrical coils in small armature/stators, transformers and solenoid equipped devices.

It includes working safely, using tools, placing and connecting conductors, following technical instructions and workplace procedures, and completing work reports.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0074 Wind electrical coils

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to place and connect electrical coils

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures for work preparation are followed
- 1.3 Work instructions are identified, obtained and applied
- 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5 Materials required for the work are obtained in accordance with workplace routines and procedures
- 1.6 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety

2 Place and connect electrical coil

- 2.1 Existing WHS/OHS risk control work measures are followed
- 2.2 Machines/equipment are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Coils and insulation are selected in accordance with work instructions and workplace procedures
- 2.4 Insulation is cut and applied in accordance with work instructions and workplace procedures
- 2.5 Coils are placed in accordance with work instructions and workplace procedures
- 2.6 Coil ends are prepared and connections made in accordance with work instructions and workplace procedures
- 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

- 2.8** Routine quality checks are conducted to ensure electrical coils are correctly placed and connected in accordance with work instructions
- 2.9** Electrical coil work is completed within timeframe, environment and workplace conditions
- 3 Complete workplace report**
- 3.1** WHS/OHS work completion risk control measures are followed
- 3.2** Workplace report, forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

placing and connecting coils must be completed in an environment designed specifically for the purpose and include at least two of the following:

- armatures
- stators
- transformers
- solenoid equipped devices

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG151A Place and connect electrical coils.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0056 Place and connect electrical coils

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- placing and connecting electrical coils, including:
 - adhering to electrical coil quality workplace procedures
 - completing workplace report/forms accurately
 - connecting coils correctly
 - cutting insulation and placing insulation and coils without damage
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - following winding job specifications and instructions
 - preparing to place and connect coils
 - selecting correct coils and insulation
 - using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- winding wires, including:
 - dangers relating to handling
 - measuring wires using a gauge and micrometer
 - methods of application, including brush, spray, dip and trickle
 - types of varnish, including air drying, baking and epoxy
 - types of winding wires
 - winding wire varnishes, temperature ratings and removal methods

- applications of winding wires, including:
 - armature windings
 - induction coils
 - solenoid
 - stator windings
 - transformer windings
- methods of winding wire connection, including:
 - conductor preparation
 - fusing, including advantages, join preparation and fusing process
 - hard soldering - silver soldering, including advantages, types of silver soldering, wire and flux, operation and safe working procedures with the oxy acetylene welding torch, join preparation, silver soldering process and inspection
 - soft soldering, including types of solder, soldering irons and tips, fluxes (purpose, types and dangers), soldering process and inspection
- insulation methods
- techniques in insulating coils for electrical static and rotating machines, including:
 - methods of insulating coils
 - precautions
 - types of insulation used
- coil types, including:
 - distributed D or mush shape coil group (three phase)
 - distributed concentric coil group (single phase/three phase)
 - distributed diamond shape coil group wound as individual coils (three phase)
 - distributed round end (three phase)
 - universal motor field coils (single phase)
- techniques in placing coils for electrical static and rotating machines, including:
 - coil finishing
 - connection for correct polarity
 - electrical testing
 - insertion into slots
 - manufacture for universal field coils
 - record data
 - taping (where applicable)
- electrical inspecting and testing regulations, industry standards and workplace procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to placing and connecting electrical coils
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0057 Plan electrical installations with a low voltage demand up to 400 A per phase

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan electrical installation with a low voltage (LV) demand up to 400 ampere (A) per phase.

It includes planning, arranging and identifying resources for an electrical installation. It also includes arrangement of circuits; metering and control; cable route planning; specifying type and rating of switchgear, control gear, protection devices and wiring based on calculated and deemed-to-comply solutions and planning documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Plan electrical installation

2 Arrange installation circuits, control and metering

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) risk control measures and workplace procedures for carrying out work are followed
- 1.2 Nature of the electrical installation is determined from job specifications
- 1.3 Safety and regulatory requirements for electrical installation are identified, obtained and applied in accordance with relevant industry standards and safe work practices
- 1.4 Electricity tariffs required are discussed with appropriate person/s to determine control and metering needs of the installation
- 2.1 Circuits are arranged to ensure safe and functional operation of the installation in accordance with relevant industry standards
- 2.2 Circuits are arranged in accordance with relevant industry standards and job specifications
- 2.3 Control and metering of the installation are arranged in accordance with relevant industry standards and job

- specifications
- 2.4** Earthing is arranged in accordance with relevant industry standards and energy supplier requirements
- 3 Identify cables protection and switchgear**
- 3.1** Fault levels at relevant point/s of the installation are determined from calculations and/or information from the energy supplier
- 3.2** Wiring systems selected are confirmed as meeting sustainable energy practices and job specifications
- 3.3** Cable conductor sizes are confirmed to meet current-carrying capacity requirements and voltage-drop and fault-loop impedance limitations and short circuit performance
- 3.4** Protection methods and devices are identified to meet coordination requirements for overload and short circuit protection
- 3.5** Switchgear and control gear are identified to meet fault levels, current voltage and ingress protection (IP) ratings and functional requirements
- 3.6** Earthing system components are identified to meet requirements of the earthing system used
- 3.7** Evidence is obtained that electrical equipment selected is in accordance with WHS/OHS and safe work practices
- 4 Document electrical installation plan**
- 4.1** Equipment identified for the installation is documented with supporting calculations in accordance with workplace procedures
- 4.2** Electrical installation is documented in accordance with workplace procedures and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Planning electrical installations with a LV demand up to 400 A per phase must include at least the following:

- a main switchboard current transformer (CT) metering
- multiple tariffs or tenants
- distribution boards - single
- three phase final sub-circuits
- consumer mains
- main earthing system and main switchboard and sub-mains
- earthing system and distribution boards
- final sub-circuits and requirement particular to the installation type

Electrical installations must include at least the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG125A Plan electrical installations with a low voltage demand up to 400 A per phase.

Assessment Requirements for UEEEL0057 Plan electrical installations with a low voltage demand up to 400 A per phase

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- arranging electrical installations to comply with control, metering, safety and other regulatory and functional requirements
- specifying appropriate type and size of cables
- specifying protection methods and devices that meet coordination requirements for overload and short circuit protection
- specifying switchgear and control gear that meet fault level, current, voltage and ingress protection (IP) ratings and functional requirements
- selecting appropriate earthing system components
- documenting installation plan, specifications of equipment, equipment locations, cable routes and schedules and supporting calculations
- arranging electrical installations to comply with control, metering, safety and other regulatory and functional requirements
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- following workplace procedures
- identifying cable protection and switchgear, including:
 - identifying protection methods and devices
 - identifying switchgear and control gear
- planning electrical installations, including applying job specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- low voltage (LV) electrical installations with demand of up to 400 ampere (A) per phase, including:

- electrical metering arrangements encompassing:
 - purpose, types and applications
 - metering equipment
 - arrangements for metering
- ingress protection rating
- relevant industry standards, including cable protection and switchgear
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0058 Plan large electrical projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan large electrical projects.

It includes preparing and developing project plans for approval. It also includes establishing budgets and critical path analysis; developing workflow strategies; and documenting, presenting and negotiating budgets and timelines.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to plan project

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Project planning techniques are reviewed and adopted in accordance with workplace procedures

- | | | |
|---|------------|--|
| | 1.3 | Scope of the project is identified from design brief specification and/or relevant documentation and from discussions with relevant person/s |
| 2 Develop project plan proposal | 2.1 | Estimated plant, material, labour and related costs are sought from relevant person/s in accordance with workplace procedures |
| | 2.2 | Project budget is established from estimated plant, material, labour and related costs in accordance with workplace procedures |
| | 2.3 | Critical path analysis is applied to develop workflow strategies |
| | 2.4 | Sources and availability of materials and resources needed for the project are identified in accordance with workplace procedures |
| | 2.5 | Risk management strategies are sought and obtained for incorporating in the project plan |
| | 2.6 | Project plan is reviewed against all inputs and adjusted to rectify any anomalies |
| | 2.7 | Project plan proposal is documented in accordance with workplace procedures |
| 3 Obtain approval for project plan | 3.1 | Project plan is presented and discussed with relevant person/s |
| | 3.2 | Alterations to the project plan resulting from the presentation/discussion are negotiated with relevant person/s in accordance with workplace procedures |
| | 3.3 | Final project plan is documented and approval obtained from relevant person/s |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG170A Plan large electrical projects.

Links

Assessment Requirements for UEEEL0058 Plan large electrical projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- determining the project requirements accurately
- establishing a project budget
- developing effective workflow strategies
- documenting project plan proposal
- negotiating alterations to the proposed project plan successfully
- obtaining approval of the final plan
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- identifying project scope and requirements, including plant, material, labour and related costs.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical project planning and analysing progress, including:
 - project planning encompassing:
 - purpose of project planning
 - defining project parameters encompassing:
 - project scope
 - project stakeholders and clients
 - project phases and the relationship between phases
 - time requirements and limitations
 - resource requirements and limitations
 - quality requirements and limitations
 - time-management concepts and standard practices
 - financial management encompassing:

- financial management concepts
- standard practices for managing project finances
- project budgets
- costs
- variations and estimations
- invoicing against project phases/deliverables
- acquittals
- quality management concepts and practices
- human resource management concepts and practices within a project
- communication management concepts and practices within a project
- risk management and contingencies encompassing:
 - risk management concepts
 - internal risks
 - external risks
 - contingencies
 - standard practices for managing risk within a project
 - risk minimisation
 - risk removal
- procurement management concepts and practices
- physical resource management concepts and practices relating to equipment, technology, information and facilities
- contracts encompassing:
 - contract format
 - contract content
 - interpreting contract clauses
 - legal obligations of contract parties
 - working to contract specifications
 - documentation accompanying contracts, such as schedules
- performance assessment and continuous improvement
- engineering ethics principles
- customer/client relations encompassing:
 - importance of customer/client relations
 - interpersonal skills that enhance customer/client relationships
 - dispute resolution
 - customer/client relations strategies
- electrical industry sector customs and practices encompassing:
 - equipment procurement, cost-benefit analysis and performance testing
 - typical approaches to planning and management
 - successful planning techniques
 - best practice management methods and styles

- documents needed to plan a project
- factors influencing sequence and restraints of project activities
- critical path analysis covering graphical representation methods and methods of representing time/rates
- critical path and project analysis encompassing:
 - purpose of critical path analysis
 - essential data
 - relational sequence of work activities
 - graphical representation methods
 - methods of representing time/rates
 - monitoring methods
- relevant manufacturer specifications and operating instructions
- relevant plant, material, labour and related costs to project
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment and currently used in industry
- resources that reflect current industry practices in relation to planning electrical projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0059 Plan low voltage switchboard and control panel layouts

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan low voltage (LV) switchboard and control panel layout.

It includes preparing and planning the layout of electrical switchboards and control panel operating at voltages up to 1,000 volts (V) alternating current (a.c.) or 1,500 V direct current (d.c.) and fault levels not exceeding 20 kiloamps (kA) for approval.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to plan switchboard and control panel layout

2 Plan switchboard and control panel layout

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) risk control measures and workplace procedures for carrying out work activities are identified, obtained and applied
- 1.2 Scope of switchboard and control panel layouts is determined from job specifications and/or design brief
- 1.3 Switchboard and control panel layout safety and regulatory requirements are identified, obtained and applied in accordance with WHS/OHS requirements and relevant industry standards
- 1.4 Equipment to be incorporated in the switchboard and control panel is determined from job specifications and/or design brief
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work activities are documented
- 2.2 Equipment is selected in accordance with technical standards, job specifications and requirements
- 2.3 Switchboard and control panel layouts are planned to accommodate equipment with sufficient clearance to enable wiring/connecting and servicing from job

specifications

- 2.4 Switchboard and control panel layouts are planned in accordance with WHS/OHS and relevant industry standards
 - 2.5 Switchboard and control panel layout draft is checked with the design brief and in accordance with relevant industry standards
 - 2.6 Switchboard and control panel layout is documented for submission to appropriate person/s for acceptance and approval
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 3 Obtain approval for switchboard and control panel layout**
- 3.1 Requests for alterations to the layout are negotiated with appropriate person/s in accordance with workplace procedures
 - 3.2 Final layout design is documented and approval obtained from appropriate person/s
 - 3.3 Switchboard and control panel layout documentation is forwarded to appropriate person/s for production
 - 3.4 Quality of work is monitored in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Switchboard must be in more than one section and comprise essential and general supply controls, including:

- current transformer (CT) metering
- sub-main controls
- local distribution board
- load monitoring

Control panel must consist of controls for more than two electrical machines, electromechanical and/or electronic control devices, including:

- fault indication
- relays
- timers
- logic controllers
- indicators
- switches/push buttons

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG128A Plan low voltage switchboard and control panel layouts.

Assessment Requirements for UEEEL0059 Plan low voltage switchboard and control panel layouts

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative layouts
- selecting equipment that complies with safety and functional requirements and budget limitations
- developing the layout within the safety and functional requirements and budget limitations
- successfully negotiating layout alteration requests
- obtaining approval for final layout design
- documenting layout and equipment specifications clearly
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following quality procedures
- preparing and planning switchboard and control panel layouts.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- switchboard/control panel planning, including:
 - electrical metering arrangements encompassing:
 - purpose, types and applications
 - metering equipment
 - arrangements for metering
 - switchgear/control gear encompassing:
 - types and applications
 - operating principles
 - interlocking systems

- control and protection
- installation requirements
- control panel wiring encompassing:
 - equipment layout methods and accessories
 - connection identification methods
 - wiring techniques
- problem-solving techniques
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions for tools and equipment
- relevant tools, equipment, resources and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- relevant workplace quality procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0060 Prepare quotations for the supply of effective and efficient lighting products for lighting projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to prepare quotations for supply of effective and efficient lighting products.

It includes identifying job specifications, and developing and submitting quotations to the customer.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0063 Provide photometric data for illumination system design

UEEEL0070 Select light sources and luminaries for given locations and designs

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify job specifications for quotation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work area are identified, obtained and applied

1.2 WHS/OHS risk control measures and procedures are

followed

- 1.3** Scope of lighting products required is determined from job specifications and discussions with appropriate person/s
 - 1.4** Level of service quotation is determined from job specification, documented and agreement sought from appropriate person/s
 - 1.5** WHS/OHS policies and relevant industry standards are incorporated in work on which the quotation is based
 - 1.6** Timeline for the submission of the quotation is determined with the appropriate person/s
- 2 Develop quotation**
 - 2.1** Lighting products and related material take-off lists are prepared accurately and checked against job specification
 - 2.2** Lighting products are selected to meet job specification requirements
 - 2.3** Calculations are applied to selecting the type and quantity of lighting products included in the quotation
 - 2.4** Item costs are determined in accordance with workplace policy and procedures
 - 2.5** Quotations are checked for accuracy in costing and job specification
- 3 Document and submit quotation**
 - 3.1** Quotation is documented in accordance with workplace policies and procedures
 - 3.2** Quotation is submitted to customer by an agreed date

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package

Companion Volume Implementation Guide.

Preparing quotation for the supply of lighting products with a quotation value in excess of \$10,000 must include at least the following:

- three types of products:
 - luminaries type
 - high efficiency troffer fitting
 - high bay fittings
 - compact floodlamps
 - energy efficient halogen downlights
 - compact fluorescent downlights
 - diffused fluorescent fittings
- two types of installations:
 - large residential lighting design
 - store/shop lighting
 - shopping centre general lighting
 - security lighting
 - car park lighting

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG188A Prepare quotations for the supply of effective and efficient lighting products for lighting projects.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEEL0060 Prepare quotations for the supply of effective and efficient lighting products for lighting projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- determining the scope of lighting products required from job specifications and discussions with customer and/or other appropriate person(s)
- documenting the compliance requirements and level of service on which the quotation is to be given
- establishing timelines for submission of the quotation
- performing material take-offs accurately
- applying calculation to selecting appropriate type and quantity of lighting products
- determining item costs from enterprise costing policy and procedures
- checking quotation against item costs and job specifications
- documenting quotation accurately and submitting it on time
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, includes using risk control measures
- developing quotations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- lighting products — quotation preparation, including:
 - knowledge of lighting products
 - illumination principles
 - lighting applications
 - lighting product parameters
 - compliance requirements

- installation conditions
- interpreting manufacturer's technical data
- interpreting job specifications
- interpreting equipment schedules
- documenting quotations
- use of computer program for quoting purposes
- relevant item and service costing
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0061 Provide advice on the application of energy efficient lighting for ambient and aesthetic effect

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to advise customer on energy efficient lighting for ambient and aesthetic effects.

It includes identifying and providing lighting product advice on lighting principles, light source types, effects of colour and visual perception; interpreting manufacturer technical information and documenting advice.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0016 Provide advice on effective and energy efficient lighting products

UEEEL0022 Supply effective and efficient lighting products for domestic and small commercial applications

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify lighting products

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- are identified and applied
- 1.2 Appropriate questioning and active listening techniques are used to determine nature of lighting enquiry
 - 1.3 Lighting documentation/specifications that will assist in providing advice are reviewed
- 2 Provide advice on lighting products**
- 2.1 WHS/OHS risk control measures are followed in accordance with workplace procedures
 - 2.2 Product knowledge of lighting colour rendering index (CRI) and creation of effects is applied to providing the necessary advice
 - 2.3 Technical or costing inquiries are referred to appropriate person/s, as required
 - 2.4 Inquiries and responses are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Providing accurate and clear advice on lighting must include at least three of the following:
- home theatre
 - hotel and club dining rooms
 - domestic entertainment areas
 - semi-covered alfresco dining area
 - lobby and gathering area
 - special requirements for a reception centre

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG183A Provide advice on the application of energy efficient lighting for ambient and aesthetic effect.

Assessment Requirements for UEEEL0061 Provide advice on the application of energy efficient lighting for ambient and aesthetic effect

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying product knowledge of lighting effects, including determining the most appropriate advice
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- preparing and providing advice on the application of lighting for ambient and aesthetic effects, including:
 - referring technical and costing inquiries to appropriate person/s
 - responding to and documenting inquiries and responses
- using questioning techniques and active listening when dealing with customers.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- colour rendering index (CRI)
- control of lighting levels, including use of electrical or electronic and natural daylight
- customer communication skills and techniques
- diffused light
- effects of indirect and reflected light, including pelmet lighting
- effects of surface texture
- function of ambience
- lighting effects
- product knowledge of ambient and aesthetic lighting effects
- psychology of lighting, perception and mood, including colour, temperature and space and confinement
- relevant lighting workplace documentation

- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements, including risk control measures
- relevant workplace policies and procedures
- visual perception.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0062 Provide engineering solutions to problems in complex polyphase power circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide engineering solutions to problems in complex polyphase power circuits at balanced and unbalanced conditions.

It includes working safely, applying problem-solving techniques, using electrical measuring devices, and providing solutions from measurements and calculations and justification for solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0036 Provide engineering solutions for problems in complex multiple path circuits

UEEEL0020 Solve problems in low voltage a.c. circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop engineering solutions in complex polyphase

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

power circuit problems

- 1.2** WHS/OHS risk control work preparation measures and workplace procedures are followed
 - 1.3** Scope of complex polyphase power circuit problems is identified from documentation and/or work instructions
 - 1.4** Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
 - 1.5** Sources of materials required for work are identified in accordance with workplace procedures
 - 1.6** Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety
- 2 Provide engineering solutions to problems**
- 2.1** WHS/OHS risk control work measures and procedures are followed
 - 2.2** The need to test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Complex polyphase power circuit problems are solved from interpreting measurements and calculated values in accordance with workplace procedures
 - 2.5** Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.6** Problems are solved without damage to apparatus, circuits, the environment and/or services using sustainable energy practices
- 3 Complete work and document solutions**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Justification for solutions used to solve complex polyphase power circuit problems is documented
 - 3.4** Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG149A Provide engineering solutions to problems in complex polyphase power circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0062 Provide engineering solutions to problems in complex polyphase power circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- determining the operating parameters of existing circuit
- using established problem-solving methods
- taking relevant measurements accurately
- interpreting measured values appropriately
- providing effective solutions to circuit problems from measurements and calculations
- giving written justification of solutions provided
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- checking and isolating circuits
- documenting completed work and notifying relevant person/s
- identifying sources of materials required for work
- identifying the scope of the complex polyphase power circuit problems
- preparing for problems in complex polyphase power circuits
- testing and measuring live work
- using tools, equipment and testing equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- polyphase power circuit analysis, including:
 - polyphase supply system encompassing:
 - advantage of three phase system compared to single phase systems
 - double subscript notation
 - phase sequence
 - 120 degree operator
 - given circuit component parameters, solve practically-based problems using:

- equivalent circuits of transformers, lines and loads
- component values using rectangular and polar notation
- current divider and potential divider rules using complex impedances
- the "per unit" values of voltage, current and impedance to a common VA base
- types of three phase system connections encompassing:
 - supply to balanced star, three and four wire loads
 - supply to delta connected loads
 - effects of phase reversal
 - representation of currents and voltages as complex phasors for three phase, and three phase and neutral quantities
 - calculation of the values of, and drawing labelled phasor diagrams, not to scale, to represent complex values of current and voltage for balanced and unbalanced loads for star and delta systems
 - calculation of values of P, Q and S for balanced and unbalanced systems
 - draw and label single phase diagrams to represent one phase of a complex three phase system
 - represent unbalanced voltages or currents as symmetrical components
 - phase-to-phase currents
 - phase-to-neutral/earth currents
- balanced three phase loads encompassing:
 - calculations of balanced loads connected in star
 - calculations of balanced loads connected in delta
 - calculation of steady state values of fault current for various configurations
 - evaluation of the symmetrical component impedances for the various distribution system components, transformers (earthed neutral case) and generators (high impedance earth)
 - calculation of fault currents using the per unit approach
 - calculation using the "worst case" values based on transformer impedance only (i.e. a short circuit fault)
 - estimation of peak values using accepted multipliers
 - effects of the direct current (d.c.) component on the instantaneous magnitudes of fault currents in transformers and generators
- unbalanced three phase loads encompassing:
 - star – four wire systems
 - delta systems
 - star – three wire systems
 - star - four wire with neutral impedance
- power in three phase circuits encompassing:
 - summation of phase powers and power in balanced loads
 - measurement of power in balanced loads – two Wattmeter methods
- reactive three phase power encompassing:

- power triangle calculation
- measurement of VAR
- power factor correction
- fault currents encompassing:
 - symmetrical components
 - positive, negative and zero sequence impedance
 - fault current breaking and let-through energy capacities of circuit breakers and fuses
 - importance of fault/arc impedance
 - calculation of fault currents - phase-to-earth faults
 - calculation of fault currents - phase-to-phase faults
 - analysis of asymmetrical fault currents
- harmonics in three phase systems encompassing:
 - presence of triple in harmonics in three phase systems
 - effects of three phase harmonics for different star and delta connections
 - methods for reducing harmonics in three phase systems
- problem-solving techniques
- relevant checks and isolation of circuits
- relevant manufacturer specifications and operating instructions
- relevant materials, tools, equipment and testing devices
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to providing engineering solutions for solving problems in complex polyphase power circuits

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0063 Provide photometric data for illumination system design

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide photometric data for illumination system design.

It includes preparing and providing photometric data, and documenting justification of the data.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to provide photometric data

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Illumination parameters of the design are obtained from a design brief, job specification and/or consultations

- with the client
- 1.3 Illumination parameters for particular situations and tasks are obtained and applied in accordance with relevant industry standards
 - 1.4 Lighting manufacturer specification for products are obtained and reviewed
- 2 Provide photometric data**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Photometric data is calculated for applications and variety of appropriate lighting products
 - 2.3 Data illumination is in accordance with relevant industry standards
 - 2.4 Data is documented in accordance with workplace procedures
 - 2.5 Photometric data documentation is forwarded to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Providing photometric data must include at least the following:

- determination of lighting levels for specific situations
- interpretation of manufacturer photometric data
- determination of lighting level transitions where safety is a consideration
- calculations using the inverse square law
- measurement of lighting levels using a light (lux) meter

- presentation of a simple photometric report
- present a report (lighting levels) on an existing installation

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG184A Provide photometric data for illumination system design.

Assessment Requirements for UEEEL0063 Provide photometric data for illumination system design

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least three occasions and include:

- obtaining illumination parameters from a design brief, job specification or by consultation with the client
- understanding compliance and recommended illumination parameters for particular situations and tasks
- understanding manufacturers' technical information
- documenting photometric data, including justification for conclusions
- dealing with unplanned events
- applying industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures
- providing photometric data, including:
 - applying manufacturer specifications
 - calculating photometric data.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- photometric principles, vision and colour, including:
 - nature of light encompassing:
 - dual nature of light electromagnetic spectrum
 - frequency and wavelength (nm)
 - photometric principles and definitions encompassing:
 - scope and definitions from AS/NZS 1680.1 Interior and workplace lighting - General principles and recommendations, and AS ISO 1000 – 1998 The international system of units (SI) and its application

- luminous flux, definition and unit of measurement
- luminous intensity, definition and International System of Units (SI) unit of measurement
- radians and steradians
- illuminance and luminance
- basic optics, reflection and refraction
- reflectance and transmittance
- diffuse surfaces
- the point source and the inverse square law
- cosine law
- relationship between watts and lumens
- older imperial measurements (such as the footcandle or lumen per square foot and candlepower)
- physiology of the eye and light detection encompassing:
 - scotopic, mesopic and photopic vision
 - contrast sensitivity
 - colour vision – rods and cones
 - light levels and recognition of colour
 - adaptation
 - accommodation and visual acuity
 - brightness and lightness
 - image detection
 - glare and comfort
 - cognition and visual perception
- colour encompassing:
 - Munsell and CIE colour system
 - chromaticity coordinates
 - black body radiation and colour temperature
 - uniform chromaticity scale diagrams
 - factors determining colour appearance
- photometry encompassing:
 - the integrating sphere
 - distribution photometry
 - selected requirements of AS/NZS 1680.3 Interior and workplace lighting - Measurement, calculation and presentation of photometric data
 - the goniophotometer
 - measurement of luminous flux
 - measurement of luminance and cut-off angle
 - measurement of illuminance (single luminaire)
 - graphical representation of photometric data

- test reports and data presentation
- lux meters and measuring equipment
- required light levels for various situations in accordance with Australian/New Zealand Standards
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0064 Rewind HV three phase induction machines rated for voltages above 3.3 kV

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to rewind high voltage (HV) three phase induction machines rated for voltages above 3.3 kilovolt (kV).

It includes preparing and rewinding three phase induction machines rated voltage above 3.3 kV, applying technical and quality industry standards and keeping winding records.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0068 Rewind three phase low voltage induction machines

UEEEL0065 Rewind HV three phase induction machines rated for voltages to 3.3 kV

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to rewind three phase induction machines

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures for work preparation are followed
- 1.3** Scope of work is determined in accordance with workplace procedures for work specifications and relevant industry standards
- 1.4** Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 1.5** Induction machine is dismantled, parts tagged and stored to prevent loss or damage
- 1.6** Winding data is obtained from records or from measurements of stator and recorded in accordance with workplace procedures
- 1.7** Winding is stripped from stator in accordance with workplace procedures
- 1.8** Materials required for the work are obtained in accordance with workplace procedures
- 1.9** Tools, equipment and testing devices required for work are obtained and checked for operation and safety

2 Rewind three phase induction machines

- 2.1** WHS/OHS risk control work measures and workplace procedures are followed
- 2.2** Machines/equipment are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Stator is wound and insulated to 3.3 kV standards in

- accordance with workplace procedures and relevant industry standards
- 2.4** Machine is assembled and prepared for final testing in accordance with workplace procedures
- 2.5** Problem-solving techniques are used to resolve unplanned events
- 2.6** Quality checks are conducted to ensure coils are correctly wound with correct wire, number of turns and shape in accordance with workplace procedures and work instructions
- 2.7** Work is completed in accordance with timeframe, environment and workplace procedures
- 3 Complete work report**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Work report and forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Dismantling and winding stators must include at least two of the following:

- three phase induction machines rated for HV above 3.3 kV

Hazard and risk control measures must include at least the following:

- high voltage (HV) hazards
- isolating machine/equipment for HV

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG156A Rewind HV three phase induction machines rated for voltages above 3.3 kV.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0064 Rewind HV three phase induction machines rated for voltages above 3.3 kV

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- dismantling machine and storing parts securely
- preparing stator for winding
- following winding specifications
- selecting correct coils and insulation
- winding and connecting stator correctly
- assembling machine and preparing for testing
- adhering to quality procedures
- completing work report/forms accurately
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following quality procedures, workplace procedures and instructions
- rewinding three phase induction machines, including taking readings
- using tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- high voltage (HV) three phase motor winding techniques rated above 3.3 kilovolt (kV), including:
 - HV winding conductors and their applications
 - HV winding wire connection methods encompassing:
 - conductor handling
 - conductor preparation
 - connection mediums

- insulation types and methods
- critical details and measurements when stripping a stator encompassing:
 - winding types:
 - hairpin wound stator and lap wound stator
 - winding diagram
 - wedges of a radially ventilated machine
 - factors to be considered when selecting cables for a stator
- procedures for checking the condition of a stripped stator in preparation for rewind encompassing:
 - manufacturer specifications
 - sequence of events between the removal of the old winding and the start of rewinding
 - core loss test, the effect this test may have on the core and expected test results
 - methods of overcoming hot spots in a stator core
 - level of insulation required to insulate the steel bracing rings that support the overhang
 - difference between the slot liners and packers of a 6.6 kV machine
- procedures for the fitting of coils to core, wedging and bracing encompassing:
 - significance of the slot portion of coils for machines above 3.3 kV
 - method of inserting the coils of a ribbon winding into slots
 - effects of undue mechanical stress on B stage insulated coils
 - importance of coil pitch and why it is important
 - sequence of events in fitting the first pole pitch group of coils in a lap winding
 - sequence of events in fitting the coils of a concentric winding
 - purpose and location of the excess packing in a slot
 - difference between the wedges for a lap and hairpin winding
 - method of fitting a wedge
 - difference that may be encountered between the wedges for a radial ventilated and the wedges for an axially ventilated machine
 - methods used to brace and strengthen the overhang of a lap winding and a hairpin winding
- procedures for making inter turn and inter coil connections on a hairpin winding and inter coil connections on a lap and bar winding encompassing:
 - sequence of events in making turn to turn connections, and insulating the turns of a lap winding:
 - connection methods, including silver solder or brazing and soft solder
 - sequence of events, from hand forming the coil to final insulation, in making the turn to turn connections in a hairpin winding, using a welded joint
 - sequence of events in making the coil to coil connections in a bar winding
- testing according to Australian, British and International Electrotechnical Commission (IEC) standards:
 - 6.6 kV B stage insulated winding and VPI winding test
- materials, procedures, tests and precautions required during and after the impregnation of

- completed windings according to Australian, British and IEC standards:
- precautions to be taken when handling and using varnishes and resins
 - important features of an oven used to cure large impregnated machines
 - application and features of various impregnating materials:
 - water-based varnish, Xylol-based varnish and 100% solids resin
 - method of carrying out a gel test on a resin and a viscosity test on a varnish
 - typical quality procedures carried out on an impregnating varnish
 - procedure and precautions for carrying out a hot dip impregnation, a flood coat impregnation and a VPI impregnation
 - tests to be carried out after impregnation and bake on a 6.6 kV B stage insulated winding and a VPI winding
 - winding to terminal connections according to Australian, British and IEC standards:
 - criteria for selection of winding to terminal cables:
 - voltage rating, full load current and fault capacity
 - common types of terminal boxes and their structure:
 - phase segregated, phase separated and phase insulated
 - method of making the joint between winding and terminal cables and insulating such a joint
 - procedures and precautions to be followed when performing static electrical testing of a completed rewind according to Australian, British and IEC standards encompassing:
 - types and purpose of tests
 - testing safety precautions
 - testing procedures:
 - repetitive surge test, loss tangent test, polarisation index (PI) test, cold resistance test and polarity test
 - interpretation of test results
 - calculation of winding cold resistance and line and phase resistance
 - relevant induction machines relevant industry standards
 - relevant quality workplace procedures
 - relevant job safety assessments or risk mitigation processes
 - relevant tools, equipment and materials
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation
 - relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0065 Rewind HV three phase induction machines rated for voltages to 3.3 kV

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to rewind high voltage (HV) three phase induction machines rated for voltages to 3.3 kilovolt (kV).

It includes planning and rewinding three phase induction machines rated voltage to 3.3 kV.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0068 Rewind three phase low voltage induction machines

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0046 Solve problems in single path circuits

UEECD0044 Solve problems in multiple path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Plan to rewind three phase induction machines

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures for work preparation are followed
- 1.3** Scope of work is determined in accordance with workplace procedures, job specifications and relevant industry standards
- 1.4** Advice is sought from work supervisor to ensure work activity is coordinated effectively with others
- 1.5** Induction machine is dismantled, parts tagged and stored to prevent loss or damage
- 1.6** Winding data is obtained from records or measurements of stator and recorded in accordance with workplace procedures
- 1.7** Winding is stripped from stator in accordance with workplace procedures
- 1.8** Materials required for the work are obtained in accordance with workplace procedures
- 1.9** Tools, equipment and testing devices required for work are obtained and checked for operation and safety

2 Rewind induction machines

- 2.1** WHS/OHS risk control measures and workplace procedures are followed
- 2.2** Machines/equipment are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Induction machine is dismantled, parts tagged and stored to prevent loss or damage
- 2.4** Winding is stripped from stator in accordance with workplace procedures
- 2.5** Stator is wound and insulated to 3.3 kV standards in

- accordance with workplace procedures and relevant industry standards
- 2.6** Machine is assembled and prepared for final testing in accordance with workplace procedures
- 2.7** Methods for dealing with unplanned events are in accordance with workplace procedures
- 2.8** Quality checks are conducted to ensure coils are correctly wound with correct wire number of turns and shape in accordance with workplace procedures and work instructions
- 2.9** Work is completed in accordance with timeframes, environment and workplace procedures
- 3 Complete work report**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Work report and forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Dismantling and winding stators must include at least two of the following:

- three phase induction machines for HV to 3.3 kV

Hazard and risk control measure must include at least the following:

- HV hazards
- isolating machine/equipment for HV

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG155A Rewind HV three phase induction machines rated for voltages to 3.3 kV.

Assessment Requirements for UEEEL0065 Rewind HV three phase induction machines rated for voltages to 3.3 kV

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- dismantling machine and storing parts securely
- preparing stator for winding
- following winding specifications
- selecting correct coils and insulation
- winding and connecting stator correctly
- assembling machine and preparing for testing
- adhering to quality procedures
- completing work report/forms accurately
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following quality procedures, workplace procedures and instructions
- rewinding three phase induction machines.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- high voltage (HV) three phase motor winding techniques rated to 3.3 kilovolt (kV), including:
 - HV winding conductors and their applications
 - HV winding wire connection methods encompassing:
 - conductor handling
 - conductor preparation
 - connection mediums
 - insulation types and methods

- critical details and measurements when stripping a stator encompassing:
 - winding types:
 - hairpin wound stator and lap wound stator
 - winding diagram
 - wedges of a radially ventilated machine
 - factors to be considered when selecting cables for a stator
- procedures for checking the condition of a stripped stator in preparation for rewind encompassing:
 - manufacturer specifications
 - sequence of events between the removal of the old winding and the start of rewinding
 - core loss test, the effect this test may have on the core and expected test results
 - methods of overcoming hot spots in a stator core
 - level of insulation required to insulate the steel bracing rings that support the overhang
 - difference between the slot liners and packers of a 3.3 kV machine
- procedures for the fitting of coils to core, wedging and bracing encompassing:
 - significance of the slot portion of coils for machines
 - method of inserting the coils of a ribbon winding into slots
 - effects of undue mechanical stress on B stage insulated coils
 - importance of coil pitch
 - sequence of events in fitting the first pole pitch group of coils in a lap winding
 - sequence of events in fitting the coils of a concentric winding
 - purpose and location of the excess packing in a slot
 - difference between the wedges for a lap and hairpin winding
 - method of fitting a wedge
 - difference that may be encountered between the wedges for a radial ventilated and the wedges for an axially ventilated machine
 - methods used to brace and strengthen the overhang of a lap winding and a hairpin winding
- procedures for making inter-turn and inter-coil connections on a hairpin winding and inter-coil connections on a lap and bar winding encompassing:
 - sequence of events in making turn to turn connections, and insulating the turns of a lap winding:
 - connection methods, including silver solder or brazing and soft solder
 - sequence of events, from hand forming the coil to final insulation, in making the turn to turn connections in a hairpin winding using a welded joint
 - sequence of events in making the coil to coil connections in a bar winding
- testing according to Australian, British and International Electrotechnical Commission (IEC) standards:
 - 3.3 kV B stage insulated winding test and VPI winding test
- materials, procedures, tests and precautions required during and after the impregnation of completed windings according to Australian, British and IEC standards:

- precautions to be taken when handling and using varnishes and resins
- important features of an oven used to cure large impregnated machines
- application and features of various impregnating materials:
 - water-based varnish, Xylol-based varnish and 100% solids resin
- method of carrying out a gel test on a resin and a viscosity test on a varnish
- typical quality procedures carried out on an impregnating varnish
- procedure and precautions for carrying out a hot dip impregnation, a flood coat impregnation and a VPI impregnation
- tests to be carried out after impregnation and bake on a 3.3 kV B stage insulated winding and a VPI winding
- winding to terminal connections according to British and IEC standards:
 - criteria for selection of winding to terminal cables:
 - voltage rating, full load current and fault capacity
 - common types of terminal boxes and their structure:
 - phase segregated, phase separated and phase insulated
 - method of making the joint between winding and terminal cables and insulating such a joint
- procedures and precautions to be followed when performing static electrical testing of a completed rewind according to Australian, British and IEC standards encompassing:
 - types and purpose of tests
 - testing safety precautions
 - testing procedures:
 - repetitive surge test, loss tangent test, polarisation index (PI) test, cold resistance test and polarity test
 - interpretation of test results
 - calculation of winding cold resistance and line and phase resistance
- problem-solving techniques
- relevant industry standards
- relevant quality workplace procedures
- relevant safe work method statements (SWMS) /job safety assessments or risk mitigation processes
- relevant tools, equipment and materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and instructions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0066 Rewind LV direct current machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to prepare, place and connect coils and insulating in direct current (d.c.) motor armatures and poles.

It includes preparing to and rewinding d.c. machines by working safely, using tools, measuring and stator windings. It also includes applying technical and quality industry standards and completing workplace reports and winding records.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0046 Solve problems in single path circuits

UEECD0044 Solve problems in multiple path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to rewind d.c. machine

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures for work preparation are followed
- 1.3 Scope of work is determined from job specifications and regulatory requirements
- 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5 Winding data is obtained from winding data records or directly from measurements of stator and recorded in accordance with workplace procedures
- 1.6 Materials required for the work are obtained in accordance with workplace procedures and job specification
- 1.7 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety

2 Rewind d.c. machine

- 2.1 Existing WHS/OHS risk control work measures are followed
- 2.2 Machines/equipment are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Induction machine is dismantled and parts tagged and stored to prevent loss or damage in accordance with workplace procedures and instructions
- 2.4 Winding is stripped from stator in accordance with

workplace procedures

- 2.5 Armature and fields are wound and insulated in accordance with winding data, job specifications and workplace procedures
 - 2.6 Machine is assembled and prepared for inspection and testing in accordance with workplace procedures
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8 Routine quality checks are conducted to ensure coils are correctly wound, with correct wire, number of turns and shape in accordance with workplace procedures and job specifications
 - 2.9 Electrical coil work is completed in timeframe, environment and workplace conditions
- 3 Complete workplace reports**
- 3.1 WHS/OHS work completion risk control measures are followed
 - 3.2 Workplace report, forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Dismantling and winding armatures and field coils must include the following:

- three different d.c. machines in an environment designed specifically for the purpose

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG154A Rewind LV direct current machines.

Assessment Requirements for UEEEL0066 Rewind LV direct current machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing workplace reports and documentation
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- inspecting and testing of completed machine work
- planning to rewind low voltage (LV) direct current (d.c.) machines
- rewinding d.c. machines rated for LV, including:
 - adhering to quality workplace procedures
 - assembling machine and preparing for testing
 - completing workplace reports/forms accurately
 - dismantling machine and storing parts securely
 - following winding specifications
 - preparing stator for winding
 - selecting correct coils and insulation
 - winding and connecting armature and fields correctly
 - checking dimensions
- using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commutation and interpoles, including:
 - conditions for sparkless commutation and methods used to reduce sparking

- interpoles or commutating poles
- principles of commutation and advantages of interpoles
- resistance and electromagnetic field commutation
- current industry practices and technologies
- d.c. motor winding techniques
- calculations and insulation specifications, including:
 - calculation of a half coil length and the amount of copper required
 - commutators and identification of insulation specifications
 - preparation of coils and equalisers
 - preparation of copper prior to insulating coils and equalisers on armatures
- commutation and interpoles
- critical details and measurements when stripping a stator of a d.c. machine, including:
 - lap winding with equalisers
 - types of windings
 - wave winding
 - winding layout
- d.c. armature windings, including:
 - lap and wave windings, progressive and retrogressive windings
 - terms
- preparation for rewinding, including:
 - checking the condition of a stripped core
 - core loss test
 - hot spots in armature core
 - testing commutator before use
 - removing of old winding
- principles and construction, including:
 - construction of d.c. machine
 - d.c. machine types
 - types of armature windings, including parallel circuits
 - value of generated electromagnetic field
- procedures and precautions required when inspecting, testing and/or re-using a commutator, including:
 - coil position and commutator segment relationship
 - commutator wear ring
 - removal of armature leads on tungsten inert gas (TIG) welded commutator
 - TIG welded and soft soldered commutators
- selection of appropriate insulation, including:
 - B stage and VPI insulation
 - dielectric strength, temperature rating,
 - insulation properties, method of application and specific uses

- insulations used on the slot portion and overhang
- manufacturer recommendations
- reason for selecting a particular insulation
- simplex armature lap windings and wave windings, including:
 - characteristics and applications
 - commutator pitch
 - number and position of brushes
- electrical power systems LV
- identification of insulation specifications
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- simplex lap windings, including equalising connections for armature windings
- simplex wave windings, including dummy coils, comparison of lap and wave windings, and armature winding calculations
- sustainable energy principles and practices
- testing techniques, including continuity, insulation testing, use of 'growler' and magnetic field testing.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to rewinding LV d.c. machines
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0067 Rewind single phase machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to dismantle and wind stators for single phase machines.

It includes planning to and rewinding single phase machines by working safely, using tools, measuring and winding data. It also includes following technical instructions/specifications, workplace procedures and recording workplace activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to rewind single phase machines

2 Rewind single phase machines

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2 Existing WHS/OHS risk control measures for work preparation are followed
- 1.3 Work instructions are identified, obtained and applied
- 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.5 Winding data is obtained from records or work supervisor in accordance with workplace procedures
- 1.6 Materials required for work are obtained in accordance with technical specifications and workplace procedures
- 1.7 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety
- 2.1 Existing WHS/OHS risk control work measures are followed
- 2.2 Machines/equipment are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Single phase machine is dismantled and parts tagged and stored to prevent loss or damage in accordance with workplace procedures and instructions

- 2.4 Winding is stripped from stator in accordance with workplace procedure and instructions
 - 2.5 Stator is wound and insulated in accordance with winding data and workplace procedures
 - 2.6 Machine is assembled and prepared for inspection and testing in accordance with workplace procedures
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.8 Routine quality checks are conducted to ensure electrical coils are correctly wound with correct wire, number of turns and shape in accordance with work instructions and technical specifications
 - 2.9 Rewind stators work is completed within timeframe, environment and workplace conditions
- 3 Complete workplace report**
- 3.1 WHS/OHS workplace completion risk control measures are followed
 - 3.2 Workplace report, forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Rewinding single phase machines must include the following:

- dismantling and winding stators for single phase machines in an environment designed specifically for the purpose

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG152A Rewind single phase machines.

Assessment Requirements for UEEEL0067 Rewind single phase machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing work reports
- planning to dismantle and wind stators for single phase machines
- rewinding single phase induction machines, including:
 - adhering to quality workplace procedures
 - assembling machine and preparing for inspection and testing
 - completing workplace report/forms accurately
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - dismantling machine and storing parts securely
 - following winding specifications and/or instructions
 - preparing stator for winding
 - selecting correct coils and insulation
 - winding and connecting stator correctly
- using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures
- safe working practices and rewinding single phase machines
- sustainable energy principles and practices
- techniques of winding single phase machines, including:
 - electrical machine insulation types and applications
 - coil placement techniques
 - coil connection arrangements and terminations
 - winding insulation methods.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

UEEEL0068 Rewind three phase low voltage induction machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to prepare, place and connect coils and insulation in three phase stators and rotors in low voltage (LV) induction machine.

It includes preparing to and rewinding three phase induction machines by working safely, using tools, measuring and stator windings. It also includes applying technical and quality industry standards and completing workplace reports and winding records.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0074 Wind electrical coils

UEEEL0056 Place and connect electrical coils

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

Assessment Requirements for UEEEL0068 Rewind three phase low voltage induction machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing workplace reports and forms
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- inspecting and testing completed induction machine work
- planning to rewind three phase induction machines
- rewinding three phase induction machines rated for low voltage (LV), including:
 - adhering to quality workplace procedures
 - assembling machine and preparing for inspection and testing
 - completing workplace report/forms accurately
 - dismantling machine and storing parts securely
 - following winding specifications and/or instructions
 - preparing stator for winding
 - selecting correct coils and insulation
 - winding and connecting stator correctly
- using tools safely in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- three phase windings, including:
 - chain, lap and wave windings
 - concentrated and distributed windings

- half-coil and whole-coil windings
- half-coil winding for a three phase alternator
- pole-pitch and coil-span
- three phase stator winding
- whole-coil stator winding for a three phase alternator
- rating and cooling of alternators and the voltage regulator
- techniques of winding three phase motors, including:
 - coil connection arrangements and terminations
 - coil placement techniques
 - electrical machine insulation types and applications
 - winding insulation methods
- testing techniques, including continuity, insulation testing, use of 'growler' and magnetic field testing
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to rewinding three phase induction machines rated for LV
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0069 Select and arrange equipment for special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select and arrange electrical equipment into distribution circuits for installations associated with construction and demolition sites, transportable structures and vehicles, including their site supplies, marinas, electromedical treatment areas (patient areas), and shows and carnivals operating up to 1,000 volt (V) alternating current (a.c.) or 1,500 V direct current (d.c.).

It includes arranging the installation for correct functioning and safe connection to supply by the selection of switchgear, control gear, protection devices and wiring based on calculated and deemed-to-comply solutions. It also includes completing electrical installation documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V a.c or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to select equipment

1.1 Scope and nature of the electrical installation is determined from job specifications

1.2 Safety and relevant regulatory electrical installation requirements are identified and applied

2 Arrange installation into circuits

2.1 Circuits are arranged to ensure safe and functional operation of the installation

2.2 Circuits are arranged to comply with applicable technical industry standards and job specification requirements

2.3 Earthing is arranged to comply with the multiple earthed

- neutral (MEN) system requirements
- 3 Select cables, protection and switchgear**
- 3.1** Wiring is selected for suitability for the environments in which they are installed
- 3.2** Cable conductor sizes are selected to meet current-carrying capacity requirements and voltage-drop and fault-loop impedance limitations
- 3.3** Protection methods and devices are selected to meet coordination requirements for overload and short circuit protection
- 3.4** Switchgear and control gear are selected to meet current, voltage and ingress protection (IP) ratings and functional requirements
- 3.5** Earthing system components are selected to meet requirements of the MEN system
- 3.6** Evidence is obtained that electrical equipment selected complies with safety requirements
- 4 Document electrical installation**
- 4.1** Electrical installation equipment selections and calculations are documented in accordance with workplace procedures
- 4.2** Electrical installation arrangement and specifications for items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting and arranging low voltage (LV) electrical equipment must include at least two of the following types of special installations:

- caravan parks
- construction and demolition sites
- marinas
- medical treatment areas

Special LV electrical installations must include the following:

- moveable premises
- shows and carnivals
- consumer mains
- main earthing system and main switchboard
- sub-mains
- earthing system and distribution boards
- final sub-circuits and requirements particular to the installation type

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG120A Select and arrange equipment for special LV electrical installations.

Assessment Requirements for UEEEL0069 Select and arrange equipment for special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing workplace documentation
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- selecting and arranging equipment for special electrical installations, including:
 - arranging special electrical installations to comply with safety, other regulatory and functional requirements, technical industry standards and job specifications
 - documenting installation arrangements, specifications for items selected and reasons for the selections made
 - selecting appropriate earthing components that meet multiple earthed neutral (MEN) system requirements in special installations
 - selecting appropriate type and size of cables that are suitable for the environment requirements and meet current-carrying capacity, voltage-drop and fault-loop impedance requirements
 - selecting protection methods and devices that meet coordination requirements for overload and short circuit protection
 - selecting switchgear and control gear that meet current, voltage and ingress protection (IP) ratings and functional requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant manufacturer specifications
- relevant workplace documentation

- relevant workplace policies and procedures
- technical industry standards, regulations and codes for special electrical installations, including:
 - scope of relevant industry standards for special installations, including additional industry standard wiring rules requirements
 - transportable structures and vehicles, including their site supplies
 - construction and demolition sites
 - marinas
 - electromedical treatment areas (patient areas)
 - shows and carnivals
- awareness of high voltage (HV) consumer installations standards.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0070 Select effective and efficient light sources and luminaries for given locations and designs

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select effective and efficient light sources and luminaries for given locations and designs.

It includes preparing and selecting light sources and luminaries, and documenting justification for the selections.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0063 Provide photometric data for illumination system design

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to select light sources and luminaries

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work location are identified and applied
- 1.2** Lighting design parameters are obtained from a design brief, job specification and/or consultations with the

- client
- 1.3 Illumination parameters for particular situation and task are obtained and applied in accordance with relevant industry standards
 - 1.4 Lighting manufacturer specifications for products are obtained and reviewed
- 2 Select light sources and luminaries**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Light sources and luminaries are selected appropriate to lighting design parameters
 - 2.3 Selected light sources and luminaries are within the illumination in accordance with relevant industry standards and the job specification
 - 2.4 Selected light sources and luminaries are documented accordance with workplace procedures
 - 2.5 Documentation is forwarded to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting light sources and luminaries must be demonstrated in at least three of the following:

- an application using incandescent lamps for colour rendition
- outside security lighting
- high bay application
- highway lighting
- store/shop lighting
- school or training classroom
- localised task lighting
- flood-lighting application

- situation integrating some natural daylight

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG185A Select effective and efficient light sources and luminaries for given locations and designs.

Assessment Requirements for UEEEL0070 Select effective and efficient light sources and luminaries for given locations and designs

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- obtaining illumination parameters from a design brief, job specification or by consultation with the client
- understanding compliance and recommended illumination parameters for particular situations and tasks
- understanding manufacturers' technical information
- selecting appropriate light sources and luminaries
- documenting selected light sources and luminaries, including justification for the selections made
- dealing with unplanned events
- applying industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- following workplace procedures
- applying manufacturer specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- light sources, lamps and luminaries, including:
 - types of light sources and their historic development, including the practical requirements, advantages and disadvantages encompassing:
 - incandescent
 - electrical discharge in gases
 - tubular fluorescent
 - compact fluorescent types

- phosphor types
- low pressure sodium
- high pressure sodium
- metal halide
- mercury vapour
- tungsten halogen cycle lamps
- neon and advertising tube types
- light-emitting diode (LED) technologies
- each practical lamp type is designated in terms encompassing:
 - luminous efficacy
 - spectral output
 - colour rendering
 - longevity of operation
 - supply requirements and control equipment
 - cost
 - sustainability and recycling
- types of luminaries encompassing:
 - general design and types
 - provision of data on luminaries
 - methods of light control
 - properties of optical systems: refractors, reflectors and diffusers
 - luminance control techniques
 - luminaires and auxiliaries
 - Australian Standards for indoor and outdoor luminaries
 - calculation of utilisation factors
 - provision of photometric data
 - luminance of various fittings
- natural lighting and building design
- techniques used to minimise energy expenditure
- specific application lamps:
 - specific task lamps
 - germicidal lamps
 - indoor agricultural or hydroponic lamps
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0071 Select low voltage power factor correction equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select low voltage (LV) power factor correction equipment.

It includes preparing and selecting (sizing) power factor correction equipment for commercial and/or industrial installations and documenting the selection of the equipment.

The correction equipment is limited to the capacitive type, including control devices/systems, including contactors or solid-state types.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for general electrical installations

UEEEL0005 Develop and connect electrical control circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Solve problems in alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to select power factor correction equipment

2 Select power factor correction equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|------------|---|
| 1.1 | Scope of the electrical installation is determined from job specifications and/or appropriate person/s |
| 1.2 | Work health and safety (WHS)/occupational health and safety (OHS) electrical installation requirements and relevant industry standards are identified and applied |
| 1.3 | Cable routes, route lengths of cables and conditions of the wiring system for operation are determined from job specifications and/or appropriate person/s |
| 2.1 | Wiring systems are selected for suitability of the environments |
| 2.2 | Cable conductor sizes are selected for current-carrying capacity requirements, voltage-drop and earth fault-loop |

impedance limitations

- 2.3 Circuit protective devices are selected to meet job specifications for coordination with conductor current-carrying capacity
 - 2.4 Earthing system components are selected for the multiple earth neutral (MEN) system
 - 2.5 Evidence of the electrical equipment selected is obtained in accordance with WHS/OHS safety requirements
- 3 Complete documentation**
- 3.1 Evidence from manufacturer/supplier of the selected electrical equipment is obtained in accordance with WHS/OHS safety requirements
 - 3.2 Selection justification and calculations are documented in accordance with workplace procedures
 - 3.3 Electrical installation arrangement and manufacturer specifications for selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting power factor correction equipment must include at least two different power factor installations from the following:

- LV installation using contactor switching
- LV installation using solid-state switching
- high voltage (HV) installation using contactor switching
- HV installation using solid-state switching

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG177A Select low voltage power factor correction equipment.

Assessment Requirements for UEEEL0071 Select low voltage power factor correction equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent and nature of the installation from job specifications
- obtaining and understanding the safety and other regulatory requirements to which the electrical installation shall comply
- determining power factor correction equipment using graphical or mathematical methods
- selecting wiring system suitable for the environment requirements
- selecting cable conductor sizes in consideration to current-carrying capacity and voltage-drop/earth fault-loop limitation
- ensuring coordination between circuit protective device and conductor current-carrying capacity
- selecting compliant earthing system components
- documenting equipment and systems requirements to be used, specification for items selected and reasons for the selections made
- dealing with unplanned events
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- documenting power factor correction equipment installation details
- following workplace procedures
- performing relevant industry calculations
- selecting power factor correction equipment, including:
 - obtaining and applying safety and relevant industry standards
 - selecting power factor correction equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- power factor correction — equipment selection, including:
 - definitions, concept of power factor and reasons for improving power factor
 - situations leading to reduction of power factor
 - consequences of poor power factor encompassing:
 - demand tariff costs
 - non-compliance with national service provider (NSP) and system energy loss
 - design considerations encompassing:
 - special conditions existing and the suitability for power factor correction (PFC) such as existence of distortion due to electronic loads, uninterruptable power supply (UPS) systems, and power generation facilities or complex electronic loads
 - load profile and the nature of the load in all operating modes and with all possible sources of supply using three phase power recorders
 - power supply quality issues in terms of voltage and frequency stability
 - calculation of corrective VARs
 - circuit protection issues and safety
 - nominal location and arrangement
 - types of capacitors to be used
 - use of synchronous motor for large installations
 - possibility of resonance
 - discharge measures
 - types of PFC controls
 - low voltage (LV) PFC, high voltage (HV) PFC and solid-state switched
 - compliance with Australian Standards (AS) encompassing:
 - AS 1013-1971 Shunt capacitors for connection to power frequency systems
 - AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules)
 - AS/NZS 3947 Low voltage switchgear and control gear
 - testing and commissioning of power factor equipment, including controls
- relevant industry calculations
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory

requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0072 Set up and place LV electrical apparatus and associated circuits into service

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and place low voltage (LV) electrical apparatus and associated circuits into service.

It includes preparing and setting up electrical apparatus and associated controls, and completing mandatory documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

- UEEEL0005 Develop and connect electrical control circuits
- UEEEL0025 Test and connect transformers
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0046 Solve problems in single path circuits
- UEECD0044 Solve problems in multiple path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to set up electrical apparatus and associated controls

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in preparation for the work are followed
- 1.3** WHS/OHS hazards not previously identified are noted on job safety assessment, risks assessed and risk control

measures implemented

- 1.4 Work is appropriately sequenced in accordance with workplace procedures
 - 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others
 - 1.6 Location of electrical apparatus and controls is determined from site inspection and/or job specifications and diagrams
 - 1.7 Control settings and operating parameters are determined from job specifications and in accordance with workplace procedures
 - 1.8 Tools, equipment and testing devices needed to commission the system are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.9 Checks are undertaken to ensure all components are in place and secure in accordance with workplace procedures and relevant industry standards
 - 1.10 Need to inspect, test and measure live electrical work and operating system is determined in accordance with WHS/OHS requirements and workplace procedures
- 2 Set up electrical apparatus and associated controls**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Electrical apparatus and associated controls are adjusted to the required settings
 - 2.4 Testing/measuring devices are used to observe the operation of electrical apparatus and adjustments of controls, as required
 - 2.5 Methods for dealing with unplanned events are dealt with in accordance with workplace procedures and safe work practices
 - 2.6 Set-up is conducted efficiently without waste of materials, services, damage to apparatus or the

environment using sustainable energy practices

- 3 Complete documentation**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Results of work and final operating parameters are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG162A Set up and place LV electrical apparatus and associated circuits into service.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0072 Set up and place LV electrical apparatus and associated circuits into service

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- selecting appropriate testing/measuring devices
- making initial adjustments of apparatus and controls correctly
- finely adjusting apparatus and controls based of measured observations
- documenting final operating parameters accurately
- dealing with unplanned events
- applying relevant industry standards
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- following job specifications, workplace procedures and instructions
- setting up electrical apparatus and associated controls, including:
 - locating electrical apparatus and controls.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- commissioning processes and procedures and setting up and placing electrical apparatus and associated circuits into service, including:
 - commissioning processes and procedures encompassing:
 - purpose of commissioning
 - commissioning planning and documentation
 - procedures for configuring, calibrating and tuning systems during commissioning systems
 - procedures for validating system performs to specification
 - procedures followed to commission instrument systems
 - purpose and importance of documentation
- problem-solving techniques

- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant sustainable energy practices
- relevant tool, equipment and testing/measuring devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies, procedures and job specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0073 Verify compliance and functionality of special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify compliance and functionality of a special low voltage (LV) electrical installation.

It includes preparing for testing and visual inspection for verifying an electrical installation, and completing reporting and recommendations of finding.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEEEL0003 Arrange circuits, control and protection for general electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0018 Select wiring systems and cables for low voltage general electrical installations

UEEEL0005 Develop and connect electrical control circuits

- UEEEL0069 Select and arrange equipment for special LV electrical installations
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Solve problems in alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers
- UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories and
- UEECD0043 Solve problems in direct current circuits
- or
- UEECD0044 Solve problems in multiple path circuits
- UEECD0046 Solve problems in single path circuits

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to inspect and test an electrical installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) measures for the site are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and procedures in preparation for the work are followed
- 1.3** WHS/OHS hazards not previously identified are noted,

risks assessed and risk control measures implemented

1.4 Installation documentation and relevant industry standard are reviewed and applied

1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others

1.6 Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for operation and safety

1.7 Preparatory work is checked to ensure no damage has occurred in accordance with workplace procedures

2 Visually inspect the installation

2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed

2.2 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures

2.3 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.4 Installed wiring is checked for suitability for the environments and protected from damage and overheating

2.5 Cable conductor sizes acquired are inspected to meet current-carrying capacity requirements, voltage-drop and fault-loop impedance limitations in accordance with relevant industry standards

2.6 Inspection protection methods and devices are validated to meet coordination requirements for overload and short circuit protection in accordance with relevant industry standards

2.7 Switchgear and control gear are inspected, validated and appropriately rated to meet functional requirements in accordance with relevant industry standards

2.8 Electrical equipment is checked for compliance with safety requirements in accordance with relevant industry standards

2.9 Earthing system components are checked, located and conductors correctly sized in accordance with relevant

- industry standards
- 2.10** Markings on switchboards are checked for accuracy and clarity in accordance with relevant industry standards
- 3 Conduct safety testing**
- 3.1** WHS/OHS risk control measures and procedures for carrying out the work are followed
- 3.2** Need to test and measure live electrical work is conducted in accordance with WHS/OHS requirements and workplace procedures
- 3.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 3.4** Mandatory tests are conducted to verify earthing conductor resistance is sufficiently low; insulation resistance is sufficiently high; polarities are correct; circuit connections are correct; and tests are in accordance with relevant industry standards
- 3.5** Inspection and testing are conducted to verify fault-loop impedance is sufficiently low and residual current device (RCD) operates as intended in accordance with job requirements and relevant industry standards
- 4 Report inspection and test findings**
- 4.1** WHS/OHS risk control work completion measures and workplace procedures are followed
- 4.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 4.3** Non-compliance defects are identified and reported in accordance with workplace procedures
- 4.4** Recommendations for rectifying defects are made in accordance with workplace procedures
- 4.5** Mandatory documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Verifying compliance and functionality must include at least two types of installations from the following:

- caravan parks
- construction and demolition sites
- marinas
- medical treatment areas
- moveable premises

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG121A Verify compliance and functionality of special LV electrical installations.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0073 Verify compliance and functionality of special LV electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- selecting correct tools and testing equipment
- identifying visual non-compliance defects
- using effective methods for conducting mandatory and optional tests
- identifying non-compliance from test results
- identifying causes of non-compliance
- completing mandatory reporting
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- preparing, inspecting and testing an electrical installation
- reporting inspection and test findings
- reviewing relevant industry documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical installations, testing, compliance and functionality verification of special electrical installations, including:
 - technical standards, regulations and codes for special electrical installations encompassing:
 - additional requirements for special installations
 - caravan parks
 - construction and demolition sites
 - marinas
 - medical treatment areas

- moveable premises
- high voltage (HV) installation in consumer's premises
- mandatory and optional testing and verification requirements applicable to special installations encompassing:
 - testing techniques
 - features of special installations that can be visually inspected
 - caravan parks
 - construction and demolition sites
 - marinas
 - medical treatment areas
 - moveable premises
 - HV installation in consumer's premises
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0074 Wind electrical coils

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up coil former and winding machine/s to wind electrical coils for static and rotating electrical machines.

It includes working safely, using hand and power tools, following technical instructions and set procedures, recording work activities and winding electrical coils.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to wind electrical coils

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and understood

- 1.2 Existing WHS/OHS risk control measures for work preparation are followed
 - 1.3 Work instructions are identified, obtained and applied
 - 1.4 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
 - 1.5 Materials required for work are obtained in accordance with work instructions and workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out electrical work are obtained and checked for correct operation and safety
- 2 Wind electrical coils**
- 2.1 Existing WHS/OHS risk control measures for winding electrical coils work are followed
 - 2.2 Winding machines are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Winding wire and insulation are selected in accordance with work instructions and workplace procedures
 - 2.4 Winding formers and machine are set up in accordance with workplace instructions
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Routine quality checks are conducted to ensure electrical coils are correctly wound with correct wire, number of turns and shape in accordance with work instructions
 - 2.7 Coil work is completed within timeframe, environment and workplace conditions
- 3 Complete workplace report**
- 3.1 WHS/OHS workplace completion risk control measures are followed
 - 3.2 Workplace report, forms/data sheets are completed accurately in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Winding electrical coils must include the following:

- winding at least four different types of electrical coils in an environment designed specifically for the purpose

Unit Mapping Information

This unit replaces and is equivalent to UEENEEG150A Wind electrical coils.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEEL0074 Wind electrical coils

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- completing workplace reports and documentation
- preparing to wind electrical coils
- winding electrical coils, including:
 - adhering to coil quality and workplace procedures
 - completing workplace report/forms accurately
 - dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - following winding job specifications
 - selecting correct winding wire and insulation
 - setting up and operating winding machine in accordance with safe operating and workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- collecting coil data, including:
 - coil shape
 - gauge
 - number of turns
 - type of wire, coil and insulation
- coil former types, construction/set up and factors which govern coil shape, including:
 - bore size of stator iron core

- coil flexibility
- coil shapes
- depth of iron below the slots in the iron core
- end room
- pressure points between the coils
- types coil winding formers
- coil winding machines, including:
 - computer operated
 - foot pedal
 - layer winding machine
 - remote foot switch on a flexible lead, variable speed fitted with a face plate
 - variable speed
 - winding head fitted with a chuck
- coil insulations, including:
 - paper laminates
 - cloth, tape and adhesive tape (glass); and polyester glass laminate
 - polyester film
 - purpose
 - adhesive tape (polyester film)
 - temperature ratings
- rewind small and medium-sized solenoid coils, including:
 - strip and record data
 - prepare/insulate coil formers
 - wind each type of coil
 - finishing off process
 - test procedures
- types and purpose of testing devices, including:
 - multimeter
 - insulation resistance tester
 - wheatstone bridge
- types of tests, including:
 - continuity
 - short circuited turns
 - insulation resistance
- testing techniques to identify faulty coils, including:
 - physical inspection.
 - using a testing device
- current industry practices and technologies
- relevant job safety assessments, risk mitigation processes or operational safety precautions
- relevant manufacturer specifications

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to winding electrical coils
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0075 Inspect, test and maintain emergency alarm systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to inspect, test and maintain audible and visual emergency alarm systems and equipment in buildings with fire separated compartments. It does not include control and indicating equipment.

It includes working safely, inspecting, testing and maintaining emergency alarm systems, and completing required documentation.

This unit includes understanding the different types of systems and the relevant parts of the associated Australian Standards and the Building Code of Australia and Building Regulations. Refer to the UEE Electrotechnology Companion Volume Implementation Guide for a list of Standards relevant to this unit.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.). Where equipment has the capability to be connected to a telecommunications network, cabling registration may be required.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment, and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0021 Solve problems in electromagnetic devices

UEEEL0025 Test and connect transformers

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to inspect, test and maintain emergency alarm systems and equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2** Hazards are identified, risks assessed and control measures implemented
- 1.3** Safety hazards not previously identified are noted on job safety sheet and risk control measures are implemented
- 1.4** Work plan is prepared in consultation with others affected by work and sequenced appropriately
- 1.5** Required access, permits and permissions are obtained prior to commencing work
- 1.6** Nature and location of work, and access to equipment, is determined from documentation and/or appropriate person/s
- 1.7** Advice is sought from appropriate person/s to ensure work is coordinated effectively with others
- 1.8** Material needed for the work is obtained in accordance with workplace procedures and checked against job

requirements

- 1.9** Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
 - 1.10** Preparatory work is checked to ensure no damage has occurred and complies with job requirements and specifications
- 2 Inspect, test and maintain emergency alarm systems and equipment**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Need to test or measure live electrical work is determined in accordance with WHS/OHS workplace procedures
 - 2.3** Circuits, machines and/or plant are checked and isolated in accordance with workplace procedures
 - 2.4** Emergency alarm systems and associated equipment are inspected, tested and maintained to comply with technical industry standards, job specifications and requirements with sufficient access to affect adjustment and maintenance
 - 2.5** Quality inspections and checks of equipment are undertaken in accordance with workplace procedures
 - 2.6** Problems are solved safely, using sustainable energy principles and without damaging equipment, the surrounding environment or services in accordance with workplace procedures
- 3 Complete and report, inspection, testing and maintenance activities**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Final checks are made to ensure, inspected, tested and maintained equipment conforms to job requirements and specifications
 - 3.4** Completed work is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Demonstration of this unit of competency must include:

- inspecting, testing and maintaining audible and visual emergency alarm systems and equipment in a building which has fire separated compartments (excluding control and indicating equipment).

Unit Mapping Information

Newly created.

Assessment Requirements for UEEEL0075 Inspect, test and maintain emergency alarm systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- preparing to test, inspect and maintain emergency systems and equipment
- consulting with relevant person/s
- locating alarm systems and equipment
- arranging required permits, permissions and building access for work to be completed
- isolating circuits and equipment
- testing, inspecting and maintaining emergency alarm systems and equipment
- completing and reporting, inspection, testing and maintenance activities
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of alarm systems, equipment and designs
- testing requirements for different alarm systems and equipment
- emergency alarm installation and maintenance, including:
 - arrangements and control
 - labelling of devices operation of emergency alarms
- requirements for emergency alarm systems and equipment contained within:
 - relevant industry standards
 - Building Code of Australia
 - performance based designs
- reporting requirements.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEEEL0076 Inspect, test and maintain emergency lighting systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- preparing to test, inspect and maintain emergency systems and equipment
- consulting with relevant person/s
- locating emergency lighting
- arranging required permits, permissions and building access for work to be completed
- isolating circuits and equipment
- testing, inspecting and maintaining emergency lighting systems
- completing and reporting inspection, testing and maintenance activities
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- battery systems used in emergency lighting, including types of batteries and their characteristics, recharging arrangements and procedures for testing emergency lighting
- design of emergency escape luminaire installation
- electrical wiring and equipment for centrally supplied systems
- emergency lighting and exit sign luminaires
- emergency lighting control systems
- emergency lighting installation and maintenance, including:
 - arrangements and control
 - labelling of devices operation of emergency lighting
- emergency power supplies for single and centrally supplied systems
- installation and maintenance workplace procedures for single point systems, including battery replacement and cleaning of emergency luminaires
- installation of electrical wiring and equipment for centrally supplied systems, including:

- circuit voltage-drop
- protection against over current and the electrical installation against fire
- segregation or identification of sub-mains and arrangement of final sub-circuits
- inspection of electrical wiring and equipment for centrally supplied and single point systems, including:
 - the required procedures for six and twelve-monthly inspections
 - maintenance and inspection requirements and relevant industry standards, and Building Code of Australia
 - information required for operating and maintaining the system
 - maintenance manual
 - provision for the recording of maintenance
- quality assurance processes
- requirements for self-contained emergency escape luminaires and exit signs, including:
 - arrangement and control, electrical requirements and control equipment
 - batteries and battery chargers
 - self-contained automatic discharge testing facilities
 - suitability for operating temperatures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0077 Evaluate and report on the performance of LV machines

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit covers determining correct operation of single and three phase machines, evaluating and reporting on their performance.

It includes safe working practices, machine connections circuit arrangements, issues related to machine operation, characteristics and protection and solutions to machine problems derived from calculated and measured parameters.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0021 Solve problems in magnetic and electromagnetic devices

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to evaluate and report on the performance of LV

1.1

Work, health and safety (WHS) / occupational health and safety (OHS) risk control measures are identified and applied

machines

- | | | |
|---|------------|--|
| | 1.2 | Machines to be evaluated, and scope of works to be undertaken are identified and confirmed |
| | 1.3 | Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety |
| 2 Evaluate single and three phase low voltage machines | 2.1 | Correct machine is identified for a specified range of applications |
| | 2.2 | Machine performance is evaluated from measured and calculated values as they apply to single and three-phase low voltage machines and results are recorded |
| | 2.3 | Problems are diagnosed, recorded, and solutions are identified |
| 3 Complete work and document problem solving activities. | 3.1 | Results of evaluation and recommendations are reported |
| | 3.2 | Justification for identified solutions is reported |
| | 3.3 | Work completion is documented, and an appropriate person notified |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEEL0077 Evaluate and report on the performance of LV machines

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- evaluating the operating parameters of existing machines
- recommending alterations to an existing machine for compliance with specified operating parameters
- justifying selection of machines/circuits to comply with a specified function and operating parameters
- determining the cause of problems in an existing machine
- determining solutions for problems in an existing machine
- determining conditions causing an existing machine to be unsafe
- recommending solutions for identified machine problems
- determining correct machine for a specified range of applications
- determining parameters for the equivalent circuit using data from short circuit and open circuit tests
- determining percentage resistance, reactance and impedance of a transformer
- determining voltage regulation using percentage resistance, percentage reactance and load power factor
- determining parameters for maximum regulation and zero regulation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- single and three phase transformers including:
 - transformer construction including:
 - types of lamination style and core construction used in single-phase, three phase, double wound, auto transformers and instrument transformers
 - identification of different winding styles/types used in transformers
 - methods used to insulate low and high voltage transformers
 - construction of transformer tanks for distribution transformers

- transformer auxiliary equipment
- function of transformer auxiliary equipment
- types of information stated on transformer nameplates
- application of transformers
- performing basic insulation resistance, continuity and winding identification tests
- transformer operation including:
 - principles of mutual induction of a transformer
 - factors that determine the induced voltage in a transformer winding
 - determining the value of a transformer's secondary voltage and current given one winding's electrical details and the turns ratio
 - identification of voltage and current components of a phasor diagram for a transformer no-load and load
 - principles of power transferred from the primary to the secondary when a load is connected using a phasor diagram neglecting impedance drops
 - selecting transformers for specific application/s
 - safety features specified in AS/NZS3000 with respect to transformers and isolating transformers
 - transformer resistance, reactance and impedance, including total equivalent values, referred to the primary and the secondary
 - equivalent circuit of a transformer
 - harmonics in transformers, including their generation, measurement, problems they cause and overcoming their impact
 - the purpose of tertiary windings
- transformer losses, efficiency and cooling including:
 - power losses which occur in a transformer
 - tests which allow the power losses of a transformer to be determined
 - determination of transformer losses and efficiency using test results
 - efficiency for loads other than full load
 - relationship between transformer cooling and rating
 - methods used for natural and forced cooling of transformers
 - properties of transformer oil
 - tests conducted on transformer oil
- transformer voltage regulation and percent impedance including:
 - voltage regulation as applicable to a transformer
 - reasons for voltage variation in the output of a transformer
 - determine the voltage regulation of a transformer from voltage and percentage impedance values
 - percentage impedance as applied to transformers
 - determine the percent impedance by using test results
 - determine percent impedance of a transformer by calculation
 - approximate voltage drop and exact voltage drop equations

- parallel operation of transformers and transformer auxiliary equipment including:
 - determine polarity markings for an unidentified single phase double wound transformer
 - need for parallel operation of transformers
 - conditions/restrictions required before two transformers can be connected in parallel
 - vector grouping
 - connecting transformers in parallel to supply a single load
 - loading on transformers operating in parallel
 - the consequences/effect of an incorrect connection
- auto-transformers and instrument transformers including:
 - identification of auto-transformers, voltage transformers and current transformers from their winding diagrams
 - determining voltage and current in the windings of an auto-transformer by calculation
 - advantages and disadvantages of an auto-transformer
 - AS/NZS3000 requirements with respect to transformers
 - construction and ratings of voltage transformers
 - construction and ratings of current transformers
 - precautionary measures taken to connect and disconnect instrument transformers
 - connection diagrams for instrument transformers
 - applications for auto-transformers and instrument transformers
- alternating current rotating machines including:
 - operating principles of three phase induction motors including:
 - characteristics of the magnetic field produced by a single-phase, two-phase and three-phase windings
 - speed of rotation of a rotating magnetic field
 - relationship between the rotor speed, slip and rotor frequency
 - basic principle of operation of an induction motor
 - reversing the direction of rotation of a three-phase induction motor
 - three phase induction motor construction including:
 - basic component parts of a three-phase induction motor
 - types of rotors used in three-phase induction motors
 - connecting a three-phase induction motor in both star and delta
 - testing insulation resistance of a three-phase induction motor prior to connection to the supply
 - testing winding resistance (ohmic value and continuity) of a three-phase induction motor prior to connection to the supply
 - three phase induction motor characteristics including:
 - relationship between torque, speed, and power and interpretation of speed/torque curves of induction motors
 - squirrel cage motors operating characteristics conditions necessary for an induction motor to produce maximum torque

- operating characteristics of an induction motor from name plate information and by measurement
- induction motor efficiency and minimum energy performance standards (MEPS)
- full load efficiency and power factor of induction motors
- comparison of the advantages of squirrel cage and wound rotor induction motors
- single-phase motors – split phase including:
 - common types of single-phase motors
 - principles of operation of split phase induction motors
 - construction and basic characteristics of split phase induction motors
 - applications of split phase induction motors
 - operation of split phase induction motors
- single phase motors – capacitor including:
 - identification of single-phase induction motors including capacitor start, capacitor start/capacitor run and permanent split capacitor (PSC)
 - principles of operation
 - operating characteristics and typical applications
 - connection and running
 - reversing the direction of rotation
- single phase motors –shaded pole including:
 - principles of operation
 - operating characteristics and typical applications
 - connection and running
 - reversing the direction of rotation
- single phase motors – universal including:
 - principles of operation
 - identification and functions of each of the basic parts
 - operating characteristics and typical uses
 - connecting, running and reversing
- motor protection including:
 - reasons why motor protection is required
 - requirements of the AS/NZS3000 Wiring rules with regards to motor protection
 - types of motor overload protection
 - operating principles of microtherm devices, thermal and magnetic motor protection devices
 - electrical features of motor protection HRC fuses
 - effects of under voltage and over voltage on motors and motor circuits
 - effects of repetitive starting and/or reversing on motors and motor circuits
 - special requirements for motor protection, in high humidity or moist environments, high temperature areas and corrosive atmospheres
 - operating principles of phase failure protection

- selecting suitable protection devices for a given motor and starter combination
- three phase synchronous machines- operation principles and construction including:
 - power transfer diagram of an a.c. synchronous machine
 - need for the generation of a sinusoidal waveform
 - principles of operation of a synchronous alternator
 - principles of operation of a synchronous motor
 - principles of operation of an asynchronous generator (induction generator)
 - identification of main parts of a synchronous alternator/motor
 - methods used to provide the excitation of a synchronous alternator/motor
 - block diagram of an alternator voltage regulator
 - advantages gained by the parallel operation of alternators
 - starting methods of synchronous motors
 - vee curves
 - the behaviour of synchronous motors at various excitation levels and their associated phasor diagrams
 - limits of stability for synchronous motors
- alternators and generators including:
 - effects on the generated voltage of variations in excitation
 - effects on generated voltage of variations in load
 - identification of characteristic curves of an alternator
 - types of prime movers used with single and three phase portable/standby alternators
 - manual operation of single and three phase portable/standby alternators
 - ratings of single and three phase portable/standby alternators
 - applications of single and three phase portable/standby alternators
 - construction details of single and three phase portable/standby alternators
 - common faults found in portable/standby alternators
 - limits of stability for synchronous alternators.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0078 Install and commission whole current electricity meters

Modification History

Release 2. Updated Elements and Performance Criteria number sequence.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEEEL0013 Install, set up and commission interval metering.

Modifications this release include:

- The title has been changed
- Prerequisite requirements amended
- Significant changes have been made to performance criteria to reflect current industry practice
- The Range of conditions has been amended to specify essential operating conditions
- Significant changes have been made to Performance Evidence to reflect current industry practice
- Significant changes have been made to Knowledge Evidence to reflect current industry practice
- Minor amendments made to Assessment Conditions.

Application

This unit involves the skills and knowledge required to the install, configure and commission whole current electricity meters comprised of single-element, multi-element (Multi-Tariff) and polyphase, for measurement of energy for end use consumers.

It includes working safely in accordance with work order and workplace procedures in planning, installing and configuring whole current electricity meters; testing and evaluating integrity and compliance of meter wiring and Main-Earth-Neutral (MEN) systems in accordance with AS/NZS3000; fixing and relocating meters; making power and communication connections; configuring meters and checking functionality; and completing the necessary service metering certificates of completion and documentation.

It also includes performing risk assessments and hazard identification and control for working on or near energised electrical equipment and in confined spaces and potentially asbestos containing materials; performing electrical tests; performing and confirming safe isolation and restoration of electrical supply; communicating with others such as distributors, electricity retailers and meter providers; confirming integrity of metering enclosure; identifying and reporting defects and problems in metering enclosures and associated installation to relevant bodies; and demonstrating knowledge of Meter Installation Authorisation Schemes and national and local metering service and installation rules and requirements.

This unit does not cover installing and commissioning Current Transformer (CT) meters; High Voltage Current Transformer / Voltage Transformer Meters (HVCT/VT meters) – HV metering.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

If this unit is delivered as part of a Certificate III Electrician qualification it should be done concurrent to UEEEL0039 Design, install and verify compliance and functionality of general electrical installations, and final determination of competence only made after completion of UEEEL0039.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

UETDRRF004 Perform rescue from a live LV panel

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install whole current meter

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Scope of work activity is confirmed from the work order / instruction, in consultation with supervisor / authorised person
- 1.2 Appropriate electricity meter and enclosure are identified and confirmed in accordance with workplace

procedures

- 1.3 Customer is advised of proposed work and scheduling in accordance with job requirements/specifications and workplace procedures
 - 1.4 Work Health and Safety (WHS) / Occupational Health and Safety (OHS) requirements and relevant workplace procedures including de-energising, isolation and energising are identified and implemented
 - 1.5 Hazards are identified, risks assessed, and risk control measures and Safe Work Method Statements (SWMS) applied
 - 1.6 Switchboard on which the meter is to be installed is inspected and evaluated for compliance with safety and functionality requirements and industry standards
 - 1.7 Approval to rectify safety and/or functionality defects identified by visual inspection of the switchboard is sought from relevant person/s in accordance with workplace procedures
 - 1.8 Installation and any rectification work is planned and sequenced appropriately in consultation with relevant person/s and in accordance legislative framework
 - 1.9 Confirmation that safe isolation of the installation, access to a communication's connection and implementation of any relevant safeguards to associated metering services can be completed in accordance with job requirements is obtained
 - 1.10 Resources, materials, tools, equipment and testing devices are obtained and checked for correct operation and safety and against job requirements and specifications in accordance with workplace procedures
 - 1.11 Personal Protective Equipment (PPE) is selected, checked and used accordance with workplace procedures
- 2 Install whole current electricity meter**
- 2.1 Need to test or measure live work is determined in accordance with WHS/OHS requirements, workplace procedures and SWMS
 - 2.2 Pre installation tests and assessments are carried out, correct meter to be replaced confirmed and information

documented in accordance with workplace procedures

- 2.3** Approval to rectify safety and/or functionality defects identified by testing and assessment is sought from relevant person/s in accordance with workplace procedures
- 2.4** Work activities outside of the limits of own authority and/or qualification are identified, and assistance sought if required in accordance with operating instructions and workplace procedures
- 2.5** Existing meter is isolated by authorised person and checked and tested to confirm 'deenergised' in accordance with workplace procedures and WHS/OHS requirements
- 2.6** Approved rectification work is carried out to comply with industry standards and in accordance with workplace procedures
- 2.7** Meter is installed to comply with relevant technical industry standards, job specifications and workplace procedures and requirements
- 2.8** Meter power and communication connections, and where required communications technology device installation, are made in accordance with manufacturer and job specifications and workplace procedures
- 2.9** Meter is configured and functionality confirmed in accordance with manufacturer specifications and workplace procedures
- 2.10** Work progress is monitored against the approved pre-start risk assessment (workplan) and adjustments to the plan made, as required, in accordance with workplace procedures
- 2.11** Test procedures are performed to establish and confirm a neutral integrity test point (NITP), integrity of MEN, phase rotation where applicable, and main earth connections in accordance with workplace procedures
- 2.12** Ongoing checks of the quality of installation are undertaken in accordance with workplace procedures
- 2.13** Installation is carried out efficiently without unnecessary waste of materials or damage to apparatus circuits, the surrounding environment or services using

sustainable energy principles

2.14 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

3 Complete meter installation activity and report completion of work

3.1 WHS/OHS work completion risk control measures and workplace procedures are followed

3.2 Supply is reinstated 'energised' to the installation in accordance with workplace procedures

3.3 Final inspection and tests are made to ensure the installation conforms to job requirements and workplace procedures

3.4 Worksite and tools are cleaned and made safe, and waste disposed of, in accordance with workplace procedures

3.5 Where required, hazardous waste is removed and disposed of in accordance with regulatory requirements and workplace procedures

3.6 Final visual inspection of installation and work area is performed to ensure the work site is left clean of any hazardous materials or substances in accordance with workplace procedures

3.7 'As-installed' meter or rectification work is documented, and appropriate person/s notified in accordance with workplace procedures

3.8 Installation and certification compliance report/s and other documentation is updated and submitted, as required, in accordance with workplace procedures

3.9 Work supervisor or authorised person/s notified of completion of work and the completion of activity is documented in accordance with the pre-start risk assessment (workplan)

3.10 Metering installation work outcomes, configurations and completion of work is communicated to the customer in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and commissioning whole current electricity meters must include all the following meter types:

- single element bi-directional whole current electricity meters
- multi-element (Multi-Tariff) whole current electricity meters
- meters with internal load control switching
- three-phase whole current electricity meters

Connections of metering equipment must include:

- arrangement of meter neutrals, and neutral and active links in accordance with jurisdictional requirements
- electricity supply

Unit Mapping Information

This unit replaces and is not equivalent to UEEEL0013 Install, set up and commission interval metering.

Assessment Requirements for UEEEL0078 Install and commission whole current electricity meters

Modification History

Release 2. Updated Elements and Performance Criteria number sequence.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEEEL0013 Install, set up and commission interval metering.

Modifications this release include:

- The title has been changed
- Prerequisite requirements amended
- Significant changes have been made to performance criteria to reflect current industry practice
- The Range of conditions has been amended to specify essential operating conditions
- Significant changes have been made to Performance Evidence to reflect current industry practice
- Significant changes have been made to Knowledge Evidence to reflect current industry practice
- Minor amendments made to Assessment Conditions.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including:
 - completing risk assessment and implementing risk control measures
 - inspecting and evaluating safety and functionality compliance of the switchboard
 - identifying and eliminating hazards such as Asbestos Containing Materials (ACMs)
 - producing draft pre-start risk assessment (workplan) including any rectification work and need for issuance of Safe Work Method Statements (SWMS)
- completing all work in accordance with relevant workplace procedures, industry standards, manufacturer specifications and regulation
- communicating with customers about metering installation work outcomes, planned interruption notification work on accordance with required legislative framework, and configurations completion of work schedule
- carrying out required pre and post installation tests and assessments

- installing, configuring and commissioning whole current electricity meters
- installing communication connection devices
- rectifying compliance defects
- reinstating supply to the installation safely
- performing final inspection and tests to ensure installed meter conforms to work order and job requirements
- cleaning and making safe work area and tools and removing and disposing of consumable items and waste materials including meters and any hazardous substances
- conducting final visual checks of the meter installation activity and work area to ensure the work site is left clean of any potential hazards or inappropriate materials
- completing and submitting installation compliance certification and documentation and reporting meter installation completion of work activities to relevant person/s
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- the contestable market and market participants overview:
 - purpose of a contestable market
 - market participants and their roles and responsibilities encompassing electricity retailers
 - reasons for meter and the regulated market
 - regulatory timeframes (AER)
 - regulatory framework
- relevant WHS/OHS legislated and regulation requirements including:
 - identifying hazards at customers premises
 - identifying hazards at electrical switchboards
 - identifying known electrical design hazards
 - performing site specific risk assessment
 - carrying out job safety assessments and/or risk mitigation processes
 - implementing critical controls including PPE
 - principles of duty of care responsibilities
 - risks and hazards of working on or near live electrical equipment and conductors
 - risks associated with testing or measuring live
 - risks associated with lifting and shorting CT circuits, opening slides on test blocks, CATIV connectors to test equipment
 - safeguards for potential fault currents
 - safeguards potential arc flash and arc flash burns
 - safeguards of potential risks with other services (e.g. gas meters)

- hazards and mitigation requirements of Asbestos Containing Materials (ACMs), including:
 - ACMs code of practice
 - identifying ACMs
 - meters containing ACMs
 - other components ACMs
 - drilling, removal, disposal, and decontamination
- hazards and mitigation requirements of other potential hazardous materials and substances in metering installation work
- isolation requirements and risks, including:
 - isolating customer load via m/s or rewirable fuse
 - isolating supply to meter via SPD / MPD / MIL
 - confirming isolated – proving safe to work
- whole current electricity meter concepts and installation, including:
 - purpose, types and applications
 - single and polyphase (multi-element) meters
 - classes of meter types (e.g. integrated, Whole Current [WC], functions (e.g. controlled load, net and gross as well as those with internal load control switching), and typical construction and associated risks
 - relevant state/territory regulator whole current electricity meter commissioning requirements and specifications
 - communication methods and arrangements as well as:
 - segregation and dangers of exposure to conductive parts
 - configuration techniques and practices
 - communications technology devices (e.g. antenna/transmitter)
 - installing communications technology devices and cables in the proximity of LV conductors, mountings and routing cables
 - performance verification and rectification of communication problems
 - importing and exporting energy incorporating power and energy difference
 - installation and power connection arrangements and segregation with gas metering
 - procedures for configuring meter parameter
- current industry practices and technologies, including:
 - scope for meter installer
 - managing defects
 - meter reading
 - meter disposal (including identified Asbestos Containing Materials (ACMs) meters)
 - metering details (administration)
 - communications technology device and cabling installation
 - planned interruptions notification and network isolations
- standard wiring configurations, including:
 - single phase

- single phase with Communication Links (CL)
- three-phase
- three-phase with Communication Links (CL)
- net generation
- gross generation
- meter layouts and requirements as determined by meter providers
- non-standard configurations (e.g. ANNA – looped neutral – multiple occupancy; rural – multiple meter locations, SWER systems; network load control devices; direct supply to metering; embedded networks)
- electrical testing techniques and practices, including:
 - test methods and pre-test calibration of test equipment
 - types of electrical tests including live tests
 - pre and post work tests
 - polarity and neutral tests
 - phase rotation
 - MEN integrity tests
 - pre energisation tests
 - equipment integrity tests
- facilities for the installation of metering equipment including:
 - seals or locks to metering equipment
 - local jurisdictional rules and procedures related to Service Protection Device/s (SPD) / Meter Protection Device/s (MPD) / Meter Isolation Link (MIL)
 - meter equipment panel
 - meter equipment components
 - metering equipment enclosure
 - physical protection and segregation of metering equipment
 - meter equipment enclosure fixing requirements
 - metering equipment fixing requirements
 - isolated and unattended locations and locking of metering enclosures
- location and accessibility of metering equipment for different types of premises
- documentation including:
 - Australian standards (e.g. wiring rules), codes of practice
 - National Electricity Law
 - Meter Installation Authorisation Schemes
 - meter provider rules
 - rules or Service and Installation Rules (SIRs)
 - planned legislative interruption notification framework - National Energy Customer Framework (NECF) guidelines
 - customers' electricity retailer provider certificates of compliance or completion
 - work orders and job requirements

- Safe Work Method Statements (SWMS)
- labelling of metering equipment and metering installation components
- workplace procedures encompassing meter equipment and installation pre-start risk assessment (workplan)
- manufacturer specifications
- communicating technical information including requirements for:
 - liaising with customers
 - liaising with retailers
 - liaising with supervisors and/or authorised persons
 - resolving interruptions and complaints.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources used should reflect current industry practices in relation to installing and setting up interval meters
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEEEL0079 Plan and analyse LV electrical apparatus

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit covers planning and analysing the correct operation of single and three phase low voltage electrical apparatus. It covers planning their use in electrical installations, apparatus arrangements, and issues related to operation, characteristics, protection and solutions to apparatus problems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

NIL

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to plan and analyse single and three phase low voltage electrical apparatus

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work, health and safety (WHS) / occupational health and safety (OHS) risk control measures are identified and applied

1.2 Apparatus to be analysed, and scope of work to be undertaken are identified and confirmed

- | | | |
|---|------------|---|
| | 1.3 | Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety |
| 2 Plan and analyse single and three phase low voltage electrical apparatus | 2.1 | Apparatus is confirmed as being isolated where necessary in accordance with WHS/OHS requirements |
| | 2.2 | Apparatus is analysed using measured and calculated values as they apply to single and three-phase low voltage apparatus |
| | 2.3 | Apparatus problems are identified from analysis and solutions for rectification are recommended |
| | 2.4 | The use of apparatus in a specified electrical installation is planned in accordance with requirements |
| 3 Complete and document work | 3.1 | Results of analysis are recorded |
| | 3.2 | Justification for apparatus selection and installation planning is documented |
| | 3.3 | Work completion is documented and stored in an appropriate location |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEEL0079 Plan and analyse LV electrical apparatus

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- analysing the operating parameters of existing apparatus
- recommending alterations to existing apparatus to comply with specified operating parameters
- determining the cause of problems in existing apparatus
- recommending solutions for identified apparatus problems
- determining conditions causing existing apparatus to be unsafe
- justifying selection of apparatus for a specified range of applications and operating parameters
- planning apparatus installation in accordance with requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- lighting including:
 - wiring diagrams for lighting circuits
 - switching methods for lighting circuits
 - cabling requirements for lighting circuits
 - correct operation of installed lighting circuits
 - required compliance testing
 - basic concepts, terminology, principles and standards relevant to lighting
 - types of luminaires and incandescent lamps
 - operation of different lamp types including their control equipment
 - expected lamp life, colour rendering and efficacy for different lamp types
 - lighting layout in terms of visual comfort and relevant Australian standards
 - types of low intensity discharge lamps
 - types of high intensity discharge lamps

- LED lighting and its applications
- Neon, Argon and Xenon lighting and their applications
- power factor requirements
- comparison of incandescent, low intensity discharge, high intensity discharge, LED and other types of lighting
- emergency and evacuation lighting and lighting control including:
 - factors and requirements of emergency and evacuation lighting concerning illumination levels, luminaire positioning and operating period
 - characteristics of maintained, non-maintained and sustained emergency lighting systems
 - arrangement of batteries in point and central bank emergency lighting supply systems
 - lighting control methods
- fire protection – residential fire and smoke alarms including:
 - types of fire and smoke alarms
 - regulations and standards requirements regarding residential fire and smoke alarms
 - locations for residential fire and smoke alarms
 - operation of typical residential fire and smoke alarms
- electrical heating control devices including:
 - methods of manual heat control
 - methods of automatic heat control
 - types and application for common thermostats
 - operation of common thermostats
 - sensitivity and differential of thermostats
 - testing of a thermostat
 - applications and operation of simmerstats
 - electronic heat control (phase control and zero voltage switching)
- fixed electrical heating appliances including:
 - determining the heat energy in joules and kWh in a simple heating process
 - methods of heat transfer
 - determining the heat energy input and output of a heating process
 - operation of reverse cycle air conditioning
- electrical water heater operation including:
 - types of water heaters (instantaneous and storage) and their methods of control
 - intrinsic safety (pressure relief and thermal cut-out)
 - testing of over temperature cut-out point of a thermostat
 - switchboard requirements to supply a controlled load water heater
 - internal circuit of a twin element water heater, and supply connections
 - solar heating system and its integration into an installation
- alternative supplies including:
 - reasons for the installation of alternative supplies
 - types of alternative supply systems

- characteristics and operation of uninterruptible power supplies (UPSs)
- batteries including:
 - common types of primary cells and secondary batteries and typical applications
 - terminal voltage of common primary cells and secondary cells
 - correct storage, handling and disposal techniques for cells and batteries
 - charge/discharge cycle for a secondary cell
 - effect of internal resistance on a secondary cell
 - state of charge of a secondary cell
 - commissioning procedures for various secondary batteries
 - safe working procedures when working with secondary cells and batteries.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEEL0080 Plan and analyse wiring systems, circuits, control and protection for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan and analyse wiring systems, circuits, control and protection for electrical installations.

It covers knowledge and application of schemes for protection of persons and property, correct functioning, ensuring compatibility with the supply, arranging installations into circuits and planning switchgear/controlgear and protective devices, selecting wiring systems compatible with the installation conditions, selecting cables that comply with required current carrying capacity, voltage drop and earth fault loop impedance limitations, coordination between protective devices and conductors and documenting arrangement decisions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

No prerequisites

Competency Field

Electrical

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to plan and analyse wiring systems,

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 The scope and nature of the electrical installation is determined from job specifications

circuits, control and protection

- 1.2** Load requirements for individual current using equipment are determined from job specifications and/or consultation with appropriate people
 - 1.3** Cable routes, the route lengths of cable, and the conditions in which the wiring system is to operate is determined from job specifications or from consultation with appropriate people
- 2 Evaluate and plan electrical circuits, control and protection**
- 2.1** Circuits, control and protective devices are planned to ensure safe and functional operation of the installation and to comply with relevant requirements
 - 2.2** Earthing is planned to comply with the multiple earthed neutral (MEN) system requirements
 - 2.3** Protective devices are selected to meet the required switching and tripping currents, coordination and discrimination for overload and short circuit protection in accordance with relevant industry technical standards
 - 2.4** Residual current devices (RCDs) are planned to meet the required circuit switching and tripping currents, in accordance with relevant industry technical standards
 - 2.5** Switchgear/control gear is planned to meet current and voltage requirements and confirmed suitable for environmental conditions (ingress protection (IP) ratings) and functional requirements
 - 2.6** Switchboards are planned to accommodate control and protective devices, links, safety services and other distributor equipment in accordance with relevant industry technical standards
- 3 Plan wiring systems and cables for general electrical installations**
- 3.1** Wiring system is planned and suitable for the environments in which it will operate
 - 3.2** Cable conductor sizes are planned to meet current carrying capacity requirements and voltage drop and earth fault loop impedance limitations in accordance with relevant industry standards
 - 3.3** Circuit protective devices are planned to meet requirements for co-ordination with conductor current carrying capacity in accordance with relevant industry

standards

- 4 Document electrical installation wiring systems, circuits, control and protection**
- 3.4** Earthing system components are planned to meet multiple earthed neutral (MEN) system in accordance with relevant industry standards
 - 4.1** Rationale for device and wiring system planning and calculations are documented
 - 4.2** Manufacturer data is referenced in planning of equipment to ensure materials comply with safety requirements and relevant industry standards
 - 4.3** Electrical installation arrangement and specifications for all items are documented

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

- Planning circuits for control and protection and selecting wiring systems and cables for at least two different general electrical installations, including:
- a main switchboard, supplying more than one circuit each for:
 - lighting
 - socket outlets
 - fixed appliances
 - one installation must include a circuit supplying a three-phase load
 - one installation must include a distribution board separate from the main switchboard

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEEL0080 Plan and analyse wiring systems, circuits, control and protection for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- calculating:
 - prospective fault current in accordance with fault levels specified by the local supply authority
 - earth fault loop impedance in a given circuit
 - expected voltage drop in a given circuit
 - maximum demand on consumer mains, submains and final subcircuits
- determining:
 - requirements for discrimination and back-up protection for coordination of protection devices
 - individual load requirements
 - cable routes, the route lengths of cables and the conditions in which the wiring system is to operate
 - the number and types of circuits required for a particular installation
 - current requirements for given final subcircuits
 - layout/schedule of circuits for given installations
 - maximum demand for consumer mains, submains and final subcircuits for an installation in accordance with industry and regulatory standards
 - suitability of the cable insulation
 - the control and protection for electrical installations
 - multiple earthed neutral (MEN) earthing system
 - control and protective devices to comply with requirements
- selecting:
 - circuit protection devices and residual current devices (RCDs) that comply with all requirements
 - circuit protection devices to satisfy maximum demand and coordination
 - circuit protection devices to satisfy requirements for coordination, discrimination, fault

protection and overcurrent

- minimum size earthing conductors in accordance with relevant industry standards
- circuit breakers to operate when the installation is in island mode
- RCDs/residual-current circuit breaker with overcurrent protection (RCBO) to operate when installation is in island mode
- equipment for damp situations
- overcurrent protection devices, fuses, circuit breakers, RCDs/RCBOs, emergency controls, isolation devices, functional controls and shutdown devices
- a device for fault current limiting protection
- cables for consumer mains, submains and final subcircuits to meet maximum demand and installation conditions, including any derating factors
- cables to satisfy fault loop impedance requirements in addition to current carrying capacity requirements and voltage drop requirements
- conductor size based on the maximum current requirement for a given installation condition
- cables to satisfy voltage drop requirements in addition to current carrying capacity requirements
- isolation and control devices as required by the designed installation and in accordance with industry and regulatory requirements
- dividing the installation into circuits
- obtaining evidence of compliance for the equipment selected
- drawing arrangements of circuit control and protection devices
- documenting the installation arrangement, specification for items selected, reasons for the selections made and electrical installation design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- Standards philosophy and format, including:
 - performance versus prescriptive requirements
 - purpose of technical standards
 - arrangement and use of technical standards in relation to electrical and electronic work
 - how to read and apply a standard
 - standards and codes that apply to all types of electrical installations
 - standards mandated under regulation (e.g. Wiring Rules) or by an authority, deemed-to-comply standards and local service requirements (e.g. service rules)
 - codes applicable to electrical safe working practices and some aspects of the Building Code of Australia (BCA)
- AS/NZS 3000 requirements and safety principles related to wiring systems, circuits, control and protection for electrical installations
- safety principles for electrical systems in buildings and premises

- WHS/OHS legislated requirements and hazards/risks in an electrical installation
- circuit and control arrangements, including:
 - requirements for the provision of the isolation of every circuit in an electrical installation
 - factors to be considered in determining the number and type of circuits required for an installation
 - number and types of circuits required for a particular installation
- methods of protection against direct and indirect contact
- earthing, including:
 - parts of an earthing system and the purpose of each
 - typical arrangement for a MEN system and for a range of installation arrangements of PE conductors
- requirements for equipotential bonding in a range of installation situations
- the effects of overload and short circuit current
- methods of protection against overload and short circuit current
- devices for automatic disconnection of supply, including:
 - operating principles of thermal/magnetic circuit breakers, common types of fuses and RCDs
 - tripping characteristics of various types of circuit breakers
 - time/current curves and fusing characteristics of various types of fuses
 - tripping characteristics of various types of RCDs
 - factors in a fault loop that will affect the impedance of the circuit
 - maximum impedance of an earth fault loop to ensure operation of a protection device
- methods of protection against over voltage and under voltage
- control of an electrical installation and circuits, including:
 - switch types
 - switching requirements
- switchboards including:
 - purpose, types and applications
 - equipment arrangement
 - whole current metering
 - current transformer metering
 - compliance requirements
 - tariff structures for the supply of electricity
 - single-phase metering
 - multi-phase metering
- design and safety performance requirements, including:
 - supply characteristic considerations when designing an electrical installation
 - external factors that may damage an electrical installation
 - methods to protect against risk of ignition of flammable materials and injury by burns from the thermal effects of current in normal service
 - likely sources of unwanted voltages and the methods for dealing with this potential hazard

- requirements for protection against the harmful effects of faults between live parts of circuits supplied at different voltages
- need for protection against injury from mechanical movement and how this may be achieved
- features of ‘fire rated construction’ and how the integrity of the fire rating can be maintained in relation to the electrical installation
- maximum demand on consumer mains and submains, including:
 - methods for determining the maximum demand on an installation’s consumer mains and submains
 - maximum demand for the consumer mains for given installations up to 400 amperes (A) per phase
- cable selection based on the following requirements:
 - current carrying capacity
 - voltage drop
 - fault loop impedance
- cable types including:
 - application of various cord and cable types, as defined by the properties of their insulation, sheathing, armouring and/or screening
 - Australian and international standard colour codes for cords and cables
 - identification of cords and cables by conductor size, type and rating
 - identification of hardware used in terminating cords and cables
 - requirements to protect and support cables adequately (protection against mechanical damage, protection from adverse temperatures and corrosion and protection from magnetic fields that may affect the performance of the cable)
 - structural components of cables and their purpose (conductor material, stranding, insulation type, voltage rating, screening, sheathing, armour and serving)
- wiring system features, applications, relevant industry standards and testing requirements for safe operation relating to:
 - cords, cables and plugs
 - circular and flat TPS wiring systems
 - TPI cables in non-metallic enclosures
 - TPI cables in metallic enclosures
 - fire protection cabling, including:
 - requirements when passing a wiring system through a fire rated wall or floor
 - techniques for recognising different fire protection cable types
 - SWA cables
 - trailing cables and catenary systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to enter a classified hazardous area to undertake work related to electrical equipment. It includes the obligations and safety practices for entering a classified hazardous area. It covers risks associated with flammable gas/vapours or combustible dust and the need for areas where such substances may be present to be classified as explosive atmosphere areas; basic principles of explosion-protected electrical equipment; the limitations of devices/equipment that be may be taken into the area; health and safety responsibilities; and the necessary procedures to enter and work in explosive atmosphere areas. It is adopted from clause 2.2 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA).

This unit can be used in relation to any job function requiring entry to a classified hazardous area.

Site-specific work permits maybe required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment, such as elevated work platforms (EWPs), in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Not applicable.

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to enter and work in a classified hazardous area

1.1 The need for specific safety, entry and work procedures is understood based on knowledge of the properties of flammable substances, the nature of hazardous areas and explosion-protected electrical equipment, and the responsibilities of owners/occupiers for safety of the area

1.2 Site safety procedures related to the explosive atmosphere area are obtained from the person authorised to issue site safety procedures and entry and clearance-to-work permits

1.3 Site safety procedures related to the hazardous area are obtained, interpreted and applied

1.4 Permission to take required devices and equipment into a hazardous area is obtained from the authorised person

1.5 Entry and clearance-to-work permits are obtained from the authorised person, read and understood

2 Follow safety instructions and procedures in a classified explosive atmosphere

2.1 Site safety procedures including entry and clearance-to-work permits are followed

2.2 Limitations on the use of devices and equipment permitted that can be taken into the hazardous area are followed

2.3 Instructions and signage related to the hazardous area are followed

2.4 Emergency procedures and instructions are followed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Entering a classified hazardous area to undertake work related to electrical equipment. must include:

- entering and applying safety responsibilities in an area classified as hazardous

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing to enter a hazardous area, including:
 - obtaining, interpreting and applying hazardous area site safety procedures
 - seeking permission from authorised person/s to take particular devices and equipment into a hazardous area
 - obtaining, interpreting and applying the conditions of entry and clearance-to-work permit
- complying with all safety requirements for the hazardous area, including:
 - limitations on the use of devices/equipment permitted to be taken into the hazardous area
 - entry permit and clearance-to-work conditions
 - hazardous area instructions and signage
 - emergency procedures and instructions

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- nature of hazardous areas and explosion protection, including:
 - the standard definition of a hazardous area
 - conditions in an explosive atmosphere that will lead to ignition, combustion and propagation of a hazardous area
 - the explosive nature of flammable substances in the form of gas, vapour, dust, fibres or flyings
 - typical parameters for flammable gases and vapours such as lower explosive limits (LEL) and upper explosive limits (UEL), flash point, auto-ignition temperature, minimum ignition energy and relative density
 - the toxic nature of gases and vapours and potential harmful consequences
 - typical parameters for combustible dusts such as minimum explosible concentration, minimum cloud and layer ignition temperatures, minimum ignition energy and the

- considerations of clouds versus layers of dust
- the classifications given to hazardous areas
- electrical equipment as a potential source of ignition
- characteristics of devices/equipment that require authorisation to be taken into a hazardous area
- responsibilities for the safety of a hazardous area and the responsibilities of persons entering a hazardous area, including:
 - responsibilities of owners/occupiers of sites where production, process, handling and/or storage activities may cause explosive atmospheres to be present
 - features and purpose of an entry permit and clearance-to-work system
 - safety precautions to be taken while in a hazardous area
 - safety procedures to be followed before entering a hazardous area
 - typical procedures to be followed in the event of an emergency.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions and include:

- an area designated as a hazardous area which is a close facsimile of a real work environment
- an area entry point
- delineation of the area into zones for both gas and dust
- a person to act as the 'authorised person' for the site
- a qualified supervisor.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate access equipment, explosive atmosphere equipment, tools and testing devices permitted in a hazardous area, materials and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, safe work methods, plan of the site showing delineation of classified zones, regulations, codes of practice and details of:
 - signage used on the site
 - limitations of devices and equipment that may be taken into the area
 - limitations of work that may be undertaken in the area

- an entry and clearance-to-work system.

UEEHA0008 Design gas detection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design gas detection electrical systems and installation for a hazardous area.

It includes determining gas detection electrical system equipment parameters and evaluating these against manufacturer specifications. It also includes designing and documenting gas detection electrical system.

This unit augments formally-acquired competencies in a relevant industry. It applies to engineering design job functions at least at an engineering associate level.

Hazardous area (gas or vapour) is one in which an explosive gas atmosphere is present, or may be expected to be present, in quantities such as to require special precautions for the construction, installation and use of apparatus.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|---|------------|--|
| 1 Determine gas detection electrical system parameters | 1.1 | Requirements for gas detection system are obtained or determined with relevant person/s |
| | 1.2 | System parameters for gas detection are obtained and documented from consultation with relevant person/s |
| | 1.3 | Explosion-protection requirement for gas detection equipment is determined from area classification documents |
| 2 Select gas detection electrical equipment | 2.1 | Manufacturer specifications and operating limitations of gas equipment are obtained and analysed in accordance with workplace requirements |
| | 2.2 | Manufacturer specifications and operating limitations are compared with the required workplace parameters for gas detection system |
| | 2.3 | Gas detection equipment is selected on compatibility with hazardous area workplace parameters and economic considerations |
| 3 Document gas detection equipment design | 3.1 | Proposed gas detection equipment design is checked in accordance with workplace procedures for compliance with relevant industry standards and hazardous area requirements |
| | 3.2 | Gas system specification for gas detection equipment is documented in accordance with workplace procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEM079A Design of gas detection systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEHA0008 Design gas detection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- accessing and interpreting gas detection hazardous area workplace needs and parameters
- applying relevant contingency management skills
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - risk control measures
 - workplace procedures and practices
- applying sustainable energy principles and practices
- designing gas detection systems within a hazardous area
- documenting gas detection equipment system design
- following, checking and documenting workplace procedures
- providing gas detection equipment selection options based on parameters for gas detection and economic considerations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- maintenance procedures in hazardous areas that will ensure the integrity of the explosion-protection technique, including:
 - the purpose of a maintenance schedule
 - the purpose and extent of ‘close’, ‘sample’ and ‘periodic’ inspections
 - the features of each explosion-protection techniques that should be included in a maintenance schedule
 - the impact of environmental conditions on explosion-protected equipment, including corrosion and frequency of maintenance
 - the documentation requirements for recording the maintenance process and results
 - the use of standards in determining the requirements with which the design of explosion-protected apparatus shall comply

- techniques for the installation and maintenance of fixed gas detection equipment, including:
 - use of manufacturer instruction manuals; for example, operating instructions, adjustments procedures and operational limitations
 - installation and maintenance of standards and/or codes of practice for gas detection equipment
- location of fixed sample points or sensors, including:
 - optimal sensing
 - maintainability and ease of calibration
 - protection against environmental and mechanical damage
- gas and vapour releases, including:
 - the nature of a site
 - natural and mechanical ventilation
- common problems with fixed gas detectors
- calibration and response checking
- factors to consider in the evaluation and selection of portable and fixed gas detection equipment, including:
 - requirements for gas detection for a given situation, including:
 - sources for obtaining data on physical chemistry of the gas to be detected
 - sources for obtaining data on the conditions under which the gas may be present
 - processes of assessing the specifications of gas detection equipment against established requirements
- detecting gases and vapours, including:
 - apparatus capability and users' knowledge
 - propagation of gases - release of gas and vapours, ventilation, density, and temperature and location
 - gases to be detected and not to be detected
 - intended application
 - environmental effects
 - safety when monitoring for flammable gases where personnel could be present
 - common properties of gases and vapours - density of gases, vapours and their mixtures; effect of temperature on density; lower explosive limit (LEL) and upper explosive limit (UEL) of combustibles and toxicity
 - the differences between detecting gases and vapours - added complication of evaporation, condensation and temperature effects of vapours and their effect on propagation, calibration and detection, including sampling
- oxygen deficiency and effects on safety, including:
 - chemical reaction of oxygen with solid products
 - chemical reaction of oxygen with gaseous products
 - dilution of the air by displacement by some other gas or vapour
- measuring principles of catalytic sensors, electrochemical sensors, infrared sensors and semi-conductor sensors, including:

- common applications
- limitations and safety
- interferences of other gases with the measurement
- poisoning of the sensor
- measuring principles of thermal conductivity sensors, flame ionisation, detectors (FID), flame temperature analysers (FTA), photo ionisation detectors (PID) and paramagnetic oxygen detectors
- selection of apparatus, including:
 - environment
 - system response delay
 - gas to be detected with respect to measurement principles
- behaviour of gas and vapour releases, including:
 - rate of release
 - density
 - temperature/pressure
- design and installation, including:
 - sensor, sampling or open path
 - location
 - site
 - environmental conditions (adverse weather, excess temperature, vibration and other mechanical interference, hosing, airborne contaminants and corrosion)
- integrity and safety, including:
 - redundancy
 - protection against loss of power supply
- commissioning and scheduled maintenance, including:
 - sample lines
 - diffusion sensor screens
 - initial gas calibration
 - adjustment of alarm set points
 - plans and records.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to designing gas detection systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEHA0016 Assess the fitness-for-purpose of explosion-protected equipment

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assess the fitness-for-purpose of explosion-protected aspects of equipment that has no certificate of conformity available (or the origin of a certificate cannot be verified), consistent with the requirements of AS/NZS60079.17.

It includes: gathering, establishing and evaluating technical information on relevant explosion-protection types; and, reporting on evaluations and findings, including recommendations based conditions of control, sound engineering, safety requirements and economic considerations.

This unit applies to personnel involved in engineering functions or maintenance (e.g. end users) when considering the continued use and/or refurbishment of legacy plant. It applies also to those personnel involved in the reclamation and/or repair and overhaul of equipment.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit is adopted from clause 2.12 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.12 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to assess the compliance of general electrical and control equipment at AQF level 7 and NZQF level 7 (BD) or equivalent."

Pre-requisite Unit

UEEHA0019 Conduct a conformity assessment review of explosion-protected equipment

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to assess fitness-for-purpose of equipment and systems

2 Gather technical information to assess fitness-for-purpose of equipment and systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS policies and safe work methods are obtained and reviewed
- 1.2** Equipment or system to be assessed is determined from instructions and in consultation with authority of the owner
- 1.3** Equipment specification is obtained from site records or equipment/system manufacturer (where available)
- 1.4** Authenticity of obtained documentation is verified with the issuing organization or the assessor
- 1.5** Applicable standards and codes of practice the equipment or systems are to be assessed against are obtained and reviewed
- 1.6** If equipment specification is unavailable, arrangements are made to establish the specification of the equipment to determine the normal operating and explosion-protection performance parameters of the equipment or system
- 1.7** Tools and certified measuring and testing devices needed to carry out field measurements and testing are obtained and checked for correct operation and safety
- 2.1** Safe work methods for hazardous areas and assessment tasks are accepted and followed
- 2.2** Measurements and tests are carried out to verify the specification and operating parameters of the equipment or system

- 2.3** Data relevant to the specification is gathered to assess and verify the equipment or system according to the applicable standards and codes of practice
- 3 Assess equipment/systems against standards**
- 3.1** Equipment or system details are assessed, including measurement, tests, 'alternative' tests and calculations and the design specifications, for compliance with each relevant clause in the applicable standard
- 3.2** Differences between the equipment or system assessment and standards requirements are identified and documented
- 3.3** Recommendations are developed as to whether remedial work is viable for equipment or systems that are not initially assessed as fit-for-purpose
- 3.4** Specifications are recommended for the remediation of equipment or systems to be suitable as fit-for-purpose
- 4 Develop and submit a fitness-for-purpose report**
- 4.1** Assessment results concerning the integrity of explosion-protected electrical equipment or systems are documented in a fitness-for-purpose report that includes the processes taken and justification for the outcomes
- 4.2** Fitness-for-purpose report and all required appended documentation is forwarded to the person responsible for maintaining compliance records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0016 Assess the fitness-for-purpose of explosion-protected equipment

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to assess fitness-for-purpose of equipment and systems including:
 - obtaining and reviewing WHS policies and safe work methods.
 - obtaining design documentation for the equipment or systems to be assessed from site records or the manufacturer and verifying their authenticity with issuing organization or assessor
 - obtaining the standards and codes of practice against which the equipment or system are to be assessed
 - arranging for the equipment or system specifications and normal operating parameters to be established, given design documentation is not available
 - obtaining required tools and certified measuring and testing devices and checking them for correct operation and safety
- gathering technical information to assess equipment and systems including:
 - accepting and following safe work methods
 - carrying out measuring and testing to verify equipment or system specifications and parameters
 - gathering all data relevant to the specification to assess and verify the equipment or system according to the applicable standards and codes of practice
- assessing equipment/systems against standards including:
 - assessing equipment or system details, including calculations, measurements, test results and design specifications, for compliance with each relevant clause in the applicable standard
 - identifying and documenting differences between the equipment or system assessment and standards requirements
 - developing a recommendation as to whether remedial work is viable for equipment or systems that are not initially assessed as fit-for-purpose
 - developing specifications, as a recommendation, for the remediation of equipment or systems to be suitable as fit-for-purpose
- developing and submitting a fit-for-purpose report including:

- documenting a fit-for-purpose report that includes assessment results concerning explosion-protection integrity of the equipment or system, the processes taken and justification for the outcomes
- forwarding the fit-for-purpose report and all appended documents to the person responsible for maintaining compliance records.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standards and codes of practice including:
 - compliance requirements in standards/codes applicable to the equipment or system at the time of installation
 - compliance requirements in current standards applicable to the equipment or system
 - means of accessing older and redundant standards and design documentation
- explosion-protected equipment and systems including:
 - explosion-protection aspects specified in current and redundant standards
 - equipment or system specifications and parameters relevant to the assessment
 - scope for developing a specification given design documentation is unavailable
- measurement and testing including:
 - measurements and tests specified in standards
 - alternate 'equivalent' tests or calculations
 - measuring and testing procedures including:
 - calibration and certification of required devices
 - safe work methods
 - availability and use of third party testing facilities
- assessment process including:
 - data and information required
 - comparing information gathered with requirement in standards
 - limits of remedial work
 - content of a fit-for-purpose report.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational

situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- safe work methods
- compliance records (verification dossier) for the site.
- equipment subject to the assessment:
 - single items
 - packaged equipment
- certification documentation and related hazardous area compliance standards for which the certification was granted
- standards against which compliance is sought
- relevant measurement and testing equipment or facility.

UEEHA0017 Classify areas where a combustible dust hazard may arise

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to classify areas where explosive dust atmospheres and combustible dust layers may arise. It includes: applying area classification recommendations from relevant codes and standards to meet objectives, gathering and analysing data relative to potential explosion hazards, including characteristics of the hazardous materials; identifying and characterising sources of release; assessing dispersion and ventilation factors; considering housekeeping level; and determining the extent of the hazard and documenting findings.

Area classification should be carried out by those who understand the relevance and significance of properties of flammable materials (dust), and those who are familiar with the process and the equipment (refer AS/NZS60079.10.2).

This unit applies to personnel involved in the front-end engineering and design (FEED) scopes for facilities that may contain explosive dust atmospheres and combustible dust layers, as well as those persons involved in the ongoing operations, maintenance and/or modification of these same facilities, during the facility life cycle. It is appropriate for people who need to meet their responsibilities as required by AS/NZS3000:2018.

Site-specific work permits may be required to work in a classified hazardous area. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions. The classification process assists in the implementation of these safe systems of work.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit is adopted from clause 2.16 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.16 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to gather and analyse technical data in a relevant engineering or scientific discipline at AQF level 7 or NZQF level 7 (BD) or equivalent."

Pre-requisite Unit

There are no prerequisite units

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine the combustible characteristics of the material and extent of explosion hazard

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Knowledge of the factors considered in classification of combustible dust atmospheres is applied
- 1.2** Consideration is given to reducing the extent of explosion hazards by the application of hierarchy of risk controls
- 1.3** Dust combustibility is determined in consultation with process specialists and relevant sources of information and, where applicable, obtaining confirmation by commissioning laboratory tests
- 1.4** Material characteristics such as particle size, moisture content, cloud and layer minimum ignition temperature and electrical resistivity, are obtained from process specialists and relevant sources of information and, where applicable, laboratory tests
- 1.5** Dust containment and sources of release, including likely formation of dust layers are identified from process personnel with operational and maintenance experience
- 1.6** The probability that dust will be released and form an

explosive dust atmosphere in an installation is determined from possible causes and characteristics of release taking into account ventilation and dust extraction

2 Assign the type and extent of zones

2.1 Sources and grades of release and dust deposits in layering that may occur in the area are established from collected data and consultation with process specialists

2.2 Area classification zones are attributed according to the frequency and duration of the occurrence of explosive dust atmospheres

2.3 The extent of each zone is determined in accordance with the relevant standard and in consideration of examples of locations that may give rise to a zone

2.4 The nature of housekeeping is taken into account

3 Document classification and delineation of zones

3.1 Area classification processes and procedures are documented as required by the relevant standards including the level of housekeeping on which the classification is based

3.2 Classification documentation records are provided for future reference and for incorporation in the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Essential operating conditions include:

- existing, new or proposed site and engineering office associated with the activities where a combustible dust hazard may arise
- inspection access to site processes and operation personnel
- relevant plant design specifications and drawings, process line diagrams, relevant material data and

technical standards

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0017 Classify areas where a combustible dust hazard may arise

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- determining the combustible characteristics of the material and extent of explosion hazard including:
 - determining dust combustibility in consultation with process specialists and obtaining confirmation from laboratory tests and other sources
 - obtaining relevant material characteristics from process specialists and, where applicable, laboratory tests and other sources
 - identifying dust containment and sources of release, including likely formation of dust layers from process diagrams and plant drawings
 - determining the probability that dust will be released and form an explosive dust atmosphere in an installation from possible causes and the characteristics of release
 - considering the application hierarchy of risk controls to reducing the extent of explosion hazards
- assigning the type and extent of zones including:
 - establishing the sources and grades of release and dust deposits in layering that may occur in the area from collected data and in consultation with process specialists and site personnel
 - attributing area classification zones according to the frequency and duration of the occurrence of explosive dust atmospheres and the extent of each zone
 - determining the extent of each zone in accordance with the relevant standard
 - consulting with plant management to develop strict housekeeping arrangements to negate the hazards posed by the formation of dust layers
- documenting classification and delineation of zones including:
 - documenting the area classification processes and procedures as required by the relevant standards
 - providing classification documentation records for future reference and for incorporation in the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- properties of combustible dusts including:
 - material characteristic (of a given process)
 - dust groups
- dust containment process study including:
 - determining the frequency of dust clouds for:
 - normal operation
 - abnormal operation
 - start-up
 - shut-down
 - documenting results
- sources and characteristics of release including:
 - plant and process design
 - examples of locations that may give rise to a given zone cited in the relevant standard
 - factors affecting:
 - formation of dust atmosphere outside equipment
 - extent of dispersion of dust to a point where dust is not hazardous
 - assigning grades of release
- attributing zones including:
 - frequency and duration of the occurrence of explosive dust atmospheres forming
 - factors affecting the extent of zones
- dust layer hazards including:
 - how dust layers form
 - behaviour of dust layers
 - dust layers as an ignition source
 - negating risk of dust layering
- documentation requirements including:
 - all relevant information and references
 - results material combustibility and process studies
 - marked up drawings data sheets and table
 - justifications for decisions made.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory

requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- the following equipment and artefacts in relation to several different processes:
 - plant specification and design including:
 - plan and elevation drawings
 - details of plant design and operation
 - climatic and topographic information of the site
 - verification dossier for the site
 - process specification including:
 - process line diagram
 - process specification
 - known material data
 - relevant standards and codes.

UEEHA0018 Classify areas where flammable gas or vapour hazards may arise

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to classify areas where flammable gas or vapour hazards may arise. It includes: applying area classification recommendations from relevant codes and standards to meet objectives; gathering and analysing data relative to potential explosion hazards, including characteristics of the hazardous materials; identifying and characterising sources of release; assessing dispersion and ventilation factors; considering plant process and environmental conditions; and determining the extent of a potential release and documenting findings.

Area classification should be carried out by those who understand the relevance and significance of properties of flammable materials (gas & vapours), and those who are familiar with the process and the equipment (refer AS/NZS60079.10.2).

It applies to personnel involved in the front-end engineering and design (FEED) scopes for facilities that may contain flammable gas or vapour hazards, as well as those persons involved in the ongoing operations, maintaining and/or modification of these same facilities, during the facility life cycle. It is appropriate for people who need to meet their responsibilities as required by AS/NZS3000:2018.

Site-specific work permits may be required to work in a classified hazardous area. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions. The classification process assists in the implementation of these safe systems of work.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements have been adopted from clause 2.15 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.15 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to gather and analyse technical data in a relevant engineering or scientific discipline at AQF 7 or NZQF level 7(BD) or equivalent."

Pre-requisite Unit

There are no prerequisite units

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine the type and extent of explosion hazard

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Knowledge of the safety principles and objectives of area classification and methods applied to examining the extent to which an explosive hazard may arise
- 1.2** Extensive knowledge of gas and vapour characteristics are applied
- 1.3** Consideration is given to reducing the extent of explosion hazards by the application of a hierarchy of risk controls
- 1.4** The likelihood of an explosive atmosphere occurring, in accordance with the definitions of zones, is established from process and plant layout drawings and specifications, and by consultation with process-operating personnel
- 1.5** The parameters of flammable materials and the processes by which they may arise affecting the type and extent of zones are obtained and listed together with the sources from which they came
- 1.6** Sources and grades of release of flammable gases or vapours that may occur are established from first principles with reference to process, instrumentation and plant layout drawings and specifications and by consultation with process and engineering design

- personnel
- 1.7 Characteristics of release are assessed with the factors affecting those characteristics including gas mixtures
 - 1.8 Consideration is given to eliminating or reducing the likelihood of an explosive atmosphere arising in consultation with process, operating and engineering personnel
 - 1.9 Understanding of ventilation and dispersion aspects and the application of artificial ventilation is applied including estimations/calculations of the ventilation rates to reduce an explosive gas atmosphere in consultation with process and engineering design personnel
- 2 Establish the area classifications**
- 2.1 Acceptable methods for establishing the type and extent zones are applied
 - 2.2 The use of illustrative examples in establishing the type and extent of zones is validated in accordance with the standards and any limitations are documented
 - 2.3 The types and extent of zones are established from the data collected in the analysis of the area and in consultation with process and engineering specialist personnel
- 3 Document classification process and delineation of zones**
- 3.1 The classification process taken, relevant material properties and justification for the classifications given is documented in accordance with provisions of standards
 - 3.2 Sources of release and zones are shown on plant drawing in accordance with provisions of standards
 - 3.3 All classification documents are filed for future reference and forwarded to the appropriate personnel for inclusion in the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

- Essential operating conditions include:
- an engineering office associated with an existing, new or proposed site where the activities may cause a flammable gas or vapour hazards to arise
 - plant specifications such as plan and elevation drawings
 - process drawings (e.g. PID diagrams)
 - relevant pipe work diagrams
 - details of vessels and storage tanks
 - climatic and topographic information of the site
 - process specifications such as liquids and gases involved, flow rates, pressures and temperatures and process descriptions and operations are required
 - process and engineering design and operational personnel
 - relevant standards and codes

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0018 Classify areas where flammable gas or vapour hazards may arise

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- establishing the likelihood of an explosive atmosphere arising including:
 - reviewing process, instrumentation and plant layout drawings and specifications to identify sources and grades of release
 - obtaining properties of materials relevant to the area classifications
 - estimating/calculating the rates of release and release conditions
- considering means of eliminating or reducing risks of an explosive atmosphere arising in the presence of a potential ignition source including:
 - elimination or relocation of potential ignition sources
 - elimination or relocation of sources of release
- investigating the application and influence of ventilation and dispersion factors including:
 - determining the rate and availability of ventilation and dispersion factors
 - applying guidance given in standards to assess the degree of dilution and the persistence of an explosive gas atmosphere
- establishing the types and extent of zones for the final plant/process design including:
 - analysing the collected data
 - using appropriate analysis methodologies
 - consulting process and engineering specialist personnel
- documenting area classification in accordance with provisions of standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- safety principles and objectives of area classification encompassing safety and economic aspects including:
 - reducing the likelihood of a gas atmosphere occurring
 - using equipment that has a low likelihood of creating an ignition source

- relative cost of compliant equipment within the classified zones
- properties of hazardous materials including:
 - properties of materials relevant to area classification such as, molecular mass, flash point, boiling point, ignition temperature, vapour pressure, vapour density, explosive limits, equipment group and temperature class
 - sources from which properties of explosive hazardous material can be obtained
 - fundamentals of all alternative analysis methodologies
- sources and grades of release of a flammable gas or vapour hazard including:
 - items of plant that should be considered as potential sources of release including those giving:
 - continuous grades of release
 - primary grade of release
 - secondary grade of release
 - the criteria on which openings are considered a source of release
 - the criteria for establishing the zones in which an explosive atmosphere may arise
 - release rate of gas or vapour including:
 - geometry of the source of release
 - release velocity
 - concentration
 - volatility of a flammable liquid
 - liquid temperature
 - methods and equations for estimating the release rate of liquid and the release rate of gas, including the limitations and accuracy of the selected equations
- ventilation and dispersion including:
 - location of sources of release in relation to ignition sources
 - effects of climatic conditions and topography
 - nature and mechanisms for dispersion and dilution
 - ventilation including:
 - purpose
 - types and degrees of ventilation
 - methods for estimating and calculating ventilation and dispersion criteria
 - influence of independent ventilation on types of zones
 - multiple sources of release
- acceptable methods for establishing the type and extent of zones including:
 - limitations and application in the use of illustrative examples
 - generalized methods
 - limitations and use of calculation methodologies in relevant standards
 - suitability and use of modelling tools such as CFD
 - alternative codes
 - relationship to 'equipment protection level' (EPL) and risk assessment

- fundamentals of all alternative analysis methodologies
- recommendations for documenting classification decisions including:
 - steps which lead to the final area classification including:
 - recommendations from relevant standards and codes
 - gas and vapour characteristics and calculations
 - study of ventilation and dispersion characteristics
 - data sheets and tables listing flammable material characteristics and sources of release
 - drawings showing the type and extent of zones, equipment groups and ignition temperature.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- the following equipment and documentation in relation to several different processes:
 - plant specification and design including:
 - plan and elevation drawing
 - process drawings such as PID diagrams
 - relevant pipe work diagrams
 - relevant details of process equipment including vessels and storage tanks
 - relevant climatic and topographic information of the site
 - process specification including:
 - liquids and gases involved
 - flow rates, pressures and temperatures
 - process and operational (if available) descriptions
 - relevant standards and codes.

UEEHA0019 Conduct a conformity assessment review of explosion-protected equipment

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assess for conformity single items of explosion-protected equipment or systems, or packaged explosion-protected equipment that has certification documentation however, not covered under industry certification schemes or AS/NZS Standards.

It includes: examining, comparing and documenting explosion-protection methods and related protection types; evaluating the certification issued for a single item or system, or packages of explosion-protected equipment against certification requirements for another country/region; and writing a conformity assessment document.

This unit applies to personnel involved in engineering functions or maintenance (end users) when considering the selection, installation and maintaining of equipment, packages and systems during a facility life cycle.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.11 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.11 of AS/NZS 4761.1:2018 also includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to assess electrical/electronic equipment and perform general technical evaluation at AQF level 7 or NZQF level 7 Bachelor Degree (BD) or equivalent."

Pre-requisite Unit

UEEHA0020 Conduct detailed inspection of electrical installations for hazardous areas

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct conformity assessment

2 Conduct conformity assessment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Criteria on which the equipment subject to assessment was certified is determined from the original certification documents
- 1.2** Standards against which conformity is to be assessed are obtained and relevant clauses identified and reviewed
- 1.3** Equipment details are obtained to assess relevance of clauses in standards against which conformity is to be assessed
- 1.4** Understanding of certification processes and the requirements for validation of certification documents and manufacturing quality controls is applied
- 1.5** Safety procedures for site inspections are followed where equipment subject to the conformity assessment is installed in an operating plant
- 2.1** Conformity assessment is carried out in accordance with WHS and other required procedures
- 2.2** Knowledge of explosion-protection standards is applied to a detailed comparison of standards on which the original certification is based with those of another country/region
- 2.3** The documented certification criteria of the equipment are compared to those required for a given country/region, including any compliance tests on which the certification is based

- 2.4 All information in the equipment certification documents, including that relevant to its use are addressed in the conformity assessment, e.g. installation, maintenance, overhaul/repair and conditions of use
 - 2.5 Differences between the certification documentation and that for a given country/region are identified and actions needed to address non-compliant safety issues are recorded
- 3 Document and submit conformity assessment report**
- 3.1 Results are documented in a conformity assessment document, informing whether the equipment provides an ‘equivalent level of safety’ to be installed, maintained, overhauled/repared and used safely in a hazardous area
 - 3.2 Recommendations for remedial actions, if needed to address non-compliance safety issues, are included in the conformity assessment document
 - 3.3 Conformity assessment documentation is forwarded to the appropriate person for inclusion in the hazardous area/explosion-protection compliance records for the site (verification dossier)

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEHA0019 Conduct a conformity assessment review of explosion-protected equipment

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to conduct conformity assessment including:
 - determining the criteria by which equipment is to be assessed from its original certification documentation
 - reviewing requirements in the standards against which conformity is to be assessed for certification
 - obtaining equipment details to assess relevance of Clauses in standards against which conformity is to be assessed
 - following safety procedures for inspecting equipment subject to the assessment that is in situ
- conducting conformity assessment including:
 - carrying out assessment in accordance with WHS/OHS and other required procedures
 - comparing certification criteria against those for a given country/region
 - addressing all information in the equipment certification documents including conditions for use
 - identifying the differences between the equipment certification and that required for a given country/region and recording actions needed to address these
- documenting and submitting conformity assessment report including:
 - documenting conformity assessment report including:
 - whether the equipment provides an ‘equivalent level of safety’ to be installed, maintained, overhauled/repaired and used safely in a hazardous area; or
 - recommendations for remedial actions to correct non-compliance issues
 - providing conformity assessment documentation to the appropriate person.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- explosion-protected equipment certification including:
 - certification requirements and the applicable standards which may be used for certification of equipment acceptable for use in relevant regions of the world which may:
 - Australia and New Zealand
 - European Union countries
 - USA
 - Canada
 - Asian countries
 - Latin American countries
 - South American countries
 - South Africa
 - other aspects of electrical equipment compliance that may affect Ex certification
- common and different aspects of hazardous areas and explosion-protection equipment specified in compliance requirements for different countries/regions including:
 - classification of zones and divisions
 - equipment group and class
 - explosion -protection concepts
 - temperature classifications
 - equipment classification and protection levels
 - enclosure ingress protection/type rating
 - equipment marking
- common and different aspects of hazardous areas installation specified in compliance requirements for different countries/regions including:
 - installation practices
 - inspection and maintenance
 - overhaul, repair and reclamation
 - equipment modification
 - certification processes and requirements for validation of certification documents and manufacturing quality controls.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- applicable documentation including:
- WHS/OHS policy and procedures for the site
- explosive-protected equipment to be assessed (single items and package explosion-protected equipment)
- equipment certification documents
- Standards to which equipment was certified
- Standards and processes against which equipment certification is to be assessed.

UEEHA0020 Conduct detailed inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0001 Conduct detailed inspection of electrical installations for hazardous areas.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to conduct detailed inspections of the explosion-protection aspects of electrical installations for hazardous areas. It includes using a verification dossier; working safely in a hazardous area; conducting initial, periodic and sample inspections; complying with inspection standards; and recording inspection results.

This unit applies to inspection functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.7 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.7 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to inspect electrical installations in a non-hazardous area at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

UEEHA0038 Conduct visual and close inspection of electrical installations for hazardous areas

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for inspection

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS procedures and safe work methods are reviewed in preparation to work in a classified hazardous area
 - 1.2 Knowledge of the scope of detailed inspections specified in inspection standards and site inspection program is applied to work preparation
 - 1.3 Classification of the area is ascertained from hazardous area layout drawings retained in the verification dossier
 - 1.4 Type and grade of inspection is ascertained from the inspection schedule retained in the verification dossier
 - 1.5 Classification details and specified location of each item of equipment and circuits subject to inspection are determined from design drawings and equipment certification documentation retained in the verification dossier
 - 1.6 Special tools, equipment and testing devices needed to carry out the inspection are checked to ensure they are safe and serviceable, and any defective items are either rectified or replaced
-
- 2.1 Safe work methods relating explosive atmospheres and inspections, including isolation of equipment, are obtained and applied
 - 2.2 Knowledge of the explosion-protection aspects of equipment and hazardous area installation requirements is applied

2 Conduct inspection

- 2.3 Equipment, systems and installation are inspected for compliance with the design specifications retained in the verification dossier and in accordance with the inspection schedule and standards
 - 2.4 Where applicable in a given jurisdiction, an appropriately authorised person is directed to remove equipment enclosure covers and internal components, where needed, to enable inspection
 - 2.5 Arrangements are made to store and protect equipment covers and components that are removed to enable inspection
 - 2.6 Where applicable in a given jurisdiction, after the inspection of each item, an appropriately authorised person is directed to replace equipment covers and components in a manner that ensures the integrity of the explosion-protection system
- 3 Record results of detailed inspection**
- 3.1 Results of inspection are recorded in accordance with inspection standards
 - 3.2 Defects such as equipment deterioration, faults and unauthorised modifications are recorded in accordance with inspection standards
 - 3.3 Actions to rectify defects are specified in the inspection record
 - 3.4 The inspection record is forwarded to the appropriate personnel for inclusion in the verification dossier in accordance with inspection standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Conducting detailed inspection of electrical

- new and existing installations and existing

installations for hazardous areas must apply to:

Conducting detailed inspection of electrical installations for hazardous areas be guided by:

installation after repairs and maintenance have been carried out

- content of the verification dossier and requirements of inspection standards requiring the use of access equipment, tools and testing devices

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0001 Conduct detailed inspection of electrical installations for hazardous areas.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEHA0020 Conduct detailed inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0001 Conduct detailed inspection of electrical installations for hazardous areas.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing to conduct a detailed inspection of the electrical installation, including:
 - reviewing safe work methods associated with the classified area in which the work is to be carried out
 - determining the scope of inspection, including:
 - ascertaining the area classification from hazardous area layout drawings retained in the verification dossier
 - ascertaining the type and grade of inspection from the inspection schedule retained in the verification dossier
 - determining classification details and the specified location of each item of equipment and circuits subject to the inspection from design drawings and equipment certification documentation retained in the verification dossier
 - checking safety and serviceability of special tools, equipment and testing devices needed to carry out the inspection
- conducting detailed inspections of the electrical installation encompassing:
 - accepting and following safe work methods relating to the work
 - carrying out the detailed inspection to requirements, including:
 - conducting detailed inspections for compliance with design specifications and in accordance with inspection schedules and standards
 - making arrangements to store and protect parts of equipment dismantled in order to conduct inspection
 - where applicable in a given jurisdiction, directing an authorised person to:
 - disconnect and dismantle equipment as necessary to conduct the inspection
 - reconnect and reassemble equipment in a manner that ensures the integrity of the explosion-protection system after equipment is inspected
- completing records of detailed inspections of the electrical installation, including:

- recording the results of the detailed inspection including equipment deterioration, faults and unauthorised modifications
- specifying actions to rectify defects found in the inspection
- forwarding the inspection record for inclusion in the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- safe work procedures for explosive atmospheres, including:
 - Work health and safety (WHS)/occupational health and safety (OHS) procedures for working in hazardous areas
 - permit to work systems that cover the hazardous aspects of specific work and location
- scope and aspects of detailed inspections, including:
 - inspection program for the site based on schedules specified by inspection standards
 - periodic inspection schedules covering equipment, installations and environment for:
 - Ex ‘d’, Ex ‘e’ and Ex ‘n’ installations
 - Ex ‘i’, Ex ‘iD’ and Ex ‘nL’ installations
 - Ex ‘p’ and Ex ‘pD’
 - Ex ‘t’
- specific aspects of initial inspections including ensuring:
 - equipment is appropriate to the equipment protection level (EPL)/zone requirements of the location
 - equipment group is correct
 - equipment maximum surface temperature is correct
 - equipment circuit identification
 - cable gland
 - type of cable
 - sealing
 - fault-loop impedance or earthing resistance
 - overload protection
- additional aspects of initial inspection schedule requirements for types of protection:
 - ‘d’ – flameproof enclosure
 - ‘e’ – increased safety
 - ‘i’ and ‘iD’ – intrinsic safety
 - ‘p’ and ‘pD’ – pressurised enclosure
 - ‘n’ - non-sparking enclosure
 - ‘t’ – protection by enclosure
 - ‘m’ and ‘mD’ -encapsulation

- ‘o’ oil-immersion
- ‘q’ powder-filling
- ‘v’ – ventilation
- ‘p’ – pressurisation — rooms
- requirements for installing equipment and wiring systems for explosive atmospheres, including:
 - required documentation
 - installation requirements for protection from dangerous (incendive) sparking, including:
 - earthing system requirements
 - SELV and PELV systems
 - electrical separation
 - limitation of equipment installed above a hazardous area
 - requirements for potential equalisation, including:
 - various earthing systems
 - bonding systems
 - cable armour and screens
 - exposed conductive parts
 - metallic enclosures
 - cathodic protection
 - temporary bonding
 - wiring systems, including:
 - limitation on the use of aluminium conductors
 - fixed cable and wiring systems permitted for Groups I, II and III
 - wiring systems permitted and not permitted in or above hazardous areas
 - cables supplying transportable and portable equipment
 - flexible connections and flexible cables
 - connection to equipment, including:
 - cable glands and blanking elements per enclosure type
 - non-electrical entries
 - conduit systems
 - termination of conductors
 - treatment of unused core
 - unused opening/entries in enclosures
 - joining cables
 - openings in walls
 - passage and collection of flammables
 - additional requirements for each type of explosion protection
- cable and conduit termination devices and techniques, including:
 - cable glands, conduits and sealing:
 - types of glands and components

- requirements for fitting glands and applying sealing compound
- requirements for conduit seals and applying sealing compound.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions and include:

- an area designated as a hazardous area which is a close facsimile of a real work environment
- an area entry point
- delineation of the area into zones for both gas and dust
- a person to act as the 'authorised person' for the site
- a qualified supervisor.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, safe work methods, explosive atmosphere equipment, installation and inspection standards, and verification dossier for the site, including:
 - design documentation
 - area classification drawings
 - certification documents for each item of equipment
 - inspection records
 - maintenance records.

UEEHA0021 Design explosion-protected electrical systems and installations

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply explosion-protection aspects in designing electrical power, control and instrumentation systems and installations for hazardous areas.

It includes: understanding of the explosion-protection required for electrical installation for hazardous areas; determining the scope of the required electrical installation from hazardous area classification drawings, process specifications and plant design; documenting detailed specifications of compliant explosion-protected equipment and wiring systems, equipment locations, cable routes; and obtaining and interpreting the standards to which the installations need to comply.

This unit applies to electrical, instrumentation and control engineering design job functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.13 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.13 of AS/NZS 4761.1:2018 also includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to design general electrical and control systems and installations at AQF level 6 or NZQF level 7 or equivalent."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Establish the explosion-protection requirements for an electrical system and installation

2 Incorporate the explosion-protection requirements in electrical systems and installation design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Explosion- protection requirements for electrical installation for hazardous areas are obtained, interpreted and applied

1.2 Hazardous area classification drawings, process specifications and plant design documentation are reviewed and the scope of the required electrical installation determined

1.3 Explosion-protection requirements are determined from reviewing the standards to the installation is required to comply

2.1 Consideration is given to locating electrical equipment in non-hazardous areas, where possible

2.2 The installation is designed to maximise ease of access for inspection and maintenance

2.3 Ability to obtain the required degree of operational safety for the installation is incorporated in the design

2.4 The specification for the ratings and characteristics of electrical equipment in the installation are compatible with the explosion-protection requirements

2.5 Engineering principles are applied to ensure the parameters for each equipment type, equipment group,

equipment temperature class, cables and other factors for correct application are compliant and correctly specified

2.6 Equipment is specified for the explosive atmosphere, zone and external influences in the locations where equipment is to be installed

2.7 Wiring systems (cables, supports, enclosures) are specified for the atmosphere, zones and external influences along the routes where they are to be installed

3 Document and finalise design

3.1 Design is checked for compliance with the requirements established for the electrical system and installation

3.2 Design is documented to include specification of all explosion-protected equipment and wiring systems, equipment location and cable route drawings and compliance documents for each item of explosion-protected equipment

3.3 Design is submitted for appropriate organisational approval and, where applicable, statutory or regulatory approval

3.4 Approved copies of design documents are included in the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Essential operating conditions include:

- an engineering office engaged in electrical design of electrical systems and installations for explosive atmospheres
- hazardous area classification drawings
- process specifications
- plant design documentation

- relevant standards and codes and relevant technical data from manufacturers of explosion-protected equipment

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0021 Design explosion-protected electrical systems and installations

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- establishing the explosion-protection requirements including:
 - determining the scope of the electrical system and installation from reviewing hazardous area classification drawings, process specifications and plant design documentation
 - determining explosion-protection requirements by reviewing the standards with which the installation is required to comply
- incorporating the explosion-protection requirements in the design including:
 - locating equipment in non-hazardous areas if possible and providing ease of access for inspection and maintenance
 - incorporating the ability to obtain the required degree of protection for operational safety
 - applying relevant engineering disciplines to ensure parameters for each equipment type, equipment group, equipment temperature class and cables are compliant and correctly specified
 - specifying equipment for the explosive atmosphere, zone and external influences in the locations where they are to be installed
 - specifying wiring systems (cables, supports, enclosures) relevant to the atmosphere, zones and external influences along the routes where they are to be installed
- documenting and finalising the design including:
 - checking the design for compliance with the requirements established for the electrical system and installation
 - documenting the explosion-protection aspects of the design to include specification of all explosion-protected equipment and wiring systems, equipment location and cable route drawings and compliance documents for each item of explosion-protected equipment
 - submitting the design to the relevant parties for approval
 - including approved copies of the design in the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of

the requirements of the elements and performance criteria and include knowledge of:

- design aspects of electrical installation for hazardous area equipment including:
 - location of explosion-protected equipment
 - electrical rating and characteristics of equipment
 - providing ease of access for inspection and maintenance
 - means of obtaining the required degree of operational safety
 - documentation (additional to that required for a non-hazardous area) to be included in the verification dossier
 - assurance of conformity of equipment including:
 - equipment with acceptable certification
 - equipment without acceptable required certification
 - repaired, second-hand or existing equipment
- explosion-protected requirements including:
 - explosive atmosphere electrical installation design and selection of equipment including:
 - general requirements
 - information required for selecting explosion-protected equipment
 - procedure for selection of repaired or existing equipment
 - selection of equipment
 - protection from dangerous incendive sparking
 - electrical protection
 - emergency switch-off and electrical isolation
 - wiring systems
 - additional requirements for each type of protection including determination of required parameters
 - verification of intrinsically safe circuits
 - method for determining maximum safety parameters for intrinsically safe circuits
 - equipment protection levels (EPLs) as an alternative method for the selection of equipment.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- applicable documentation including:
 - hazardous area classification drawings
 - process specifications
 - plant design documentation
 - relevant standards and codes
- relevant technical data from manufacturers of explosion-protected equipment.

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0003 Determine the explosion-protection requirements to meet a specified classified hazardous area.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to determine the explosion-protection requirements to meet a specified classified hazardous area. It includes determining the type of explosion-protected equipment for a given explosive atmosphere. It also includes reading and interpreting the explosion-protection fundamentals in explosive atmosphere technical standards; understanding the information given in certification documents, verification dossiers and equipment marking; identifying the design features of each type of explosion-protected equipment; understanding actions and conditions that would void the explosion-protection afforded by each equipment type; and understanding where each equipment type may be used.

This unit applies to design, installation, maintenance, inspection, auditing, and repair and overhaul functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.4 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.4 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to install, maintain, inspect and/or engineer electrotechnology equipment and installations from AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to review explosion-protection technical standards

1.1 Technical standards specifying the requirements to which each type of explosion-protected equipment is required to comply are identified

1.2 A verification dossier for a site that has gas hazards is reviewed and requirements for the explosive atmospheres are established

1.3 A verification dossier for a site that has dust hazards is reviewed and requirements for the explosive atmospheres are established

2 Ascertain the requirements for each explosion-protection type

2.1 Protective features of each equipment type are identified through application of knowledge of explosion-protection methods

2.2 Equipment standards are reviewed to establish the compliance requirements for each equipment type

2.3 Aspects that are vulnerable to voiding the protection due to defective installation or poor maintenance are determined from knowledge of equipment types and equipment standards

2.4 Items of explosion-protected equipment are examined to identify any condition that would void the protection

2.5 Where particular explosion-protected equipment types may be used, relevant technical standards, equipment certification and the verification dossier for a given site are established

3 Identify acceptable equipment certification

- 3.1** Knowledge of the equipment certification process and acceptable standards are applied
- 3.2** The required marking on certified equipment is obtained from relevant technical standards
- 3.3** The suitability of explosion-protection equipment items for a given application and location is ascertained from relevant technical standards, certification documents, equipment marking and the verification dossier for a given site

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining the explosion-protection requirements to meet a specified classified hazardous area must include:

- using standards, equipment certification and installation design documentation and site-specific verification dossiers for any application in which explosion-protected equipment is used

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0003 Determine the explosion-protection requirements to meet a specified classified hazardous area.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0003 Determine the explosion-protection requirements to meet a specified classified hazardous area.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- selecting the correct standard/s relevant to each equipment type
- establishing the requirement for explosive atmospheres from a verification dossier
- examining flameproof Ex 'd', increased safety Ex 'e' and intrinsic safety Ex 'i' items of explosion-protected equipment and identifying any condition that would void the protection
- ascertaining the suitability of items of explosion-protected equipment for a given application and location from equipment standards, certification documents, equipment marking and the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- methods for preventing ignition of an explosive atmosphere by an electrical source including:
 - exclusion method, including:
 - dust ignition protection type 'tD' or 't'
 - pressurisation 'p'
 - encapsulated 'm'
 - oil-immersed 'o'
 - powder filling 'q'
 - explosion containment method - flameproof 'd' enclosure type
 - energy limitation, including:
 - intrinsic safety 'i'

- protection type ‘n’ (e.g. non-sparking, hermetically sealed and enclosed break)
- avoidance of ignition source, including:
 - increased safety ‘e’
 - protection type ‘n’
- dilution-ventilation
- equipment and circuits protected by the flameproof (Ex ‘d’) enclosure type, including:
 - how flameproof-type enclosures work to provide explosion protection
 - features of flameproof enclosures and their function, including:
 - enclosure materials
 - flame paths
 - fasteners
 - gaskets
 - enclosure entries
 - breathing and drain devices
 - attributes of flameproof enclosures, including:
 - integrity under pressure
 - suitability for power switching equipment
 - situations where this type can be used
- aspects that are vulnerable to voiding the protection due to defective installation or poor maintenance, including:
 - installed location
 - cable/conduit entries
 - flame paths
 - gaskets
 - fasteners
 - pressure piling
- equipment and circuits protected by the increased safety (Ex ‘e’) method, including:
 - how increased safety ‘e’ type works to provide explosion protection
 - features of increased safety and their function, including:
 - electrical connections
 - length of conductors within an enclosure
 - clearances between bare conductive parts
 - creepage distances
 - enclosure entries
 - ingress protection (IP) rating of enclosures
 - temperature limitation
 - certified components
 - attributes of increased safety including:
 - absence of sparking contacts
 - situations where this type can be used

- aspects that are vulnerable to voiding the protection due to poor installation or maintenance, including:
 - installed location
 - electrical connections
 - clearances
 - preservation of temperature limitations
 - components
- purpose and characteristics of the design features of equipment and circuits protected by the intrinsic safety (Ex 'i') type, including:
 - how the intrinsic safety type works to provide explosion protection
 - features of intrinsic safety and their function, including:
 - associated equipment
 - simple devices
 - dependant components
 - infallible components, assemblies and connections
 - external wiring
 - safety barrier
 - attributes of intrinsic safety including:
 - levels of protection
 - ignition energy limiting
 - entity versus integrated system concept
 - situations where this type can be used
 - aspects that are vulnerable to voiding the protection due to poor installation or maintenance, including:
 - installed location
 - stored energy sources
 - insulation ratings
 - external wiring
 - methods of earthing/bonding
- purpose and characteristics of the design features of equipment and circuits protected by the type of protection 'n' (Ex 'n') technique, including:
 - how type of protection 'n' works to provide explosion protection
 - features of type of protection 'n' and their application, including:
 - non-sparking device 'nA'
 - range of devices and components designated 'nC'
 - energy-limited equipment 'nL'
 - associated energy-limited equipment '[nL]' or '[Ex nL]'
 - self-protected energy-limited equipment 'nA nL'
 - restricted-breathing enclosure 'nR'
 - aspects that are vulnerable to voiding the protection due to poor installation or

- maintenance, including:
 - installed location
 - enclosures
 - cable/conduit entries
 - external connections
- purpose and characteristics of the design features of equipment protected by the encapsulation (Ex ‘m’) technique including:
 - how the encapsulation type works to provide explosion protection
 - features of type of protection ‘m’ and their function, including:
 - levels of protection
 - temperature limitations
 - protective devices
 - situations where this type can be used
 - aspects that are vulnerable to voiding the protection due to poor installation or maintenance
- purpose and characteristics of the design features of equipment by the oil immersion (Ex ‘o’) technique, including:
 - how the oil immersion type works to provide explosion protection
 - features of type of protection ‘o’ and their function, including:
 - protective liquid
 - limiting temperature
 - immersion depth
 - situations where this type can be used
- purpose and characteristics of the design features of equipment protected by the powder filled (Ex ‘q’) technique, including:
 - how the powder-filling type works to provide explosion protection
 - features of the type of powder-filling ‘q’ and their function, including:
 - permanently sealed enclosures
 - enclosures intended to be opened for repair
 - temperature limitation
 - types of devices
 - situations where this type can be used
- purpose and characteristics of the design features of equipment and circuits protected by the pressurisation enclosure (Ex ‘p’) technique including:
 - how the pressurization enclosure type works to provide explosion protection
 - features of the type of pressurization enclosure ‘p’ and their function, including:
 - types of pressurisation
 - pressurisation system
 - purging
 - temperature limitation

- safety devices
- containment systems
- protection types
- situations where this type can be used
- aspects that are vulnerable to voiding the protection due to pressure failure, including:
 - inadequate cable/conduit entries
 - poorly secured doors and covers
 - failed safety devices
 - negating purging requirements after maintenance
- purpose and characteristics of the design features of equipment protected from dust ignition by enclosure (Ex ‘t’), including:
 - how the dust ignition by enclosure type works to provide explosion protection
 - features of dust ignition by enclosure ‘t’ and their function, including:
 - level of protection
 - protective devices
 - gaskets
 - cable/conduit entries
 - situations where this type can be used
 - type protection ‘pD’ in legacy systems
 - aspects that are vulnerable to voiding the protection due to poor installation or maintenance, including:
 - cable/conduit entries
 - sealing
 - dust layer accumulation
- common characteristics of explosion-protection types, including:
 - criteria on which equipment protection levels (EPLs) are assigned
 - the purposes of ‘temperature classification’ and ‘equipment grouping’
 - equipment markings (nameplate)
 - limitations of non-metallic or specific alloy enclosures
 - the purpose and use of conformity and certification/approval for equipment used in explosive atmospheres
 - environmental conditions that may impact on explosion-protection techniques
 - the principles and applications of other and mixed explosion-protection techniques
- standards to which explosion-protected equipment is required to comply, including
 - standards to which the protective features of each type of explosion protection are required to comply
 - typical content of equipment (Ex) certificates, including:
 - explosion-protection parameters
 - electrical parameters
 - instruction and limitation of use

- verification dossiers, including:
 - purpose
 - content
- Ex certification schemes to accepted standards, including
 - purpose and scope of certification schemes
 - accepted certification schemes
 - processes for having equipment certified under the acceptable Ex schemes, including:
 - scheme procedures
 - quality management requirements
 - conformance testing and assessment
 - requirements for ongoing certification.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate access equipment, explosive atmosphere equipment, tools and testing devices permitted in a hazardous area, materials and personal protective equipment (PPE) currently used in industry
- applicable documentation and workplace procedures, including:
 - safe work methods
 - technical standards for explosive-protected electrical equipment types and explosive atmospheres
 - verification dossier for a classified gas atmosphere area
 - verification dossier for a classified dust atmosphere area
 - safety procedures for the area
 - equipment certification documents
- defective and non-defective items of Ex 'd', Ex 'e' and Ex 'i' explosion-protected equipment.

UEEHA0023 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0009 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to develop and manage the explosion-protection aspects for periodic electrical inspections and maintenance schemes. It includes understanding of the provisions of the applicable hazardous area standards in relation to area classification or equipment protection levels (EPLs) and selection and installation of electrical equipment; understanding of repair and reclamation of equipment; determining the frequency and grades of inspections and levels of maintenance required; and specifying and overseeing the inspection and maintenance processes to be followed and maintaining the required documentation in the verification dossier.

This unit applies to technical management and maintenance functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.9 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.9 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to develop and manage electrical/instrumentation inspection and maintenance programs for non-hazardous areas at AQF level 4 or NZQF level 5 or equivalent."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified

hazardous area

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Establish inspection and maintenance requirements

2 Develop an inspection program for a hazardous area

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Understanding of the provisions of hazardous area standards applicable to area classification, electrical installation design, selection and installation, and repair and reclamation of electrical equipment is applied to establishing the inspection and maintenance program
- 1.2** Documentation in the verification dossier is reviewed to ascertain the extent of hazardous areas, the area classifications and the electrical installation details and, for an existing site, previous inspection schedule and maintenance program records
- 1.3** The effect of external factors that may influence equipment integrity are assessed and included in establishing the types, grades and frequency inspections
- 2.1** Inspection schedules are developed from knowledge of the extent of the hazardous area and the electrical installation, the assessment of factors influencing equipment integrity and an understanding of the requirements and recommendations of standards and equipment manufacturers
- 2.2** Procedures for each grade of inspection are developed from recommendations of standards and equipment manufacturers and conditions particular to the site
- 2.3** A documentation system is developed for reporting inspection activities and identifying non-compliance

- defects and recommendations for maintenance
- 2.4** WHS/OHS policies and procedures are incorporated into the inspection and resulting maintenance program
- 3 Implement and evaluate the inspection and maintenance program**
- 3.1** Qualifications of inspectors and maintenance personnel are reviewed to ensure they are currently competent to do the work
- 3.2** Periodic and sample inspection reports are used to develop maintenance programs and identify the need to revise the extent and frequency of inspections
- 3.3** Maintenance programs are established within the limits permitted for remedial maintenance in hazardous areas
- 3.4** Procedures are established for equipment identified as requiring repair or overhaul to be removed from service and sent to an accredited facility
- 3.5** Reports and other documentation related to the inspection and maintenance program activities are retained in the site verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0009 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0023 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0009 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- determining inspection requirements, including:
 - reviewing all documentation held in the verification dossier
 - assessing the effect of factors that may influence equipment integrity
- developing an inspection program for a given hazardous area, including:
 - developing inspection schedules based on information gathered from the verification dossier, factors that may influence equipment integrity, requirements of relevant standards and any previous inspection results
 - developing procedures for each grade of inspection based on the recommendations of standards and equipment manufacturers and conditions particular to the site
 - developing or reviewing the documentation systems for reporting inspection activities and identifying non-compliance defects and recommendations for maintenance
 - establishing or improving work health and safety (WHS)/occupational health and safety (OHS) procedures and safe work methods for inspection and maintenance activities
- implementing and evaluating the inspection program and the resulting maintenance required, including:
 - reviewing qualifications of inspection and maintenance persons to ensure they are currently competent
 - developing a maintenance program from periodic and sample inspection reports, including procedures for dealing with equipment that may require repair or overhaul
 - evaluating the need to revise the extent and frequency of inspections from analysis of information in the inspection reports
 - ensuring all inspection and maintenance documents are retained in the verification dossier
 - establishing procedures for remedial maintenance and equipment repair and overhaul.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- area classification, including:
 - general principles and objectives
 - area classification procedures, including:
 - sources and grades of release
 - type and extent of zones
 - dust layer hazards
 - application of equipment protection levels (EPLs)
- required inspection documentation including:
 - site-specific documents, including:
 - area classification and, where included, EPL for each location
 - records of explosion-protected equipment to be maintained in accordance with its type of protection
 - previous inspection records
 - compliance standards for equipment, electrical installation, design and selection and inspection and maintenance
- inspection requirements, including:
 - grades of inspection and types of inspection
 - aspects to consider in establishing an inspection schedule
 - inspection schedule requirements
 - documentation of the results of scheduled inspections
 - WHS/OHS policy and safe work methods, including isolation of equipment within the hazardous area
- maintenance requirements, including:
 - aspects of equipment subject to maintenance
 - limits of remedial maintenance within hazardous areas
 - requirements for repair, overhaul and reclamation of equipment
 - defects and remedial recommendations identified in schedule inspections.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational

situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- applicable documentation, including:
 - WHS/OHS policy and procedures for the site
 - verification dossier for the site that includes the following:
 - area classification documents
 - plant design specifications
 - 'as-installed' electrical equipment location and distribution drawing
 - process diagrams
 - certification documents for all installed equipment
 - relevant technical standards
 - inspection reports and maintenance records.

UEEHA0024 Inspect, maintain and fit plugs/couplers for reeling, trailing and flexible cables - coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to inspect, maintain by component replacement, and fit plugs/couplers on reeling, trailing and flexible cables used in coal mining. It includes: working safely and to standards; evaluating the condition of plugs/couplers; identifying correct core and pin configurations; applying maintenance techniques; and documenting repair/replacement work.

It is adopted from clause 2.19 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it.

This unit applies to electrical equipment overhaul and repair job functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEHA0036 Test reeling, trailing and flexible cables and their attachments used in coal mining

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to inspect and fit plugs/couplers

- 1.1** Safe work methods to inspect and fit plugs/couplers are obtained and interpreted
- 1.2** Cable plugs/couplers to be inspected are confirmed with supervising personnel
- 1.3** Types of plugs/couplers are identified by marking and explosion-protection certification documentation
- 1.4** Special tools, equipment and testing devices needed to carry out the plugs/couplers work are obtained and checked for correct operation and safety

2 Inspect plugs/ couplers

- 2.1** Safe work methods to carry out inspecting plugs/couplers are applied
- 2.2** Knowledge of the explosion-protection types and features for plugs and couplers is applied to the inspection process
- 2.3** Plugs/couplers are dismantled and inspected for damage to housings, pins and sockets and defects to explosion-protection parts/components
- 2.4** Damage to plugs/coupling housings, pins and sockets and defects to explosion-protection parts/components is documented in accordance with quality assurance procedures
- 2.5** Knowledge of explosion-protected equipment certification is applied to obtaining replacement parts required for the repair and in accordance with quality assurance procedures
- 2.6** Arrangements are made for maintenance by replacement only of defective items of explosion-protective enclosures/housings in accordance with quality assurance procedures

3 Fit and connect plugs/couplers

- 3.1** Safe work methods to carry out the fitting of plugs/couplers are applied

- 3.2 Replacement parts/components are identified as being authorized by the plugs/couplers manufacturer and complying with certification documents
 - 3.3 Correct phasing for voltage, current and pin configurations are identified
 - 3.4 Cable is prepared and plugs and couplers fitted ensuring correct termination length, sheath protrusion and clamping are maintained
 - 3.5 Cable cores are prepared and terminated to correct polarity using compliant connection methods maintaining required creepage and clearances
 - 3.6 Cable tails, leads and terminations are inspected to ensure they are correct and sound
 - 3.7 Safe work methods for the care and storage of tools and equipment at the completion of work are applied
- 4 Complete and document repair work**
- 4.1 Plug and coupling repair history records are updated in accordance with quality assurance procedures
 - 4.2 Responsible supervisor is notified of the completion of the work in accordance with established quality procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

This unit must include these conditions in relation to inspecting and fitting of plugs/couplers certified for each explosion-protection technique of flameproof (Ex 'd'), increased safety (Ex 'e') intrinsically safe (Ex 'i') and encapsulation-dusts (Ex 'mD'). Among the cables for which competency is required all of the following features shall be included:

Cable features AS/NZS designated cable type

- Standard conductor construction 209; 210; 240; 241; 260; 275; 409; 412.1; 440; 441.1; 441; 450; 455.
- Super flexible 245.
- XR-EP-90 insulated compound 441; 450; 455.
- Semi conductive extruded screens 241; 245; 441.1; 441; 450; 455.
- Metal braided screens 209; 210; 240; 260; 409; 440; 450.
- Interstitial earths 241; 245; 275; 412.1; 441.1; 441; 450; 455.
- Interstitial pilots 240; 260; 440; 450; 455.
- Central pilot 209; 210; 241; 245; 275; 409; 441.1; 441.
- Pliable armour 260; 412.1.
- Sheath reinforcement 241; 245; 274; 441.1; 441; 450; 455.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0024 Inspect, maintain and fit plugs/couplers for reeling, trailing and flexible cables - coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to inspect and fit plugs/couplers including:
 - reviewing safe work methods
 - receiving and understanding work instructions
 - identifying plugs/couplers by marking and explosion-protection certification documentation
 - obtaining tools and equipment needed and checking them for correct operation and safety
- inspecting the condition of plugs/couplers including:
 - obtaining and applying safe work methods
 - dismantling plugs/couplers and identifying and noting any damage to housings, pins and sockets and/or defects to any explosion-protection parts/components
 - documenting plug/coupler damage defects in accordance with quality assurance procedures
 - obtaining compliant replacement parts
 - making arrangements for maintenance by replacement only of defective explosion-protective enclosures/housings in accordance with quality assurance procedures
- fits and connects plugs /couplers including:
 - applying safe work methods
 - checking that replacement parts are authorized and compliant
 - preparing and terminating cables maintaining correct termination length, sheath protrusion and clamping
 - preparing and terminating cable cores to correct polarity and maintain required creepage and clearances
 - checking cable tails, leads and terminations
 - applying safe work methods for the care and storage of tools and equipment
- updating plug and coupling repair history record and notifying the responsible supervisor on the completion of the work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- nature of explosion protection in explosive atmosphere areas including:
 - the standard definition of an ‘explosive atmosphere area’
 - conditions in an explosive atmosphere area that will lead to ignition, combustion and propagation of an explosive atmosphere
 - the explosive nature of flammable substances in the form of gas, vapour, dust, fibres, or flyings
 - low and upper explosive limits (LEL/UEL) and flash point of flammable substances encountered in explosive atmosphere areas
 - the toxic nature of gases and vapours and potentially harmful consequences
 - the classifications given to explosive atmosphere areas
 - electrical equipment as a potential source of ignition
 - characteristics of devices/equipment that require authorization to be taken into an explosive atmosphere area
- methods for preventing ignition of an explosive atmosphere from an electrical source including:
 - exclusion method including:
 - dust ignition protection type ‘tD’ or ‘t’
 - pressurization ‘p’
 - encapsulated ‘m’
 - oil-immersed ‘o’
 - powder filling ‘q’
 - explosion containment method – Flameproof ‘d’ enclosure type
 - energy limitation including:
 - intrinsic safety ‘i’
 - protection type ‘n’ (e.g. non-sparking, hermetically sealed, enclosed break)
 - avoidance of ignition source including:
 - increased safety ‘e’
 - protection type ‘n’
 - dilution—ventilation
- equipment and circuits protected by the flameproof (Ex ‘d’) enclosure type including:
 - how a flameproof-type enclosure works to provide explosion protection
 - features of flameproof enclosures and their function including:
 - enclosure materials
 - flamepaths
 - fasteners
 - gaskets

- enclosure entries
- breathing and drain devices
- attributes of flameproof enclosures including:
 - integrity under pressure
 - suitability for power switching equipment
 - situations where this type can be used
- aspects that are vulnerable to voiding the protection due to defective installation or poor maintenance including:
 - installed location
 - cable/conduit entries
 - flamepaths
 - gaskets
 - fasteners
 - pressure piling
- equipment and circuits protected by the increased safety (Ex ‘e’) method including:
 - how increased safety ‘e’ type works to provide explosion protection
 - features of increased safety and their function including:
 - electrical connections
 - length of conductors within an enclosure
 - clearances between bare conductive parts
 - enclosure entries
 - IP rating of enclosures
 - temperature limitation
 - certified components
 - attributes of increased safety including:
 - absence of sparking contacts
 - situations where this type can be used
 - aspects that are vulnerable to voiding the protection due to poor installation or maintenance including:
 - installed location
 - electrical connections
 - clearances
 - preservation of temperature limitations
 - components
- the purpose and characteristics of the design features of equipment and circuits protected by the intrinsic safety (Ex ‘i’) technique including:
 - how intrinsic safety type works to provide explosion protection
 - features of intrinsic safety and their function including:
 - associated equipment
 - dependant components

- infallible components, assemblies and connections
- external wiring
- safety barrier
- attributes of intrinsic safety including:
 - levels of protection
 - ignition energy limiting
 - entity versus integrated system concept
 - situations where this type can be used
- aspects that are vulnerable to voiding the protection due to poor installation or maintenance including:
 - installed location
 - external wiring
 - methods of earthing/bonding
- the purpose and characteristics of the design features of equipment protected from dust ignition by enclosure ‘t’ covering the following:
 - how dust ignition by enclosure type works to provide explosion protection
 - features of dust ignition by enclosure ‘t’ and their function including:
 - level of protection
 - protective devices
 - gaskets
 - cable/conduit entries
 - situations where this type can be used
 - type protection ‘pD’ in legacy systems
 - aspects that are vulnerable to voiding the protection due to poor installation or maintenance including:
 - cable/conduit entries
 - sealing
 - dust layer accumulation
- the common characteristics of explosion-protection types including:
 - criteria on which equipment protection levels (EPLs) are assigned
 - the purposes of ‘temperature classification’ and ‘equipment grouping’
 - equipment markings (nameplate)
 - limitations of non-metallic or specific alloy enclosures
 - the purpose and use of conformity and certification/approval for equipment used in explosive atmospheres
 - environmental conditions that may impact on explosion-protection techniques
 - the principles and applications of other and mixed explosion- protection techniques
- Standards to which explosion-protected equipment is required to comply including:
 - Standards to which the protective features of each type of explosion protection are required to comply

- typical content of equipment (Ex) certificates including:
 - explosion-protection parameters
 - electrical parameters
 - instruction and limitation of use
- verification dossiers including:
 - purpose
 - content
- ex certification schemes to accepted standards including:
 - purpose and scope of certification schemes
 - accepted certification schemes
 - processes for having equipment certified under the acceptable Ex schemes including:
 - scheme procedures
 - quality management requirements
 - conformance testing and assessment
 - requirements for on-going certification
- features of plugs and couplers including:
 - explosion-protection types
 - pin configuration
 - keying systems
 - IP ratings
- inspection process and techniques including:
 - parts of plugs and couplers that are required to be inspected
 - inspection procedures
 - condition of each part effecting fitness for service
- fitting processes and techniques including:
 - factors affecting the correct fitting of plugs and couplers
 - cable preparation requirements and techniques
 - conductor termination methods.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- safe work method documentation
- resources relevant to the cable repairs undertaken and required to be a recognised cable repair workshop to the scope of AS/NZS 1747 with ISO 9001 type quality assurance.

UEEHA0025 Install explosion-protected equipment and associated apparatus and wiring systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0005 Install explosion-protected equipment and associated apparatus and wiring systems.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to install explosion-protected equipment and associated apparatus and wiring systems for hazardous areas. It includes understanding and applying the explosion-protection aspects of installing electrical equipment and wiring systems for hazardous areas; matching items of explosion-protected equipment with that specified for a given location; and complying with installation standards and retaining/completing the required documentation.

This unit applies to hazardous area electrical installation functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.5 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.5 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to install electrotechnology equipment and wiring systems for non-explosive atmospheres at AQF level 3 or NZQF level 4."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install equipment and wiring

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS procedures and safe work methods are obtained and interpreted
- 1.2** Knowledge of requirements for installing electrical equipment and wiring for a hazardous area is applied to work preparation
- 1.3** Types of explosion-protected equipment and wiring systems to be installed are determined from the area classification and planning and/or design documentation
- 1.4** Location in which specific items of equipment and circuits are to be installed is determined from the area classification and planning and/or design documentation
- 1.5** Explosion-protected equipment markings are checked to ensure they conform to their certification document and planning and/or design specifications
- 1.6** Certification document supplied with each item of equipment is collected for forwarding to the relevant person for filing in the verification dossier
- 1.7** Cables and cable enclosures to be installed are checked to ensure they conform to planning and/or design documentation
- 1.8** Cable glands, seals and conductor terminations are checked to ensure they are compatible with the cable types and equipment specified in the planning and/or

design documentation

- 1.9** Special tools, equipment and testing devices needed to carry out the installation work are checked to ensure they are safe and serviceable, and any defective items are either rectified or replaced
- 2 Install equipment and wiring systems**
- 2.1** Safe work methods statements (SWMS) relating to explosive atmospheres are obtained and applied
- 2.2** Installation of equipment and wiring systems demonstrates application of knowledge of requirements for installing electrical equipment and wiring for hazardous areas
- 2.3** Equipment enclosure covers and internal components are removed where needed to enable installation and covers, components and their fixing devices are stored to protect them against loss or damage
- 2.4** Equipment is installed to conform with the planning and/or design documentation, installation standards and within the limits specified by the equipment certification and manufacturer's instructions
- 2.5** Equipment is installed in a manner that maintains the integrity of protection afforded by the equipment type
- 2.6** Cables and conduits are installed to conform with installation standards, planning and/or design documentation
- 2.7** Cables and conduits are terminated to conform with installation standards and equipment certification and manufacturer's instructions
- 2.8** Circuits are tested before connecting them to devices to ensure protective earth resistance is sufficiently low, insulation resistance is safe, polarity and connections are correct and each circuit complies with installation standards
- 2.9** Conductors are terminated and connected complying with planning and/or design documentation, installation standards, equipment certification and manufacturer's instructions
- 2.10** Equipment covers and internal components are removed to enable installation and are replaced ensuring the integrity of the equipment type is not

compromised

- 3 Confirm that installation is complete**
- 3.1** Appropriate person/s is notified that the installation has been completed and is ready for the initial inspection
 - 3.2** Action is taken to rectify non-conformance and general installation defects found during the initial inspection and to ensure the installation complies with requirements
 - 3.3** Documents used during the installation are forwarded to the person responsible for compiling the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing explosion-protected equipment and associated apparatus and wiring systems must apply to:

- new installations and additions, and repairs to existing installations related to a classified hazardous area

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0005 Install explosion-protected equipment and associated apparatus and wiring systems

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0025 Install explosion-protected equipment and associated apparatus and wiring systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0005 Install explosion-protected equipment and associated apparatus and wiring systems.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing to install explosion-protected equipment and associated apparatus and wiring systems, including:
 - reviewing safe work methods associated with the classified area in which the work is to be carried out
 - determining the types and locations of equipment and cabling to be installed from area classification and planning and/or design documentation
 - completing pre-installation checks, including:
 - equipment supplied complies with planning and/or design specifications
 - equipment marking conforms to the certification documentation provided with the equipment
 - cables and cable enclosures to be installed conform to planning and/or design documentation
 - cable glands, seals and conductor terminations are suitable for the cable types and equipment specified
 - serviceability and safety of tools and testing devices needed to carry out the installation work is checked
- installing Ex 'd', Ex 'e', Ex 'i' and Ex 't' equipment and associated apparatus and wiring systems, including:
 - obtaining and applying safe work method statements (SWMS) relating to the work
 - carrying out the installation to requirements, including:
 - removing equipment enclosure covers and internal components and their fixing devices to enable installation and safe storage
 - installing equipment to conform to planning and/or design documentation, installation standards, manufacturer's instructions and limitations

- installing equipment in a manner that maintains the integrity of the equipment protection type
- testing circuits before connecting them to ensure:
 - resistance of protective earthing conductors is sufficiently low
 - insulation resistance is safe
 - polarity and connections are correct
- replacing internal components and equipment covers previously removed to enable installation
- terminating cables and conduits conforming with installation standards and equipment certification and manufacturer's instructions, including:
 - installing conduit systems, including seals to meet hazardous area requirements (gases and liquids)
 - terminating cables with a barrier gland (gases and liquids)
 - terminating multicore, steel wire armoured (SWA), overall screened and individual screened cable into an enclosure
 - terminating and connecting conductors in accordance with requirements
- replacing equipment internal components and covers ensuring the integrity of the equipment type
- confirming that installation is complete, including:
 - notifying an appropriate person that the installation is completed and ready for the initial inspection
 - taking action to rectify any installation defects revealed by the initial inspection
- forwarding documents used during the installation to the person responsible for compiling the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- safe work procedures for explosive gas atmospheres, including:
 - work health and safety (WHS)/occupational health and safety (OHS) procedures for working in hazardous areas
 - permit to work that covers the hazardous aspects of the specific work and location
- requirements for installing equipment and wiring systems for explosive atmospheres, including:
 - required documentation
 - installation requirements for protection from dangerous (incendive) sparking including:
 - earthing system requirements
 - SELV and PELV systems
 - electrical separation
 - limitation of equipment installed above a hazardous area

- requirements for potential equalisation for the following:
 - various earthing systems
 - bonding systems
 - cable armour and screens
 - exposed conductive parts
 - metallic enclosures
 - temporary bonding
- limitation of cathodic protection
- wiring systems, including:
 - limitation on the use of aluminium conductors
 - fixed cable and wiring systems permitted for Groups I, II and III
 - the wiring systems permitted and not permitted in or above hazardous areas
 - cables supplying transportable and portable equipment
 - flexible connections and flexible cables
- connection to equipment, including:
 - cable glands and blanking elements per enclosure type
 - non-electrical entries
 - conduit systems
 - termination of conductors
 - treatment of unused core
 - unused opening/entries in enclosures
 - joining cables
 - openings in walls
 - passage and collection of flammables
- additional requirements for each type of explosion protection
- cable and conduit termination devices and techniques, including:
 - cable glands, conduits and sealing including:
 - types of glands and components
 - techniques for fitting glands and applying sealing compound
 - techniques for using conduit seals and applying sealing compound
- conductor terminations and techniques, including:
 - installing conduit systems, where applicable, including seals to meet hazardous area requirements (gases and liquids)
 - terminating a cable with a barrier gland (gases and liquids)
 - terminating a multicore, SWA, overall screened and individual screened cable into an enclosure
 - methods for terminating MIMS cable in accordance with manufacturer's instructions
 - testing termination/connections of installed cables/circuits.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions and include:

- an area designated as a hazardous area which is a close facsimile of a real work environment
- an area entry point
- delineation of the area into zones for both gas and dust
- a person to act as the 'authorised person' for the site
- a qualified supervisor.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- applicable documentation including workplace procedures, safe work methods, verification dossier for the site and planning and/or design documentation specifying:
 - Ex 'd', Ex 'e', Ex 'i' and Ex 't' equipment to be installed
 - cables and cable enclosures to be installed
 - cable glands, seals and conductor terminations.

UEEHA0026 Maintain equipment associated with hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0006 Maintain equipment associated with hazardous areas.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to maintain equipment associated with hazardous areas. It includes determining required remedial maintenance from inspection reports; carrying out remedial and breakdown maintenance in compliance with regulations and safe working methods, standards and manufacturer's instructions; and completing the necessary maintenance documentation.

For the purpose of applying this unit, 'hazardous areas' are defined as areas in which an explosive atmosphere may be present.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.6 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.6 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to maintain electrical equipment in a non-hazardous area at AQF level 3 or NZQF level 4.

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to carry out maintenance of equipment

2 Carry out equipment maintenance

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS policies and procedures to work in hazardous areas are identified and applied
- 1.2** Area classification and details of explosion-protected equipment and wiring are ascertained from hazardous area zone drawings and equipment certification documents held in the verification dossier
- 1.3** Extent of remedial maintenance to be conducted is determined from regulatory requirements and/or inspection records held in the verification dossier
- 1.4** Extent of breakdown maintenance is evaluated and confirmed with person/s reporting the breakdown
- 1.5** Limits of breakdown maintenance that can be carried out in situ with regard to explosion risk is determined in consultation with technical management personnel
- 1.6** Required tools, equipment and testing devices are obtained and checked for operational safety
- 2.1** WHS/OHS policies and procedures for working in hazardous areas, including isolation of equipment, are followed
- 2.2** Work is carried out in accordance with inspection records
- 2.3** Requirements and limitations of scheduled and breakdown remedial maintenance requirements are applied

- 2.4 Equipment is adjusted and maintained within the limits permitted by the equipment certification and in accordance with the manufacturer's instructions
 - 2.5 Certification documentation for like-for-like replacement parts is sighted to ensure compliance with the equipment certification and manufacturer's instructions
 - 2.6 Circuits of equipment being withdrawn from service are isolated and terminated safely and in accordance with maintenance standards
 - 2.7 Flexible cables and cords are examined and removed from service if they are not in immediate use or are found to be defective or damaged
 - 2.8 Spare equipment, flexible cables and cords are maintained and stored where they are not likely to suffer deterioration or damage
- 3 Complete maintenance work and documentation**
- 3.1 Inspection of maintenance work is arranged in compliance with maintenance standards and regulatory requirements
 - 3.2 Action is taken to rectify maintenance defects (non-conformances) found during the maintenance work inspection
 - 3.3 Safety assessment for isolation of equipment is recorded in accordance with maintenance standards
 - 3.4 Completed maintenance work is documented in accordance with requirements and forwarded to relevant person/s for inclusion in the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package

Companion Volume Implementation Guide.

Maintaining equipment associated with hazardous areas must include:

- maintaining electrical equipment in a classified hazardous area

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0006 Maintain equipment associated with hazardous areas.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEHA0026 Maintain equipment associated with hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0006 Maintain equipment associated with hazardous areas.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing to undertake maintenance of equipment associated with explosive atmospheres, including:
 - reviewing safe work methods associated with the classified area in which the work is to be carried out
 - ascertaining the area classification and details of equipment from documentation held in the verification dossier
 - reviewing inspection records to determine the extent of remedial maintenance
 - evaluating the extent of breakdown maintenance in consultation with reporting personnel
 - consulting with technical personnel to determine the limits of maintenance and repair that can be carried out in situ
 - checking the safety of compliant tools, equipment and testing devices required to carry out the inspection
- maintaining electrical equipment associated with explosive atmospheres as specified in the inspection records, including:
 - following safe work methods relating the work, including isolation of equipment
 - adjusting and repairing equipment within the limits permitted by the equipment certification regulations and in accordance with manufacturer's instructions
 - using replacement parts permitted by the equipment certification, regulations and manufacturer's instructions
 - isolating and terminating circuits of equipment withdrawn from service in accordance with applicable standards
 - examining flexible cables and cords and removing them from service if not in immediate use or if showing deflections
 - maintaining spare equipment flexible cable and cords and storing them to prevent deterioration or damage

- completing maintenance work inspections and documentation, including:
 - arranging for inspection of the maintenance work
 - rectifying maintenance defects (non-conformances) found by the maintenance work inspection
 - recording safety assessments undertaken for isolation equipment during maintenance
 - completing maintenance work, documenting the work and forwarding the documentation for inclusion in the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- safe work procedures for explosive atmospheres including:
 - work health and safety (WHS)/occupational health and safety (OHS) procedures for working in hazardous areas
 - permit to work systems that cover the hazardous aspects of specific work and locations
- requirements and limitations of remedial maintenance, including:
 - scheduled maintenance specified in inspection records for particular items of equipment
 - limits of maintenance in response to a breakdown
 - isolation and termination of circuits of equipment being withdrawn from service
 - compliance standards, equipment certification and manufacturer's instructions regarding use, maintenance and repair of explosion-protected equipment.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions and include:

- an area designated as a hazardous area which is a close facsimile of a real work environment
- an area entry point
- delineation of the area into zones for both gas and dust
- a person to act as the 'authorised person' for the site
- a qualified supervisor.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate access equipment, explosive atmosphere equipment, tools and testing devices permitted in a hazardous area, materials and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, safe work methods, explosive atmosphere installation and inspection standards, industry standards, equipment specifications, regulations, codes of practice and operation manuals
- verification dossier for the site, including:
 - design documentation
 - area classification drawings
 - certification documents for each item of equipment
 - inspection records
 - maintenance records
- clearance-to-work permit in particular locations and situations.

UEEHA0027 Manage continuous supervision inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to manage and/or coordinate the inspections of hazardous area electrical installations during the maintenance phase of an installation by the 'continuous supervision by skilled personnel' maintenance strategy, as described in AS/NZS60079.17:2017.

It includes: understanding the provisions of the hazardous area standards applicable to area classification, electrical installation design, selection and erection, repair and reclamation of electrical equipment; assessing the viability of a continuous supervision process and the frequency and grades of inspections and levels of maintenance required for a given hazardous area installation; ensuring personnel are competent to undertake inspection tasks required; specifying and overseeing the inspection and maintenance processes to be followed; and, maintaining the required documentation.

This unit applies to personnel within technical/engineering management job functions or maintenance departments of companies that have electrical installations within Classified Hazardous Areas, in relation to the strategies for inspection and maintenance of Ex equipment as part of other routine inspection and maintenance activities. This unit is considered to be appropriate for personnel that are required to complete some, or all, of the responsibilities required of 'The Person with Executive Function' (TPEF), as described in AS/NZS60079.17:2017.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions. The continuous supervision inspection strategies adopted need to consider these permit systems and understand the limitations.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.10 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.10 of AS/NZS 4761.1:2018 also includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent in engineering management of electrotechnology systems at AQF 6 or NZQF level 7 or

equivalent."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment and

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

or

UEEHA0023 Develop and manage periodic electrical inspection and maintenance programs for hazardous areas

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine the viability of continuous supervision inspection for a given hazardous area

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Continuous supervision inspection to maintain the explosion-protection integrity for a given hazardous area concepts are applied in determining the viability of a continuous supervision process
- 1.2** Applicable hazardous area standards in relation to area classification, EPL's and selection, erection/installation, repair and reclamation of equipment is applied to determining the viability of a continuous supervision process
- 1.3** Availability of personnel and their experience is assessed in relation to the particular hazardous area electrical installation
- 1.4** The scope of equipment to be considered under continuous supervision is evaluated on factors that can

- affect explosion-protection integrity, frequency of attendance, special knowledge, workflow and location of equipment
- 1.5** The frequency and grade of inspection and the content of reporting to enable meaningful analysis of equipment performance is determined
- 2 Develop a continuous supervision inspection process for a given hazardous area**
- 2.1** Updated documentation necessary for inspection (and maintenance) are made available in the continuous supervision process
- 2.2** Skilled personnel needed to carry out inspections in the continuous supervision process are selected
- 2.3** Initial and refresher training, assessment programs and records are established to ensure the appropriate level of knowledge and skills of personnel is maintained
- 2.4** A documentation system is developed to provide information of inspection (and maintenance) activities, defects found and remedial action taken, and to verify the effectiveness of the continuous supervision process
- 3 Implement and manage a continuous supervision process for a given hazardous area**
- 3.1** Skilled personnel are provided with adequate time to carry out inspections and provide readily available technical support
- 3.2** Supervision documentation is continuously reviewed to verify that a process of continuous supervision is being followed
- 3.3** Information from the continuous supervision documentation system is analysed to verify the effectiveness of the continuous supervision process
- 3.4** Actions are taken to address any deficiencies found in the continuous supervision process

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Essential operating conditions include:

- area classification documents
- plant design specifications and as-installed electrical equipment location and distribution drawings, process diagrams, certification documents for all installed equipment, relevant technical standards, inspection reports and maintenance records
- other plant management and maintenance persons, plant operatives and training provider

Unit Mapping Information

This is a new unit.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0027 Manage continuous supervision inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- determining the viability of the continuous supervision inspection for a given hazardous area including:
 - assessing the availability of experienced personnel in relation to the particular hazardous area electrical installation
 - evaluating the scope of equipment to be considered under continuous supervision based on factors that can affect explosion-protection integrity, frequency of attendance, specialist knowledge, workflow and location of equipment
 - determining the frequency and grade of inspection and the content of reporting to enable meaningful analysis of equipment performance
- developing a continuous supervision inspection process for a given hazardous area including:
 - making available updated documentation necessary for inspection (and maintenance) in the continuous process including:
 - zone classification and, where included, equipment protection levels
 - equipment group and temperature class or maximum surface temperature
 - equipment characteristics
 - records to enable the explosion-protected equipment to be maintained in accordance with its type of protection
 - copies of previous inspection records
 - selecting skilled personnel to carry out inspection in the continuous supervision process based on job and regulatory requirements to undertake the extent of inspection work and the candidate's:
 - understanding of the concept of continuous supervision and the need for any reporting or analysis function
 - knowledge of the explosion-protected equipment within their area of responsibility
 - previous experience in hazardous area inspection and maintenance
 - establishing the initial and refresher training and assessment program and records to ensure the appropriate level of knowledge and skills of personnel undertaking

- inspections is maintained
- developing a document system to provide information of inspection (and maintenance) activities
- implementing and managing a continuous supervision process for a given hazardous area including:
 - providing adequate time and readily available technical support for inspections to be carried out
 - reviewing and analysing documentation to verify that the process is being followed and to ascertain its effectiveness
 - taking action to address any deficiencies found.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- area classification including:
 - general principles and objectives
 - area classification procedures including:
 - sources and grades of release
 - type and extent of zones
 - dust layer hazards
 - application of equipment protection levels (EPL)
- electrical installation requirements associated with explosive atmospheres including:
 - design, selection and erection including:
 - documentation
 - selection of equipment
 - protection from dangerous (incendive) sparking
 - electrical protection
 - emergency switch-off and electrical isolation
 - wiring systems
 - additional requirements for each protection type
 - inspection requirements including:
 - documentation
 - applicable standards
 - competency of personnel
 - frequency of inspections—initial and periodic schedules
 - grades of inspection—visual, close, and detailed
 - additional inspection schedules for specific types of equipment
 - maintenance requirements including:
 - documentation

- remedial measures and alterations to equipment
 - flexible cables
 - withdrawal from service
 - fastenings and tools
 - environmental conditions
 - isolation of equipment
 - earthing and equipotential bonding
- concept, role and responsibilities of the technical person managing continuous supervision including:
 - concept of continuous supervision
 - objective of continuous supervision
 - factors to be considered in assessing the viability of inspection by continuous supervision
 - documentation
 - training of skilled personnel.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- applicable documentation including:
 - available personnel WHS policy and procedures for the site
 - verification dossier for the site that includes the following:
 - area classification documents
 - plant design specifications
 - as-installed electrical equipment location and distribution drawing
 - process diagrams
 - certification documents for all installed equipment
 - relevant technical standards
 - inspection reports and maintenance records

- other plant management and maintenance persons, plant operatives and a training provider.

UEEHA0028 Perform compliance audits of hazardous areas and related electrical installation

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct an audit of classified hazardous areas (e.g. where flammable gas or vapour hazards or explosive dust atmospheres and combustible dust layers have the potential to be, or are present), and the explosion-protection aspects of the related electrical installation, which include electrical, instrumentation, control and/or communications equipment and installations.

It includes: reviewing the processes given for the hazardous area and its compatibility with the classification documentation held in the verification dossier; determining by the use of various tools or resources (e.g. construction or maintenance systems, facility documentation), or by inspection whether equipment or systems are compliant for the area in which they are installed including wiring systems; evaluating the currency of documentation held in the verification dossier; and reporting audit results, including recommendations for remediation of non-compliance and required updating of the verification dossier or documents that support the verification dossier.

This unit applies to personnel required to audit areas that have been classified as hazardous in reference to AS/NZS60079.10.2 or equivalent. The auditing task itself would apply to the various lifecycle phases of an installation. It is appropriate for personnel that are required to complete some, or all, of the responsibilities required of 'The Person with Executive Function' (TPEF), as described in AS/NZS60079.17:2017, for example, where the continuous supervision maintenance strategy has been adopted, and there is a need to analyse or verify the effectiveness of the continuous supervision process.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions. Before any audit is planned, these conditions of control are to be considered.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.14 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.14 of AS/NZS 4761.1:2018 also includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to audit

compliance of electrotechnology systems at AQF level 4 or NZQF level 5 (BD) or equivalent."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0020 Conduct detailed inspection of electrical installations for hazardous areas

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

UEEHA0038 Conduct visual and close inspection of electrical installations for hazardous areas

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for and establish extent of the audit

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Records system (verification dossier) is reviewed to verify that essential hazardous area documentation is retained and procedures for maintaining records are established
- 1.2 Hazardous area classification processes are applied to auditing classification and design documentation including the procedures followed and verifying traceability and authentication
- 1.3 Details of any alterations/modification to the plant or processes are ascertained from consultation with responsible plant personnel
- 1.4 Type and intended location of each item of equipment and routes of wiring systems subject to audit are determined from design drawings and documentation

- 1.5 WHS policies and procedures for working in the given hazardous area are obtained and interpreted
 - 1.6 Compliant tools and equipment required for the audit are obtained and checked for correct operation and safety
- 2 Perform audit**
- 2.1 WHS/OHS procedures, including compliance with requirements for isolation of explosion-protected equipment and circuits, are interpreted and applied
 - 2.2 Area classification documentation is examined for compliance of process, traceability and relevance to the current plant and processes
 - 2.3 Electrical design documents for the installation are assessed for compliance with the relevant standards and as-installed documentation
 - 2.4 Certification documentation and any repair/overhaul or compliance assessment record for item of explosion-protected equipment are assessed for compliance with requirements for the current plant and processes
 - 2.5 Appropriately authorised persons are directed to open equipment enclosures as required for the audit and on completion ensure integrity of explosion-protection is restored
 - 2.6 Electrical equipment and installation are audited for conformance to the design as-installed specifications and compliance with requirements of the applicable standards
 - 2.7 Inspection and maintenance records are evaluated against the condition of the plant and assessed for compliance with requirements
- 3 Report audit results**
- 3.1 Differences between the hazardous area documentation (verification dossier), including the as-installed design specifications and installation, are reported
 - 3.2 Deficiencies and inaccuracies in site record and non-conformances of explosion-protected equipment and the installation, and recommendation for their rectification, are documented in the audit report
 - 3.3 The audit report is forwarded to the person responsible

for actioning the recommendation/s

- 3.4** The audit report is forwarded to the person responsible for maintaining the hazardous area documentation (verification dossier)

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Essential operating conditions include:

- an engineering office engaged in electrical design of electrical systems and installations for explosive atmospheres
- area classification documents
- installation design
- as-installed equipment
- inspection and maintenance records
- the hazardous area installation at the site and relevant authorised personnel

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0028 Perform compliance audits of hazardous areas and related electrical installation

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- establishing the extent of the audit including:
 - reviewing the verification dossier to confirm whether essential hazardous area documentation is retained and procedures for maintaining records are established
 - checking hazardous area classification and design drawings and documentation to confirm whether appropriate procedures have been followed and are traceable and authentic
 - ascertaining details of any alteration/modification to plant or processes
 - determining the type and intended location of each item of equipment subject to audit from design drawings and documentation
 - obtaining WHS/OHS policies and procedures and compliant tools and equipment needed for the audit
- performing audit including:
 - interpreting and applying WHS/OHS work procedures
 - examining area classification documentation for compliance of process, traceability and relevance to the current plant and processes
 - assessing electrical design documents for the installation for compliance with the relevant standards and as-installed documentation
 - assessing certification documentation and any repair/overhaul or compliance assessment record for item of explosion-protected equipment for compliance with requirements for the current plant and processes
 - directing appropriately authorized persons to open equipment enclosures as required for the audit and on completion ensuring integrity of explosion-protection is restored
 - auditing electrical equipment and installation for conformance to the design as-installed specifications and compliance with requirements of the applicable standards
 - evaluating inspection and maintenance records against the condition of the plant and accessing compliance with requirements
- reporting audit results including:
 - reporting differences between the hazardous area documentation (verification dossier),

including the as-installed design specifications and installation

- documenting audit report deficiencies and inaccuracies in the site records and non-conformances of explosion-protected equipment and its installation and recommendation for rectification
- forwarding the audit report to the person responsible for acting on the recommendation and for maintaining the hazardous area documentation (verification dossier).

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- documentation retained in a verification dossier appropriate and sufficient for the site and includes details such as the following where relevant including:
 - area classification including:
 - site drawings showing the horizontal and elevated delineation of each zone
 - explosive/flammable characteristics of the material creating the explosive atmosphere
 - information related to dust layers
 - justification/explanation for the zones and delineation
 - justification for the area classification
 - installation design including:
 - specification for non-hazardous areas
 - specification for each item of explosion-protected equipment
 - specification of wiring systems
 - equipment location drawings
 - cable schedule/route drawing for wiring system
 - as-installed equipment including:
 - certification documents for each item and manufacturer's information including limits of use
 - history of repairs/overhaul to an item of explosion-protected equipment including compliance assessment
 - certification documents for any second-hand equipment
 - fitness-for-purpose assessments
 - inspection and maintenance reports including:
 - initial inspection
 - periodic inspection schedules
 - maintenance program and actions
 - equipment repair/overhaul
 - other documentation required for the given purpose/activities of the site
- auditing process and procedures
- reference compliance standards for:
 - area classification

- installation design
- selection of equipment
- installation/erection
- inspection and maintenance.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- applicable documentation including:
 - safe work methods
- verification dossier for the site including documentation of:
 - area classification
 - installation design
 - as-installed equipment
 - inspection and maintenance records
- electrical installation at the site.

UEEHA0029 Plan electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0007 Plan electrical installations for hazardous areas

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan electrical installations for hazardous areas by selecting compliant explosion-protected equipment and wiring systems. It includes determining the extent of the installation from area classification documents and plant specifications; identifying the hazardous area zones; referencing manufacturer's data and plant design specifications to select and locate compliant explosion-protected and associated equipment and wiring systems; ensuring equipment received is consistent with the plan; and documenting the hazardous area installation plan.

This unit applies to electrical installation planning functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.8 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.8 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to arrange circuits, control and protection and select wiring systems and cables for non-hazardous electrical installations at AQF level 4 or NZQF level 5 or equivalent or higher".

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine the extent of the installation

2 Select and check equipment, wiring components and accessories

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Nature and characteristics of explosion hazards in the area are identified from the area classification and plant design documents
- 1.2 In the absence of classification documents, arrangements are made with the appropriate person to have the area formally classified
- 1.3 The extant gas zones, the gas groups and temperature classes or ignition temperatures are identified from the classification documents and any regulatory requirements
- 1.4 The extent of dust zones, minimum cloud ignition temperatures and layer ignition energy are identified from the classification documents and any regulatory requirements
- 1.5 Arrangements for the supply protection/control for the hazardous area installation are determined from plant design and electrical specifications taking into account existing installation arrangement
- 1.6 The location of the electrical and control equipment items and routes of wiring systems for the hazardous area are determined from the plant design and electrical specifications
- 2.1 Information obtained to determine the extent of the installation is applied to selecting equipment, wiring components and accessories

- 2.2 Equipment and accessories are selected for their compliance with requirements of the relevant standards for the explosive atmosphere and zone in which they are to be installed and allowing for the equipment protection level (EPL) specified in the area classification documents
 - 2.3 Consideration is given to the adverse effects of external influences when selecting equipment and wiring systems as required by relevant standards
 - 2.4 The additional requirements for explosive atmospheres are applied to selecting electrical overload and short circuit protection devices as required by relevant standards
 - 2.5 Manufacturer's data is referenced to ensure equipment selected is certified for the area classification zonings, groups and temperature limitations for the location in which equipment is to be installed
 - 2.6 Wiring systems, cables, glands and terminations are selected to comply with the associated protection types and installation requirements
 - 2.7 Certification documents for equipment received are checked to ensure they are consistent with the equipment marking and installation requirements
 - 2.8 Cables and accessories received are checked to ensure they are consistent with the markings and installation requirements previously determined
- 3 Document installation plan**
- 3.1 Equipment location, circuit arrangement diagrams, certification details for each item of equipment, and installation schedules are included in the planning documentation
 - 3.2 The installation planning documentation is forwarded to the appropriate person for acceptance

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Planning electrical installations for hazardous areas must include reference to:

- verification dossier
- plant design and electrical installation requirements
- standards
- explosion-protected equipment manufacturer's data

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0007 Plan electrical installations for hazardous areas.

Assessment Requirements for UEEHA0029 Plan electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0007 Plan electrical installations for hazardous areas

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- determining the extent of the installation, including:
 - identifying the nature and characteristic of the explosive hazard
 - in the absence of classification documents, arranging with the appropriate person to have the area formally classified
 - determining the extent of classified areas, including:
 - gas hazards and parameters
 - dust hazards and parameters
 - any regulatory requirements
 - arranging the electrical installation for compliance with hazardous area requirements, including:
 - supply, circuit protection and controls to comply with hazardous area requirements
 - location of electrical and control equipment items
- selecting and checking equipment, wiring components and accessories, including:
 - selecting equipment compliant with:
 - requirements for the explosive atmosphere and zone in which they are to be installed
 - equipment protection level (EPL) when specified
 - required protection against the adverse effects of external influences
 - hazardous area requirements for limiting temperature rise of Ex 'e' equipment for normal and overload conditions
 - selecting wiring systems and cables compliant with:
 - equipment groups and protection types
 - surface temperature limitations
 - flame propagation requirements

- requirements for Ex ‘i’ circuits
- checking equipment, cables and accessories received to ensure they are consistent with certification, equipment marking and installation requirements
- documenting installation plan, including:
 - circuit arrangement diagrams
 - equipment location
 - certification details of each item of Ex equipment
 - schedules of equipment, cables and connection arrangements
 - forwarding installation plan report to the appropriate person for acceptance.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- information needed to select compliant equipment, including:
 - gas, vapour or dust classification in relation to the group or sub-group of the electrical equipment
 - temperature class or ignition temperature of the gas or vapour involved
 - minimum ignition temperature and energy of the combustible dust cloud
 - minimum ignition temperature of the combustible dust layer
 - external influences and ambient temperature
 - relationship between EPLs and types of protection
- requirements for the selection of equipment specified, including:
 - additional requirements for specific equipment types
 - limitation of metallic materials (e.g. cable trays, mounting plates, weather protection and enclosures) in Group I and Group II installations
- requirements for wiring systems, cables and components, including:
 - wiring systems not permitted in hazardous areas
 - wiring systems not permitted above hazardous areas
 - cables suitable for fixed wiring for:
 - Group I
 - Group II
 - Group III
 - additional requirements for wiring systems supplying protection Ex ‘d’, Ex ‘e’ and Ex ‘n’ equipment
 - wiring requirements for intrinsically safe and energy-limited circuits.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, safe work methods, installation and inspection standards, and verification dossier for the site, including:
 - area classification diagrams and documents
 - plant design specification
- electrical installation specifications, including:
 - electrical equipment to be installed
 - load requirements for each item of electrical equipment
- relevant technical standards.

UEEHA0030 Repair reeling, trailing and flexible cables used in coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair the sheathing, insulation and conductors of reeling, trailing and flexible cables. It includes: working safely and to standards; following repair instructions; applying repair techniques; and documenting the repair work.

It is adopted from clause 2.17 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it.

This unit applies to electrical equipment overhaul and repair job functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Not applicable

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to repair cable

- 1.1** Safe work methods to repair cables are obtained from workshops, standards and original manufacturer's instructions and understood
- 1.2** Knowledge of mining cable types, features, component functions, typical applications and how they are stored is applied to preparing for the work
- 1.3** Cable to be repaired and instructions on the extent of repairs are received and confirmed with supervising personnel
- 1.4** Materials required for the repair are obtained and checked against received instructions
- 1.5** Tools and equipment needed to carry out the cable repair work are obtained and checked for correct operation and safety

2 Carry out cable repair

- 2.1** Safe work methods to carry out cable repair work are accepted and followed
- 2.2** Knowledge of cable repair methods and procedures are applied and instructions for the extent of repair are followed
- 2.3** Damaged cable material is removed and cables prepared for joining
- 2.4** An acceptable method is applied to splicing and joining armoring, screens and conductive materials
- 2.5** Insulation, insulation screening and covering is replaced on all cores and outer sheaths correctly using materials specified in the work instructions
- 2.6** The correct method is used to join pliable cable armour
- 2.7** Cable sheath is repaired using the correct sheath tape and vulcanized at the required temperature and timed to ensure as new electrical and mechanical properties are retained
- 2.8** Cable repair is done in a manner that does not reduce the operating parameters for the cable type

- 2.9** Safe work methods for ‘house-keeping’ at the completion of cables repair work are followed
- 3 Document cable repair work**
- 3.1** Cable repair work completion sheets are filled out in accordance with quality assurance procedures
- 3.2** Responsible supervisor is notified of the completion of the work in accordance with quality assurance procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

This unit must include these conditions in relation to pre and post repair testing of at least four separate cables. Among the cables for which competency is required, all of the following features shall be included:

Cable features	AS/NZS designated cable type
• Standard conductor construction	209; 210; 240; 241; 260; 275; 409; 412.1; 440; 441.1; 441; 450; 455.
• Super flexible	245.
• XR-EP-90 insulated compound	441; 450; 455.
• Semi conductive extruded screens	241; 245; 441.1; 441; 450; 455.
• Metal braided screens	209; 210; 240; 260; 409; 440; 450.
• Interstitial earths	241; 245; 275; 412.1; 441.1; 441; 450; 455.
• Interstitial pilots	240; 260; 440; 450; 455.
• Central pilot	209; 210; 241; 245; 275; 409; 441.1; 441.
• Pliable armour	260; 412.1.

- Sheath reinforcement 241; 245; 274; 441.1; 441; 450; 455.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0030 Repair reeling, trailing and flexible cables used in coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to repair cables including:
 - reviewing safe work methods
 - receiving and understanding work instructions
 - obtaining and checking material required for the work against the work instructions
 - obtaining tools and equipment needed and checks them for correct operation and safety
- repairing cables including:
 - selecting four or more different cable types and voltages which collectively incorporate the features specified in AS/NZS 1747
 - confirming and accepting safe work methods
 - following repair instructions for each including:
 - removing damaged cable material and preparing a cable for repair
 - splicing and joining cable conductors correctly as required
 - replacing insulation and covering of conductors and outer sheath correctly as required
 - joining pliable cable armour correctly
 - applying cable sheath tape and vulcanizes at the required temperature, timed to ensure as new electrical and mechanical properties are retained
 - following safe work methods for 'house-keeping' at the completion of work
- documenting cable repair including:
 - filling out work completion sheet accurately
 - notifying the responsible supervisor that the work is completed.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- cable types including:

- cable construction, materials and features of cable components
- function of each cable component
- conditions under which cables should be stored
- Standards to which cables are manufactured
- typical applications of specific cables
- cable repair preparation and conductor splicing methods including:
 - criteria for determining the section of cable suitable to be joined
 - cable preparation and methods
 - splicing methods and application for power, pilot and earthing conductors
- replacement of cable insulation including:
 - preparation of power conductors prior to the application of insulation
 - types of insulation repair tapes and their application
 - techniques for applying insulation repair tape
- techniques for joining pliable wire armour including:
 - cable manufacturers recommendation
 - established workshop procedures
- replacing and repairing cable sheath including:
 - techniques used in replacing cable sheath
 - setting up a vulcanizer to vulcanize a repair
 - vulcanizing techniques and issues.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- safe work method documentation
- resources relevant to the cable repairs undertaken and required to be a recognised cable repair workshop to the scope of AS/NZS 1747 with ISO 9001 type quality assurance.

UEEHA0031 Supervise repair and overhaul of explosion-protected equipment type flameproof (Ex d)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0011 Supervise repair and overhaul of explosion-protected equipment type flameproof (Ex d).

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan and supervise the repair and overhaul of explosion-protected equipment type flameproof (Ex d). It includes liaising with equipment users to establish and document the level of work required; writing specifications for the repair and overhaul and arranging for repairs to be carried out; verifying compliance of repaired and overhauled equipment; and completing all the required documentation.

This unit applies to electrical equipment repair workshop supervisory job function, designated as the 'responsible person'.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

It is adopted from clause 2.22 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.22 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall be competent to overhaul and repair electrical components and/or non-electrical components of electrical equipment at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for repair and overhaul of equipment

2 Establish the level of repair/overhaul required

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Repair facility quality assurance system is obtained, interpreted and applied
- 1.2** Instructions on repair and/or overhaul are received and expected outcomes of the work confirmed with the user
- 1.3** All documentation relevant to the equipment repair and/or overhaul is obtained, interpreted and applied
- 1.4** Where adequate relevant equipment information is not available, steps taken to source such information are documented
- 1.5** Agreement is made with the user for the repair and/or overhaul of Group II and III equipment to be completed in accordance with standards where adequate documentation is not available
- 1.6** The common requirements for equipment repair and overhaul are ascertained from relevant standards and regulations and applied to the preparation for the work only where this arrangement is permitted
- 2.1** Safe work methods are applied to measurements, tests and inspections carried out on the equipment to establish the extent of repair and/or overhaul
- 2.2** The requirements, evaluation procedures and parameters of the type of equipment to be repaired and/or overhauled are ascertained from relevant standards and regulations and applied to establishing the extent of the work

- 2.3 Measurement devices and instruments are maintained and calibrated in accordance with recognised practices
 - 2.4 The extent of work to be completed is established from measurements, tolerances and evaluation procedures and their correspondence with equipment documentation and the requirements of standards
 - 2.5 Specifications and instructions for the repair and/or overhaul work are documented ensuring compliance with original documentation, standards and user instructions
- 3 Arrange repair and overhaul work**
 - 3.1 Arrangements are made for the repair and overhaul work to be completed in accordance with the specification and instructions, by an operative with the competencies specified in standards
 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for completing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and applicable to an equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3 Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4 The steps taken to obtain the certificate documents where adequate equipment documentation was not available is included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Supervising repair and overhaul of explosion-protected equipment type flameproof (Ex d) must:

- apply to the supervision of overhaul and repair of explosion-protected equipment
- be carried out under an approved quality management system
- include access to all relevant standards and liaison with end-users

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0011 Supervise repair and overhaul of explosion-protected equipment type flameproof (Ex d).

Assessment Requirements for UEEHA0031 Supervise repair and overhaul of explosion-protected equipment type flameproof (Ex d)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0011 Supervise repair and overhaul of explosion-protected equipment type flameproof (Ex d).

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing for repair and overhaul work of equipment, including:
 - following quality assurance system procedures
 - gathering required documentation
- establishing the level of repair and overhaul required, including:
 - following safe work methods
 - examining equipment submitted for repair and overhaul using appropriately maintained measuring devices and instruments
 - documenting the specification for the repair and overhaul
- arranging repair and overhaul work, including:
 - selecting appropriately competent operatives to carry out repair and/or overhaul, including reclamation activities
 - providing operative with the repair and/or overhaul specifications
- verifying that equipment complies with original certification, including:
 - choosing the scope and level of tests and measurements required to verify whether the repaired and/or overhauled equipment complies with original documented requirements
 - arranging for verification of compliance tests and measurements to be carried out
 - reviewing results of verification tests and taking actions to rectify any non-compliance identified by the verification tests and measurements
- documenting repair and overhaul work, including:
 - marking equipment in accordance with standard requirements to show that equipment has been repaired
 - preparing job report of the completed repair and overhaul, including all items specified by standards and submitted to the user
 - updating the repair and overhaul undertaken in the repair facility records, including steps

taken to obtain equipment documentation as required by standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- repair and overhaul of explosion-protected equipment (common requirements), including:
 - common requirements for repair and overhaul work of explosive-protected equipment including:
 - equipment with documentation and without documentation
 - statutory requirements for repair facility and user
 - instructions for the user
 - instructions for the repair facility
 - identification of repaired equipment by marking including:
 - marking information
 - symbols in accordance with standards requirements
 - other situations
 - requirements for the repair and overhaul of equipment with protection level (EPL) Ga
 - limitations and requirements for the repair and overhaul of equipment with type of protection special 's'
- repair and overhaul of explosive-protected equipment type flameproof 'd', including:
 - examination procedures of Ex 'd' equipment submitted for repair and overhaul including:
 - identifying key components and relevant physical parameters
 - identify indications of component damage
 - testing and inspection required to establish relevant physical parameters
 - comparison of physical parameters with equipment documentation
 - additional requirements for the repair and overhaul work of equipment with type of protection Ex 'd' including:
 - application
 - repair and overhaul requirements
 - reclamation of equipment
 - alterations and modifications of equipment
 - requirements for measurements in Ex 'd' equipment during overhaul, repair and reclamation including:
 - general requirements
 - guidance on tolerances to be achieved at overhaul Groups I, II and III
 - evaluation procedures and parameters including:
 - general requirements
 - Ex 'd' motors

- Ex 'd' enclosures
- electrical equipment installed within a Ex 'd' enclosures
- corrosion or surface indentation tolerance
- repair and overhaul of explosive-protected equipment type non-sparking 'n', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'n' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:
 - general requirements
 - Ex 'n' enclosures
 - electrical equipment installed within Ex 'n' enclosures
- repair and overhaul of explosive-protected equipment type pressurisation 'pD' including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'pD' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type encapsulation 'm', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'm' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type oil-filled, 'o', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'o' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type powder-filled 'q', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'q' including:
 - application
 - repair and overhaul requirements

- reclamation
- alterations and modifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- a certified quality management system
- documentation and record systems required of a workshop certified to undertake repair and overhaul of explosive-protected equipment
- relevant equipment standards and manufacturer's data
- equipment to be repaired/overhauled.

UEEHA0032 Supervise repair and overhaul of explosion-protected equipment type increased safety (Ex e)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0012 Supervise repair and overhaul of explosion-protected equipment type increased safety (Ex e).

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan and supervise the repair and overhaul of explosion-protected equipment type increased safety (Ex 'e'). It includes liaising with equipment users to establish and document the level of work required; writing specifications for the repair and overhaul and arranging for repairs to be carried out; verifying compliance of repaired and overhauled equipment; and completing all the required documentation.

This unit applies to electrical equipment repair workshop supervisory job function, designated as the 'responsible person'.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.22 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.22 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall be competent to overhaul and repair electrical components and/or non-electrical components of electrical equipment at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for repair and overhaul of equipment

2 Establish the level of repair/overhaul required

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Repair facility quality assurance system is obtained, interpreted and applied
- 1.2** Instructions on repair and/or overhaul are received and expected outcomes of the work confirmed with the user
- 1.3** All documentation relevant to the equipment repair and/or overhaul is obtained, interpreted and applied
- 1.4** Where adequate relevant equipment information is not available, steps taken to source such information are documented
- 1.5** Agreement is made with the user for the repair and/or overhaul of Group II and III equipment to be completed in accordance with standards where adequate documentation is not available
- 1.6** The common requirements for equipment repair and overhaul are ascertained from relevant standards and regulations and applied to the preparation for the work only where this arrangement is permitted
- 2.1** Safe work methods are applied to measurements, tests and inspections carried out on the equipment to establish the extent of repair and/or overhaul
- 2.2** The requirements, evaluation procedures and parameters of the type of equipment to be repaired and/or overhauled are ascertained from relevant standards and regulations and applied to establishing the extent of the work

- 2.3 Measurement devices and instruments are maintained and calibrated in accordance with recognised practices
 - 2.4 The extent of work to be completed is established from measurements, tolerances and evaluation procedures and their correspondence with equipment documentation and the requirements of standards
 - 2.5 Specifications and instructions for the repair and/or overhaul work are documented ensuring compliance with original documentation, standards and user instructions
- 3 Arrange repair and overhaul work**
 - 3.1 Arrangements are made for the repair and overhaul work to be completed in accordance with the specification and instructions, by an operative with the competencies specified in standards
 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for doing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and applicable to the equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3** Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4** The steps taken to obtain the certificate documents where adequate equipment documentation was not available is included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Supervising repair and overhaul of explosion-protected equipment type increased safety (Ex e) must:

- apply to the supervision of overhaul and repair of explosion-protected equipment
- be carried out under an approved quality management system
- include access to all relevant standards and liaison with end-users

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0012 Supervise repair and overhaul of explosion-protected equipment type increased safety (Ex e).

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0032 Supervise repair and overhaul of explosion-protected equipment type increased safety (Ex e)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0012 Supervise repair and overhaul of explosion-protected equipment type increased safety (Ex e).

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing for repair and overhaul work of equipment, including:
 - following quality assurance system procedures
 - gathering required documentation
- establishing the level of repair and overhaul required, including:
 - following safe work methods
 - examining equipment submitted for repair and overhaul using appropriately maintained measuring devices and instruments
 - documenting the specification for the repair and overhaul
- arranging repair and overhaul work, including:
 - selecting appropriately competent operatives to carry out repair and/or overhaul, including reclamation activities
 - providing operative with the repair and/or overhaul specifications
- verifying that equipment complies with original certification, including:
 - choosing the scope and level of tests and measurements required to verify whether the repaired and/or overhauled equipment complies with original documented requirements
 - arranging for verification of compliance tests and measurements to be carried out
 - reviewing results of verification tests and taking actions to rectify any non-compliance identified by the verification tests and measurements
- documenting repair and overhaul work, including:
 - marking equipment in accordance with standard requirements to show that equipment has been repaired
 - preparing job report of the completed repair and overhaul, including all items specified by standards and submitted to the user

- updating the repair and overhaul undertaken in the repair facility records, including steps taken to obtain equipment documentation as required by standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- repair and overhaul of explosion-protected equipment (common requirements), including:
 - common requirements for repair and overhaul work of explosive-protected equipment including:
 - equipment with documentation and without documentation
 - statutory requirements for repair facility and user
 - instructions for the user
 - instructions for the repair facility
 - identification of repaired equipment by marking including:
 - marking information
 - symbols in accordance with standards requirements
 - other situations
 - requirements for the repair and overhaul of equipment with protection level (EPL) Ga
 - limitations and requirements for the repair and overhaul of equipment with type of protection special 's'
- repair and overhaul of explosive-protected equipment type increased safety 'e', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'e' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:
 - general requirements
 - Ex 'e' motors
 - Ex 'e' enclosures
 - electrical equipment installed within ex 'e' enclosures
- repair and overhaul of explosive-protected equipment type non-sparking 'n', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'n' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications

- evaluation procedures and parameters including:
 - general requirements
 - Ex 'n' enclosures
 - electrical equipment installed within Ex 'n' enclosures
- repair and overhaul of explosive-protected equipment type pressurisation 'pD', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'pD' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type encapsulation 'm', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'm' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type oil-filled 'o', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'o' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type powder-filled 'q', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'q' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- a certified quality management system
- documentation and record systems required of a workshop certified to undertake repair and overhaul of explosive-protected equipment
- relevant equipment standards and manufacturer's data
- equipment to be repaired/overhauled.

UEEHA0033 Supervise repair and overhaul of explosion-protected equipment type intrinsically safe (Ex i)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0013 Supervise repair and overhaul of explosion-protected equipment type intrinsically safe (Ex i).

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan and supervise the repair and overhaul of explosion-protected equipment type intrinsically safe (Ex i). It includes liaising with equipment users to establish and document the level of work required; writing specifications for the repair and overhaul and arranging for repairs to be carried out; verifying compliance of repaired and overhauled equipment; and completing all the required documentation.

This unit applies to electrical equipment repair workshop supervisory job function, designated as the 'responsible person'.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.22 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.22 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall be competent to overhaul and repair electrical components and/or non-electrical components of electrical equipment at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for repair and overhaul of equipment

2 Establish the level of repair/ overhaul required

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Repair facility quality assurance system is obtained, interpreted and applied
- 1.2** Instructions on repair and/or overhaul are received and expected outcomes of the work confirmed with the user
- 1.3** All documentation relevant to the equipment repair and/or overhaul is obtained, interpreted and applied
- 1.4** Where adequate relevant equipment information is not available, steps taken to source such information are documented
- 1.5** Agreement is made with the user for the repair and/or overhaul of Group II and III equipment to be completed in accordance with standards where adequate documentation is not available
- 1.6** The common requirements for equipment repair and overhaul are ascertained from relevant standards and regulations and applied to the preparation for the work only where this arrangement is permitted
- 2.1** Safe work methods are applied to measurements, tests and inspections carried out on the equipment to establish the extent of repair and/or overhaul
- 2.2** The requirements, evaluation procedures and parameters of the type of equipment to be repaired and/or overhauled are ascertained from relevant standards and regulations and applied to establishing the extent of the work

- 2.3 Measurement devices and instruments are maintained and calibrated in accordance with recognised practices
 - 2.4 The extent of work to be completed is established from measurements, tolerances and evaluation procedures and their correspondence with equipment documentation and the requirements of standards
 - 2.5 Specifications and instructions for the repair and/or overhaul work are documented ensuring compliance with original documentation, standards and user instructions
- 3 Arrange repair and overhaul work**
 - 3.1 Arrangements are made for the repair and overhaul work to be completed in accordance with the specification and instructions, by an operative with the competencies specified in standards
 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for completing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and applicable to an equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3 Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4 The steps taken to obtain the certificate documents where adequate equipment documentation was not available is included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.
