 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for completing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and applicable to an equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3 Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4 The steps taken to obtain the certificate documents where adequate equipment documentation was not available is included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Supervising repair and overhaul of explosion-protected equipment type pressurised (Ex p) must:

- apply to the supervision of overhaul and repair of explosion-protected equipment
- be carried out under an approved quality management system
- include access to all relevant standards and liaison with end-users

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0014 Supervise repair and overhaul of explosion-protected equipment type pressurised (Ex p).

Assessment Requirements for UEEHA0034 Supervise repair and overhaul of explosion-protected equipment type pressurised (Ex p)

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0014 Supervise repair and overhaul of explosion-protected equipment type pressurised (Ex p).

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing for repair and overhaul work of equipment, including:
 - following quality assurance system procedures
 - gathering required documentation
- establishing the level of repair and overhaul required, including:
 - following safe work methods
 - examining equipment submitted for repair and overhaul using appropriately maintained measuring devices and instruments
 - documenting the specification for the repair and overhaul
- arranging repair and overhaul work, including:
 - selecting appropriately competent operatives to carry out repair and/or overhaul, including reclamation activities
 - providing operative with the repair and/or overhaul specifications
- verifying that equipment complies with original certification, including:
 - choosing the scope and level of tests and measurements required to verify whether the repaired and/or overhauled equipment complies with original documented requirements
 - arranging for verification of compliance tests and measurements to be carried out
 - reviewing results of verification tests and taking actions to rectify any non-compliance identified by the verification tests and measurements
- documenting repair and overhaul work/ including:
 - marking equipment in accordance with standard requirements to show that equipment has been repaired
 - preparing job report of the completed repair and overhaul/ including all items specified by standards and submitted to the user

- updating the repair and overhaul undertaken in the repair facility records/ including steps taken to obtain equipment documentation as required by standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- repair and overhaul of explosion-protected equipment (common requirements). including:
 - common requirements for repair and overhaul work of explosive-protected equipment including:
 - equipment with documentation and without documentation
 - statutory requirements for repair facility and user
 - instructions for the user
 - instructions for the repair facility
 - identification of repaired equipment by marking including:
 - marking information
 - symbols in accordance with standards requirements
 - other situations
 - requirements for the repair and overhaul of equipment with protection level (EPL) Ga
 - limitations and requirements for the repair and overhaul of equipment with type of protection special 's'
- repair and overhaul of explosive-protected equipment type pressurised 'p', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'p' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:
 - testing requirements and methods
 - service facilities' established requirements
- repair and overhaul of explosive-protected equipment type non-sparking 'n', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'n' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:
 - general requirements

- Ex 'n' enclosures
- electrical equipment installed within Ex 'n' enclosures
- repair and overhaul of explosive-protected equipment type pressurisation 'pD', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'pD' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type encapsulation 'm', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'm' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type oil-filled 'o', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'o' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type powder-filled 'q', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'q' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- a certified quality management system
- documentation and record systems required of a workshop certified to undertake repair and overhaul of explosive-protected equipment
- relevant equipment standards and manufacturer's data
- equipment to be repaired/overhauled.

UEEHA0035 Supervise repair and overhaul of explosion-protected rotating machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0015 Supervise repair and overhaul of explosion-protected rotating machines.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan and supervise the repair and overhaul of explosion-protected rotating machines. It includes liaising with equipment users to establish and document the level of work required; writing specifications for the repair and overhaul and arranging for repairs to be carried out; verifying compliance of repaired and overhauled equipment; and completing all the required documentation.

This unit applies to electrical equipment repair workshop supervisory job function, designated as the 'responsible person'.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.22 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.22 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall be competent to overhaul and repair electrical components and/or non-electrical components of electrical equipment at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for repair and overhaul of equipment

2 Establish the level of repair/overhaul required

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Repair facility quality assurance system is obtained, interpreted and applied
- 1.2** Instructions on repair and/or overhaul are received and expected outcomes of the work confirmed with the user
- 1.3** All documentation relevant to the equipment repair and/or overhaul is obtained, interpreted and applied
- 1.4** Where adequate relevant equipment information is not available, steps taken to source such information are documented
- 1.5** Agreement is made with the user for the repair and/or overhaul of Group II and III equipment to be completed in accordance with standards where adequate documentation is not available
- 1.6** The common requirements for equipment repair and overhaul are ascertained from relevant standards and regulations and applied to the preparation for the work only where this arrangement is permitted
- 2.1** Safe work methods are applied to measurements, and tests and inspections carried out on the equipment to establish the extent of repair and/or overhaul
- 2.2** The requirements, evaluation procedures and parameters of the type of equipment to be repaired and/or overhauled are ascertained from relevant standards and regulations and applied to establishing the extent of the work

- 2.3 Measurement devices and instruments are maintained and calibrated in accordance with recognised practices
 - 2.4 The extent of work to be completed is established from measurements, tolerances and evaluation procedures and their correspondence with equipment documentation and the requirements of standards
 - 2.5 Specifications and instructions for the repair and/or overhaul work are documented ensuring compliance with original documentation, standards and user instructions
- 3 Arrange repair and overhaul work**
 - 3.1 Arrangements are made for the repair and overhaul work to be completed in accordance with the specification and instructions, by an operative with the competencies specified in standards
 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for completing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type, standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3 Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4 The steps taken to obtain the certificate documents where adequate equipment documentation was not available are included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Supervising repair and overhaul of explosion-protected rotating machines must:

- apply to the supervision of overhaul and repair of explosion-protected equipment
- be carried out under an approved quality management system
- include access to all relevant standards and liaison with end-users

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0015 Supervise repair and overhaul of explosion-protected rotating machines.

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0035 Supervise repair and overhaul of explosion-protected rotating machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0015 Supervise repair and overhaul of explosion-protected rotating machines.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing for repair and overhaul work of equipment, including:
 - following quality assurance system procedures
 - gathering required documentation
- establishing the level of repair and overhaul required, including:
 - following safe work methods
 - examining equipment submitted for repair and overhaul using appropriately maintained measuring devices and instruments
 - documenting the specification for the repair and overhaul
- arranging repair and overhaul work, including:
 - selecting appropriately competent operatives to carry out repair and/or overhaul, including reclamation activities
 - providing operative with the repair and/or overhaul specifications
- verifying that equipment complies with original certification, including:
 - choosing the scope and level of tests and measurements required to verify whether the repaired and/or overhauled equipment complies with original documented requirements
 - arranging for verification of compliance tests and measurements to be carried out
 - reviewing results of verification tests and taking actions to rectify any non-compliance identified by the verification tests and measurements
- documenting repair and overhaul work, including:
 - marking equipment in accordance with standard requirements to show that equipment has been repaired
 - preparing job report of the completed repair and overhaul, including all items specified by standards and submitted to the user
 - updating the repair and overhaul undertaken in the repair facility records, including steps

taken to obtain equipment documentation as required by standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- repair and overhaul of explosion-protected equipment (common requirements), including:
 - common requirements for repair and overhaul work of explosive-protected equipment including:
 - equipment with documentation and without documentation
 - statutory requirements for repair facility and user
 - instructions for the user
 - instructions for the repair facility
 - identification of repaired equipment by marking including:
 - marking information
 - symbols in accordance with standards requirements
 - other situations
 - requirements for the repair and overhaul of equipment with protection level (EPL) Ga
 - limitations and requirements for the repair and overhaul of equipment with explosive-protection type special Ex 's'
- explosion-protected rotating machines, including:
 - requirements for the repair and overhaul of explosive-protection type flameproof Ex 'd' for rotating machines including:
 - instructions for the repair facility - rotating machines
 - winding data and repair parameters
 - embedded winding temperature sensors
 - machine frames/enclosures and flameproof joints
 - repair of rotors
 - winding tests conducted after repair
 - machine tests after repair/overhaul
 - auxiliary equipment
 - documentation of repair/overhaul
 - requirements for the repair and overhaul of explosive-protection type increased safety Ex 'e' for rotating machines including:
 - instructions for the repair facility - rotating machines
 - winding data and repair parameters
 - embedded winding temperature sensors
 - machine frames/enclosures, clearances and terminations
 - repair of rotors

- winding tests conducted after repair
- machine tests after repair/overhaul
- documentation of repair/overhaul
- evaluation procedures and parameters including overhaul of equipment protected by enclosures Ex 't' (dip) motors.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- a certified quality management system
- documentation and record systems required of a workshop certified to undertake repair and overhaul of explosive-protected equipment
- relevant equipment standards and manufacturer's data
- equipment to be repaired/overhauled.

UEEHA0036 Test reeling, trailing and flexible cables and their attachments used in coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to pre and post-repair test reeling, trailing and flexible cables and their attachments, as used in coal mining. It includes: working safely and to standards; evaluating the condition of cables; conducting cable tests; finding faults; writing repair specifications; and documenting test results and cable repair history.

It is adopted from clause 2.18 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it.

This unit applies to electrical equipment overhaul and repair job functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEHA0030 Repair reeling, trailing and flexible cables used in coal mining

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to test cables

- 1.1** Safe work methods to test damaged and repaired cables are obtained and understood
- 1.2** Cable to be tested before and after repair is confirmed with supervising personnel
- 1.3** Cable repair history and test records are reviewed to identify potential issues and ascertain the viability of repair
- 1.4** Tools, equipment and testing devices needed to carry out the tests are obtained and checked for correct operation, safety and currency of calibration certification

2 Determine the extent of cable repairs by fault finding, testing and inspection

- 2.1** Safe work methods to carry out cable inspecting and testing are obtained interpreted and applied
- 2.2** Knowledge of basic electrical quantities, circuits and cable design parameters and how they are tested and measured is applied to cable testing
- 2.3** Cable testing devices are handled carefully and set up correctly prior to each test
- 2.4** Cables are inspected and tested to ascertain the viability of repairs or extent of repairs required
- 2.5** Viability and extent of the cable repair is determined from inspection, test results and cable repair history records
- 2.6** Decision on the viability of repair and instructions for the repair of the cable are documented and forwarded to the responsible personnel

3 Test repaired cable

- 3.1** Safe work methods to carry out cable testing are obtained interpreted and applied
- 3.2** Cable testing devices are handled carefully and set up correctly prior to each test
- 3.3** Each test reading is taken accurately, interpreted and recorded

- 3.4** Actions to rectify any non-complying parameters shown by test results are documented and forwarded to the responsible personnel
 - 3.5** Safe work methods for the care and storage of test equipment at the completion of testing are followed
 - 4 Document test results, fault finding and cable repair**
 - 4.1** Cable history test records are updated in accordance with quality assurance procedures
 - 4.2** Responsible supervisor is notified of the completion of the work in accordance with quality assurance procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

This unit must include these conditions in relation to pre and post repair testing of at least four separate cables. Among the cables for which competency is required, all of the following features shall be included:

Cable features	AS/NZS designated cable type
• Standard conductor construction	209; 210; 240; 241; 260; 275; 409; 412.1; 440; 441.1; 441; 450; 455.
• Super flexible	245.
• XR-EP-90 insulated compound	441; 450; 455.
• Semi conductive extruded screens	241; 245; 441.1; 441; 450; 455.
• Metal braided screens	209; 210; 240; 260; 409; 440; 450.
• Interstitial earths	241; 245; 275; 412.1; 441.1; 441; 450; 455.

- Interstitial pilots 240; 260; 440; 450; 455.
- Central pilot 209; 210; 241; 245; 275; 409; 441.1; 441.
- Pliable armour 260; 412.1.
- Sheath reinforcement 241; 245; 274; 441.1; 441; 450; 455.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0036 Test reeling, trailing and flexible cables and their attachments used in coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to test damaged cable including:
 - reviewing safe work methods
 - reviewing repair history and test records of cable to be repaired
 - obtaining equipment and testing devices and checking them for safe operation and currency of calibration certification
- determining the extent of cable repairs including:
 - confirming and accepting safe work methods
 - inspecting and testing damaged cables using fault finding procedures
 - using inspection and test results together with cable repair history in determining the viability or extent of repair required
 - documenting the viability of repair and repair instruction from fault finding and forwarding to responsible personnel
- testing repaired cable including:
 - confirming and accepting safe work methods
 - setting up testing devices and taking and recording each test reading accurately
 - documenting actions to be taken to rectify non-complying parameters shown by test results and forwarded to the responsible personnel
 - following safe work methods for the care and storage of test equipment
- updating cable repair history record and notifying the responsible supervisor on the completion of the work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- nature of electricity and electrical circuits including:
 - electrical current and charge

- sources of electricity
- effects of current
- single-source single-load circuits covering:
 - components that make up the circuit
 - the relationship between voltage and current
 - consequences of a short-circuit and an open-circuit
- electrical properties of material including:
 - insulating materials including:
 - insulating properties
 - types and applications of insulation in cable technology
 - conducting materials including:
 - conducting properties
 - factor affecting resistance
 - types and applications of conducting materials in cable technology
 - semiconducting materials including:
 - semiconducting properties
 - types and applications in cable technology
- electrical parameters of cables and electrical measurement including:
 - testing devices including:
 - devices used for testing cables
 - care and handling
 - requirement of measuring instruments to have current calibration certification
 - cable tests including:
 - continuity test
 - phase rotation test
 - insulation resistance test
 - high-voltage proof test
 - partial break test
 - symmetrical load test
 - sheath test
- testing electrical parameters of cables and cable assemblies including:
 - causes of inaccuracies and overcoming them
 - test device set up and safety procedures
 - interpreting test readings
 - test results that show a cable complies with standard requirements.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- safe work method documentation
- resources relevant to the cable repairs undertaken and required to be a recognised cable repair workshop to the scope of AS/NZS 1747 with ISO 9001 type quality assurance.

UEEHA0037 Verify compliance of repaired reeling, trailing and flexible cables and attachments - coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify compliance of repaired and tested reeling, trailing and flexible cables and their plug/coupler assemblies. It includes: working safely and to standards; and evaluating repairs against the required standards and required repair records in accordance with the duties of 'the responsible person'.

It is adopted from clause 2.20 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it.

This unit applies to electrical equipment overhaul and repair job functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEHA0024 Inspect, maintain and fit plugs/couplers for reeling, trailing and flexible cables - coal mining

Competency Field

Hazards

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to verify compliance of repaired cables

1.1 Safe work methods for the work are obtained and interpreted

1.2 Cable repair facility quality assurance system procedures are interpreted and applied

1.3 Specifications and instructions for cable repair are received and expected outcomes of the work confirmed with the user

1.4 Cable history test records are reviewed to identify potential issues and ascertain the viability of repair

1.5 Certification documentation for plugs/couplers are obtained and compliance of the equipment with certification checked

1.6 Tools, equipment and testing devices needed to verify compliance are obtained and checked for correct operation, safety and currency of calibration certification

2 Carry out verification of compliance

2.1 Safe work methods for the work are applied

2.2 Documentation of pre and post repair test results are compared with requirements of compliance standards

2.3 Compliance verification measurements, tests and inspections carried out on the repaired cable and fitted plug/coupler assemblies in accordance with quality assurance systems procedures

2.4 Actions are taken to have any non-compliance aspects shown by measurements, tests and inspection results rectified in accordance with quality system procedures

2.5 Safe work methods for cleaning the work area and storing equipment at the completion of cable repair work are applied

- 3 Complete and document cable repair work**
- 3.1** Verification of compliance is documented, including update of cable test history records in accordance with quality assurance procedures
 - 3.2** Verification of compliance is issued to the appropriate persons in accordance with quality assurance procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

This unit must include these conditions in relation to compliance verification of the repair of at least four separate cables, including the fitting of the plugs/couplers certified for each explosion-protection technique of flameproof (Ex 'd'), increased safety (Ex 'e'), intrinsically safe (Ex 'i') and encapsulation-dusts (Ex 'mD'). Among the cables for which competency is required, all of the following features shall be included:

- Standard conductor construction 209; 210; 240; 241; 260; 275; 409; 412.1; 440; 441.1; 441; 450; 455.
- Super flexible 245.
- XR-EP-90 insulated compound 441; 450; 455.
- Semi conductive extruded screens 241; 245; 441.1; 441; 450; 455.
- Metal braided screens 209; 210; 240; 260; 409; 440; 450.
- Interstitial earths 241; 245; 275; 412.1; 441.1; 441; 450; 455.
- Interstitial pilots 240; 260; 440; 450; 455.
- Central pilot 209; 210; 241; 245; 275; 409; 441.1; 441.
- Pliable armour 260; 412.1.
- Sheath reinforcement 241; 245; 274; 441.1; 441; 450; 455.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEEHA0037 Verify compliance of repaired reeling, trailing and flexible cables and attachments - coal mining

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to verify compliance of repaired cables including:
 - following quality assurance system procedures
 - reviewing specifications and instruction for repair of cables and cable repair history to ascertain the viability of repair
 - checking compliance certification of plugs and couplings
 - checking tools and equipment for correct operation and safety and currency of testing device calibration
- verifies compliance of repaired cables and fittings including:
 - accepting and following safe work methods
 - comparing pre and post repair test results with requirements of compliance standards
 - carrying out compliance verification measurements, tests and inspections in accordance with quality assurance procedures
 - tacking action to have non-compliance aspects of repairs rectified
 - following safe work methods for cleaning the work area and storing equipment at the completion of work
- documenting verification of compliance repairs and issues to appropriate person in accordance with quality assurance procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- quality assurance systems including:
 - quality assurance systems overview
 - quality procedures for cable, plug and coupler repairs
- compliance documentation system including:

- user records and instructions for repair
- plug and coupler certification
- repair history records.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and PPE currently used in industry
- safe work method documentation
- resources relevant to the cable repairs undertaken and required to be a recognised cable repair workshop to the scope of AS/NZS 1747 with ISO 9001 type quality assurance.

UEEHA0038 Conduct visual and close inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0002 Conduct visual and close inspection of electrical installations for hazardous areas.

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to conduct visual and close inspections of the explosion-protection aspects of electrical installations associated with hazardous areas. It includes working safely in a hazardous area; identifying by visual or close inspection conditions of the electrical installation that affect the integrity of explosion-protection; and documenting inspection findings.

This unit applies to basic inspection functions.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.3 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.3 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall have been deemed competent to either inspect, operate, install, maintain and/or service equipment for non-hazardous areas at Australian Qualification Framework (AQF) level 2 or New Zealand Qualification Framework (NZQF) level 3 or higher."

Pre-requisite Unit

UEEHA0004 Enter a classified hazardous area to undertake work related to electrical equipment

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1 Prepare for inspection | 1.1 Safe work methods for undertaking visual and close inspections are obtained and interpreted |
| | 1.2 Knowledge of the purpose, scope and limitations of visual and close inspections is applied to preparation for the work |
| | 1.3 Type and location of each item of equipment subject to inspection are determined from the inspection program for the site |
| 2 Carry out verification of compliance | 2.1 Safe work methods for undertaking visual and close inspections in hazardous areas, including isolation of equipment, are applied |
| | 2.2 Knowledge of defects impairing the integrity of the type of protection that are identifiable by visual and close inspection is applied |
| | 2.3 Equipment is visually and |

closely inspected and defects impairing the integrity of the type of protection are identified

3 Record inspection results

- 3.1** Defects identified by visual and close inspection are recorded in accordance with inspection standards and site record systems
- 3.2** Documentation in relation to all aspects of the inspection is forwarded to the authorised person for inclusion in the verification dossier

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0002 Conduct visual and close inspection of electrical installations for hazardous areas.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0038 Conduct visual and close inspection of electrical installations for hazardous areas

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0002 Conduct visual and close inspection of electrical installations for hazardous areas.

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- preparing to conduct a visual and close inspection of electrical installations for gas and dust hazardous areas, including:
 - reviewing safe work methods associated with the classified area in which the work is to be carried out
 - determining the type and location of equipment subject to the inspection
- conducting visual and close inspections of electrical installations in gas and dust hazardous areas, including:
 - obtaining interpreting and applying safe work methods
 - identifying defects impairing the integrity of the type of protection
- completing record of visual and close inspections of electrical installations in gas and dust hazardous areas, including:
 - recording defects identified in the inspection impairing the integrity of the type of protection
 - forwarding the inspection record for inclusion in the verification dossier.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- purpose, scope and limitations of visual and close inspections, including:
 - inspection program for the site based on schedules specified in inspection standards
 - periodic inspection schedules covering equipment, installations and environment for:
 - flameproof - Ex 'd'

- increased safety - Ex 'e'
- non-sparking - Ex 'n'
- intrinsic safety - Ex 'i'
- intrinsic safety - Ex 'iD'
- non-sparking - Ex 'nL'
- pressurisation - Ex 'p'
- pressurisation - Ex 'pD'
- protection by enclosure - Ex 'tD'
- aspects of close and visual inspections, including:
 - items subject to visual and close inspection listed in schedules specified in inspection standards
 - defects impairing the integrity of the type of protection that can be identified by visual and close inspection, including:
 - excessive corrosion
 - missing cover and mounting bolts
 - enclosure or cable damage
 - non-secured cables
 - exposed armouring/cable cores at glanding points
 - missing or illegible labels.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Where evidence is gathered from a simulated work environment, the environment shall be arranged to include the following:

- an area designated as an explosive atmosphere area which is a close facsimile of a real work environment
- an area entry point
- delineation of the area into zones for both gas and dust
- a person to act as the 'authorised person' for the site
- a qualified supervisor

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- site inspection schedule
- inspection reporting system
- explosion-protected electrical installation with and without defects that can be detected by visual and close inspection.

UEEHA0039 Supervise repair and overhaul of explosion-protected equipment type Group III ('t')

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0010 Supervise repair and overhaul of explosion-protected equipment type Group III ('t').

Prerequisite requirements have been amended.

Application

This unit involves the skills and knowledge required to plan and supervise the repair and overhaul of explosion-protected equipment type Group III ('t'). It includes liaising with equipment users to establish and document the level of work required; writing specifications for the repair and overhaul and arranging for repairs to be carried out; verifying compliance of repaired and overhauled equipment; and completing all the required documentation.

This unit applies to electrical equipment repair workshop supervisory job function, designated as the 'responsible person'.

Site-specific work permits may be required to work in the hazardous environment. In addition, other permits may be required, such as confined space and to operate specific pieces of equipment such as elevated work platforms (EWPs) in various jurisdictions.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

This unit of competency and associated assessment requirements is adopted from clause 2.22 of AS/NZS 4761.1:2018 Competencies for working with electrical equipment for hazardous areas (EEHA). There may be differences between the content of this unit and AS/NZS 4761.1:2018, so the Standard must be checked to ensure compliance with it. Clause 2.22 of AS/NZS 4761.1:2018 includes the following precondition for assessment:

- "A candidate seeking assessment in this unit shall be competent to overhaul and repair electrical components and/or non-electrical components of electrical equipment at AQF level 3 or NZQF level 4 or higher."

Pre-requisite Unit

UEEHA0022 Determine the explosion-protection requirements to meet a specified classified hazardous area

Competency Field

Hazardous

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare for repair and overhaul of equipment

2 Establish the level of repair/ overhaul required

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Repair facility quality assurance system is obtained, interpreted and applied
- 1.2** Instructions on repair and/or overhaul are received and expected outcomes of the work confirmed with the user
- 1.3** All documentation relevant to the equipment repair and/or overhaul is obtained, interpreted and applied
- 1.4** Where adequate relevant equipment information is not available, steps taken to source such information are documented
- 1.5** Agreement is made with the user for the repair and/or overhaul of Group II and III equipment to be completed in accordance with standards where adequate documentation is not available
- 1.6** The common requirements for equipment repair and overhaul are ascertained from relevant standards and regulations and applied to the preparation for the work only where this arrangement is permitted
- 2.1** Safe work methods are applied to measurements, tests and inspections carried out on the equipment to establish the extent of repair and/or overhaul
- 2.2** The requirements, evaluation procedures and parameters of the type of equipment to be repaired and/or overhauled are ascertained from relevant standards and regulations and applied to establishing the extent of the work

- 2.3 Measurement devices and instruments are maintained and calibrated in accordance with recognised practices
 - 2.4 The extent of work to be completed is established from measurements, tolerances and evaluation procedures and their correspondence with equipment documentation and the requirements of standards
 - 2.5 Specifications and instructions for the repair and/or overhaul work are documented ensuring compliance with original documentation, standards and user instructions
- 3 Arrange repair and overhaul work**
 - 3.1 Arrangements are made for the repair and overhaul work to be completed in accordance with the specification and instructions, by an operative with the competencies specified in standards
 - 3.2 A copy of repair and/or overhaul specifications and instructions is provided to the operative responsible for completing the work
- 4 Verify that equipment complies with original certification**
 - 4.1 Scope and level of testing and measurements required to verify that overhauled and/or repaired equipment complies with original certification is determined in accordance with manufacturers' documentation and standards requirements as applicable to an equipment group
 - 4.2 Verification tests and measurements are arranged, conducted and documented in accordance with equipment type, standards and instruction manuals
 - 4.3 Results of verification tests and measurements are reviewed to ascertain whether they comply with original equipment documentation and/or agreement with the user
 - 4.4 Actions are taken to rectify any non-compliance identified through the verification tests and measurements
- 5 Document repair and overhaul work**
 - 5.1 Equipment is marked to show it has been repaired and/or overhauled in accordance with standards and applicable to an equipment group
 - 5.2 Job report of the completed repair and/or overhaul is prepared in accordance with standards and submitted to the user for inclusion in their verification dossier

- 5.3 Repair facility records are updated to include the job record in accordance with standards and quality system
- 5.4 The steps taken to obtain the certificate documents where adequate equipment documentation was not available is included in the repair facility records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Supervising repair and overhaul of explosion-protected equipment type Group III ('t') must:

- apply to the supervision of overhaul and repair of explosion-protected equipment
- be carried out under an approved quality management system
- include access to all relevant standards and liaison with end-users

Unit Mapping Information

This unit replaces and is equivalent to UEEHA0010 Supervise repair and overhaul of explosion-protected equipment type Group III ('t').

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEHA0039 Supervise repair and overhaul of explosion-protected equipment type Group III ('t')

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is equivalent to UEEHA0010 Supervise repair and overhaul of explosion-protected equipment type Group III ('t').

Prerequisite requirements have been amended.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- preparing for repair and overhaul work of equipment, including:
 - following quality assurance system procedures
 - gathering required documentation
- establishing the level of repair and overhaul required, including:
 - following safe work methods
 - examining equipment submitted for repair and overhaul using appropriately maintained measuring devices and instruments
 - documenting the specification for the repair and overhaul
- arranging repair and overhaul work, including:
 - selecting appropriately competent operatives to carry out repair and/or overhaul, including reclamation activities
 - providing operative with the repair and/or overhaul specifications
- verifying that equipment complies with original certification, including:
 - choosing the scope and level of tests and measurements required to verify whether the repaired and/or overhauled equipment complies with original documented requirements
 - arranging for verification of compliance tests and measurements to be carried out
 - reviewing results of verification tests and taking actions to rectify any non-compliance identified by the verification tests and measurements
- documenting repair and overhaul work, including:
 - marking equipment in accordance with standard requirements to show that equipment has been repaired
 - preparing job report of the completed repair and overhaul, including all items specified by standards and submitted to the user
 - updating the repair and overhaul undertaken in the repair facility records, including steps

taken to obtain equipment documentation as required by standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- repair and overhaul of explosion-protected equipment (common requirements). including:
 - common requirements for repair and overhaul work of explosion-protected equipment including:
 - equipment with documentation and without documentation
 - statutory requirements for repair facility and user
 - instructions for the user
 - instructions for the repair facility
 - identification of repaired equipment by marking including:
 - marking information
 - symbols in accordance with standards requirements
 - other situations
 - requirements for the repair and overhaul of equipment with protection level (EPL) Ga
 - limitations and requirements for the repair and overhaul of equipment with explosion-protection type special 's'
- repair and overhaul of explosive-protected equipment type Group III enclosure 't', including:
 - additional requirements for the repair and overhaul of equipment Group III with type of protection Ex 't' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:
 - Ex 't' (dip) motors
 - Ex 't' (dip) enclosures
 - electrical equipment installed within Ex 't' (dip) enclosures
- repair and overhaul of explosive-protected equipment type non-sparking 'n', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'n' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
 - evaluation procedures and parameters including:

- general requirements
- Ex 'n' enclosures electrical equipment installed within Ex 'n' enclosures
- repair and overhaul of explosive-protected equipment type pressurisation 'pD', including:
 - additional requirements for the repair and overhaul of equipment with type of protection Ex 'pD' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type encapsulation 'm', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'm' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type oil-filled 'o', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'o' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications
- repair and overhaul of explosive-protected equipment type powder-filled 'q', including:
 - requirements for the repair and overhaul of equipment with type of protection Ex 'q' including:
 - application
 - repair and overhaul requirements
 - reclamation
 - alterations and modifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate tools and testing devices and personal protective equipment (PPE) currently used in industry
- safe work methods
- a certified quality management system
- documentation and record systems required of a workshop certified to undertake repair and overhaul of explosion-protected equipment
- relevant equipment standards and manufacturer's data
- equipment to be repaired/overhauled.

UEEIC0001 Analyse complex electronic circuits controlling fluids

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to analyse complex electronic circuits that integrate with the operation of fluid control systems on machinery.

It includes working safely, applying knowledge of equipment and electronic and fluid control circuit operations, gathering and analysing data, applying problem-solving techniques, and developing and documenting solutions and alternatives.

Typical problems are those encountered in meeting performance requirements and compliance standards, revising machine operating parameters and dealing with function.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to analyse complex circuits controlling fluids

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures implemented in preparation for work
 - 1.3 Scope of circuit analysis is determined from performance specifications, situation reports and in consultation with relevant person/s
 - 1.4 Activities are planned to meet scheduled timelines in consultation with person/s involved in the work
 - 1.5 Strategies are determined, solution developed and implemented in accordance with workplace procedures
- 2 Undertake analysis of complex circuits controlling fluids**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Control concepts and electro-fluid control circuits are applied in developing analytical solutions to machine parameters/faults and operation
 - 2.3 Parameter specifications and performance requirements in relation to each circuit are obtained in accordance with workplace procedures and relevant industry standards
 - 2.4 Circuit parameters and specifications are analysed to provide the most effective solution/s in accordance with workplace procedures
 - 2.5 Unplanned events are dealt with safely and effectively consistent with regulatory requirements and workplace policies and procedures
 - 2.6 Quality of work is monitored in accordance with performance agreement and/or workplace procedures or relevant industry standards
- 3 Document and report result/s of circuit analysis and action/s taken**
- 3.1 Solutions to circuit analysis are inspected and tested to determine their effectiveness and modified as required
 - 3.2 Analysis is documented, including details of fault findings, calculations and assumptions
 - 3.3 Analysis is reported to appropriate person/s to determine suitable action/s to be taken based on fault-findings analysis

- 3.4** Justification for analysis findings and any actions to be undertaken in relation to the equipment is documented for inclusion in work/project records in accordance with relevant industry standards and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI127A Analyse complex electronic circuits controlling fluids.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0001 Analyse complex electronic circuits controlling fluids

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- analysing electronic circuits controlling fluids
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting instruction for implementing any actions resulting from the analysis that incorporates risk control measure to be followed
- documenting justification of actions to be implemented in accordance with relevant industry standards
- forming effective strategies for analysing circuit performance
- inspecting and testing the results of the analysis
- obtaining circuit control parameters, specifications and performance requirements appropriate to each situation
- understanding the operation of electronic and fluid controls
- documenting and reporting on results of circuit analysis and actions taken
- preparing to analyse complex circuits controlling fluids.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- control system functions
- current industry practices and technologies
- electronic control of fluid processes
- identification of process characteristics from process test data

- interfacing electronics with hydraulic and pneumatic devices and systems
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- selection of proportional valves to suit fluid applications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to analysing complex electronic circuits controlling fluids
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0002 Assemble, enter and verify operating instructions in microprocessor equipped devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assemble, enter and verify operating instructions in microprocessor equipped device with simple inbuilt programming functions ensuring the device operates as intended.

It includes working safely, checking device installation, following written and oral instructions and workplace procedures, and completing necessary documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to assemble and enter operating instructions

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** Hazards are identified, risks assessed and control

measures implemented

- 1.3** Safety hazards not previously identified are reported on job safety assessment and advice on risk control measures is sought from supervisor
 - 1.4** Supervisor/customers are consulted to determine which functions of the device are used and the parameter of each
 - 1.5** Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures
 - 1.6** Device installation is checked for compliance with job specification and regulations where required
- 2 Assemble and enter operating instructions**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Required status of each function of the device is entered and their parameters set in accordance with manufacturer programming instructions
 - 2.4** Entered data is checked in accordance with specifications stated by work supervisor/customer
 - 2.5** Unplanned situations are responded to in accordance with workplace procedures and approval of an authorised person/s
- 3 Test device operation and report**
- 3.1** Device operation is tested in accordance with workplace procedures
 - 3.2** Operating anomalies are identified and corrected in accordance with workplace procedures
 - 3.3** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.4** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.5** Work completion is documented and appropriate person/s notified in accordance with workplace

procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assembling, entering and verifying operating instructions must include at least two of the following types of microprocessor equipped devices with inbuilt icon based programmable functions:

- programmable relays
- timers
- temperature controllers
- detection devices for security and fire
- programmable logic controller (PLC)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI116A Assemble, enter and verify operating instructions in microprocessor equipped devices.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0002 Assemble, enter and verify operating instructions in microprocessor equipped devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing risk control measures
 - applying safe working practices
- completing required documentation
- assembling, entering and verifying operating instructions in basic microprocessor equipped devices
- identifying non-compliance conditions of device installation
- isolating electrical components in accordance with workplace procedures
- correcting programming anomalies
- testing, entering functions, verifying device operation parameters correctly and reporting
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- using required operating functions and parameters.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- digital controllers, including:
 - types
 - block diagram of controller
 - applications
 - terms
- controller input and output equipment, including:
 - input sensors (transducers)

- current loop concepts
- output current and voltage ratings
- supplementary solid-state relays/contactors
- installation of microprocessor equipped device/s, including:
 - types of input sensors
 - wiring
 - mounting techniques
 - terminal types
 - output current protection
- configuration and digital controller set-up, including:
 - manufacturer's data
 - testing
- microprocessor equipped devices including simple programmable relays, timers, temperature controllers, switches and basic detection devices for security and fire systems
- operating instructions in basic microprocessor equipped devices
- function
- equipment and tools relating to testing of microprocessor equipped devices
- relevant workplace documentation
- relevant workplace policies and procedures
- risk control measures, including safe working practices
- techniques for resolving programming anomalies.
-

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0003 Assist in commissioning process and instrumentation control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to assist in commissioning of process control systems.

It includes working safely and with others, complying with requirements, applying knowledge of process and control components, pre-commissioning tests, checking and adjusting components and controls to ensure efficient and safe operation and completing commissioning documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEIC0048 Verify compliance and functionality of instrumentation and control installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to assist in commissioning process control systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Safety hazards that have not previously been identified are noted and risk control measures implemented
- 1.4 Commissioning plan is reviewed with relevant team members to ensure commissioning role/s of members are identified and ensure work is coordinated effectively in accordance with workplace procedures
- 1.5 Measurement parameters are identified with team in accordance with workplace procedures, process requirements and manufacturer instructions
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred and work is in accordance with relevant industry standards
- 1.8 Need to test and measure live work is determined in accordance with WHS/OHS requirements and

- workplace procedures
- 1.9** Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Assist in commissioning process control systems**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2** Commissioning testing/measuring devices are connected and set up in accordance with relevant industry standards for control system and work instructions
- 2.3** Process instruments and apparatus are set up and adjusted in accordance with relevant industry standards, process control requirements, equipment manufacturer instructions and work instructions
- 2.4** Adjustments are made to provide optimum transmission/reception performance in accordance with relevant industry standards
- 2.5** Decisions for dealing with unplanned situations are made from discussions with relevant person/s and/or job specifications
- 2.6** Methods for dealing with unplanned situations are selected in accordance with WHS/OHS requirements and job specifications
- 2.7** Commissioning assistance is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report commissioning activities**
- 3.1** WHS/OHS risk control work completion measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Adjustment settings are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Process control systems incorporating closed loop control and digital and analogue elements must include at least five of the following:

- interacting control functions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI122A Assist in commissioning process and instrumentation control systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0003 Assist in commissioning process and instrumentation control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- assisting in commissioning process control systems
- carrying out commissioning assistance without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- checking and isolating circuits
- checking preparatory work to ensure no damage has occurred
- connecting and setting up commissioning testing/measuring devices in accordance with relevant industry standards for particular control system and work instructions
- dealing with unplanned situations with decisions from discussions with relevant person/s and/or job specifications
- determining need to test and measure live work
- documenting adjustment settings in accordance with workplace procedures
- identifying measurement parameters by reviewing process requirements and equipment manufacturer instructions
- identifying roles of each commission team member
- making adjustments to provide optimum transmission/reception performance
- obtaining tools, equipment and testing devices required for work
- preparing to assist in commissioning process control systems
- setting up and adjusting process instruments and apparatus in accordance with relevant industry standards for process control, equipment manufacturer instructions and work instructions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- isolation procedures
- problem-solving techniques
- process instruments and apparatus
- relevant commissioning process, including:
 - commissioning planning and documentation
 - procedures for commissioning instrumentation
 - purpose and importance of documentation
 - purpose of commissioning
- relevant industry standards for control system
- relevant manufacturer specifications and operating instructions
- relevant measurement parameters
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing/measuring device
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including:
 - commissioning plan
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to assisting in commissioning process control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0004 Calibrate, adjust and test measuring instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to calibrate, adjust and test measuring instruments.

It includes working safely, following calibration and adjustment procedures, applying knowledge of parameters to be measured, testing and reporting.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to calibrate, adjust and test measuring

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a

- instruments** given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for work
 - 1.3** Safety hazards that have not previously been identified are noted and established risk control measures implemented
 - 1.4** Relevant person/s is consulted to ensure work is coordinated effectively with others involved on worksite
 - 1.5** Instrument parameters are identified by reviewing process specifications and manufacturer instructions
 - 1.6** Tools, equipment and testing devices needed for the work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Calibrate, adjust and test measuring instruments**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Calibration testing/measuring arrangement is connected and arranged in accordance with manufacturer instructions and certification requirements for relevant instrument
 - 2.3** Factors effecting instrument error are determined and recorded in the calibration process in accordance with manufacturer specifications and relevant industry standards
 - 2.4** Instrument set-point is determined and error adjustments noted in accordance with manufacturer specifications and relevant industry standards
 - 2.5** Instrument is tested and adjustment made, as required, to ensure instrument meets calibration requirements
 - 2.6** Methods for dealing with unplanned situations are discussed with relevant person/s and documented
 - 2.7** Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.8** Quality checks of process output are undertaken to ensure control loop is tuned in accordance with workplace procedures

- 3 Complete and report calibration activities**
- 2.9** Calibration is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
 - 3.1** WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Calibration is documented in accordance with certification requirements and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Calibrating, adjusting and testing measuring instruments must include at least one of the following:

- electrical/electronic
- non-electrical instrument

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI117A Calibrate, adjust and test measuring instruments.

Assessment Requirements for UEEIC0004 Calibrate, adjust and test measuring instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- calibrating instrument to measure within specified tolerance
- carrying out calibration without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- connecting calibration testing/measuring arrangement in accordance with manufacturer instructions and certification requirements for instrument
- dealing with unplanned situations safely and in discussion with relevant person/s
- determining factors effecting instrument error
- documenting calibration with certification requirements
- identifying instrument parameters
- obtaining tools, equipment and testing devices
- preparing to calibrate, adjust and test measuring instruments
- quality checking of process outputs in accordance of workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques
- relevant calibration techniques
- relevant fundamentals of calibration
- relevant industry standards
- relevant instrument parameters and tolerance
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions

- relevant measurement standards applicable to scientific instruments
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including certification
- relevant workplace quality, instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to calibrating and testing measuring instruments
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0005 Configure and maintain industrial control system networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to configure and maintain communication services on an industrial control system network.

It includes industrial control network topology and protocols, configuring data links, bus monitoring and system management and access, network testing and documenting system settings.

This unit applies to all aspects of electrotechnology – engineering applications only. For general competencies related to information technology (IT) refer to the latest endorsed ICT Information and Communications Technology Training Package.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to configure industrial control system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a

- networks** given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures are implemented in preparation for work
 - 1.3** Scope of the industrial control system and network is established from control system specifications and in consultation with relevant person/s
 - 1.4** Activities are planned to meet scheduled timelines in consultation with others involved in the work
 - 1.5** Network operating system versions and updates needed to configure and maintain the network are obtained in accordance with workplace procedures and checked against job requirements
- 2 Configure and maintain industrial control system networks**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2** Control application network components are installed, upgraded and configured in accordance with design instructions and network requirements
 - 2.3** Devices desktop environment, network protocols and services and system security are implemented in accordance with network requirements
 - 2.4** Access to control data and resources is configured within the limitations specified for each relevant network user
 - 2.5** Network malfunctions are identified and rectified using logical fault-finding techniques of control devices, storage network protocols, connections and services and system security configuration processes
 - 2.6** Network performance and reliability is monitored and optimised in accordance with workplace procedures
 - 2.7** Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.8** Network administration is carried out efficiently, without waste of materials and energy or damage to apparatus, the surrounding environment or other

services

3 Document network configuration and maintenance activities

- 3.1** Written justification is documented detailing network maintenance and upgrade requirements and relevant person/s notified in accordance with workplace procedures
- 3.2** Network maintenance documentation is maintained in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Configuring and maintaining an industrial control system network must include the following:

- at least two programable controllers
- at least one human-machine interface (HMI)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI157A Configure and maintain industrial control system networks.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0005 Configure and maintain industrial control system networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying sustainable energy principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- configuring and maintaining industrial control system networks
- configuring access to control data and resources for each user
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting network configuration and maintenance activities
- determining industrial control system and network requirements and operating system versions and updates
- identifying network malfunctions/faults
- installing, upgrading and configuring control application network components correctly
- rectifying network malfunctions/faults in accordance with workplace procedures
- documenting control system network configuration and maintenance requirements
- planning and preparing to configure and maintain industrial control system networks.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- bus monitor, including capturing and filtering
- control system networks interface
- data link layer
- field bus message specification
- high-speed ethernet and protocols
- industrial control systems networks
- network topology, including nodes and connecting lines

- open and common proprietary control system networks models (layers) and protocols
- purpose and application of control system networks systems
- relevant job safety assessments or risk mitigation processes
- relevant industry standards and protocols
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to configuring and maintaining industrial control system networks
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0006 Design and configure Human-Machine Interface (HMI) networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design and configure human-machine interface (HMI) networks.

It includes applying safe working practices; designing, installing and configuring controllers and devices; monitoring system operations; diagnosing malfunctions and faults; and documenting development activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Select and design HMI control system network

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Hazards are identified, WHS/OHS risks assessed, and

control measures and workplace procedures are implemented in preparation for work

- 1.3 Scope of HMI control system network is determined from network specifications/design brief and in consultation with relevant person/s
- 1.4 Activities are planned to meet scheduled specifications/design brief timelines in consultation with person/s involved in the work
- 1.5 Management tools and software are selected based on specified requirements and performance standards
- 1.6 Strategies are implemented to ensure network development is carried out efficiently

2 Install, configure and manage HMI control system network

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Network infrastructure components are installed and configured in accordance with industry standards and variants as specified for the network
- 2.3 Structural components of directory services are installed and configured in accordance with industry standards and variants as specified for the network
- 2.4 Management components of network control system are configured in accordance with industry standards and requirements specified for the network
- 2.5 Security components of network control system are created in accordance with industry standards and requirements specified for the network
- 2.6 Network malfunctions/faults are identified and rectified using logical problem-solving techniques of complex network control system infrastructure
- 2.7 Network is monitored and solutions are developed to optimise network performance and reliability in accordance with workplace procedures
- 2.9 Security events are analysed and actions taken in accordance with workplace policies and protocols
- 2.10 Methods for dealing with unplanned issues/problems are analysed to provide the most effective solutions in

- accordance with workplace procedures
- 2.11** Quality of work is monitored in accordance with performance agreement/specifications and/or workplace procedures or industry standards
- 3 Report HMI network administration activities**
- 3.1** Written justification is produced for HMI network services development activities and relevant person/s notified in accordance with workplace procedures
- 3.2** Network service development records are maintained in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing and configuring HMI networks must include at least the following:

- controllers and devices installation and configuration
- development activities documentation
- malfunctions and faults diagnostics
- operation of distributive and central control system networks monitoring and maintenance
- safe working practices
- system operations monitoring

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI153A Design and configure Human-Machine Interface (HMI) networks.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEIC0006 Design and configure Human-Machine Interface (HMI) networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- applying sustainable energy principles and practices
- configuring management components of human-machine interface (HMI) network services
- creating security components of HMI network services
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing solutions to optimise network performance
- documenting HMI network services development activities
- establishing network services to be developed
- identifying and rectifying HMI network malfunctions/faults
- installing and configuring network infrastructure components
- installing and configuring structural components of directory services
- installing, configuring and managing HMI control system networks
- preparing to design control system networks
- reporting network administration activities in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques and troubleshooting remote access including remote access policy, configuration of remote access profile, virtual private network (VPN), multi-link connection, routing and remote access for dynamic host configuration protocol (DHCP)

- control system networks interface
- DHCP
- HMI control system networks
- installation, configuring and troubleshooting of internet protocol (IP) routing protocols including updating routing tables and implementing demand-dial routing
- internet naming services in a network
- IP routing, including border routing, internal routing and IP routing protocols
- network address translation (NAT)
- network infrastructure
- network protocols
- open and common proprietary control system networks models (layers) and protocols, including CANopen, ControlNet, devicenet, ethernet, foundation fieldbus, interbus, modbus and profibus
- purpose and application of HMI control system networks systems
- relevant certificate services
- relevant domain name service (DNS)
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- remote access security including authentication protocols, encryption protocols and access policy.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to designing and configuring HMI networks
- applicable documentation, including workplace procedures, equipment specifications,

regulations, codes of practice and operation manuals.

UEEIC0007 Design and use advanced programming tools, PC networks and HMI Interfacing

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design and use advanced programming tools, personal computer (PC) networks and human-machine interface (HMI) in the design of computer applications for control processes.

It includes preparing, developing and obtaining design approval for computer applications by designing control systems, programmable logic controllers (PLCs), and supervisory control and data acquisition (SCADA) systems.

It also includes control programming methods, developing alternative design schemes based on design brief and customer relations and documenting design.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a

- computer applications** given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures are implemented in preparation for work
- 1.3** Scope of proposed control system is determined from the design brief and in consultation with relevant person/s
- 1.4** Design development work is planned to meet scheduled design brief timelines in consultation with person/s involved on the worksite
- 2 Develop computer applications design for control process**
- 2.1** Control devices, control systems and control programming methods are applied to the computer applications design
- 2.2** Alternative concepts for the design are tested in accordance with the requirements outlined in the design brief
- 2.3** Safety specifications and budget constraints are considered in the design process
- 2.4** System design draft is checked for compliance with the design brief, relevant industry standards and regulatory requirements
- 2.5** System design is documented for submission to relevant person/s for approval
- 2.6** Solutions to unplanned situation are dealt with in a manner that minimises risk to personnel and equipment in accordance with workplace policies and procedures
- 3 Obtain design approval for computer applications**
- 3.1** System design is presented and explained to client representative and/or relevant person/s
- 3.2** Requests for alterations to design are negotiated with relevant person/s in accordance with workplace policy
- 3.3** Final design is documented and approval obtained from relevant person/s
- 3.4** Quality of work is monitored in accordance with performance agreement/specifications and/or workplace procedures or industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Designing a computer-based control system must include at least two of the following:

- configure and test a PLC peer to peer network
- configure and test a PLC hierarchical network
- configure and test a PLC field bus style network
- develop PLC code using a structured text programming tool
- develop PLC code using a sequential function chart programming tool
- design a simple HMI interface using a typical touch screen device
- use system diagnostics to fault find hardware/software issues
- program and test a proportional integral derivative (PID) functional control/program block

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI154A Design and use advanced programming tools PC networks and HMI Interfacing.

Assessment Requirements for UEEIC0007 Design and use advanced programming tools, PC networks and HMI Interfacing

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- designing a programmable logic controller (PLC) computer-based control system
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing computer applications design
- obtaining design approval for computer applications
- planning and preparing to design of computer application for control processes
- testing design concepts by real or virtual prototyping, where it cannot be shown easily by other means, and confirming that particular aspects of the design meet specified requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- alternative/enhancing programming methods
- bus monitor, including capturing and filtering
- communications methods and requirements, including:
 - common protocols and interface standards
 - communication mediums
 - network types and topologies
 - peer to peer networks
 - remote input/output (I/O)
 - requirements when networking/interfacing PLCs
- high-speed ethernet specification/requirements
- intelligent terminals/graphic interfaces installation and communication requirements

- proportional integral derivative (PID) computer-based control system and system applications
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant specialist instructions, including interrupt driven applications, high-speed counters and positional encoders
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system diagnostics techniques.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to design a computer-based control system
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0008 Design electronic control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design electronic control systems.

It includes working safely, following design brief, applying knowledge of digital and analogue devices, interpreting device specifications, constructing prototypes, using appropriate development software, applying programming techniques, testing developed system prototype operation and documenting design and development work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0018 Diagnose and rectify faults in digital controls systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

UEEEL0003 Arrange circuits, control and protection for electrical installations
 UEEEL0008 Evaluate and modify low voltage heating equipment and controls
 UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls
 UEEEL0010 Evaluate and modify low voltage socket outlets circuits
 UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
 UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
 UEEEL0024 Test and connect alternating current (a.c.) rotating machines
 UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits
 UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals
 UEEIC0041 Solve problems in pressure measurement components and systems
 UEEIC0038 Solve problems in density/level measurement components and systems
 UEEIC0039 Solve problems in flow measurement components and systems
 UEEIC0043 Solve problems in temperature measurement components and systems
 UEEIC0029 Set up and adjust PID control loops
 UEEIC0030 Set up and adjust advanced PID process control loops
 UEEIC0048 Verify compliance and functionality of instrumentation and control installations
 UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify electronic control 1.1 Work health and safety (WHS)/occupational health and

- system requirements** safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures are implemented in preparation for work
 - 1.3 Scope of the proposed electronic control system is determined from design brief in consultation with appropriate person/s
 - 1.4 Design of electronic control system development work is planned to meet scheduled timelines in consultation with person/s involved on the worksite
 - 1.5 Materials and devices/components required for work are determined on compatibility of their specifications with control system requirements and project budget constraints
- 2 Design electronic control system**
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Digital and analogue device elements used in control systems and relevant industry standards are applied to the design specification
 - 2.3 Alternative design/s is considered based on the design brief
 - 2.4 Safety, functional and budget considerations are incorporated in the design specification
 - 2.5 Prototype devices and circuits are constructed, programmed and tested for compliance with design brief and regulatory requirements
 - 2.6 Prototype faults are rectified and retested to ensure effective operation of design
 - 2.7 Control system design specifications are documented for submission to appropriate person/s for approval
 - 2.8 Solutions to unplanned situations are implemented in accordance with workplace policy
- 3 Obtain approval for electronic control system**
- 3.1 Control system design is presented and explained to client representative and/or relevant person/s
 - 3.2 Alterations to design are negotiated with relevant

person/s within the constraints of workplace policy

- 3.3 Final system design is documented and approval obtained from appropriate person/s
- 3.4 Quality of work is monitored against performance agreement and/or workplace or relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing electronic control systems must include at least the following:

- one closed loop control system based on digital and analogue elements
- one open loop control systems based on digital and analogue elements
- a combination of inputs and outputs

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI123A Design electronic control systems.

Assessment Requirements for UEEIC0008 Design electronic control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- designing electronic control system
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing outlines of alternative designs
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- identifying and planning to design electronic control systems
- obtaining design approval for electronic control systems design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- designing control systems
- control systems, including:
 - process controllers, programmable controllers and personal computers
 - control peripherals and suitable control
- purpose built microprocessor controller with multiple inputs resulting in different or changed outputs
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to designing electronic control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0009 Develop an electrical integrated system interface for access through a touch screen

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop an electrical integrated system interface for access through a touch screen.

It includes preparing and developing an integrated system touch screen interface. It also includes backing up, transferring and testing touch screen interface integrated system, working with customers to determine required control parameters, application of touch screen software components and embellishments, network connectivity, using diagnostic tools and documenting the developed systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s):

Electrical

Common Unit Group

ICTICT203 Operate application software packages

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0011 Develop electrical integrated systems

Electrotechnology Pathway Group

UEECD0025 Lay wiring/cabbling and terminate accessories for extra-low voltage (ELV) circuits

Electrical Pathway Group

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop an integrated system touch screen interface

2 Develop an integrated system touch screen interface

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Areas and controls accessed from touch screen are determined from integrated systems, database and customer requirements
- 1.2** Control parameters accessed from touch screen are determined from integrated systems database and confirmed with relevant person/s
- 1.3** Applied enhancements to touch screen are discussed and confirmed with relevant person/s
- 1.4** Touch screen and integrated system programming software incorporating project specifications are downloaded to compatible information technology
- 1.5** Programming tools are used and checked for quality assurance
- 1.6** Manufacturer instructions for installing and connecting touch screens are obtained and identified
- 2.1** Hazards are identified, risks are assessed and control measures implemented
- 2.2** Touch screen is checked for compliance with manufacturer requirements, installed and connected
- 2.3** Touch screen interface is developed using current programming methods
- 2.4** Touch screen interface functions and enhancements are developed for compatibility with integrated system and

- customer requirements
- 2.5** Network connectivity is implemented, as required, and web page content made available
- 3 Back up, transfer and test touch screen interface**
- 3.1** Work health and safety (WHS)/occupational health and safety (OHS) work completion risk control measures and workplace procedures are followed
- 3.2** Touch screen interface program is backed up and transferred to the touch screen following manufacturer instructions
- 3.3** Touch screen tests are conducted to verify compatibility and compliance with the integrated system and customer requirements
- 3.4** Anomalies are identified and corrected to comply with manufacturer and customer requirements
- 3.5** As-programmed touch screen specifications are documented and given to relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Manufacturer designated software must include at least the following:

- programming a touch screen for safe and effective operation
- creating and editing scenes, schedules and access control
- using templates to enhance a touch screen
- backing up and restoring program
- transferring the programmed access to touch screen in an integrated system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI142A Develop an electrical integrated system interface for access through a touch screen.

Assessment Requirements for UEEIC0009 Develop an electrical integrated system interface for access through a touch screen

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the areas and control parameters to be accessed through the touch screen
- confirming touch screen embellishments to be applied
- downloading to a personal computer (PC) and checking touch screen programming and integrated system programming software and project data
- understanding manufacturer's instruction for installing and connecting touch screens
- checking that the installation and connections for the touch screen comply with manufacturer requirements
- developing touch screen interface functions and embellishments in accordance with compatibility with the integrated system and to customer requirements
- backing up and transferring touch screen interface program following manufacturer's instructions
- testing touch screen and correcting non-compliance operations and anomalies
- documenting the as-programmed touch screen specifications
- applying relevant workplace health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- checking programming for quality assurance
- implementing network connectivity and making web page content available.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- touch screen installation requirements and programming in integrated systems, including:
 - integrated system touch screen types, features and parameters
 - touch screen mounting methods and manufacturer's instructions
 - touch screen wiring and connection arrangements encompassing:
 - power supply

- integrated network
- audio
- video
- IR control
- programming
- network
- electrical protection requirements
- programming requirements and process
- programming software specifications and tools
- human-machine interface (HMI) programming techniques with proprietary software encompassing
 - component types
 - component properties
 - arranging visible properties and creating screen embellishment
 - setting integrated system properties of components (components can be text, images, shapes, buttons, sliders, level indicators, clocks, monitors, hypertext mark-up language (HTML) and web cam images)
- methods for transferring and project data and backing up
- information technology back-up processes
- relevant risk mitigation processes, including risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- compliance testing and quality assurance testing.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0010 Develop and test code for microcontroller devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop and test structured programming instructions for microcontroller devices at a fundamental level.

It includes microcontroller device code architecture and programming fundamentals, writing and testing specified instructions, and documenting development activities.

In this unit, the term ‘micro’ refers to microcontrollers, however, competency in the unit can be achieved using microprocessors.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify microcontroller device code to specifications

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are obtained and applied
- 1.2 Hazards are identified, WHS/OHS risks assessed, and

control measures and workplace procedures are implemented in preparation for work

- 1.3** Scope of specification to be developed is determined from job performance requirements and in consultation with relevant person/s
 - 1.4** Activities are planned to meet scheduled timelines in consultation with person/s involved on the worksite
 - 1.5** Appropriate development kit and software are selected in accordance with specified requirements and required performance standards
 - 1.6** Strategies are implemented to ensure programming is in accordance with relevant industry standards/protocols
- 2 Develop microcontroller device code to specifications**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2** Microcontroller functions and features are applied to developing microcontroller device code specifications
 - 2.3** Structure and syntax are applied to developing program specification for target microcontroller function
 - 2.4** Key features of the assembler programming language are identified and applied to develop and test microcontroller device solutions
 - 2.5** Approaches to issues/problems are analysed to provide most effective solutions
 - 2.6** Quality of work is monitored in accordance with performance agreement/specification and/or workplace procedures or relevant industry standards
- 3 Test and document microcontroller device code to the required application**
- 3.1** Testing workplace procedures are developed to analyse code developed
 - 3.2** Problems, faults and bugs are identified and rectified to ensure specification in the creation of the code is met
 - 3.3** Intermediate and final work reports are written in accordance with relevant industry standards and presented to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing and testing code for microcontroller devices must include at least three of the following:

- selecting an appropriate micro for a given task
- setting up and using basic input/output (I/O) functions
- using assembler/simulator software packages to debug program
- finding system fault/s

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI156A Develop and test code for microcontroller devices.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0010 Develop and test code for microcontroller devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - workplace procedures and practices
 - using of risk control measures
- developing and testing structured programming instructions for microcontroller device
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing testing procedures/protocols
- identifying problems and bugs/faults in program
- rectifying problems and bugs/faults in program in accordance with workplace procedures
- using all key features of an appropriate assembler language
- writing and presenting work reports to relevant industry standards and protocols.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- fundamental structured programming instructions for microcontroller device
- memory organisation, operation and addressing methods
- microcontroller architecture
- microcontroller control system programming methods
- microcontroller devices testing protocols
- microcontroller programmer's model
- microcontroller programming terms
- relevant industry programming standards, environment and protocols
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications

- relevant programming language fundamentals
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing and testing code for microcontroller devices
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0011 Develop electrical integrated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop electrical integrated systems.

It includes working safely; analysing and adapting project specifications, device applications and capabilities; system programming methods using diagnostic tools in developing and documenting an electrical integrated system.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

ICTICT203 Operate application software packages

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Electrotechnology Pathway Group

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

Electrical Pathway Group

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop an electrical integrated system

2 Program integrated system devices

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Types and locations of loads and control devices are determined from project specifications and customer requirements
- 1.2 Number of control bus networks and current requirements are determined from load calculations for devices
- 1.3 Appropriate placement of system devices in system scheme is determined from bus network power and load parameters whilst maintaining system stability
- 1.4 Integrated system is developed to comply with regulator safety and manufacturer specifications
- 1.5 Number of devices and accessories required for the system is documented using manufacturer title and identification (ID) for each component
- 1.6 Relevant programming and diagnostic tools are downloaded to compatible computer and checked for accurate operation and safety
- 2.1 Hazards are identified, risks assessed and control measures implemented
- 2.2 Modes of programming are applied to developing the electrical integrated system in accordance with manufacturer and programming software instructions
- 2.3 Manufacturer instructions and recommendations are followed when programming system devices to project specifications
- 2.4 Parameters for operation of loads are programmed to project specifications within manufacturer designated range

- 3 Load and test electrical integrated system**
- 2.5 Programmed system database is saved and backed up in accordance with manufacturer instructions
 - 3.1 Work health and safety (WHS)/occupational health and safety (OHS) risk control work measures and workplace procedures are followed
 - 3.2 Database of integrated system programs are transferred to the network in accordance with workplace procedures
 - 3.3 Integrated system functions are tested for compliance with project and manufacturer specifications
 - 3.4 Diagnostic tools are used to locate system faults, defects or anomalies
 - 3.5 Defects or anomalies are corrected to comply with project requirements and manufacturer specifications
 - 3.6 Integrated system is documented and a copy given to client/representative

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Developing electrical integrated systems must include the following:
- six of the following functions:
 - corridor linking
 - direct load control
 - energy saving on dimmers
 - light level maintenance
 - multiple load control
 - panic button
 - passive infrared sensor (PIR) enable/disable
 - restrike delays
 - scenes

- two-way switching
- typical master bedroom
- using more than one programming mode
- transferring a program database to a network and testing functionality
- finding at least five hardware and five software faults

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI141A Develop electrical integrated systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0011 Develop electrical integrated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying appropriate modes of programming to develop the integrated system
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- checking programming and diagnostic tools
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining types and location of loads and control devices
- documenting integrated system and giving to relevant person/s
- downloading programs to network successfully
- following manufacturer instructions and recommendations in programming devices and setting load operating parameters
- inspecting and testing electrical integrated system for compliance
- loading and testing integrated systems
- placing system devices appropriately in the system scheme
- preparing to develop an integrated system
- programming integrated system devices
- saving and backing up programmed system database
- using diagnostic tools to locate and correct system defects, faults and anomalies
- using electrical integrated systems
- using load calculations to correctly determine number of networks and current requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- applications and advantages of integrated systems
- system components, including:

- support devices for control bus supply and control
- support devices for programming, interconnection between networks and integration with third party systems
- types and capabilities of output devices
- lighting dimmer capabilities and selection
- controlling distributed signalling interface (DSI) and communicating with digital addressable lighting interface (DALI) electronic ballasts
- types and capabilities of input devices
- network specifications, including:
 - bus system cable type, polarity, length and acceptable topologies
 - importance of the location of output and input devices and control bus power supplies
 - ensuring control bus stability and multiple network connectivity
 - low voltage (LV) supply, overcurrent and surge protection
- software for system and device programming, monitoring and controlling
- system and device programming, including:
 - addressing conventions for networks, devices, applications, output groups, types of control and outputs, including 'on', 'off', a specific level, and over a specific time
 - personal computer (PC) programming tools and methods, including configuring networks
 - database using addressing tools and objects, function objects, editing, altering and transferring the database to a network
 - importance of project documentation and backup
- system fault-finding processes
- fault finding using multimeters, oscilloscope, system analysers and diagnostic software
- bus networks
- databases
- diagnostic tools
- electrical integrated systems
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes, including risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system components
- interconnections between networks and integration with third-party systems
- types and capabilities of input and output devices
- lighting dimmer capabilities and selection, including controlling DSI and communicating with DALI electronic ballasts.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0012 Develop structured programs to control external devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop structured programs to control an external device.

It includes identifying and developing structured programs for control sub-systems. It also includes testing and documenting structured programs for control sub-systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify structured program requirements for control sub-system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures implemented

- 1.3 Extent of structured programming is determined from job specifications and consultations with relevant person/s
 - 1.4 Activities are planned to meet scheduled timelines in consultation with relevant person/s
 - 1.5 Development kit and software are selected from job specifications and in accordance with workplace procedures
 - 1.6 Strategies are implemented to ensure programming is written in accordance with workplace procedures
- 2 Develop structured programs for control sub-system**
- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 2.2 Information technology functions are applied to develop structured programs
 - 2.3 Correct structure and syntax are applied to developing structured program
 - 2.4 Programming languages are applied to structured programs to develop and test solutions
 - 2.5 Issues/problems are analysed to identify and apply solutions
 - 2.6 Quality of work is monitored in accordance with workplace procedures
- 3 Test and document structured program for control sub-system**
- 3.1 Developed program is tested in accordance with workplace procedures and manufacturer specifications
 - 3.2 Programming anomalies are identified and corrected in accordance with workplace procedures and manufacturer specifications
 - 3.3 Work reports are written in accordance with workplace procedures and presented to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing structured programs to control external devices for a given representative range of programs and control devices must include the following attributes:

- safe working practices
- control applications
- knowledge application
- analogue or digital input/output (I/O) signals
- program writing and testing
- documenting programming changes

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI155A Develop structured programs to control external devices.

Links

Assessment Requirements for UEEIC0012 Develop structured programs to control external devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing testing procedures
- identifying and correcting anomalies in programs
- identifying and developing structured programs for control sub-systems
- meeting scheduled timeframes
- producing relevant documentation
- testing and documenting structured programs for control sub-systems
- using functions of relevant programming languages
- working with relevant person/s.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- control applications of software
- software terminology
- programming languages currently used by industry
- program development
- programming concepts, including:
 - programming structure
 - documentation
 - compiling source code
 - generating executable files

- scalar and structured data types
- constants variables
- reading from keyboard and writing to screen
- arithmetic, relational and logical operations
- making decisions
- looping operations
- programming to access external devices via input/output (I/O) boards
- functions - macros
- global and local variables, auto and static variables
- intrinsic functions used in control
- writing functions
- linking in external functions to control hardware
- numerical and character arrays
- control programming fundamentals, including:
 - control applications of software
 - software terminology
 - programming languages currently used by industry
 - program development, including flowcharts, pseudocode and algorithms
 - programming concepts
- job safety assessments or risk mitigation processes, including risk control measures
- problem-solving techniques
- relevant manufacturer specifications
- relevant programming languages, functions and applications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0013 Develop, enter and verify discrete control programs for programmable controllers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop, enter and verify programs for programmable logic controller (PLC) (also known as programmable controller) for a system requiring discrete control functions.

It includes working safely, using control systems and control system development methods, using ladder diagrams/statement list/function block diagram instruction sets, following written instructions, and documenting program development and testing activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify control system requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** PLC operating functions, parameters and specifications are determined from relevant documentation, electrical drawings or persons to determine the control system scope of work

- 1.2 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
 - 1.3 Control system scenario is developed from job specifications of process/plant/machine controlled through consultation with relevant person/s
 - 1.4 PLC block diagram is developed using industry standard symbols
 - 1.5 Infotechnology equipment, software and measuring devices needed to carry out the PLC work are obtained and checked for correct operation and safety
 - 1.6 Installation of PLC is checked for compliance with relevant industry standards, regulations and job specifications
- 2 Develop control system, enter and test program**
- 2.1 Established WHS/OHS risk control measures and procedures for carrying out the work are followed.
 - 2.2 Circuits/machines/plant are checked and isolated in accordance with workplace procedures
 - 2.3 Control system solutions are developed and documented based on specified control mode and using acceptable methods for designing control systems
 - 2.4 Developed control system is converted to an appropriate form
 - 2.5 Program is entered into the PLC using appropriate infotechnology and software
 - 2.6 Entered instructions and settings are tested in accordance with job specifications by control system scenario
 - 2.7 Appropriate methods and tools are used to test control system and operating faults and anomalies are identified and rectified
 - 2.8 Unplanned situations are responded to in accordance with workplace procedures, in a manner that minimises risk to persons and equipment
- 3 Verify document and report programming**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed

activities

- 3.2 Program is transferred from PLC to external medium for storage
- 3.3 Control system specification and program are documented in accordance with workplace procedures
- 3.4 Work completion is documented and relevant persons notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing, entering and verifying programs for PLCs must include at least five (5) of the following functions/controls:

- bit shift registers
- cascading counters
- cascading timers
- combining timers and counters
- constant duty cycle
- derived timers (off delay)
- internal relays/flags/markers
- jump instructions
- latching relays (set/reset)
- master control instructions
- one shot
- retentive (power fail) functions
- reversible counters
- scan time considerations
- self-resetting
- simple step sequence instructions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI150A Develop, enter and verify discrete control programs for programmable controllers.

Assessment Requirements for UEEIC0013 Develop, enter and verify discrete control programs for programmable controllers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including identifying programmable logic controller (PLC) risk control measures
- connecting the PLC
- correcting programming anomalies
- dealing with unplanned situations in accordance with workplace procedures in a manner that minimises risk to persons and control equipment
- developing applications for PLC functions including operation and programming of inputs and outputs
- developing a control system solution to specified operating functions and parameters
- developing a PLC block diagram, including identifying industry standard PLC symbols
- documenting control system and programming
 - identifying PLC modules and applications
- programming a PLC using industry standard methods such as master control, jump, shift register, step sequencing, timers and counters
- testing and verify control system inputs and outputs operation
- transferring programs to PLC
- documenting control system and programming clearly
 - identifying non-compliance conditions of device installation
- converting control system to a PLC program
- entering programming functions and parameters correctly
- transferring program to external storage.

Knowledge Evidence

- Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:
 - PLC introduction including:

- evolution of the programmable controller and applications
- relay control, static logic control and programmable control
- programmable controller block diagram (inputs and outputs)
- programmable controller advantages, symbols and functions
- numbering systems start-up procedures
- programming inputs and outputs
- operation of programmable controller inputs
- PLC operation: scan cycle
- basic programming
- types of PLC programs, including:
 - ladder diagrams
 - basic programming
 - program modification
 - ladder diagram development
 - connecting the programmable controller
 - programming timers, including:
 - purpose of timers
 - timer instructions
 - on-delay and off-delay timer instruction
 - programming timers
 - retentive and non-retentive timers
 - cascading timers
 - the self-resetting timer
 - monitoring timers
 - circuit conversion
 - programming counters, including:
 - counter instructions
 - retentive and non-retentive, up/down, programming, self-resetting and cascading counters
 - circuit conversion
 - program storage, including:
 - PLC terms
 - memory
 - the programmable read only memory (PROM) pack
 - printing ladder diagrams
 - PLC input and output modules, including:
 - purpose of modules
 - analogue, dry contact, alternating current (a.c.) and direct current (d.c.) input modules
 - relay, triac, transistor and analogue output modules
 - PLC installation requirements, including:

- installation precautions
- safety systems
- mounting the PLC
- installation documentation
- routing signal and power cables
- earthing requirements
- master control, including:
 - master control relay
 - master control relay ladder diagram
 - programming master control relays
- jump function, including:
 - jump function
 - jump function ladder diagram
 - programming jump functions
- the shift register, including:
 - purpose of registers
 - the shift register
 - shift register operation
 - clock input
 - shift register requirements
 - programming shift registers
- the step sequencer, including:
 - step sequencers
 - step sequencer operation
 - clock input
 - step sequencer requirements
 - programming step sequencer
- PLC diagnostics and fault finding, including:
 - PLC fault finding
 - controller status
 - input/output (I/O) faults
 - program faults
 - relevant risk mitigation processes
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation, including relevant industry standard documentation and regulations related to PLCs
 - relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0014 Develop, enter and verify programs in supervisory control and data acquisition systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop, enter and verify programs in supervisory control and data acquisition (SCADA) system.

It includes identifying, developing and entering programs using dedicated SCADA software. It also includes monitoring, verifying and documenting programming activities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEIC0013 Develop, enter and verify discrete control programs for programmable controllers

UEEIC0015 Develop, enter and verify word and analogue control programs for programmable logic controllers

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify SCADA system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures for a given work area are

identified obtained and applied

- 1.2 Hazards are identified, risks are assessed and control measures implemented
 - 1.3 Extent of SCADA system is determined from design brief and job specifications
 - 1.4 Process data is analysed for development of graphical design/mimic diagrams
 - 1.5 Programmable logic controller (PLC) analogue and digital addresses are related to tag databases
 - 1.6 Tag data types are entered and configured in tag database
 - 1.7 Graphic objects are created and added to a graphic library, as required, in accordance with vendor software
 - 1.8 Security requirements are determined for SCADA system to prevent access by unauthorised person/s
 - 1.9 SCADA system is configured to provide appropriate reporting mechanisms
 - 1.10 Equipment, software and testing devices for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Develop and enter program using dedicated SCADA software**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 SCADA software is used to develop human-machine interface (HMI) processes and to accept and implement operators control instructions
 - 2.3 Supervisory control functions, data acquisition components and automated tasks are programmed using SCADA software
 - 2.4 Data is manipulated within the SCADA software to function in accordance with design brief and job specifications
 - 2.5 Alarms and limits for processing variables are identified and programmed in accordance with workplace procedures

- 2.6 Trends for process variables and limits are programmed in accordance with workplace procedures and manufacturer instructions
 - 2.7 Reports are configured to display/print appropriate information
 - 2.8 User rights/security is configured to provide appropriate access to SCADA system
 - 2.9 Unplanned situations are responded to in accordance with workplace procedures and selected for safety and specified work outcomes
- 3 Monitor verify and document programming activities**
- 3.1 Device operation is tested in accordance with WHS/OHS requirements and workplace procedures
 - 3.2 Entered objects and settings are tested in accordance with job specifications and manufacturer specifications
 - 3.3 SCADA software tools are used to test and monitor programs, and operating anomalies are identified and corrected in accordance with workplace procedures
 - 3.4 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.5 SCADA system specifications and programs are documented in accordance with workplace procedures
 - 3.6 Work completion is reported and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing, entering and verifying programs

- at least five graphic objects

in SCADA systems must include the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI152A Develop, enter and verify programs in Supervisory Control and Data Acquisition systems.

Assessment Requirements for UEEIC0014 Develop, enter and verify programs in supervisory control and data acquisition systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- analysing data
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- configuring user access rights
- correcting programming faults and anomalies
- creating graphic objects and adding to graphic's library
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- developing and entering programs using dedicated supervisory control and data acquisition (SCADA) software
- developing human-machine interfaces (HMIs)
- developing SCADA system from design brief and job specifications
- documenting SCADA system programming
- entering tag data types into configured database
- identifying programs for SCADA systems
- monitoring, verifying and documenting programming activities
- producing reports using SCADA
- programming supervisory control functions and data acquisition components.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- SCADA system communications and networking, including:
 - programmable logic controller (PLC) interface requirements
 - networking requirements of the system

- SCADA system differences from distributed control system (DCS) and process control systems
- SCADA (HMI software package costing
- types of networks available with SCADA HMI
- coordinate and access of networking to factory network
- the difference between SCADA and process control systems
- mimics and animated graphics, including:
 - graphic designs, balance clarity of layout and navigation
 - assessment of data required to be entered in software package
 - validation of entered data
- trending, including:
 - analysis of process to select data, including sampling of the process
 - viewing data and graphical representation of selected information
 - trend graphs and data matching
 - the difference between real time trends and historic trends
- alarm logging, including:
 - analysing selected data and applying limits to processes
 - corrective actions and notifications of alarm status
 - alarm data availability for third-party software systems
- recipes and scheduling, including:
 - methods of producing libraries for different process parameters required for varied production runs
 - analysis of different production runs, including amounts of materials, pressure, temperature and weights
 - alarm limits/material specifications
 - where and when scheduling is used
 - scheduling, setting limits and evoking program changes
- data collection and databases, including:
 - produce a database of variable tags and range specifications involved in the process
 - conversion export of raw data into appropriate forms for data management and report creation, e.g., Excel and Paradox
 - types and layout of reports
 - aims of customer, management, statistical and account reports
 - analysis of data in reports: design and graphical data representations
 - assessment of data required for the report
- programming language, including:
 - scripting languages in SCADA HMI software
 - automate tasks within the software PLC or SCADA
- complex processing of process data where field equipment i.e. PLC does not have the capability or to minimise control lag

- implementation and applications, including:
 - typical applications in manufacturing and process control, e.g., food processing, packaging, automotive industry, energy management and steel production and mining
- relevant databases
- relevant equipment, software and testing devices
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation and reporting
- relevant workplace policies and procedures
- SCADA system authorised user access and security requirements
- SCADA systems programming
- tag databases and PLCs.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0015 Develop, enter and verify word and analogue control programs for programmable logic controllers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop, enter and verify word/text and analogue control programs for programmable logic controllers (PLCs).

It includes identifying, developing and entering industrial control system programs, as well as monitoring, verifying and documenting programming activities. It also includes installing and testing programs for an industrial system requiring advanced control functions using structure logic and acceptable design techniques.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEEIC0013 Develop, enter and verify discrete control programs for programmable controllers

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify industrial control system

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

are identified and applied

- 1.2 Hazards are identified, risks are assessed and control measures implemented
- 1.3 Mode of operation of control system is determined from job specifications and consultations with relevant person/s
- 1.4 Equipment, software and testing devices for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.5 Installation of programmable controller is checked for compliance with regulations, relevant industry standards and job specifications

2 Develop and enter programs for industrial control system

- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
- 2.2 Control solutions are developed and documented based on operational mode and using acceptable methods for designing control system containing numeric variables and values
- 2.3 Control solution is entered using information technology and appropriate software
- 2.4 Programming elements are written and used to manipulate word data
- 2.5 Program control values are assigned using applicable numbering systems and codes
- 2.6 Programs are written to read and write analogue signals
- 2.7 Arithmetic functions are used to scale analogue inputs to a specified input range
- 2.8 Arithmetic functions are used to un-scale an engineering value to drive an analogue output
- 2.9 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment

3 Monitor, verify and document programming activities

- 3.1 Device operation is tested in accordance with workplace procedures and manufacturer specifications

- 3.2 Programming is tested in accordance with specified control mode requirements
- 3.3 Operating anomalies are identified and corrected in accordance with workplace procedures
- 3.4 WHS/OHS work completion risk control measures and procedures are followed
- 3.5 Control system specifications and programs are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing, entering and verifying word/text and analogue control programs for PLCs must include at least five of the following:

- hardware configuration
- software configuration
- number systems
- converting between systems
- basic diagnostics
- binary word structure
- integer (INT), double integer (DINT) and REAL arithmetic operations
- scaling and un-scaling engineering units

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI151A Develop, enter and verify word and analogue control programs for programmable logic controllers.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0015 Develop, enter and verify word and analogue control programs for programmable logic controllers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- consulting with relevant person/s
- correcting programming anomalies
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining modes of operation from job specifications
- developing and entering programs for industrial control systems
- developing control solutions
- developing control systems to required operating functions and parameters
- documenting control system and programming clearly
- entering programming functions and parameters
- identifying industrial control systems/programs
- installing programmable controllers
- monitoring, verifying and documenting programming activities
- obtaining relevant equipment, software and testing devices
- testing and verifying device operations
- using arithmetic functions to scale and un-scale engineering values
- using word data, numbering systems and codes.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- numbering systems and codes, including:
 - types of numbering systems

- codes
- application of codes
- conversion between codes and numbering systems
- use programmable logic controller (PLC) software, including:
 - install programming software
 - memory mapping
 - computer software
 - manufacturer's instruction manuals
- PLC hardware, including selection, installation, configuration, signals and resolution
- analogue modules, including:
 - comparison of signals
 - resolution of analogue signals
 - connection of analogue field
 - programming
 - loop fault
- data manipulation, including:
 - IEC data types
 - word structure
 - select bits transfer
 - move
 - block transfer
 - compare
 - block compare
 - and words
 - mask
 - maths function
 - scaling and un-scaling
 - special registers
 - shift register
 - multiplexing
- sequencer, including:
 - application
 - event and time driven
 - programming application
- languages including:
 - ladder
 - code structure format (CSF)
 - state logic (STL)
- diagnostics, including:
 - special register

- software diagnostics
- edits
- rung scan faults
- complex industrial process, including:
 - describe process
 - write program
 - edit program
 - connect and run program
 - documentation
- analogue and word programming
- analogue modules
- control systems and programmable controllers
- job safety assessments or risk mitigation processes
- numbering systems and codes
- relevant arithmetic functions
- relevant equipment, software and testing devices
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0016 Diagnose and rectify faults in a.c. motor drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in systems controlling starting, speed, torque, power output, efficient running and braking alternating current (a.c.) motor drive systems.

It includes working safely; interpreting technical data; applying knowledge of a.c. motor operating parameters to logical fault-finding techniques; implementing fault rectification, safety and functional inspection; testing; and reporting work activities and outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) a.c. or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify a.c. motor drive system faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
 - 1.2 Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures are implemented in preparation for work
 - 1.3 Safety hazards that have not previously been identified are documented on job safety assessments and risk control measures devised and implemented in consultation with relevant person/s
 - 1.4 Scope of fault/s is determined from fault report/s, relevant documentation and in consultation with relevant person/s
 - 1.5 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
 - 1.6 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- #### 2 Diagnose and rectify a.c. motor drive system fault/s
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Need to inspect, test or measure live work is determined and conducted in accordance with WHS/OHS requirements and workplace procedures, as required
 - 2.3 Circuits/machines/plant are inspected, checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Logical diagnostic methods/techniques are applied to diagnose a.c. motor control system faults employing

measurements and estimations of system operating parameters referenced to system operational requirements

- 2.5 Fault scenarios are tested and confirmed as being the source of system problems in accordance with workplace procedures
 - 2.6 Causes of the faults are identified and relevant person/s identified to rectify the fault, as required, outside the scope of the a.c. motor drive control system
 - 2.7 Faults in the control components of the system are rectified in accordance with a.c. motor control system operation standards
 - 2.8 System is inspected and tested to verify that the system operates as intended and to specified requirements
 - 2.9 Decisions for dealing with unplanned situations are determined from discussions with relevant person/s, job specifications and requirements
 - 2.10 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.11 Diagnosis and rectification activities are carried out efficiently, without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is made safe in accordance with workplace safety procedures
 - 3.3 Rectification of faults is documented in accordance with workplace procedures
 - 3.4 Relevant person/s is notified in accordance with workplace procedures that the system faults have been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in a.c. motor drive systems must include at least four of the following:

- faults in systems controlling starting, speed, torque, power output, efficient running and braking a.c. motor drive system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI145A Diagnose and rectify faults in a.c. motor drive systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0016 Diagnose and rectify faults in a.c. motor drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying logical diagnostic methods
- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- applying sustainable energy principles and practices
- completing and reporting fault diagnosis and rectification activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting fault rectification activities and outcomes in accordance with workplace procedures
- identifying faults and determining components needed to rectify them
- inspecting, testing and verifying that the alternating current (a.c.) electrical system operates correctly
- preparing to diagnose and rectify faults in a.c. motor drive system
- rectifying faults in a.c. motor drive system controls
- using fault scenarios to test the cause of system faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements

- relevant workplace documentation
- relevant workplace policies and procedures
- variable speed drive (VSD) systems for a.c. motors, including:
 - methods and operating principles
 - installation requirements
 - filtering
 - performance characteristics
 - set-up and commissioning
 - common faults, their symptoms and causes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in a.c. motor drive systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0017 Diagnose and rectify faults in d.c. motor drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in systems controlling starting, speed, torque, power output, and efficient running and braking of direct current (d.c.) motor drive systems.

It includes applying safe working practices; interpreting technical data; applying knowledge of d.c. motors operating parameters to logical fault-finding techniques; implementing fault rectification, safety and functional testing; and reporting work activities and outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify d.c. motor drive system fault/s

2 Diagnose and rectify d.c. motor drive system fault/s

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/ OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Hazards are identified, WHS/OHS risks assessed, control measures and workplace procedures are implemented in preparation for work
- 1.3 Safety hazards that have not previously been identified are documented on job safety assessments and risk control measures devised and implemented in consultation with relevant person/s
- 1.4 Scope of fault/s is determined from fault report/s, relevant documentation and in consultation with relevant person/s
- 1.5 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
- 1.6 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Need to inspect, test or measure live work is determined and conducted in accordance with WHS/OHS requirements and workplace procedures, as required
- 2.3 Circuits/machines/plant are inspected, checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Logical diagnostic methods/techniques are applied to diagnose d.c. motor control system fault/s employing

measurements and estimations of system operating parameters referenced to system operational requirements

- 2.5 Fault scenarios are tested and confirmed as being the source of system problems in accordance with workplace procedures
 - 2.6 Causes of faults are identified and relevant person/s identified to rectify the fault, as required, outside the scope of the d.c. motor drive control system
 - 2.7 Faults in the control components of the system are rectified in accordance with d.c. motor control system operation standard
 - 2.8 System is inspected and tested to verify that the system operates as intended and to specified requirements
 - 2.9 Decisions for dealing with unplanned situations are determined from discussions with relevant person/s, job specifications and requirements
 - 2.10 Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.11 Diagnosis and rectification activities are carried out efficiently, without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is made safe in accordance with workplace safety procedures
 - 3.3 Rectification of faults is documented in accordance with workplace procedures
 - 3.4 Relevant person/s is notified in accordance with workplace procedures that the system fault/s have been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in d.c. motor drive systems must include at least the following:

- four faults in a d.c. motor control system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI146A Diagnose and rectify faults in d.c. motor drive systems.

Assessment Requirements for UEEIC0017 Diagnose and rectify faults in d.c. motor drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying logical diagnostic methods
- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- applying sustainable energy principles and practices
- completing and reporting fault diagnosis and rectification activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting fault rectification activities and outcomes in accordance with workplace procedures
- identifying faults and determining components needed to rectify them
- inspecting, testing and verifying that the electrical direct current (d.c.) motor drive system operates correctly
- preparing to diagnose and rectify faults in d.c. motor drive system
- rectifying faults in electrical d.c. motor drive system controls
- using fault scenarios to test the cause of system faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- diagnosing and rectifying faults in d.c. motor drive system
- relevant job safety assessments or risk mitigation processes, including:
 - safe working practices
- relevant manufacturer specifications

- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- variable speed drives for d.c. motor/s, including:
 - methods and operating principles
 - installation requirements
 - filtering
 - performance characteristics
 - set-up and commissioning
 - common faults their symptoms and causes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in d.c. motor drive systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0018 Diagnose and rectify faults in digital controls systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in digital controls systems.

It includes preparing, diagnosing and rectifying faults. It also includes completing and reporting fault diagnosis, interpreting diagrams and technical data, applying knowledge of digital systems to logical fault-finding processes, implementing fault rectification, and safety and functional testing.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

UEECD0020 Fix and secure electrotechnology equipment

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Test and connect alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

- UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits
- UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals
- UEEIC0041 Solve problems in pressure measurement components and systems
- UEEIC0038 Solve problems in density/level measurement components and systems
- UEEIC0039 Solve problems in flow measurement components and systems
- UEEIC0043 Solve problems in temperature measurement components and systems
- UEEIC0029 Set up and adjust PID control loops
- UEEIC0030 Set up and adjust advanced PID process control loops
- UEEIC0048 Verify compliance and functionality of instrumentation and control installations
- UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to diagnose and rectify faults

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied.
- 1.2** Hazards are identified, risks are assessed and control

measures implemented

- 1.3 Safety hazards not previously identified are reported on job safety assessment and advice on risk control measures is sought from relevant person/s
 - 1.4 Extent of work is determined from reports, other documentation and discussions with appropriate person/s
 - 1.5 Appropriate person/s are consulted to ensure work is coordinated effectively with others
 - 1.6 Tools, equipment and testing devices required for diagnosing faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Diagnose and rectify faults**
- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 2.2 Need to test or measure live electrical components is determined in accordance with workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with workplace procedures
 - 2.4 Logical diagnostic methods are applied to diagnose electronic control system apparatus faults by employing measurements and estimations of system operating parameters
 - 2.5 Scenarios are tested as suspected cause of system faults
 - 2.6 Fault causes are identified and relevant person/s engaged where fault is outside scope of digital subsystems
 - 2.7 Faults in electronic components of control system are rectified
 - 2.8 System is tested and verified as operating to specified job requirements
 - 2.9 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.10 Methods for dealing with unplanned situations are selected based on safety and specified work outcomes

- 2.11** Diagnosis and rectification work activities are performed using sustainable energy principles and practices without wasting materials, damaging apparatus, the surrounding environment or services
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is made safe in accordance with workplace safety procedures
- 3.3** Rectification of faults is documented in accordance with workplace procedures
- 3.4** Relevant person/s is notified of system fault rectification in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in digital control systems must include at least four of the following faults:

- open circuit
- short circuit
- incorrect or failed connections
- insulation failure
- unsafe condition
- apparatus/component failure
- related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI139A Diagnose and rectify faults in digital controls systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0018 Diagnose and rectify faults in digital controls systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying logical diagnostic methods
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- completing and reporting fault diagnosis and rectification activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- diagnosing and rectifying faults
- documenting fault rectification
- identifying faults, causes and rectification methods
- isolating circuits/machines/plant
- obtaining tools, equipment and testing devices
- preparing to diagnose and rectify faults
- rectifying faults in digital subsystems
- testing and measuring live electrical components
- using scenarios to test causes of system faults
- verifying system operates as intended.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- digital control systems, including:
 - comparison between analogue and digital signals
 - advantages of digital control systems
 - digital/analogue control system
 - logic gates

- truth tables
- digital testing devices
- numbering systems, including:
 - the binary number system
 - the octal number system
 - the hexadecimal number system
 - binary addition and subtraction
 - conversion between numbering systems
 - binary coded decimal (BCD)
 - Gray code
 - the American Standard Code for Information Interchange (ASCII)
- combinational logic networks, including:
 - precautions when handling electronic devices due to electrostatic discharge (ESD)
 - truth tables
 - basic operation and characteristics of logic devices
 - logic probes
 - verification of operation of logic circuits
- logic families and specifications, including:
 - logic families and specifications
 - transistor-transistor logic (TTL)
 - complementary metal oxide silicone (CMOS) logic families
 - the unit load concept
 - specifications and features of TTL, TTL low power Schottky (LS) and CMOS logic families
 - three state and open collector logic
 - input and output voltage characteristics for CMOS and TTL
 - comparison of TTL with CMOS logic families
 - unit load
 - noise margin
 - interfacing different logic families
 - tri-state logic devices
- encoders and decoders, including:
 - weighted and unweighted codes
 - Gray
 - BCD
 - ASCII
 - half and full adder
 - error detection
 - decoder and encoder integrated circuits
 - multiplexer and demultiplexer integrated circuits

-
- flip flops, including:
 - RS flipflops
 - D flipflops
 - JK flipflops
 - truth tables and operation
 - debouncing a switch
 - timing diagrams
 - sequential logic
 - state tables and timing diagrams
- registers, including shift registers and data latches
- counters, including:
 - ripple counters using JK flipflops
 - typical integrated circuit types
 - characteristics and operation
 - ripple counters
 - use of feedback to modify count
 - circuit verification of a ripple counter
 - synchronous counters
 - series and parallel data transfer
 - multivibrators
 - interconnecting digital circuits to perform an application
- digital-to-analogue (D/A) conversion, including:
 - industrial applications of D/A converters
 - summing D/A converters
 - R-2R D/A converters
 - verification of circuit operation of an IC D/A converter
- analogue-to-digital (A/D) conversion, including:
 - industrial applications of A/D converters
 - digital ramp, dual slope, successive approximation and simultaneous (flash) A/D converters
 - verification of circuit operation of an IC A/D converters
- display devices, including:
 - liquid-crystal display (LCD) devices
 - light-emitting diode (LED) devices.
 - operation and characteristics
 - seven segment LED displays
 - drive requirements
 - current limiting
 - multiplexed displays

- seven segment encoding chips
- emerging display technologies
- digital fault finding, including:
 - general fault-finding principles
 - common digital faults
 - digital test equipment
 - locating a fault
- interfacing logic devices to external loads, including:
 - interfacing with a transistor
 - interfacing with a relay
 - solid state switches
 - opto-isolator
 - verification of circuit operation of an opto-coupler
- programmable logic devices, including:
 - programmable logic devices
 - applications of programmable logic devices
 - types of programmable logic devices
 - comparison between different programmable logic devices
 - programmable array logic (PAL)
 - programmable logic devices (PLD)
 - field programmable gate arrays (FPGA)
 - programming and verifying correct operation of a programmable array logic device
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- system testing and verification techniques
- diagnostic methods including digital fault finding, including:
 - diagnostic tools, equipment and testing devices
 - digital control systems, including comparison between analogue and digital signals
 - numbering systems, including binary number system, octal number system and hexadecimal number system.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0019 Diagnose and rectify faults in servo drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in system controlling servo drive systems.

It includes applying safe working practices; interpreting technical data; applying knowledge of servo/stepper drives operating parameters to logical fault-finding processes; implementing fault rectification, safety and functional testing; and reporting work activities and outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0042 Solve problems in single phase electronic power control circuits

UEEIC0040 Solve problems in polyphase electronic power control circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify servo drive system faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
 - 1.2 Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures are implemented in preparation for work
 - 1.3 Safety hazards that have not previously been identified are documented and risk control measures devised and implemented in consultation with relevant person/s
 - 1.4 Scope of fault/s is determined from fault report/s, relevant documentation and in consultation with relevant person/s
 - 1.5 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
 - 1.6 Tools, equipment and testing devices needed to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- #### 2 Diagnose and rectify servo drive system fault/s
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Need to inspect, test or measure live work is determined and conducted in accordance with WHS/OHS requirements and workplace procedures, as required
 - 2.3 Circuits/machines/plant are inspected, checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Logical diagnostic methods/techniques are applied to diagnose servo/stepper drive control system faults employing measurements and estimations of system

- operating parameters referenced to system operational requirements
- 2.5** Fault scenarios are tested and confirmed as being the source of system problems in accordance with workplace procedures
 - 2.6** Cause of the fault/s is identified and relevant person/s identified to rectify the fault/s, as required, outside the scope of the servo/stepper drive control system
 - 2.7** Faults in the control components of the system are rectified in accordance with servo drive control system operation standard
 - 2.8** System is inspected and tested to verify that the system operates as intended and to specified requirements
 - 2.9** Decisions for dealing with unplanned situations are determined from discussions with relevant person/s, job specifications and requirements
 - 2.10** Methods for dealing with unplanned situations are selected on the basis of safety and specified work outcomes
 - 2.11** Diagnosis and rectification activities are carried out efficiently, without unnecessary waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2** Worksite is made safe in accordance with workplace safety procedures
 - 3.3** Rectification of faults is documented in accordance with workplace procedures
 - 3.4** Relevant person/s is notified in accordance with workplace procedures that the system fault/s has been rectified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in servo drive systems must include at least two of the following:

- faults in a servo/stepper drive control system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI147A Diagnose and rectify faults in servo drive systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0019 Diagnose and rectify faults in servo drive systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- applying sustainable energy principles and practices
- completing and reporting fault diagnosis and rectification activities
- diagnosing and rectifying faults in servo drive systems
- applying logical diagnostic methods
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting fault rectification activities and outcomes in accordance with workplace procedures
- identifying faults and determining components needed to rectify them
- inspecting, testing and verifying that the system operates correctly
- rectifying faults in in servo drive system controls
- using fault scenarios to test the source of system faults
- preparing to diagnose and rectify faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- causes of hunting in servo drive systems
- common faults, symptoms and causes in servo drive systems
- difference between an open loop and a closed loop system
- differences in operation between types of servo mechanism systems

- inspection, testing and alignment of a servo mechanism system
- programming and configuration of a programmable logic controller (PLC) driven servo system
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- servo mechanism systems
- servo mechanism terminology and concepts.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in servo drive systems.
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair analogue circuits and components in electronic control systems.

It includes fault finding and repairing analogue circuits as well as completing and reporting on fault and repair activities. It also includes analogue circuits and components to logical fault-finding processes, implementing fault rectification, safety and functional testing.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

- UEECD0020 Fix and secure electrotechnology equipment
- UEEEL0003 Arrange circuits, control and protection for electrical installations
- UEEEL0020 Solve problems in low voltage a.c. circuits
- UEEEL0023 Terminate cables, cords and accessories for low voltage circuits
- UEEEL0019 Solve problems in direct current (d.c.) machines
- UEEEL0021 Solve problems in magnetic and electromagnetic devices
- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Test and connect alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

- UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits
- UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals
- UEEIC0041 Solve problems in pressure measurement components and systems
- UEEIC0038 Solve problems in density/level measurement components and systems
- UEEIC0039 Solve problems in flow measurement components and systems
- UEEIC0043 Solve problems in temperature measurement components and systems
- UEEIC0029 Set up and adjust PID control loops
- UEEIC0030 Set up and adjust advanced PID process control loops
- UEEIC0048 Verify compliance and functionality of instrumentation and control installations
- UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to fault find analogue circuits

- 1.1 WHS/OHS requirements and workplace procedures are identified and applied
- 1.2 Hazards are identified, risks assessed and control measures implemented
- 1.3 Safety hazards not previously identified are reported on job safety assessment and advice on risk control measures is sought from relevant person/s
- 1.4 Extent of faults is determined from reports, other relevant documentation and discussions with relevant person/s
- 1.5 Relevant person/s is consulted to ensure work is coordinated with others
- 1.6 Tools, equipment and testing devices required to diagnose faults are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Fault find and repair analogue circuits

- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
- 2.2 Need to test or measure live electrical components is determined in accordance with workplace procedures
- 2.3 Circuits/machines/plant are checked and isolated in accordance with workplace procedures
- 2.4 Logical diagnostic methods are applied to electronic control system apparatus faults by employing measurements and estimations of system operating parameters
- 2.5 Scenarios are tested as suspected cause of system faults
- 2.6 Fault causes are identified and relevant person/s engaged where fault is outside scope of analogue circuits and components
- 2.7 Faults in electronic components of control system are

rectified

- 2.8** System is tested and verified as operating to specified job requirements
- 2.9** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.10** Methods for dealing with unexpected situations are selected based on safety and specified work outcomes
- 2.11** Diagnosis and rectification work activities are performed using sustainable energy principles and practices without waste of materials, damaging apparatus, the surrounding environment or services
- 3 Complete and report fault-find and repair activities**
- 3.1** WHS/OHS work completion risk control measures and procedures are followed
- 3.2** Work site is made safe in accordance with workplace safety procedures
- 3.3** Rectification of faults is documented in accordance with workplace procedures
- 3.4** Relevant person/s is notified of system fault rectification in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fault finding and repairing must include at least four of the following faults in analogue circuits and components:

- open circuit
- short circuit
- incorrect or failed connections
- insulation failure
- unsafe condition

- apparatus/component failure
- related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI124A Fault find and repair analogue circuits and components in electronic control systems.

Assessment Requirements for UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying diagnostic methods
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- completing and reporting faults and repairs
- consulting relevant person/s
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting fault rectification
- finding and repairing faults of analogue circuits
- identifying, rectifying and determining extent of faults and causes
- isolating circuits/machines/plant
- obtaining tools, equipment and testing devices
- rectifying faults in system analogue circuits and components
- testing and measuring live electrical components
- using fault scenarios to test causes of system faults
- verifying the control system operates correctly.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- amplifier fundamentals, including:
 - the purpose and application of amplifiers
 - the basic characteristics of small signal amplifiers
 - the ideal operational amplifier
- basic operational amplifier configurations, including:

- various operational amplifier circuit configurations and where they are used
- measured and calculated values of gain and output voltage for various operational amplifier configurations
- circuit configurations, including:
 - inverting
 - non-inverting
 - voltage follower
 - summing
 - comparators
 - Schmitt trigger
 - differential configurations
- operational amplifier limitations, including:
 - use of frequency compensation
 - offset null
 - bias compensation
 - slew rate
 - frequency response
 - bandwidth
 - noise figures
- single-stage amplifiers, including:
 - determination of direct current (d.c.) bias conditions for a single-stage amplifier
 - small signal terminal characteristics of single-stage amplifiers
 - effects of coupling and by-pass capacitors in single-stage amplifiers
- amplifier applications, including:
 - operation of multi-stage amplifiers
 - effects of component values and frequency response
 - negative feedback loop in multi-stage amplifiers
 - negative feedback and amplifier parameters
 - effects on the output voltage when amplifiers are subjected to control signal overdrive, bias faults and amplifying device faults
- operational amplifier /diode circuits, including:
 - clippers
 - clamp circuits
 - precision rectifiers
- oscillators, including:
 - oscillator circuits using operational amplifiers
 - sine wave
 - square wave
 - triangular wave
 - sawtooth

- operational amplifier /resistance/capacitance (RC) circuits, including:
 - integrator
 - differentiator
 - function generators
- filters, including:
 - active filter circuits
 - first and second order
 - low, high and band pass circuits
- timers, including operation of typical timer integrated circuits
- power amplifiers including:
 - power output integrated circuits
 - power amplifiers using operational amplifiers
 - power supplies
- multi-stage circuits, including:
 - circuits using several different operational amplifier configurations
 - fault-finding procedures
- analogue circuit faults
- analogue circuits and components in electronic control systems
- diagnostic methods
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- system testing and verification techniques.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0021 Find and rectify faults in process final control elements

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and rectify faults in process final control elements.

It includes working safely, interpreting valve specifications, applying knowledge of final control elements operating parameters, conducting tests and repairs, and completing the necessary service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0023 Install instrumentation and control cabling and tubing

UEEIC0022 Install instrumentation and control apparatus and associated equipment

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and repair faults in final control elements

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Scope of final control element fault is obtained from documentation tests and/or work supervisor to determine work
- 1.4** Need to inspect, test and measure operating systems is determined in accordance with WHS/OHS requirements and workplace procedures
- 1.5** Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.6** Sources of materials required for work are determined in accordance with workplace procedures
- 1.7** Tools, equipment and testing devices required to carry out work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find faults in final control elements and associated equipment

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Fault finding is approached using processes control valves, actuators and positioners using measured and calculated values in accordance with workplace procedures
- 2.4** Apparatus components are dismantled, as required, and parts stored to protect against loss or damage in accordance with workplace procedures
- 2.5** Faulty components are rechecked and fault status confirmed in accordance with workplace procedures
- 2.6** Unplanned situations are dealt with safely and with the approval of relevant person/s

- 3 Rectify faults in final control elements and associated equipment**
- 2.7** Fault-finding activities are carried out without damage to apparatus, circuits, the surrounding environment or services using sustainable energy principles
 - 3.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 3.2** Apparatus is inspected and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 3.3** Materials required to rectify faults are sourced and obtained in accordance with workplace procedures
 - 3.4** Rectification and repairs are conducted without damage to components, apparatus or circuits
 - 3.5** Repairs are tested in accordance with workplace procedures
 - 3.6** Apparatus is reassembled, tested and prepared for return to service
 - 3.7** Repairs are carried out without damage to apparatus, circuits, the surrounding environment or services using sustainable energy principles
- 4 Complete and report fault-finding and rectification activities**
- 4.1** WHS/OHS work completion risk control measures and workplace procedures are followed
 - 4.2** Work area is cleaned and made safe in accordance with workplace procedures
 - 4.3** Repairs to control valves is documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package

Companion Volume Implementation Guide.

Finding and rectifying faults in final control elements must include at least two of the following:

- final control elements
- associated equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI111A Find and rectify faults in process final control elements.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0021 Find and rectify faults in process final control elements

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- applying variable speed drives (VSD)
- checking and isolating apparatus
- dealing with unplanned situations safely and with the approval of relevant person/s
- determining need for inspecting, testing or measuring operating systems
- determining sources of materials required for work
- dismantling apparatus components, as required, and storing to protect against loss or damage
- finding faults in final control elements and associated equipment
- measuring control valves actuators and positioners and calculating values to identify faults
- obtaining scope of final control element faults
- obtaining tools, equipment and testing devices required to carry out work
- preparing to find and repair faults in final control elements
- replacing/rectifying and repairing components without damage using sustainable energy principles
- sourcing and obtaining materials required to rectify faults.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- control valve body and trim types and flow characteristics
- control valve selection
- power cylinder (piston actuator) types
- problem-solving techniques
- relevant components, apparatus or circuits

- relevant control valves including:
 - control valves actuators and positioners measurements and calculations
- relevant industry standards
- relevant isolation procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant material, tools and equipment
- relevant rectification and repairs
- relevant VSD
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- self-acting pressure and temperature control valves
- spring opposed diaphragm actuator
- sustainable energy principles
- valve positioners.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that current industry practices in relation to finding and rectifying faults in process final control elements and associated equipment
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0022 Install instrumentation and control apparatus and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install instrumentation and control apparatus and associated equipment.

It includes preparing and installing instrumentation and control apparatus and associated equipment, as well as completing and reporting installation activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify instrumentation, control apparatus and associated equipment

- 1.1** WHS/OHS requirements and workplace procedures are identified and applied
- 1.2** Hazards are identified, risks are assessed and control measures implemented
- 1.3** Safety hazards not previously identified are reported on job safety assessment and advice on risk control measures are implemented
- 1.4** Installation of apparatus is prepared in consultation with relevant person/s and scheduled
- 1.5** Nature and location of work is determined from documentation and/or relevant person/s to determine scope of work
- 1.6** Location of instrumentation, control apparatus and associated equipment is planned within constraints of building structure, significant and regulations
- 1.7** Advice is sought from relevant person/s to ensure work is coordinated with others in accordance with workplace procedures
- 1.8** Materials needed for installation work are obtained in accordance with workplace procedures and checked against job requirements
- 1.9** Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.10** Preparatory work is checked by supervisor to ensure no damage has occurred and work complies with job requirements

2 Install instrumentation, control apparatus and associated equipment

- 2.1** WHS/OHS risk control measures and procedures for carrying out the work are followed

- 2.2 Need to test or measure live electrical components is determined in accordance with WHS/OHS regulatory requirements and workplace procedures
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with workplace procedures
 - 2.4 Instrumentation, control apparatus and associated equipment are installed with sufficient excess to adjust and maintain terminations in accordance with technical standards, manufacturer specifications and job requirements
 - 2.5 Wiring and tubing is terminated at instrumentation, control apparatus and associated equipment in accordance with manufacturer specifications, functional and regulatory requirements
 - 2.6 Unplanned situations are discussed with relevant person/s and documented in accordance with workplace procedures
 - 2.7 Unplanned situations are dealt with safely and with approval of authorised person/s in accordance with workplace procedures
 - 2.8 Regular quality checks of installed apparatus are undertaken in accordance with workplace procedures
 - 2.9 Apparatus installation is performed without waste of materials, damage to apparatus, circuits, surrounding environment or services using sustainable energy principles and practices
- 3 Complete and report installation activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Final checks are made to installed apparatus to ensure it meets job requirements
 - 3.4 'As-installed' apparatus and associated equipment are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Instrumentation and control apparatus and associated equipment must include at least four of the following:

- pressure measurement apparatus and systems
- temperature measurement apparatus and systems
- level/density measurement apparatus and systems
- flow measurement apparatus and systems
- chemical measurement apparatus and systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI108A Install instrumentation and control apparatus and associated equipment.

Assessment Requirements for UEEIC0022 Install instrumentation and control apparatus and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- checking circuits/machines/plant are isolated
- cleaning and making safe worksite
- completing and reporting installation activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying and installing instrumentation, control apparatus and associated equipment
- locating and installing instrumentation, control apparatus and associated equipment
- obtaining relevant materials and checking against job requirements
- obtaining tools, equipment and testing devices
- terminating wiring and tubing
- undertaking regular quality checks in accordance with relevant industry standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- instrumentation and control equipment installation requirements and techniques
- live electrical components
- quality checks
- regulatory requirements, including:
 - equipment specification
 - manufacturer s installation instructions
 - system specifications
 - communication/signal cabling installation requirements

- power wiring requirements
- initial set-up procedures
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- wiring and tubing terminations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0023 Install instrumentation and control cabling and tubing

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install instrumentation and control cabling and tubing.

It includes identifying and installing cabling, tubing and accessories. It also includes completing and reporting installation activities, routing cables and tubing to specified locations, terminating cables and tubing, and connecting wiring at accessories, instruments and control apparatus.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify cabling and tubing

- 1.1 WHS/OHS requirements and workplace procedures are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures implemented
- 1.3 Safety hazards not previously identified are reported on job safety assessment and advice on risk control measures are implemented
- 1.4 Installation of cabling and tubing is prepared in consultation with relevant person/s and scheduled in accordance with workplace procedures
- 1.5 Nature and location of work is determined from documentation and/or relevant person/s to determine scope of work
- 1.6 Cable and tube routes are planned within constraints of building, plant structure, significants and regulations
- 1.7 Advice is sought from appropriate person/s to ensure work is coordinated effectively with others
- 1.8 Material needed for installation work is obtained in accordance with workplace procedures and checked against job requirements
- 1.9 Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.10 Work is checked by supervisor to ensure and work complies with job requirements

2 Install cabling, tubing and accessories

- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
- 2.2 Plant/machines/equipment are checked and isolated in accordance with workplace procedures
- 2.3 Cabling, tubing and accessories are installed to comply with technical standards, job specifications and work

requirements with sufficient excess to affect terminations

- 2.4 Accessories are installed in required locations within acceptable tolerances
 - 2.5 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
 - 2.6 Tubing is terminated at accessories in accordance with manufacturer specifications and regulatory requirements
 - 2.7 Methods for dealing with unplanned situations are discussed with relevant person/s and documented
 - 2.8 Unplanned situations are responded to in accordance with workplace procedures and approval of authorised person/s
 - 2.9 Ongoing quality checks of installed wiring is undertaken in accordance with workplace procedures
 - 2.10 Cabling and tubing installations are performed using sustainable energy principles without wasting materials and energy, damaging apparatus or surrounding environment in accordance with workplace procedures
- 3 Complete and report installation activities**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Final checks are made to ensure installed wiring conforms to requirements
 - 3.4 'As-installed' cables, tubes and accessories are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Wiring and tubing must include the following:
- at least three wiring systems:
 - armoured cable
 - fire performance cables
 - thermoplastic insulated (TPI) cable
 - thermoplastic sheathed (TPS) cable
 - unshielded twisted pair (UTP), foiled twisted pair (FTP), shielded twisted pair (STP) and coaxial communications cables
 - at least two tubing types:
 - low pressure metallic and non-metallic tubing
 - high pressure tubing

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI107A Install instrumentation and control cabling and tubing.

Assessment Requirements for UEEIC0023 Install instrumentation and control cabling and tubing

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- acquiring relevant materials, tools, equipment and testing devices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including identifying risk control measures
- applying sustainable energy principles and practices
- checking installed wiring is compliant
- communicating and dealing with other person/s when scheduling and planning work
- completing and reporting installation activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying and installing cabling, tubing and accessories
- placing and securing accessories in accordance to specified drawings
- routing, placing and securing cables and tubing to comply with requirements
- terminating cables and tubing to comply with requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- instrumentation cable types and terminations, including:
 - cable specifications
 - cable applications
 - cable preparation
 - cable termination
 - connection hardware
- instrumentation pneumatic/hydraulic control tubing/piping, including:
 - control tubing/piping

- pneumatic/hydraulic terms
- cutting pipe tubing/piping
- bending, shaping/setting pipe and tubing
- joining connecting/terminating tubing/ piping
- instrumentation air supply maintenance
- job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0024 Plan the electrical installation of integrated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan the electrical installation of integrated system.

It includes implementing integrated system scenario and installation by determining bus system parameters, topology and installation requirements, bus system cables and terminations, control and dimming methods; and planning and documenting integrated installation plan.

A network topology is the arrangement of a network, including its nodes and connecting lines. In a bus network topology, every workstation is connected to a main cable called the bus.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Electrotechnology Pathway Group

UEECD0025 Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

Electrical Pathway Group

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine integrated system scenario

2 Plan integrated system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Customer requirements for scenes, events and controls in an integrated system are determined from job specifications and appropriate person/s
- 1.2 Types and locations of integrated system loads are determined from job specifications and customer requirements
- 1.3 Types and locations of control (input) devices of integrated system are determined from job specifications and customer requirements
- 1.4 Budget for the integrated system is determined from customer and appropriate person/s
- 2.1 Hazards are identified, risks assessed and control measures implemented
- 2.2 Integrated system devices and capabilities are incorporated the system plan
- 2.3 Number and types of output devices to meet scenario specified are chosen for compatibility with system loads
- 2.4 Number and types of control (input) devices to meet system scenario specified are obtained
- 2.5 Integrated systems are planned to comply with bus system and supply voltage parameters in accordance with job specifications
- 2.6 Other control methods are considered in developing an integrated system plan in accordance with workplace procedures
- 2.7 Integrated systems are planned within cost and budget constraints

- 2.8** Final plan is documented and submitted to appropriate person/s for approval in accordance with workplace procedures
- 3 Implement integrated system installation**
- 3.1** Work health and safety (WHS)/occupational health and safety (OHS) risk control work measures and workplace procedures are followed
- 3.2** Integrated system is arranged using appropriate topology in accordance with workplace procedures
- 3.3** Connection chart/diagram between devices in the integrated system is developed in accordance with workplace procedures
- 3.4** Appropriate cable for the bus system is selected and connected at devices and accessories using the methods and the polarity specified by manufacturer specifications

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Electrical installation of integrated systems must include the following:

- three integrated systems one of which has at least four separate scenes and five control requirements

Documentation must include the following:

- explanations of how the customer requirement will be achieved
- a material list with costs and a marked-up floor plan showing relationship of load groups to input device/s

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI140A Plan the electrical installation of integrated systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0024 Plan the electrical installation of integrated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- arranging an integrated system using an acceptable topology
- complying with a given budget
- complying with manufacturer instructions/specifications
- considering other control methods in planning the integrated system
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining customer requirements for integrated system
- determining scenario specifications including number and types of control systems
- developing a connection chart/diagram
- developing appropriate topology for integrated system
- documenting integrated system plan
- identifying integrated system scenario
- implementing an integrated system installation
- planning installations of integrated system
- planning integrated system to comply with bus system and supply voltage parameters

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- acceptable and unacceptable topologies for a single network
- bus system parameters, including:
 - how bus systems work
 - network topology
 - voltage and current limits

- cable type and length limits
- network impedance
- network and device status indication
- low voltage (LV) supply, voltage parameters and quality
- supply sources such as uninterruptable power supplies (UPS) and inverters may adversely effect voltage parameters and waveform
- cabling, including:
 - insulation resistance testing precautions and prohibitions
 - LV cable terminations and conductor size
 - bus cable polarity and pairing, termination requirements and techniques
 - field and enclosure segregation requirements related to related to relevant industry standards
- supply and load protection, including:
 - conductors and protection device coordination
 - protection on supply and load side of system devices
 - use of residual current devices (RCDs)
- output devices, including:
 - relay connections for extra-low voltage (ELV) and LV loads
 - dimmer types
 - supply and load connections for the various dimmer types
- installation requirements for input devices, including:
 - passive infrared detectors
 - light level control
 - key inputs
 - touch screens
- acceptable and unacceptable topologies for a single network
- connection chart/diagrams
- devices and connections for other control methods, including:
 - distributed signalling interface (DSI) and gateway dimming and control
 - devices and connections digital addressable lighting interface (DALI) dimming and control
 - zero to 10 volts analogue control
- installation requirements for input devices
- installations of integrated systems for input devices, including passive infrared detectors, light level control, key inputs, and touch screens
- job specifications and customer requirements
- LV supply, voltage parameters and quality, including supply sources such as UPS and inverters which may adversely affect voltage parameters and waveforms
- manufacturer documentation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation

processes

- relevant cabling industry standards, including:
 - cable type and length limits, including network impedance
 - how bus systems work and network topology
 - voltage and current limits
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- risk control measures
- supply and load protection
- acceptable and unacceptable topology requirements for a single network.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0025 Provide solutions to extra-low voltage (ELV) electro-pneumatic control systems and drives

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide solutions to extra-low voltage (ELV) electro-pneumatic elements operating at ELV and variable speed drives.

It includes working safely, establishing required control functions, checking device installation, entering instruction into programmable devices, following workplace instruction and procedures and completing documentation.

Electrical connections referred to in this unit are confined to pre-assembled plug and socket sets. This unit does not cover competencies for installation and connection of electrical wiring.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to problem solve electro-pneumatic control systems

- 1.1** WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures implemented in preparation for work
- 1.3** Safety hazards that have not previously been identified are reported on job safety assessments and advice on risk control measures is sought from relevant supervisor
- 1.4** Control functions and drive system required to perform work are identified and documented from work instructions/specifications, relevant work supervisor or customer
- 1.5** Tools, equipment, inspection and testing devices needed to carry out the work are obtained and checked for correct operation and safety

2 Provide electro-pneumatic control systems solutions

- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2** Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Circuits for electro-pneumatic control and drive system are developed to meet the required functions and specifications
- 2.4** Locations of control field devices are inspected, checked and adjusted to ensure they function correctly
- 2.5** Circuits for the electro-pneumatic control and drive system component connections are inspected and

- checked against the developed circuits specifications
- 2.6** Functioning of the systems entering into programmable components and parameters is set in accordance with developed circuit and manufacturer programming instructions/specifications
- 3 Inspect, test and document electro-pneumatic control systems**
- 3.1** Operation of the electro-pneumatic control and drive system is tested in accordance with WHS/OHS requirements and workplace procedures
- 3.2** Operating anomalies are identified and corrected in accordance with workplace procedures
- 3.3** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.4** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.5** Work completion is reported and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing an electro-pneumatic system using a programable logic controller (PLC) must include the following:

- at least four digital input/outputs (I/O)
- at least one analogue output

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI138A Provide solutions to extra low voltage (ELV) electro-pneumatic control systems and drives.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0025 Provide solutions to extra-low voltage (ELV) electro-pneumatic control systems and drives

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- establishing and documenting functions that the control and drive system is required to perform
- developing and documenting circuits for the electro-pneumatic control and drive systems that meet the required functions
- checking location of control field devices and adjusting to ensure correct functioning
- checking electro-pneumatic control and drive system components connections
- entering functions and parameters into programmable components correctly
- correcting programming anomalies
- testing and verifying correct operation
- reporting work completion to appropriate persons in accordance with established procedures
- dealing with unplanned events
- applying problem-solving techniques, including:
 - preparing to developing solutions
 - providing solutions
 - inspecting, testing and documenting solutions
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electrical and pneumatic control fundamentals, including:

- electrical and pneumatic safety encompassing:
 - hazardous and safe working methods and procedures
 - pneumatic operating pressures
 - isolation procedures
- electrical/pneumatic drawing types and applications encompassing:
 - drawing layouts and conventions (electrical and pneumatic schematics, wiring and piping diagrams)
 - drawing symbols
- electrical and pneumatic control system components encompassing:
 - electrical components, including power, human-machine interfaces (HMIs), relays, plug and socket connectors; pneumatic components, including air supply systems, HMIs, valves, actuators, tubing and connectors
- electrical relay types encompassing:
 - operation
 - contact configurations
- pneumatic control valves and actuators encompassing:
 - types and their operation
 - activated and deactivated configurations
- basic logic as applied to control systems
- logic confined to AND, OR, NOT and NOR functions
- variable speed drive (VSD) functions and configuration
- VSD functions and set-up, including:
 - basic function of a variable speed drive in controlling an induction motor
 - configuring a VSD encompassing:
 - setting rated motor voltage and current, digital and analogue inputs, speed range and ramp times
 - testing procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to provide solutions to extra-low voltage (ELV) electro-pneumatic control systems and drives
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0026 Provide solutions to fluid circuit operations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide the solution to fluid circuit operations.

It includes identifying and providing the solution to fluid circuit operation problems, completing work and documenting solutions to the operation of fluid-controlled circuits. It also includes applying problem-solving procedures, using measuring instruments, applying appropriate circuit theorems, and providing solutions derived from measurements and calculations and justification for solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify fluid circuit

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures

- operation problem** are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures implemented
 - 1.3 Circuit problems are identified from documentation and consultation with supervisor to determine scope of work
 - 1.4 Advice is sought from supervisor to ensure work is coordinated effectively with relevant person/s
 - 1.5 Sources of materials required for work are identified in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Provide solutions to fluid circuit problem**
- 2.1 WHS/OHS risk control work measures and procedures are followed
 - 2.2 Need to test or measure live circuits are determined in accordance with workplace procedures
 - 2.3 Circuits are checked and isolated in accordance with workplace procedures
 - 2.4 Fluid circuit problems are solved using measured and calculated values
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures and approval of relevant person/s in a manner that minimises risk to personnel and equipment
 - 2.6 Problems are solved using sustainable energy principles without wasting materials, damaging apparatus circuits, the surrounding environment or services in accordance with workplace procedures
- 3 Complete work and document solutions to fluid circuit problem**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Solutions used to solve circuit problems are justified and documented in accordance with workplace procedures

- 3.4 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fluid power circuits as they apply to problems related to engineering diagnosis and development work functions must include two of the following types of circuit problems:

- determining the operating parameters of an existing circuit
- altering an existing circuit to comply with specified operating parameters
- developing circuits to comply with a specified function and operating parameters

Pumps and associated control equipment must include the following:

- hydraulic
- pneumatic

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI125A Provide solutions to fluid circuit operations.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEEIC0026 Provide solutions to fluid circuit operations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying appropriate circuit theorems and providing solutions derived from measurements and calculations and justification for such solutions
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- completing work and documenting solutions to problem
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting justification of solutions
- identifying fluid circuit operations
- isolating work area
- obtaining tools, equipment and testing devices
- preparing to provide solutions to fluid circuit problems
- providing solutions to circuit problems from measurements and calculations, including:
 - operation and construction of a basic hydraulic circuit
 - operation and construction of pneumatic circuit
- providing solutions to fluid circuit problems
- sourcing work materials
- testing or measuring live circuits
- using established problem-solving methods
- working with and referring to others to solve problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- common terms and definitions used in fluid power systems

- applications of fluid power
- Pascal's law relevant to force transfer, multiplication and intensification
- mathematical relationships involving:
 - temperature and volume (Charles law)
 - pressure and volume (Boyles law)
- fluid power principles relevant to components and the identification of components
- operation of fluid power components
- interpretation of fluid system operation from circuit diagrams
- operation and construction of basic pneumatic circuit
- operation and construction of a basic hydraulic circuit
- routing maintenance procedures
- safety requirements
- fluid circuit operation problems
- relevant circuit theorems, measurements and calculations, including providing solutions derived from measurements
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant tools, equipment and measuring devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- terms and their definitions used in fluid power systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0027 Provide solutions to pneumatic-hydraulic system operations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide solutions to pneumatic-hydraulic system operations.

It includes identifying, providing, completing and documenting solutions to discovered problems in pneumatic-hydraulic system operations. It also includes setting up and maintaining pneumatic and hydraulic systems; applying problem-solving procedures, including using measuring instruments; applying appropriate circuit theorems; and providing solutions derived from measurements and calculations and justification for such solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0026 Provide solutions to fluid circuit operations

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Identify pneumatic-hydraulic system operations

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures implemented
- 1.3 System problems are identified from documentation and consultation with supervisor to determine scope of work
- 1.4 Advice is sought from supervisor to ensure work is coordinated effectively with others
- 1.5 Sources of materials required for work are identified in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Provide solution to pneumatic-hydraulic operation system

- 2.1 WHS/OHS risk control work measures and procedures are followed
- 2.2 Need to test or measure live work systems is determined in accordance with workplace procedures
- 2.3 Systems are checked and isolated in accordance with workplace procedures
- 2.4 Pneumatic-hydraulic system problems are solved using measured and calculated values
- 2.5 Unplanned situations are responded to in accordance with workplace procedures and approval of authorised person/s in a manner that minimises risk to personnel and equipment
- 2.6 Problems are solved using sustainable energy principles without waste of materials, damage to apparatus circuits, the surrounding environment or services in accordance with workplace procedures

3 Complete work and document solutions to discovered problem

- 3.1 WHS/OHS work completion risk control measures and procedures are followed
- 3.2 Worksite is cleaned and made safe in accordance with

workplace procedures

- 3.3** Solutions used to solve circuit problems are justified and documented in accordance with workplace procedures
- 3.4** Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Pneumatic-hydraulic power systems as they apply to problems related to engineering diagnosis and development work functions must include one of the following:

- determining the operating parameters of an existing system
- altering an existing system to comply with specified operating parameters
- developing systems to comply with a specified function and operating

Pneumatics must include at least two of the following main components:

- cooler
- dryer
- filter
- receiver

Pneumatic control devices must include at least two of the following components:

- linear actuator
- rotary actuator
- directional control valve
- timer
- counter

Hydraulics must include at least two of the following main components:

- two-cylinder sequenced system
- single cylinder skip-check system

Hydraulic control devices must include at least two of the following components:

- rotary actuators
- linear actuators
- directional control valve
- rotary control valve
- pressure control valve

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI126A Provide solutions to pneumatic-hydraulic system operations.

Assessment Requirements for UEEIC0027 Provide solutions to pneumatic-hydraulic system operations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- completing work and documenting solutions to discovered problems
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- giving written justification of solutions provided
- isolating work area
- obtaining tools, equipment and testing devices
- providing solutions to pneumatic-hydraulic system operations including constructing pneumatic-hydraulic circuits from control diagrams
- sourcing work materials
- taking relevant measurements accurately
- testing or measuring live circuits
- using established problem-solving methods
- working with and referring to others to solve problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- common terms and definitions used in pneumatic components and systems
- application, operation and installation requirements of pneumatic components and systems
- interpretation and selection of manufacturer's equipment specifications to establish the performance of pneumatic components
- pneumatic circuits from control diagrams
- location and correction of faults on pneumatic components and systems

- common terms and definitions used in hydraulics components and systems
- application, operation and installation requirements of hydraulic components and systems
- interpretation and selection of manufacturer's equipment specifications to establish the performance of hydraulic components
- hydraulic circuits from control diagrams
- location and correction of faults on hydraulics components and systems
- job safety assessments or risk mitigation processes
- pneumatic-hydraulic system operation problems
- relevant manufacturer specifications, including performance of pneumatic components and hydraulic components
- relevant tools, equipment and measuring devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- risk control measures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0028 Provide solutions to problems in industrial control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide solution to an industrial control systems problem.

It includes identifying, providing, testing and documenting a solution to industrial control system problems. It also includes interpreting process and circuit diagrams, applying knowledge of industry controls to problem-solving techniques, and safety and functional testing.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0018 Diagnose and rectify faults in digital controls systems

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

UEEIC0048 Verify compliance and functionality of instrumentation and control installations

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify industrial control system problem

- 1.1 WHS/OHS requirements and workplace procedures are identified and applied
- 1.2 Hazards are identified, risks are assessed and control measures implemented
- 1.3 Extent of industrial control system problems are determined from job specifications, situation reports and consultations with relevant person/s
- 1.4 Work activities are planned to meet scheduled timelines in consultation with relevant person/s
- 1.5 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Provide solution to industrial control system problem

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 Industrial control system devices, circuit operation characteristics and applications are applied to develop solutions to control problems
- 2.3 Parameters, specifications and job requirements for each industrial control system problem are obtained in accordance with workplace procedures
- 2.4 Industrial control system problems are evaluated to determine most effective solution
- 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.6 Control system problem is resolved using sustainable energy practices without wasting materials, damaging apparatus, surrounding environments or services in accordance with workplace procedures

3 Test and document solution to industrial

- 3.1 WHS/OHS risk control measures and workplace

control system problems

procedures for carrying out the work are followed

- 3.2 Solutions to industrial control system problems are tested to determine effectiveness and modified, as required
- 3.3 Adopted solutions are documented including instructions incorporating risk control measures
- 3.4 Solutions used to solve industrial control system problems are justified and documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Providing solutions must include at least four • industrial control system problems of the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI120A Provide solutions to problems in industrial control systems.

Links

Assessment Requirements for UEEIC0028 Provide solutions to problems in industrial control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining extent of and evaluating solutions to resolve industrial control system problems
- documenting justification of solutions implemented in accordance established procedures
- meeting scheduled timelines
- obtaining parameter specifications and performance requirements
- preparing to provide solutions to industrial control system problems
- providing solutions to industrial control system problems
- testing and documenting solutions to industrial control system problems
- testing solution to industrial control system problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- control amplifiers, including:
 - introduction
 - amplifier operation
 - operational amplifiers
 - operational amplifier configurations
- industrial transducers, including:
 - introduction
 - International System of Units (SI)

- forms of energy
- transducer terminology
- temperature measurement
- force measurement
- speed measurement
- positional measurement
- industrial final control elements, including:
 - introduction
 - electromagnetic devices
 - valves
 - solid state switching devices
- industrial control systems, including:
 - automatic control
 - open loop control
 - closed loop control
 - control system terminology
 - control system evaluation
 - two position control
 - proportional control (P)
 - proportional + integral control (P+I)
 - proportional + derivative control (P+D)
 - proportional + integral + derivative control (P+I+D)
- industrial control loops and control signals, including:
 - introduction
 - control loops
 - converters (digital-to-analogue and analogue-to-digital)
 - multiplexing
- circuit operation, characteristics and applications
- industrial control systems problems
- operation and safety of relevant tools, equipment and testing devices
- parameter specifications and performance requirements for control system problems
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- solutions to industrial control system problems
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0029 Set up and adjust PID control loops

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and adjust proportional-integral-derivative (PID) control loops

It includes working safely, applying problem-solving procedures, evaluating performance, using measuring devices, providing solutions to control problems and documenting solutions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0043 Solve problems in direct current circuits

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on process control loops

2 Solve process control loops problems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control work preparation measures and workplace procedures are followed
- 1.3 Scope of control problem is obtained from documentation and/or from work supervisor to determine work to be undertaken
- 1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5 Sources of materials required for work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required to carry out work are obtained and checked for correct operation and safety
- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
- 2.2 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Process controller/transmitters/converters and control loops are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Measured and calculated values are used for solving

process control loops problems

- 2.5 Unexpected situations are dealt with safely and in accordance with workplace procedures
 - 2.6 Problems are solved without damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete work and provide status report/s**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Status report/s is completed and work supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and adjusting problems in PID controllers must include at least two of the following:

- determining the operating parameters of a controller in an existing control loop
- configuring/tuning a controller in an existing control loop to comply with specified operating parameters
- configuring/tuning a controller to comply with a specified function

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI106A Set up and adjust PID control loops.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0029 Set up and adjust PID control loops

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- checking and isolating process controller/transmitters/converters and control loops
- completing status reports and/or notifying work supervisor
- dealing with unplanned situations in accordance with workplace procedures
- determining sources of materials required for work
- determining to test and measure live work
- measuring and calculating values for solving process control loop problems
- obtaining and checking tools, equipment and testing devices for correct operation and safety
- obtaining scope of control problem from documentation and/or from work supervisor
- preparing to work on process control loops
- solving process control loop problems
- solving problems without damage to apparatus, the surrounding environment or services using sustainable energy principles.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- isolation procedures
- problems-solving techniques
- process control loop principles, including:
 - connection of controllers
 - introduction to control systems, including control loop components, purpose of control loop components, open and closed loop control, control loop block diagram, direct acting and reverse acting controllers

- process control terminology
- process controllers, including proportional-integral-derivative (PID) functions, applications of PID modes of control, applications of controller options, checking/adjustment of controllers and reset windup
- testing of control modes
- types of control and control modes
- process characteristics
- relevant industry standards
- relevant manufacturer specifications and operating instructions
- tuning and installation of control loops
- relevant process controller/transmitters/converters and control loops
- job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including
 - status reports
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to solving problems in process control loops
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0030 Set up and adjust advanced PID process control loops

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and adjust advanced proportional-integral-derivative (PID) process control loops.

It includes working safely and to standards, following set-up and adjustment procedures, applying knowledge of process requirements, testing and reporting.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to tune control loop with advanced functions

2 Tune control loop for advanced functions

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 Safety hazards that have not previously been identified are noted and risk control measures implemented
- 1.4 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
- 1.5 Advanced control loop parameters are identified by reviewing process specifications and equipment instructions
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred and work is in accordance with relevant industry standards
- 1.8 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 1.9 Circuits/machines/plant are inspected, tested and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2 Testing/measuring devices are connected and set up in accordance with relevant industry standards and control system for advanced functions
 - 2.3 Control set-point is determined and control loop adjusted in accordance with relevant industry standards and process specifications
 - 2.4 Process is observed and decisions made in consultation with process operation personnel to readjust control loop settings to ensure process demand and output quality are met
 - 2.5 Process control loops are readjusted, as required, and checked
 - 2.6 Methods for dealing with unexpected situations are discussed with relevant person/s and documented
 - 2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s in accordance with workplace procedures
 - 2.8 Quality inspection is conducted of process output to ensure control loop is tuned in accordance with workplace procedures
 - 2.9 Tuning is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report control loop tuning activities**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Control loop settings are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI110A Set up and adjust advanced PID process control loops.

Assessment Requirements for UEEIC0030 Set up and adjust advanced PID process control loops

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- adjusting control loops to satisfy process demand and quality
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - risk control measures
- carrying out tuning without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- connecting and setting up testing/measuring devices
- dealing with unplanned situations with the approval of authorised person/s
- determining control set-point and adjusting control loop in accordance with relevant industry standards and process specifications
- determining the need to inspect, test and measure live work
- documenting control loop settings in accordance with workplace procedures
- identifying advanced control loop parameters
- inspecting and isolating circuits/machines/plant
- inspecting quality of process output to ensure control loop is tuned
- obtaining tools, equipment and testing devices required for work
- preparing to tune control loops with advanced functions
- tuning control loop for advanced functions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- configuration of advanced control loops, including cascade, ratio and feed forward
- inspection and testing procedures
- isolation procedures
- problem-solving techniques
- relevant advanced control loop parameters

- relevant advanced process control, including:
 - connection of controllers
 - process controllers
 - testing of control modes
 - tuning and installation of control loops
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant testing/measuring devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to setting up advanced process measuring and control instruments
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up and configure human-machine interface (HMI) and industrial networks.

It includes preparing the process control schemes that meet safety and process requirements, and selecting control equipment and interconnecting cabling and tubing/piping based on calculated and measured arrangements.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0043 Solve problems in direct current circuits

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to set up and configure HMI and industrial networks

1.1 Scope of the control system is determined from job specifications

1.2 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for the control system are identified, obtained and applied

1.3 Control apparatus and interconnecting components required for control system are arranged and determined from job specifications and in accordance with process control systems and relevant industry standards

2 Set up and configure HMI and industrial networks

2.1 Manufacturer specifications and limitations of relevant control apparatus is sought and comparisons made with process parameters and control requirements in accordance with job specifications

2.2 Control apparatus is selected in accordance with compatibility with process parameters, control requirements and relevant environmental conditions

2.3 Specified apparatus ingress protection (IP) rating is sought from manufacturer specifications, as required

2.4 Control valves are selected in accordance with percentage travel flow and loop-and-process characteristics, optimum size, range ability, ability to cope with process pressures and relevant environmental conditions

3 Select interconnecting cabling and tubing/piping

3.1 Control cabling and configuration are selected in accordance with relevant environmental conditions and interconnection requirements

3.2 Tubing/piping and accessories are sized to capacity and pressure requirements in accordance with job specifications

3.3 Route lengths of cable and tubing/piping are determined from site drawings in accordance with job specifications

- 3.4** Process control system is arranged and specifications for all selected items are documented in accordance with workplace procedures and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and configuring HMI and industrial networks must include the following:

- at least two process control systems with:
 - more than one input
 - more than one final control element

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI113A Set up and configure human-machine interface (HMI) and industrial networks.

Assessment Requirements for UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- comparing process parameters and control requirements with the control apparatus
- determining control apparatus and interconnecting components required for control system
- determining the scope of the control system
- documenting control system arrangement and specifications for items selected
- preparing to set up and configure human-machine interface (HMI) and industrial networks
- seeking specified apparatus ingress protection (IP) rating from manufacturer specifications
- selecting control valve in accordance with workplace procedures and relevant industry standards
- selecting interconnecting cabling and tubing/piping
- setting up and configuring HMI and industrial networks.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- analogue and digital signals
- distributive control principles (DCS)
- purpose and application of control system networks
- relevant apparatus IP rating
- relevant HMI and industrial networks
- relevant industry process control systems
- relevant interconnecting cabling and tubing/piping
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions

- relevant process parameters and control requirements
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- telemetry components
- telemetry installation
- telemetry overview
- telemetry systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to setting up and configuring HMI and industrial networks
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0032 Set up electronically controlled robotically operated complex systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up electronically controlled and robotically operated complex systems.

It includes working safely, applying knowledge of electronic circuits and the integration to robotically operated equipment and systems, gathering and analysing data, applying problem-solving techniques, and developing and documenting solutions and alternatives.

Typical circuits are those encountered in meeting performance requirements and compliance standards, revising machine operating parameters and dealing with machine malfunctions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0001 Analyse complex electronic circuits controlling fluids

UEEIC0018 Diagnose and rectify faults in digital controls systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

UEEIC0048 Verify compliance and functionality of instrumentation and control installations

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare electronically controlled and robotically operated system

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

1.2 Hazards are identified, WHS/OHS risks assessed, and control measures and workplace procedures implemented in preparation for work

1.3 Scope of work to be undertaken is determined from performance specifications, situation reports and in consultation with relevant person/s

1.4 Activities are planned to meet scheduled timelines in consultation with person/s involved in the work

1.5 Strategies are determined and solution developed and implemented in accordance with workplace procedures

2 Set up electronically controlled and robotically operated system

2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

2.2 Controls and integrated robot systems are applied in developing analytical solutions to machine parameters/faults and operation

2.3 Parameter specifications and performance requirements in relation to each circuit and robot device are obtained in accordance with workplace procedures and relevant industry standards

2.4 Setting up maintenance and/or modification activity is carried out to provide the most effective solution/s in accordance with workplace procedures

2.5 Unplanned events are dealt with safely and effectively in accordance with regulatory requirements and workplace policy and procedures

2.6 Quality of work is monitored in accordance with performance agreement and/or workplace procedures or relevant industry standards

- 3 Document and report results of system set-up and actions taken**
- 3.1** Set-up maintenance activity and/or modification is inspected and tested to determine their effectiveness and modified, as required
 - 3.2** Set-up maintenance activity and/or modification is documented to include details of fault findings, calculations and assumptions
 - 3.3** Set-up maintenance activity and/or modification is reported to appropriate person/s to determine suitable action/s to be taken based on fault-finding analysis
 - 3.4** Justification for analysis findings and any actions to be undertaken in relation to the work activity are documented for inclusion in work/project records in accordance with relevant standards and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up electronically controlled and robotically operated complex systems must include at least two types of machines and include the following:

- typical systems encountered in meeting performance requirements and industry standards
- revising machine operating parameters
- dealing with machine malfunctions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI130A Set up electronically controlled robotically operated complex systems.

Assessment Requirements for UEEIC0032 Set up electronically controlled robotically operated complex systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - implementing workplace procedures and practices
 - using of risk control measures
- planning set-up of electronically controlled and robotically operated complex systems
- documenting and reporting on the results of the set-up and actions taken
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining strategies for analysing circuit and robot performance effectively
- documenting instruction for implementing any actions resulting from the analysis that incorporates risk control measure to be followed
- documenting justification of actions to be implemented in accordance with relevant industry standards and workplace procedures
- identifying the operation of electronic and robot controls
- inspecting and testing the results of the analysis
- obtaining circuit control and robot parameters, specifications and performance requirements appropriate to each situation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- electronic interfacing to robotic processes
- interfacing electronics with robot functions, including:
 - robot types and selection and pre-selection planning
 - robot installation, including pre-installation design, layout and system documentation

- interfacing of robot controller with other external control systems
- robot sensor devices, characteristics and application
- diagnostic functions
- maintenance scheduling and procedures
- special features, including safety, palletising and sub-routines
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to setting up electronically controlled and robotically operated complex systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0033 Set up gas analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up gas analysis measuring and control instruments.

It includes working safely, identifying measuring parameters, testing and measuring work, following isolating procedures, arranging measuring instruments, dealing with unplanned situations and following documenting procedures.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to arrange gas analysis measuring instruments

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Safety hazards that have not previously been identified are noted and risk control measures implemented
- 1.4 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on worksite
- 1.5 Measurement parameters are identified by reviewing process requirements and instrument manufacturer instructions
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred and work is in accordance with workplace procedures
- 1.8 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 1.9 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2 Arrange gas analysis measuring instruments

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Testing/measuring devices are connected and arranged in accordance with relevant industry standards and control system
- 2.3 Measuring instruments are arranged and adjusted in accordance with workplace procedures and instrument

manufacturer instructions

- 2.4 Methods for dealing with unplanned situations are discussed with relevant person/s and documented
 - 2.5 Unplanned situations are dealt with safely and with approval of a relevant person/s
 - 2.6 Work is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report set-up activities**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Adjustment settings are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and adjusting measuring and control instruments must include at least two of the following:

- gas analysis measuring instruments

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI131A Set up gas analysis measuring and control instruments.

Assessment Requirements for UEEIC0033 Set up gas analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- arranging and adjusting measuring instruments in accordance with workplace procedures and instrument manufacturer instructions
- arranging gas analysis measuring instruments
- carrying out work efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- checking preparatory work to ensure no damage to equipment
- completing and reporting set-up activities
- connecting and arranging testing/measuring devices
- dealing with unplanned situation by discussing with relevant person/s and documenting
- determining need to test and measure live work
- documenting adjustment settings in accordance with workplace procedures
- identifying measurement parameters
- isolating circuits/machines/plant
- obtaining tools, equipment and testing devices required for work
- preparing to arrange gas analysis measuring instruments.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- principle of operation of various indicators connected in remote measurement loop
- problem-solving techniques
- relevant gas measuring and control instruments
- relevant industry standards

- relevant isolation procedures
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles
- types of recorder used in process measurement.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practice in relation to arranging gas analysis measuring and control instruments
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0034 Set up industrial field control devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up an industrial field control device.

It includes identifying, setting up, testing and documenting industrial field control device. It also includes following design briefs, operating principles, interpreting device specifications, following manufacturer specifications and testing device operation parameters.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0018 Diagnose and rectify faults in digital controls systems

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrical Pathway Group

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

- UEEEL0014 Isolate, test and troubleshoot low voltage electrical circuits
- UEEEL0008 Evaluate and modify low voltage heating equipment and controls
- UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls
- UEEEL0010 Evaluate and modify low voltage socket outlets circuits
- UEEEL0024 Test and connect alternating current (a.c.) rotating machines
- UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

- UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits
- UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals
- UEEIC0041 Solve problems in pressure measurement components and systems
- UEEIC0038 Solve problems in density/level measurement components and systems
- UEEIC0039 Solve problems in flow measurement components and systems
- UEEIC0043 Solve problems in temperature measurement components and systems
- UEEIC0029 Set up and adjust PID control loops
- UEEIC0030 Set up and adjust advanced PID process control loops
- UEEIC0048 Verify compliance and functionality of instrumentation and control installations
- UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify industrial field control device

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

1.2 Hazards are identified, risks are assessed, and control

measures implemented

- 1.3** Industrial field control devices are determined from control system specifications and consultation with relevant person/s
 - 1.4** Work activities are planned to meet scheduled timelines in consultation with relevant person/s
 - 1.5** Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Set up industrial field control device**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Industrial field control devices are set up and operated in accordance with manufacturer instructions
 - 2.3** Industrial field control devices are positioned and adjusted in accordance with operating principles manufacturer instructions
 - 2.4** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.5** Industrial field control devices are set up using sustainable energy principles without waste of materials, damaging apparatus, surrounding environments or services in accordance with workplace procedures
- 3 Test and document set-up of industrial field control device**
- 3.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 3.2** Operating anomalies are identified and corrected in accordance with workplace procedures
 - 3.3** Work completion is documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up industrial field control devices must include at least four of the following:

- measurement/detection of flow
- temperature
- pressure
- density
- weight
- level
- smoke
- motion

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI119A Set up industrial field control devices.

Assessment Requirements for UEEIC0034 Set up industrial field control devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- complying with scheduled timeframes
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting field control device set-up in accordance workplace procedures
- identifying field control devices to be set up
- positioning and adjusting devices in accordance with manufacturer operating instructions and system requirements
- preparing and setting up industrial field control devices
- testing and documenting setting up of industrial field control devices
- testing field devices and making final adjustments to correct anomalies.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- industrial processes and the terminology used in measurement, including:
 - forms of energy
 - general classification of transducers
 - measurement technology
 - static accuracy
- devices used in optoelectronic systems, including:
 - physics of light
 - spectral response

- photometry
- light sources and detectors
- lens and mirror theory
- optoelectronic systems and photoelectric switches
- optoelectronic circuits
- the laser
- temperature detection and measurement and their circuit configurations, including:
 - introduction to temperature sensing
 - bimetallic and filled thermal sensors
 - thermocouples, resistance temperature detectors, thermistors, solid state temperature, sensors, integrated circuit temperature sensors and phrometers
 - control circuits using temperature detectors
- measurement of pressure, flow and chemical, including:
 - diaphragm, bellows and venturi
 - strain gauges and load cells
 - ultrasonic and magnetic flowmeters
 - measurement technology and accuracy
 - viscosity, humidity and pH
- linear, angular and rotary motion detection, including:
 - linear motion sensors
 - angular and rotary motion sensors
 - shaft angle encoders
 - linear encoders
 - tachometers
 - accelerometer and vibrometer
- proximity and level detection, including:
 - mechanical
 - ultrasonics
 - microwave
 - passive infrared
 - nucleonics
 - capacitive and inductive proximity
- industrial field control devices set-up, operation, positioning and adjustment
- relevant job safety assessments, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0035 Set up scientific analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up scientific analysis measuring and control instruments.

It includes working safely, preparing and setting up scientific measuring instruments, applying calibration procedures and reporting activities.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to arrange scientific analysis measuring instruments

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and understood
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Safety hazards that have not previously been identified are noted and risk control measures implemented
- 1.4 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on worksite
- 1.5 Measurement parameters are identified by reviewing process requirements and instrument manufacturer instructions
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Preparatory work is checked to ensure no damage has occurred and work is in accordance with industry standards
- 1.8 Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 1.9 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2 Arrange scientific analysis measuring instruments

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 Testing/measuring devices are connected and arranged in accordance with relevant industry standards and control system
- 2.3 Measuring instruments are arranged and adjusted in accordance with workplace procedures and instrument

manufacturer instructions

- 2.4 Methods for dealing with unplanned situations are discussed with relevant person/s and documented
 - 2.5 Unplanned situations are dealt with safely and with approval of relevant person/s
 - 2.6 Work is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report arrangement activities**
- 3.1 WHS/OHS risk control work completion measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Adjustment settings are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Setting up and adjusting measuring and control instruments must include at least two of the following:

- scientific analysis measuring instruments

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI133A Set up scientific analysis measuring and control instruments.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0035 Set up scientific analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- arranging and adjusting measuring instruments in accordance with workplace procedures and manufacturer instructions
- carrying out work without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- checking preparatory work to ensure no damage has occurred
- consulting with relevant person/s to coordinate work with others
- dealing with unplanned situations by discussing with relevant person/s and documenting in accordance with WHS/OHS requirements
- documenting adjustment settings and notifying relevant person/s in accordance with workplace procedures
- identifying measurement parameters
- obtaining and checking tools, equipment and testing devices
- preparing scientific analysis measuring instruments
- testing and measuring live work in accordance with WHS/OHS requirements and workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques
- relevant circuits/machines/plant
- relevant communications protocols
- relevant isolation procedures

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant materials, apparatus, environment and services
- relevant measurement parameters
- relevant measuring instruments
- relevant scientific analysis industry standards
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices setting up process measuring and control instruments for scientific analysis
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0036 Set up water analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up water analysis measuring and control instruments.

It includes working safely, identifying measuring parameters, testing and measuring work, following isolating procedures, arranging measuring instruments, dealing with unplanned situation and following documenting procedures.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Assessment Requirements for UEEIC0036 Set up water analysis measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- arranging and adjusting measuring instruments in accordance with workplace procedures and instrument manufacturer instructions
- carrying out work efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- checking preparatory work to ensure no damage has occurred
- completing and reporting set-up activities
- connecting and arranging testing/measuring devices
- dealing with unplanned situation by discussing with relevant person/s and documenting
- determining need to test and measure live work
- documenting adjustment settings in accordance with workplace procedures
- identifying measurement parameters
- isolating circuits/machines/plant
- obtaining tools, equipment and testing devices required for work
- preparing to arrange water analysis measuring instruments.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- industrial applications of specified water analysis equipment
- principle of operation of an analyser measuring elements
- principle of operation of an analyser sensor
- problem-solving techniques
- relevant circuits/machines/plant
- relevant water measuring and control instruments

- relevant installation requirements for specified analysers
- relevant isolation procedures
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant system checks and instrument calibration
- relevant terms associated with industrial water analysis equipment
- relevant tools, equipment and testing devices
- relevant water analyser maintenance procedures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practice in relation to arranging water analysis measuring and control instruments.
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEEIC0037 Set up weighting measuring and control instruments

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- arranging and adjusting measuring instruments in accordance with workplace procedures and manufacturer instructions
- carrying out work without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- checking preparatory work to ensure no damage has occurred
- consulting with relevant person/s to coordinate with others
- dealing with unplanned situations by discussing with relevant person/s and documenting in accordance with WHS/OHS requirements
- documenting adjustment settings and notifying relevant person/s in accordance with workplace procedures
- identifying measurement parameters
- obtaining and checking tools, equipment and testing devices
- preparing weighting measuring instruments
- testing and measuring live circuits in accordance with WHS/OHS and workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- methods of weighing and common factors affecting weighing system performance
- methods of weighing materials in motion
- principles of operation of various load cells in common use
- principles of strain gauge measurement
- problem-solving techniques

- relevant circuits/machines/plant
- relevant industry standards
- relevant isolation procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant materials, apparatus, environment and services
- relevant measurement parameters
- relevant measuring instruments
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles
- weighing and the relationship between force and weighing.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational suitable situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices setting up weight measuring and control instruments
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0038 Solve problems in density/level measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up density/level measurement components and systems and provide solutions to a problem as it applies to a process and control work function.

It includes working safely, setting up and calibrating density/level measuring components and systems, applying problem-solving techniques, using of a range of measuring devices, and providing solutions derived from measurements and calculations to problems in density/level measurement components and systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to work on density/level measurement components and system

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied
- 1.2 Hazards are identified, risks assessed and control measures implemented
- 1.3 Nature of the density/level measurement problem is identified from documentation or appropriate person/s to determine the scope of work to be undertaken
- 1.4 Appropriate person/s is consulted to ensure work is coordinated effectively with others
- 1.5 Materials required for the work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures

2 Solve density/level measurement problems

- 2.1 WHS/OHS risk control work measures and workplace procedures are followed
- 2.2 Need to inspect, test or measure electrical components of live electrical work is determined in accordance with job requirements and workplace safety procedures
- 2.3 Density/level measurement apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Relevant methods are used to solve measurement problems from tests and calculated values as they apply to density/level measurement systems
- 2.5 Unplanned situations are responded to in accordance with workplace procedures and with the approval of an authorised person/s
- 2.6 Problems are resolved using sustainable energy principles and without damage to apparatus, the surrounding environment or services in accordance with workplace procedures

3 Complete work and

- 3.1 WHS/OHS work completion risk control measures and

document work activities

workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Justification for solutions used to resolve density/level measurement problems is documented
- 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Density/level measurement apparatus and system, fault finding, maintenance or development work functions must include at least three of the following:

- determining the operating parameters of a density/level measuring system
- setting up and calibrating a density/level measuring system
- altering an existing density/level measuring system to comply with specified operating parameters
- developing a density/level measuring system to comply with a specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI103A Solve problems in density/level measurement components and systems.

Assessment Requirements for UEEIC0038 Solve problems in density/level measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including applying safe working practices
- applying sustainable energy principles and practices
- cleaning and making work site safe
- completing work and documenting work activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting completed work
- implementing risk control measures
- obtaining tools, equipment and testing devices
- determining work on density/level measurement components and systems
- solving density/level measurement problems
- solving problems in density/level measurement systems
- working with density/level apparatus.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- introduction to level/density measurement. including:
 - definitions density and relative density (sg)
 - application
 - factors affecting density
 - density measurement
 - Archimedes principle
 - density calculations

- types and applications of level/density transducers
- transducers input/outputs (I/O) - measurement and evaluation
- transducer connections
- level/density measurement techniques sight type, including:
 - dipstick and hook gauges
 - tubular and flat glass gauges
 - accuracy of flat glass gauges
 - magnetically coupled gauges
 - float level measuring devices
 - application of float devices
- level/density measurement - force type techniques, including:
 - comparison of float and displacement type systems
 - interface sensing devices
 - torque tube type displacer operation
 - torque tube type displacer construction
 - pneumatic and electronic transmitters
- level/density measurement - pressure-type techniques, including:
 - diaphragm level detectors
 - applications of diaphragm level detectors
 - differential pressure cells advantages and disadvantages
 - density measurement using D/P cells
- level/density measurement - electrical type techniques, including:
 - application of conductance probes
 - operation of a conductivity-level controller
 - resistance tapes level detectors
 - capacitance probes level detectors
 - ultrasonic level detectors
 - microwave-based level detectors
 - nucleonic-type level sensors
 - load cells used for level measurement
- level/density measurement - non-intrusive type techniques, including:
 - radiation-type density sensor
 - hydrometer element used for density measurement
 - vibrating tube type liquid density meter
- level/density measurement calibration for:
 - D/P cell calculations
 - D/P calibration
 - open tank installation level measurement
- problem solutions in density/level measurement systems
- relevant job safety assessments or risk mitigation processes, including risk control measures

- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- safe working practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0039 Solve problems in flow measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in flow measurement components and systems.

It includes identifying and solving problems in flow measurement components and systems as they apply to various processes and control work functions. It also includes working safely and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to work on flow

1.1 Work health and safety (WHS)/occupational health and

measurement components and system	safety (OHS) requirements and workplace procedures for a given work area are obtained and applied
	1.2 Hazards are identified, risks assessed and control measures implemented
	1.3 Nature of the flow measurement problem is identified from documentation and/or appropriate person/s to determine the scope of work to be undertaken
	1.4 Appropriate person/s is consulted to ensure work is coordinated effectively with others
	1.5 Materials required for the work are determined in accordance with workplace procedures
	1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures
2 Solve a flow measurement problems	2.1 WHS/OHS risk control work measures and workplace procedures are followed
	2.2 Need to inspect, test or measure electrical components of live work is determined in accordance with job requirements and workplace safety procedures
	2.3 Flow measurement apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
	2.4 Relevant methods/techniques are used to solve measurement problems and calculated values as they apply to flow measurement systems
	2.5 Unplanned situations are responded to in accordance with workplace procedures and with the approval of an authorised person/s
	2.6 Problems are resolved using sustainable energy principles and without damage to apparatus, the surrounding environment or services in accordance with workplace procedures
3 Complete work and document work activities	3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
	3.2 Worksite is cleaned and made safe in accordance with

workplace procedures

- 3.3 Justification for solutions used to resolve flow measurement problem is documented
- 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Flow measurement apparatus and system fault finding, maintenance or development work functions must include at least three of the following:

- determining the operating parameters of a flow measuring system
- setting up and calibrating a flow measuring system
- altering an existing flow measuring system to comply with specified operating parameters
- developing a flow measuring system to comply with a specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI104A Solve problems in flow measurement components and systems.

Assessment Requirements for UEEIC0039 Solve problems in flow measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe work practices
 - implementing risk control measures
- applying sustainable energy principles and practices
- completing work and documenting work activities
- connecting pneumatic, hydraulic and electric equipment
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying flow measurement components and system
- identifying specifications, industry standards and equipment manuals
- solving problems in flow measurement systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- introduction to flow measurement in closed conduits, including:
 - basic principles of fluid flow
 - International System of Units (SI) units pertaining to flow and conversion factors to SI units
 - volumetric and mass flow
 - Reynolds numbers
 - behaviour of fluid flow in pipes
 - correction methods
 - flow terminology

- pressure loss
- integration
- uses of flow meters
- types and applications of flow transducers
- transducers input/outputs - measurement and evaluation
- transducer connections
- differential pressure flow measurement, including:
 - Bernoulli's theorem and square root head law
 - calculations of the differential pressure
 - calibration of the associated secondary instrument
 - installation and types of differential pressure flow meters and primary elements
- differential pressure flow measurement circuits, including define turndown and accuracy, output signals, square root extractors, scaling factors and signal scaling
- electromagnetic, vortex and ultrasonic flow meters, including:
 - construction, operating principles, performance, application and installation
 - installation of vortex and ultrasonic flow meters
 - operating principles and applications of ultrasonic flow meters
- flow measurement in closed conduits, including:
 - basic principles of fluid flow
 - behaviour of fluid flow in pipes
 - correction methods and flow terminology
 - integration, pressure loss, and Reynolds numbers
 - SI units pertaining to flow and conversion factors to SI units
 - types and applications of flow transducers, connections, and transducer input/outputs (I/O) - measurement and evaluation
 - uses of flow meters
 - volumetric and mass flow
- mass flow measurement and volumetric flow rate correction, including:
 - applications, installation, operating principles and performance of mass flow meters
 - calculations of corrected flow rate
 - calibration of corrected systems components
 - mass flow measurement
 - volumetric flow rate correction
- mechanical flowmeters for liquid service, including:
 - operating principles of mechanical flow meters
 - performance of mechanical flow meters
 - applications of mechanical flow meters
 - installation of mechanical flow meters
 - operating principles of gas flow meters
 - performance of gas flow meters

- applications of gas flow meters
- installation of gas flow meters
- open-channel flow measurement and flow meter calibration, including:
 - calculations of the head generated
 - flow meter calibration
 - installation of open channel flow meters
 - non-linear head/flow relationships
 - open channel flow measurement
 - operating principles of secondary instruments
 - principles of fluid flow in open channels
 - principles of head/flow relationships
- problems in flow measurement systems
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures, including safe work practices
- specifications, industry standards and equipment manuals
- sustainable energy principles and practices
- variable area flow meters and turbine flow meters, including:
 - applications, installation, and operating principles and performance of variable area and turbine meters
 - density correction calculations and scaling factors
 - variable area meters performance factors.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0040 Solve problems in polyphase electronic power control circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in polyphase electronic power control circuits.

It includes preparing and solving problems in polyphase electronic power control circuits. It also includes testing and documenting solutions.

Typical polyphase electronic power control problems are those encountered in meeting performance requirements and industry compliance standards, revising control operating parameters and dealing with control malfunctions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

UEEIC0020 Fault find and repair analogue circuits and components in electronic control systems

UEEIC0042 Solve problems in single phase electronic power control circuits

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify problems in polyphase electronic power control circuits

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures are identified and applied
- 1.2** Hazards are identified, risks are assessed and control measures implemented
- 1.3** Extent of polyphase electronic power control problems are determined from performance specifications, situation reports and consultations with relevant person/s
- 1.4** Work activities are planned to meet scheduled timelines in consultation with relevant person/s

- 1.5** Tools, equipment and testing devices needed for work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Solve problems in polyphase electronic power control circuits**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Polyphase electronic power control devices, circuit operation characteristics and applications are applied to developing solutions to control problems
- 2.3** Parameters, specifications and performance requirements in relation to each polyphase electronic power control problem are obtained in accordance with workplace procedures
- 2.4** Solutions to polyphase electronic power control problems are evaluated to determine most effective resolution
- 2.5** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.6** Problems are resolved using sustainable energy practices and principles without wasting materials, damaging apparatus, the surrounding environment or services in accordance with workplace procedures
- 3 Test and document solutions to polyphase electronic power control problems**
- 3.1** WHS/OHS risk control measures and procedures for carrying out the work are followed
- 3.2** Solutions to polyphase electronic power control problems are tested to determine effectiveness and modified, as required
- 3.3** Solutions are documented, including instructions for implementation, incorporating risk control measures
- 3.4** Solutions used to solve polyphase electronic power control problems are justified and documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving electrical problems in polyphase electronic power control circuits must include at least four of the following:

- polyphase electronic power control circuits

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI149A Solve problems in polyphase electronic power control circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0040 Solve problems in polyphase electronic power control circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining the extent of the polyphase electronic power control problem
- developing, evaluating and testing solutions to polyphase electronic power control problem
- documenting justification of solutions implemented in accordance with workplace procedures
- following scheduled timeframes
- obtaining electronic device and circuit parameters, specifications and performance requirements appropriate to each problem
- resolving problems in polyphase electronic power control circuits
- testing and documenting solutions to polyphase electronic power control circuits.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- job safety assessments or risk mitigation processes, including risk control measures
- three phase rectifier circuits, including:
 - three phase circuit configurations
 - resistive/inductive loads
 - output voltages/waveforms
 - ripple voltage/frequency
 - peak reverse voltages
 - freewheeling diodes

- measurement of rectifier output parameters
- three phase half wave-controlled rectifiers, including:
 - phase control
 - purpose/operation of half wave-controlled rectifiers
 - circuit configuration
 - rectifier performance and operation - resistive loads
 - output voltage resistive load
 - rectifier performance and operation - inductive loads
 - rectifier output waveforms
 - applications and limitations
 - advantages and disadvantages three phase half wave-controlled rectifiers
- three phase half-controlled bridge rectifier, including:
 - purpose/operation of a half-controlled bridge rectifiers
 - circuit configuration and connections
 - rectifier output - resistive loads
 - output voltage resistive loads
 - rectifier output - inductive loads
 - output voltage - inductive loads
 - flywheel diode
 - output voltage calculations
 - applications and limitations
 - advantages and disadvantages three phase half-controlled bridge rectifiers
- three phase fully controlled bridge rectifier, including:
 - purpose/operation of a fully controlled bridge rectifiers
 - circuit configuration and connections
 - rectifier output - resistive loads
 - output voltage resistive loads
 - rectifier output - inductive loads
 - output voltage - inductive loads
 - flywheel diode
 - output voltage calculations
 - applications and limitations
 - advantages and disadvantages three phase fully controlled bridge rectifiers
- three phase alternating current (a.c.) controllers, including:
 - circuit configurations
 - circuit operation
 - triacs and silicon controlled rectifier (SCR) circuits
 - triggering requirements
 - output voltage and waveforms

- determination of output voltage
- applications
- advantages and disadvantages
- direct current (d.c.) converters, including:
 - purpose and operation of d.c. converters
 - circuit configurations
 - voltage control methods
 - forced commutation methods
 - calculation of load voltage
 - output voltage/waveforms
 - applications
 - advantages and disadvantages
- cyclo-converters, including:
 - purpose/operation of a cyclo-converter
 - basic circuit configurations
 - measurement of output voltage
 - calculation of load voltage
 - output voltage/waveforms
 - applications and limitations
 - advantages and disadvantages
- inverters, including:
 - purpose/operation of an inverter
 - basic circuit configurations
 - measurement of inverter outputs
 - output voltage
 - applications and limitations
 - advantages and disadvantages
- thyristor protection, including:
 - power control devices failure
 - protection techniques
 - snubber networks
 - series inductors
 - amp trap high rupturing capacity (HRC) fuses
 - gate pulse suppression
- installation of thyristor devices and circuits, including:
 - need for heat sinking of power thyristor devices
 - heat sink features and types
 - installation methods for all types of thyristor packages
 - basic thermal model, only to demonstrate the effect of different heat sink

- types and profiles and installation methods on thyristor junction temperature
- series and parallel thyristor connections, including:
 - purpose of series/parallel connection
 - series connections
 - reasons
 - operational problems
 - parallel connections
 - reasons
 - operational problems
- fault finding three phase thyristor circuits, including:
 - fault finding procedures
 - typical faults power and trigger circuits
 - characteristics displayed by common faults
 - comparison of test data with expected data (voltage/current waveforms)
 - location and replacement of faulty components
- problem-solving techniques
- relevant manufacturer specifications
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0041 Solve problems in pressure measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up pressure measuring components and systems and provide solutions to a pressure measurement problem as it applies to a process and control work function.

It includes working safely, setting up and calibrating pressure measuring components and system, using problem-solving techniques, using measuring devices, and providing solutions derived from measurements and calculations to predictable problems in pressure measurement components and systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to work on pressure measurement components and system**
 - 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied
 - 1.2 Hazards are identified, risks assessed and control measures implemented
 - 1.3 Nature of the pressure measurement problem is identified from documentation or appropriate person/s to determine the scope of work to be undertaken
 - 1.4 Appropriate person/s is consulted to ensure work is coordinated effectively with others
 - 1.5 Materials required for the work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Solve a pressure measurement problem**
 - 2.1 WHS/OHS risk control work measures and workplace procedures are followed
 - 2.2 Need to inspect, test or measure electrical components of live work is determined in accordance with job requirements and workplace safety procedures
 - 2.3 Pressure measurement apparatus is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Relevant methods are used to solve measurement problem from tests and calculated values, as they apply to pressure measurement components and systems
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures and with the approval of an authorised person/s
 - 2.6 Problems are resolved using sustainable energy principles and without damage to apparatus, the surrounding environment or services in accordance with workplace procedures
- 3 Complete work and document work activities**
 - 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Justification for solutions used to resolve pressure measurement problem is documented
- 3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Pressure measurement apparatus and system fault finding, maintenance or development work functions must include at least three of the following:

- determining the operating parameters of a pressure measuring system
- setting up and calibrating a pressure measuring system
- developing a pressure measuring system to comply with a specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI102A Solve problems in pressure measurement components and systems.

Assessment Requirements for UEEIC0041 Solve problems in pressure measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including applying risk control measures
- applying sustainable energy principles and practices
- completing work and documenting work activities
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting completed work
- identifying pressure measurement components and systems
- solving problems in pressure measurement components and systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- pressure transmitters and converters
- pressure measurement terms and transducers, including:
 - applications and common relationships
 - pressure and the relationship between applied pressure, density, mass, force, area and the height of liquid columns
 - transducer types, applications, connections and input/outputs (I/O) - measurement and evaluation
- manometers ,including:
 - types of manometers
 - operating principles of manometers
 - gauge pressure measurement
 - wet leg

- manometer applications
- manometer limitations
- absolute, gauge and atmospheric pressure measurement, including:
 - absolute and gauge pressure
 - absolute zero pressure
 - atmospheric pressure
 - barometers
 - absolute pressure gauges
- mechanical pressure measuring devices, including:
 - gauges: bourdon tube, spiral and helical
 - other mechanical pressure elements: bellows, capsule and slack/stiff diaphragms
 - pressure measurement using elastic deformation gauges
 - term: flexibility spring rate
- electrical pressure measuring devices, including:
 - electrical sensors for pressure measurements, including capacitive, piezo, inductive and strain gauge
 - testing elements and electrical signal transmission devices
- dead weight testers, including:
 - law of hydraulics
 - dead weight tester operating principles
 - dead weight tester operating procedures
 - terms: backlash, hysteresis and repeatability
 - calibration of gauges
 - precautions
 - bourdon tube gauges calibration
- testing and installation of pressure measurement devices, including:
 - testing
 - calibration
 - installation of pressure measurement devices within pressure vessel systems
 - isolation, seal, vent, drain and bypass valves location and operation sequence
- pressure transmitters and converters, including:
 - principle of operation of moment, motion and forced balanced transmitters for pneumatic, electrical, and electronic transmitter
 - applications of transmitters, converters and connections
 - calibration of transmitters
 - principle of operation of signal converters
 - applications of pressure converters
 - calibration of pressure converters
- problem solutions in pressure measurement systems
- relevant job safety assessments or risk mitigation processes, including risk control measures

- relevant manufacturer specifications
- relevant materials, tools and equipment
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices
- testing and installation of pressure measurement devices, including device calibration
- live electrical components.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0042 Solve problems in single phase electronic power control circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in single phase electronic power control circuits.

This unit includes preparing and solving problems in single phase electronic power control systems. It also includes testing and documenting solutions to single phase electronic power control.

Typical single phase electronic power control problems are those encountered in meeting performance requirements and compliance standards, revising control operating parameters and dealing with control malfunctions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

Where prerequisite pathways have been identified, all competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s)

Common Unit Group

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Electrotechnology Pathway Group

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0067 Troubleshoot basic amplifier circuits

UEEEEC0065 Solve problems in basic electronic circuits

Electronics and Communications Pathway Group

UEEEEC0060 Repairs basic electronic apparatus faults by replacement of components

UEEEEC0074 Troubleshoot resonance circuits in an electronic apparatus

UEEEEC0067 Troubleshoot basic amplifier circuits

Electrical Pathway Group

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEEL0003 Arrange circuits, control and protection for electrical installations

UEEEL0020 Solve problems in low voltage a.c. circuits

UEEEL0023 Terminate cables, cords and accessories for low voltage circuits

UEEEL0019 Solve problems in direct current (d.c.) machines

UEEEL0021 Solve problems in magnetic and electromagnetic devices

UEEEL0008 Evaluate and modify low voltage heating equipment and controls

UEEEL0009 Evaluate and modify low voltage lighting circuits, equipment and controls

UEEEL0010 Evaluate and modify low voltage socket outlets circuits

UEEEL0024 Test and connect alternating current (a.c.) rotating machines

UEEEL0025 Test and connect transformers

Instrumentation and Control Pathway Group

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0045 Solve problems in multiple path extra-low voltage (ELV) a.c. circuits

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

UEEIC0048 Verify compliance and functionality of instrumentation and control installations

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify problems in single phase electronic power control system

2 Solve problems in single phase electronic power control system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----|---|
| 1.1 | WHS/OHS requirements and workplace procedures are identified and applied |
| 1.2 | Hazards are identified, risks are assessed and control measures implemented |
| 1.3 | Extent of single phase electronic power control problems are determined from performance specifications, situation reports and consultations with relevant person/s |
| 1.4 | Activities are planned to meet scheduled timelines in consultation with relevant person/s |
| 1.5 | Tools, equipment and testing devices needed for the work are obtained in accordance with workplace procedures and checked for correct operation and safety |
| 2.1 | WHS/OHS risk control measures and workplace procedures for carrying out the work are followed |
| 2.2 | Single phase electronic power control devices, circuit operation characteristics and applications are used to develop solutions for control problems |
| 2.3 | Parameters, specifications and performance requirements in relation to each single phase electronic power control problem are obtained in accordance with |

workplace procedures

- 2.4 Approaches to resolving single phase electronic power control problems are evaluated to provide most effective solutions
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Problems are solved efficiently using sustainable energy practices without waste of materials, damaging apparatus, the surrounding environment or services in accordance with workplace procedures
- 3 Test and document solutions to single phase electronic power control**
- 3.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 3.2 Solutions to single phase electronic power control problems are tested to determine effectiveness and modified as necessary
 - 3.3 Adopted solutions are documented, including instructions for implementation, incorporating risk control measures
 - 3.4 Justification for solutions used to solve single phase electronic power control problems are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving electrical problems must include at least four of the following:

- single phase electronic power control systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI148A Solve problems in single phase electronic power control circuits.

Assessment Requirements for UEEIC0042 Solve problems in single phase electronic power control circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- evaluating problem resolutions, testing for effectiveness and modifying as required
- meeting scheduled timelines
- preparing and solving problems in single phase electronic power control systems
- using tools, equipment and testing devices
- obtaining and checking tools and equipment
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- introduction to power control, including:
 - advantages and benefits of power control
 - need for power control and typical applications
 - power control methods
 - types of solid-state switches
 - block diagram of a power converter
 - power control terminology
 - modes of operation
- single phase power rectifiers, including:
 - single phase rectifier circuit configurations
 - resistive/inductive loads

- output voltages/waveforms
- ripple voltage frequency
- peak reverse voltages
- freewheeling diodes
- silicon controlled rectifiers (SCRs), including:
 - construction and symbol
 - basic operating principles
 - characteristics
 - gate requirements
 - commutation
 - electrical ratings
 - testing SCRs
 - applications
- triacs and gate turn off (GTO) thyristors, including:
 - triac construction and symbol
 - triac basic operating principles
 - triac characteristics
 - triac triggering modes
 - triac electrical ratings
 - triac testing
 - GTO construction and symbol
 - GTO basic operating principles
 - GTO characteristics
 - GTO electrical ratings
 - applications for triac and GTOs
- power transistors bipolar junction transistor (BJT), including:
 - BJT construction and symbol
 - BJT basic operating principles
 - BJT characteristics
 - BJT electrical ratings
 - BJT testing
 - applications for BJTs
- power field effect transistors (FET), including:
 - types of FETs used for power control
 - power FETs construction and symbol
 - FET basic operating principles and characteristics
 - insulated gate bipolar transistor (IGBT) basic operating principles and characteristics
 - power FET electrical ratings
 - power FET Testing

- applications for power FETs
- triggering devices diac, including:
 - construction and symbol
 - operating principles
 - breakover voltage
 - unijunction transistors (UJTs)
 - construction and symbol
 - operating principles
 - intrinsic stand-off ratio and peak point voltage
- programmable unijunction transistors (PUTs) including:
 - construction and symbol
 - operating principles
 - programmable standoff ratio
 - peak point voltage
- triggering circuits, including:
 - R-C time constant circuits
 - diac trigger circuit operation
 - UJT relaxation oscillator circuit operation
 - PUT relaxation oscillator circuit
- half wave-controlled rectification, including:
 - phase shift control
 - controlled rectifiers
 - controlled rectifier power output control
 - single phase half wave-controlled rectifier
 - circuit configuration
 - circuit operation
 - waveforms
 - load voltage
 - applications and limitations
 - problems associated with phase shift control
- full wave-controlled bridge rectification including:
 - single phase full wave-controlled bridge rectifier circuit
 - output voltage
 - output waveforms
 - applications and limitations
 - advantages and disadvantages
- fully controlled bridge rectification, including:
 - single phase fully controlled rectifier bridge circuit
 - output voltage

- output waveforms
- applications and limitations
- advantages and disadvantages
- single phase alternating current (a.c.) voltage control, including:
 - phase control of a.c. power
 - circuit configurations - half and full control circuits
 - triggering circuits
 - circuit performance and operation on resistive and inductive loads
 - output voltage and waveform, determination of output voltage using circuit characteristics
 - range of control with inductive loads
 - triggering problems associated with inductive loads
 - applications and limitations
- zero voltage switching (ZVS), including:
 - operating principles
 - circuit configuration, including trigger circuits
 - circuit operation and waveforms resistive loads only
 - relationship between load power and conduction time
 - solid state relays: types and ratings
 - applications and limitations
- fault finding of power control circuits, including:
 - fault-finding procedures
 - typical faults power and trigger circuits
 - characteristics displayed by common faults
 - comparison of test data with expected data (voltage/current waveforms)
 - location and replacement of faulty components
- job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- single phase electronic power control circuits
- solutions to single phase electronic power control problems
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0043 Solve problems in temperature measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in temperature measurement components and systems as they apply to various processes and control work functions.

It includes working safely, setting up and calibrating temperature measuring components and systems, applying problem-solving techniques, using a range of measuring devices, and providing solutions derived from measurements and calculations to predictable problems in temperature measurement components and systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to work on temperature measurement components and system**
 - 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied
 - 1.2 Hazards are identified, risks assessed and control measures implemented
 - 1.3 Nature of the temperature measurement problem is identified from documentation or appropriate person/s
 - 1.4 Appropriate person/s is consulted to ensure work is coordinated effectively with others affected by the work
 - 1.5 Materials required for work are determined in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Solve temperature measurement problem**
 - 2.1 WHS/OHS risk control work measures and procedures are followed
 - 2.2 Need to inspect, test or measure live electrical components is determined in accordance with WHS/OHS regulatory requirements and workplace procedures
 - 2.3 Temperature measurement apparatus is checked and isolated in accordance with workplace procedures
 - 2.4 Relevant methods are used to solve measurement problem from tests and calculated values as they apply to flow measurement components and systems
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures and approval of an authorised person/s
 - 2.6 Problem is solved using sustainable energy principles and without damaging apparatus, the surrounding environment or services in accordance with workplace procedures
- 3 Complete work and document work activities**
 - 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with

workplace procedures

3.3 Justification for solutions to resolve flow measurement problems is documented

3.4 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

temperature measurement apparatus and systems as they apply to installation, fault finding, maintenance or development work functions must include at least three of the following:

- determining the operating parameters of a temperature measuring system
- setting up and calibrating a temperature measuring system
- altering an existing temperature measuring system to comply with specified operating parameters
- developing a temperature measuring system to comply with a specified function and operating parameters

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI105A Solve problems in temperature measurement components and systems.

Links

Assessment Requirements for UEEIC0043 Solve problems in temperature measurement components and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - identifying risk control measures
 - applying safe working practices
- applying sustainable energy principles and practices
- completing work and documenting work activities
- coordinating work with others
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying sources of materials
- obtaining tools, equipment and testing devices
- preparing to work on temperature measurement components and systems
- solving problems in temperature measurement components and systems
- solving temperature measurement problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- introduction to temperature measurement, including:
 - temperature measurement terms
 - international temperature scale
 - temperature scales
 - conversion of temperature readings
 - temperature measuring elements
 - temperature sensor selection factors

- errors in temperature measurement
- methods used to reduce errors.
- types and applications of temperature transducers
- transducers input/outputs - measurement and evaluation
- transducer connections
- filled system thermometers, including:
 - applications of filled system thermometers
 - calibration of filled systems
 - filled systems operating principles
 - liquid in glass thermometers construction
- other temperature measuring techniques, including:
 - thermistor characteristics and circuit operation
 - thermistor temperature measuring circuits and operation
 - temperature measurement characteristics of solid-state devices and circuits
 - temperature indicators: characteristics and applications
 - liquid crystals
 - thermometers: bimetallic and digital thermistor
- problems in temperature measurement components and systems
- radiation thermometers, including:
 - operating principles, terms and factors affecting its use
 - construction, signal conditioning, and calibration of optical pyrometers and radiation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes, including risk control measures and safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- resistance temperature detectors (RTDs) and RTD measuring circuits, including:
 - calculating of unbalanced Wheatstone bridge circuits voltage outputs
 - determining RTD standard resistance values or temperature
 - non-linear voltage output compensation methods
 - RTD lead-resistance compensation methods and immersion errors
 - selecting RTD configurations and terms
- sustainable energy principles and practices
- temperature measurement principles, including:
 - terms and international temperature scales, temperature conversions, measuring elements, sensor selection factors, errors in temperature measurement and methods used to reduce them
 - types and applications of temperature transducers, connections, input/outputs (I/O), and measurement and evaluation
- thermocouple measuring circuits, including:

- advantages and disadvantages and the characteristics of thermocouples and connection wires
- calibrating and determining thermocouple measuring instruments, test equipment and junction temperature configurations
- electromagnetic field distribution in thermocouple circuits
- handling and selection of thermocouples, including installation errors
- identification of thermocouple connection wires
- industrial thermocouple assembly and fabrication methods
- thermo-electric effects, principles and laws
- thermowell properties
- relevant industry standards, regulations and codes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0044 Troubleshoot measuring and analysis systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot measuring and analysis systems.

It includes working safely, checking and testing faulty components, reading circuit diagrams and device specifications, applying fault-finding procedures, conducting repairs and completing service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEIC0048 Verify compliance and functionality of instrumentation and control installations and

UEEIC0037 Set up weighting measuring and control instruments

or

UEEIC0033 Set up gas analysis measuring and control instruments

or

UEEIC0036 Set up water analysis measuring and control instruments

or

UEEIC0035 Set up scientific analysis measuring and control instruments

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and repair faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 Scope of measuring and analysis systems fault is obtained from documentation and/or work supervisor
- 1.4 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
- 1.5 Sources of materials required for work are determined in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find and repair faults

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Apparatus is inspected and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding of measuring and analytical equipment and circuit is conducted using measured and calculated values of apparatus parameters in accordance with workplace procedures
- 2.5 Equipment components are dismantled, as required, and parts stored to protect against loss or damage in accordance with workplace procedures and relevant industry standards
- 2.6 Faulty components are rechecked and fault status confirmed

- 2.7 Faulty components are readjusted or replaced in accordance with workplace procedures
 - 2.8 Repaired components are tested in accordance with workplace procedures
 - 2.9 Apparatus is reassembled, inspected, tested and prepared for return to service
 - 2.10 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.11 Fault-finding and repair activities are carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete and report fault-finding and repair activities**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.3 Written justification is made for repairs to apparatus, components and materials in accordance with workplace procedures
 - 3.4 Acceptance that the reported fault/s have been repaired is sought from relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

finding and repairing faults must include the following:

- at least four faults
- at least two different types of measuring and analytical equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI121A Trouble shoot in measuring and analysis systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0044 Troubleshoot measuring and analysis systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- completing repair activities
- dealing with unplanned situations safely and with the approval of relevant person/s
- determining need for inspecting, testing and measuring live work
- determining sources of materials required for work
- dismantling equipment components and storing to protect against loss or damage
- finding faults efficiently
- inspecting and isolating apparatus
- obtaining scope of measuring and analysis systems fault
- obtaining tools, equipment and testing devices and checking for correct operation and safety
- preparing to find and repair faults
- providing written justification for the repairs
- rechecking and confirming faulty component status
- replacing components without damage using sustainable energy practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- isolation procedures
- problem-solving techniques
- relevant industry measuring and analysis systems standards
- relevant manufacturer specifications and operating instructions
- job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices

- relevant troubleshooting, measuring and analysis systems, including:
 - applications of measurement circuits
 - circuit components and configurations
 - principles of measurement
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to finding and repairing faults in measuring and analysis systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0045 Troubleshoot medical equipment control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot medical equipment control systems.

It includes applying safe working practices, interpreting processes, applying knowledge of medical process controls to logical fault-finding procedures, conducting effective repairs, performing safety and functional inspection and testing, and completing service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and rectify faults in medical equipment control systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
 - 1.3 Scope of medical equipment control system fault is obtained from documentation and/or work supervisor to determine work
 - 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
 - 1.5 Sources of materials required for work are identified in accordance with workplace procedures
 - 1.6 Tools, equipment and testing devices required to carry out work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2 Find faults in medical equipment control systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 Apparatus is inspected and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Fault finding of medical equipment control systems is conducted using measured and calculated system parameters values in accordance with workplace procedures
 - 2.5 Apparatus components are dismantled, as required, and parts stored to protect against loss or damage in accordance with workplace procedures and relevant industry standards
 - 2.6 Faulty components are rechecked and fault status confirmed
 - 2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 2.8 Fault-finding activities are carried out without damage to apparatus circuits, the surrounding environment or services using sustainable energy principles
- 3 Rectify faults in medical equipment control systems**
- 3.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 3.2 Apparatus is inspected and isolated in accordance with WHS/OHS and workplace procedures
 - 3.3 Materials required to rectify faults are sourced and obtained in accordance with workplace procedures
 - 3.4 Repairs are conducted without damage to relevant components or apparatus in accordance with workplace procedures and sustainable energy principles
 - 3.5 Repairs are tested in accordance with workplace procedures
 - 3.6 Apparatus is reassembled, inspected, tested and prepared for return to customer
- 4 Complete and report fault-finding and rectification activities**
- 4.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 4.2 Work area is cleaned and made safe in accordance with workplace procedures
 - 4.3 Written justification is made for repairs to apparatus
 - 4.4 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and rectifying faults must include at least two of the following:

- cardiovascular systems
- respiratory systems
- neurological systems
- renal systems
- medical imaging
- physiological equipment

- miscellaneous medical equipment

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI115A Trouble shooting in medical equipment control systems.

Assessment Requirements for UEEIC0045 Troubleshoot medical equipment control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- carrying out fault-finding activities without damage using sustainable energy principles
- completing and reporting fault-finding and rectification activities
- dealing with unplanned situations safely and with the approval of relevant person/s
- determining the need to inspect, test and measure live work
- dismantling apparatus components and storing to protect against loss or damage
- finding faults
- inspecting and isolating apparatus
- inspecting and testing reassembled apparatus
- obtaining scope of the medical equipment control system faults
- obtaining tools, equipment and testing devices
- preparing to find and rectify faults
- rectifying faults without damage
- providing written justification for the rectifications undertaken and notifying relevant person/s.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques
- relevant isolation procedures
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant medical equipment principles and control systems, including medical equipment and

systems and safe working practices, including:

- cardiovascular systems
- respiratory systems
- neurological systems
- renal systems
- medical imaging
- miscellaneous medical equipment
- physiological equipment
- medical equipment, anatomy and physiology and infection control
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to finding and rectifying faults in medical equipment control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0046 Troubleshoot process control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to troubleshoot process control systems.

It includes applying safe working practices, interpreting process and circuit diagrams, applying knowledge of process controls to fault-finding procedures, conducting repairs, performing safety and functional testing, and completing service documentation.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find and rectify faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and understood
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3 Scope of fault is obtained from documentation and/or from work supervisor to determine work
- 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
- 1.5 Sources of materials required for work are identified in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required to carry out work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Find faults

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
- 2.2 Need to inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Apparatus is inspected and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 Fault finding of industrial processes, control apparatus and systems is conducted using measured and calculated values of system parameters in accordance with workplace procedures
- 2.5 Apparatus components are dismantled, as required, and

parts stored to protect against loss or damage in accordance with workplace procedures

2.6 Faulty components are rechecked and fault status confirmed

2.7 Unplanned situations are dealt with safely and with the approval of relevant person/s in accordance with workplace procedures

2.8 Fault-finding activities are carried out without damage to apparatus circuits, the surrounding environment or services using sustainable energy principles

3 Rectify fault

3.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

3.2 Apparatus is inspected and isolated in accordance with WHS/OHS requirements and workplace procedures

3.3 Materials required to rectify faults are sourced and obtained in accordance with workplace procedures

3.4 Repairs are conducted without damage to relevant components or apparatus in accordance with workplace procedures and sustainable energy principles

3.5 Repairs are inspected and tested in accordance with workplace procedures and relevant industry standards

3.6 Apparatus is reassembled, inspected, tested and prepared for return to customer in accordance with workplace procedures and relevant industry standard

4 Complete and report fault-finding and rectification activities

4.1 WHS/OHS work completion risk control measures and workplace procedures are followed

4.2 Work area is cleaned and made safe in accordance with workplace procedures

4.3 Work completion is documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and rectifying faults must include at least two of the following:

- different systems containing more than one control loop

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI114A Troubleshoot process control systems.

- dealing with unplanned situations with the approval of relevant person/s
- dismantling apparatus components
- documenting work and notifying relevant person/s
- documenting work tasks and rectifications to workplace procedures
- identifying sources of materials required for work
- inspecting and isolating apparatus
- inspecting, testing and measuring live work
- measuring and calculating control apparatus and systems values of parameters to find faults
- obtaining the scope to the fault
- obtaining tools, equipment and testing devices to carry out work
- rectifying faults without damage
- using sustainable energy practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- intermittent faults and relevant causes of intermittent faults
- effect to cause reasoning - assumptions of possible causes
- inspection and testing procedures
- isolation procedures
- methods for testing
- problem-solving techniques

- relevant control apparatus and systems
- relevant factors and the nature of a fault
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications and operating instructions
- relevant measuring parameters
- relevant methods for testing assumptions
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace instructions, policies and procedures
- sustainable energy principles.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to finding and rectifying faults in process control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to use instrumentation drawings, specifications, industry standards and equipment manuals relevant to install, maintain and fault find process controls.

Process controls are a system dealing with mechanisms for maintaining the output of a specific process within a desired range. A process is predictable, stable and consistently operating at a target level of performance.

It includes applying principles of process control embodied in drawings, industry standards, specifications and equipment manuals; matching equipment with specifications for a given function; and locating and determining connections required between pneumatic, hydraulic and electrical equipment from instrumentation drawings and specifications.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Identify instrumentation drawings, specifications, industry standards and equipment manuals

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS), risk control measures and workplace procedures are followed
- 1.2 Need for instrumentation drawings, specifications, industry standards or equipment manuals is determined for the work to be undertaken
- 1.3 Instrumentation drawings, specifications, industry standards or equipment manuals required for the work to be undertaken are obtained in accordance with workplace procedures

2 Use instrumentation drawings, specifications, industry standards and equipment manuals

- 2.1 Instrumentation drawings, specifications, industry standards and/or equipment manuals are selected appropriate to the work being undertaken
- 2.2 Instrumentation drawings, specifications, industry standards and equipment manuals are interpreted using information from process controls, instrumentation drawing layouts, conventions and symbols
- 2.3 Dimensions are extracted and applied from drawings and diagrams for application to work being undertaken
- 2.4 Location of equipment is determined from instrumentation drawings and specifications
- 2.5 Connections between pneumatic, hydraulic and electrical equipment are determined from instrumentation drawings and specifications
- 2.6 Equipment manuals are reviewed to ascertain content, format and located information are relevant to the work to be undertaken

3 Convey instrumentation information using drawings and diagrams

- 3.1 Drawing conventions are used in freehand drawing layouts to convey instrumentation information and ideas to others involved in the work to be undertaken
- 3.2 Instrumentation drawing conventions are used to neatly correct freehand original job drawing to show final 'as-installed' arrangement
- 3.3 Corrected drawings are forwarded to appropriate

person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Instrumentation assembly, installation, fault finding, maintenance or development work functions for least two different process control systems must include:

- instrumentation drawings
- specification industry standards
- equipment manuals

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI101A Use instrumentation drawings, specifications, standards and equipment manuals.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including applying risk control measures
- conveying instrumentation information and ideas using drawings and diagrams
- determining connections between pneumatic, hydraulic and electrical equipment
- determining location of equipment from instrumentation drawings and specifications
- identifying and using instrumentation drawings, specifications, industry standards and equipment manuals
- interpreting instrumentation drawings, specifications, industry standards and equipment manuals for process controls and instrumentation drawing layouts, conventions and symbols
- sketching of instrumentation and control drawings
- using instrumentation drawings, diagrams and manuals
- using workplace conventions in freehand drawings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- industrial instrumentation. including:
 - introduction to the purposes of measurement in industrial processes
 - instrument control loops
 - types of measurement in these processes
 - local and remote measurement
 - measurement signal methods
 - signal transmissions electrical standards
 - signal transmissions pneumatic standards
 - flow, temperature, pressure and other appropriate measurements
 - identification and purpose of instruments measuring processes directly and those

- measuring indirectly
- instrumentation and control components: sensors, transducers, converters and transmitters
- instrument standards, including:
 - instrumentation standards
 - relationship between standards
 - using standards
 - fluids in process piping colour coding
 - instruments symbols
- instrumentation terminology and International System of Units (SI), including:
 - SI base units
 - SI derived units
 - scientific and engineering notation
 - SI prefixes
 - instrumentation metric units
 - non-standard SI units - kg/cm², and so on
 - conversion of units
 - instrumentation terminology:
 - span
 - range
 - accuracy
 - precision
 - errors
 - zero
 - repeatability
 - sensitivity
 - hysteresis
- calibration of link and lever instruments, including:
 - principles of levers and links and calibration of indicator recorder instrument
 - calibration terms
 - calibrate a link and lever instrument
 - interpret calibration data so as to identify the types of error displayed by an instrument and whether the instrument is within its specified accuracy
 - interpretation of graphs and tables associated with instrumentation
- instrumentation safe working practices, including:
 - identification of instrumentation and control hazards
 - risk control measures for instrumentation work
 - risk assessment
- instrumentation drawings, diagrams and manuals, including:
 - electrotechnology drawing symbols for instrumentation and control (electrical/electronic circuits, instrument circuits/diagrams, programmable logic controller (PLC) diagrams,

- pneumatic and hydraulic)
- standards used in instrumentation drawings (ISA, ASME, Australian Standards (AS), and SAMA)
- drawings used in instrumentation - schematic, single line, wiring, PLC diagrams, process flow diagrams - brief instrument information, process loop diagrams - details, terminals and types of instruments
- manufacturers data sheets, manuals, specifications and test procedures - instrumentation manuals, catalogues and drawings, including:
 - interpretation of the specifications contained within instrumentation manuals, catalogues and drawings
 - interpretation of the test procedures contained within instrumentation manuals, catalogues and drawings
 - comparison of data presented in different forms for the same equipment.
 - identification of data relevant to instrumentation from a range of publicity material
 - extraction of information such as calibration, testing or installation procedures from manuals, specification sheets and drawings
- quantity take-offs and parts lists, including:
 - part numbers for components, assemblies and equipment
 - parts list for a specified project or installation from manuals, catalogues, specifications and drawings
 - list of equipment, required to undertake a specified project or installation, from manuals, catalogues, specifications and drawings
 - identification and extraction of a part number for an actual sample component or part from a manual, catalogue, specification and/or drawing
- sketching of instrumentation and control drawings, including:
 - sketching a schematic circuit diagram from a given circuit board layout diagram, wiring or installation drawing and installation or modification of a specified project using information contained within manuals
 - sketching a part or equipment layout needed to perform a specified task, such as installation or modification, from given manuals, catalogues, specifications and drawings
- principles of process control
- relevant instrument industry standards including fluids in process piping colour coding and instrument symbols
- relevant manufacturer specifications
- relevant safe work statements (SWMS)/job safety assessments or risk mitigation processes, including risk control measures and instrumentation safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including catalogues, drawings, manufacturer's data sheets, manuals, specifications and test procedures
- instrumentation manuals, catalogues and drawings
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0048 Verify compliance and functionality of instrumentation and control installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify compliance and functionality of instrumentation and control installations.

It includes preparing and conducting inspections and testing the instrumentation and control installation. It also includes reporting instrumentation and control inspection and test results.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEEIC0047 Use instrumentation drawings, specifications, standards and equipment manuals

UEEIC0041 Solve problems in pressure measurement components and systems

UEEIC0038 Solve problems in density/level measurement components and systems

UEEIC0039 Solve problems in flow measurement components and systems

UEEIC0043 Solve problems in temperature measurement components and systems

UEEIC0029 Set up and adjust PID control loops

UEEIC0030 Set up and adjust advanced PID process control loops

UEEIC0031 Set up and configure human-machine interface (HMI) and industrial networks and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to inspect and test instrumentation and control installation

- 1.1** WHS/OHS measures for the site are identified, obtained and understood
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3** Safety hazards not previously identified are noted and risk control measures implemented
- 1.4** Documentation of installation is reviewed and implemented in accordance with relevant industry standards
- 1.5** Relevant person/s is consulted to ensure work is coordinated effectively with others involved on worksite
- 1.6** Tools, equipment and testing devices are checked for correct operation and safety in accordance with workplace procedures and relevant industry standards

- 1.7** Preparatory work is checked to ensure no damage has occurred and work is in accordance with relevant industry standards
- 2 Visually inspect instrumentation and control installation**
 - 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Need to visually inspect, test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 2.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4** Instrument cabling and tubing are checked for suitability of the environments to be installed and protected from damage in accordance with workplace procedures
 - 2.5** Type, configuration/sizing of instrument cabling and tubing is confirmed for the installation in accordance with relevant industry standards and workplace procedures
 - 2.6** Control apparatus and installation requirements are cited in accordance with WHS/OHS requirements and relevant industry standards
 - 2.7** Marking of control apparatus is checked for accuracy and clarity in accordance with relevant industry standards
- 3 Conduct functional and safety testing**
 - 3.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 3.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
 - 3.3** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 3.4** Process control apparatus is operated at low voltage (LV) arrangements to conduct and report on electrical safety tests in accordance with WHS/OHS requirements and workplace procedures

- 3.5** Insulation and continuity tests are conducted on process control cabling operating at extra-low voltage (ELV) in accordance with WHS/OHS requirements and workplace procedures
- 3.6** Process control tubing/piping is pressure tested in accordance with WHS/OHS requirements and workplace procedures
- 3.7** Functional inspections and tests are conducted on process control apparatus in accordance with workplace procedures and relevant industry standards
- 4 Report instrumentation and control inspection and test findings**
- 4.1** WHS/OHS risk control work completion measures and workplace procedures are followed
- 4.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 4.3** Non-compliance defects are identified and reported in accordance with workplace procedures
- 4.4** Recommendations for rectifying defects are made in accordance with workplace procedures
- 4.5** Verification documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Verifying compliance and functionality must include the following:

- at least one electrical/electronic installation
- at least one pneumatic process control installation comprising of:
 - a measuring transmitter
 - controller

- final control element
- indicator
- cabling/tubing

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI112A Verify compliance and functionality of instrumentation and control installations.

Assessment Requirements for UEEIC0048 Verify compliance and functionality of instrumentation and control installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - using risk control measures
- checking accuracy and clarity of control apparatus marking
- checking and isolating circuits/machines/plant
- checking for correct operation of tools, equipment and testing devices
- checking instrument cabling and tubing for non-compliance defects
- checking preparatory work to ensure no damage has occurred and work is in accordance with relevant industry standards
- completing verification documentation
- confirming instrument cabling and tubing, type and configuration/sizing for installation
- identifying defects of non-compliance and recommending rectifying defects
- identifying non-compliance results
- preparing instrumentation and control installations
- reviewing control apparatus and installation requirements
- testing and measuring live circuits
- using effective methods for conducting inspections and tests
- visually inspecting instrumentation and control installation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- problem-solving techniques
- relevant circuits/machines/plant
- relevant control installations to industry standards
- relevant inspection and test methods

- relevant inspection, test and measurement methods for live work
- relevant instrument cabling and tubing for installation
- relevant isolation procedures
- relevant manufacturer specifications and operating instructions
- relevant job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including
 - verification and compliance industry standards
- relevant workplace instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to verifying compliance and functionality of process control installations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0049 Manage instrumentation and control projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to manage instrumentation and control projects.

It includes managing safety, budget variation, personnel, resources and critical path timelines; implementing project plan strategies; identifying measurable outcomes; managing conflict; monitoring procurement and completing documentation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine scope of instrumentation and control project

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Project deliverables and budget are determined from project planning and/or relevant documentation and

discussions with relevant person/s

1.3 Measurable outcomes are identified to evaluate project on completion from project planning and relevant documentation

1.4 Plant, materials and skills required to meet project outcome are determined from project planning and relevant documentation

1.5 Processes are developed to manage contract variations from discussions with relevant person/s in accordance with contractual agreement and workplace procedures

2 Manage project

2.1 WHS/OHS requirements, workplace procedures and programs are implemented and monitored

2.2 Achievement of project outcome is delegated to relevant person/s involved in project

2.3 Risk events are identified and project plan strategies implemented to ensure standard of quality outcomes are achieved in accordance with WHS/OHS requirements and contractual agreement

2.4 Procurement processes are monitored to ensure timely supply of plant and materials in accordance with workplace procedures and project plan

2.5 Project progress is monitored in accordance with schedule, quality requirements and budget

2.6 Conflict issues on worksite between stakeholders, clients and regulators are identified and managed in accordance with workplace procedures

2.7 Variations are managed in accordance with workplace procedures and project plan

2.8 Project records are maintained, progress reports written and forwarded to relevant person/s

3 Complete instrumentation and control project

3.1 Project outcomes are reviewed in accordance with project scope, implemented risk strategies, contract variations, safety record and budget

3.2 Project completion acceptance is sought from relevant person/s and handover documented in accordance with workplace procedure

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI134A Manage instrumentation and control projects.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEEIC0049 Manage instrumentation and control projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- adopting risk management strategies
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- completing project
- delegating achievement of project outcomes
- determining plant, materials and skills required to meet project outcomes
- determining project deliverables and budget
- developing processes manage contract variations
- identifying and managing conflicts
- identifying measurable outcomes
- maintaining records and submitting progress reports
- managing resources and variations
- monitoring procurement processes
- monitoring project progress in accordance with schedule, quality requirements and budget.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant instrumentation and control project management, including:
 - communication management
 - control system industry sector customs and practices
 - customer/client relations
 - defining project parameters
 - financial management
 - human resource management

- physical resource management
- procurement management
- quality management
- risk management and contingencies
- time management
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including:
 - project records
 - contracts
- relevant workplace quality, instructions, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to managing instrumentation and control projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0050 Plan instrumentation and control projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan instrumentation and control projects.

It includes applying critical path analysis; developing workflow strategies; and documenting, presenting and negotiating budgets and timelines.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to plan project

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Techniques for project planning are reviewed and adopted in accordance with workplace procedures
- 1.3 Instrumentation and control project is determined from design brief specification and/or relevant documentation

- and in discussions with relevant person/s
- 2 Develop project plan proposal**
- 2.1** Estimated plant, material, labour and relevant costs are sought and obtained from relevant person/s in accordance with workplace procedures
 - 2.2** Project budget is determined from estimated plant, material, labour and relevant costs in accordance with workplace procedures
 - 2.3** Critical path analysis is applied to developing workflow strategies
 - 2.4** Sources and availability of materials and human resources required for project are determined in accordance with workplace procedures
 - 2.5** Risk management strategies are sought and obtained in accordance with project plan
 - 2.6** Project plan is reviewed against inputs and adjusted to rectify any anomalies
 - 2.7** Project plan proposal is documented in accordance with workplace procedures
- 3 Obtain approval for project plan**
- 3.1** Project plan is presented and discussed with relevant person/s
 - 3.2** Alterations to the project plan from presentation/discussion are negotiated with relevant person/s in accordance with workplace procedure
 - 3.3** Final project plan is documented and approval obtained from relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEI135A Plan instrumentation and control projects.

Assessment Requirements for UEEIC0050 Plan instrumentation and control projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
- determining and adopting project planning techniques
- developing effective workflow strategies
- developing project plan proposal
- documenting project plan proposal
- establishing a project budget estimating plant, material, labour and related costs
- negotiating alterations to proposed project plan
- obtaining approval of the final plan
- obtaining risk management strategies
- preparing to plan project
- reviewing project plan against inputs and rectifying any anomalies.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- control system industry sector customs and practices
- critical path and project analysis
- instrumentation and control project planning
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant plant, material, labour and related costs
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including:
 - design brief specification

- project plan proposal
- relevant workplace quality, instructions, policies and procedures
- risk management strategies.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to planning instrumentation and control projects
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEEIC0051 Evaluate motor drive systems and diagnose faults

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in systems controlling starting, speed, torque, power output, efficient running and braking for motor drive systems.

It includes working safely; interpreting technical data; applying knowledge of motor operating parameters to logical fault-finding techniques; implementing fault rectification, safety and functional inspection; testing; and reporting work activities and outcomes.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0019 - Solve problems in direct current (d.c.) machines

UEEEL0077 - Evaluate and report on the performance of LV machines

Competency Field

Instrumentation & Control

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to evaluate motor drive systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work, health and safety (WHS) / occupational health and safety (OHS) risk control measures are identified and applied

- 1.2 Scope of work, including motor drive systems to be evaluated is determined from relevant documentation and in consultation with relevant people
 - 1.3 Tools, equipment and testing devices needed to diagnose faults are obtained and checked for correct operation and safety
- 2 Evaluate motor drive systems and diagnose faults**
 - 2.1 Circuits/machines/plant are inspected, checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
 - 2.2 Logical diagnostic methods/techniques are applied to evaluate motor drive operation and diagnose motor control system faults employing measurements and estimations of system operating parameters referenced to system operational requirements
 - 2.3 Fault scenarios are tested and confirmed as being the source of system problems in accordance with workplace procedures
 - 2.4 Causes of the faults are identified and recommendations to rectify the fault are documented
 - 2.5 System is inspected and tested to verify that the system operates as intended and to specified requirements
 - 2.6 Evaluation and diagnosis activities are carried out efficiently, without unnecessary waste of materials or damage to apparatus, the surrounding environment or services, using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
 - 3.1 Worksite is made safe in accordance with workplace safety procedures
 - 3.2 Evaluation and rectification activities are documented
 - 3.3 Relevant people are notified of work completion.

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating motor drive systems must include:

- both a.c. and d.c. motor control systems

Unit Mapping Information

This is a new unit.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEEIC0051 Evaluate motor drive systems and diagnose faults

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and sustainable energy principles and practices
- applying logical diagnostic methods
- applying problem-solving techniques
- documenting fault identification activities and outcomes
- evaluating motor drive systems
- identifying faults and recommending components and process needed to rectify them
- inspecting, testing and verifying that the electrical system operates correctly
- using fault scenarios to test the cause of system faults.
- completing and reporting evaluation and fault diagnosis activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace policies and procedures and documentation
- variable speed drive (VSD) systems for a.c. and d.c. motors, including:
 - methods and operating principles
 - installation requirements
 - filtering
 - performance characteristics
 - set-up and commissioning
 - common faults, their symptoms, causes and solutions.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment currently used in industry
- resources that reflect current industry practices in relation to diagnosing and rectifying faults in motor drive systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0001 Analyse the operation of HVAC air and hydronic systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to analyse the operating parameters of heating, ventilation and air conditioning (HVAC) air and hydronic systems.

It includes working safely, applying knowledge of operating parameters, gathering and analysing data, applying problem-solving techniques, and developing and documenting results and solutions for use in design work.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to analyse the operation of HVAC air and hydronic systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS processes and procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Operating analysis is determined from performance specifications, situation reports and consultations with relevant person/s
- 1.4** Activities are planned to meet scheduled timelines in accordance with workplace procedures and consultations with others involved in the work

- 1.5** Strategies are formed for solution development and implementation is carried out in accordance with workplace procedures
- 2 Analyse the operation of systems**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Principles of HVAC air and hydronic systems operating parameters are applied to analytical solutions to refrigeration and air conditioning systems
- 2.3** Parameters, specifications and performance requirements in relation to HVAC air and hydronic systems are obtained in accordance with workplace procedures
- 2.4** Analysis of operating parameters is carried out to provide solution in accordance with workplace procedures
- 2.5** Unplanned events are dealt with safely in accordance with relevant industry standards and workplace procedures
- 2.6** Quality of work is monitored in accordance with workplace procedures and relevant industry standards
- 3 Report on results of operation systems analysis and actions taken**
- 3.1** Results of system operating analysis are evaluated to determine performance requirements in accordance with workplace procedures and performance specifications
- 3.2** Analysis, findings, calculations and assumptions are documented in accordance with workplace procedures
- 3.3** Analysis is reported to relevant person/s to determine relevant action in accordance with workplace procedures
- 3.4** Justification for findings and actions to be undertaken in relation to equipment is documented in relevant work/project and/or development records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Analysing operating parameters must include at least the following:

- two different HVAC systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ164A Analyse the operation of HVAC air and hydronic systems.

Links

Companion Volume implementation guides are found in VETNet - -
<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERA0001 Analyse the operation of HVAC air and hydronic systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the operating performance
- forming effective strategies for analysing air conditioning systems performance
- obtaining operating parameters, specifications and performance requirements appropriate to each situation
- evaluating the results of the analysis
- documenting analysis details of all findings, calculations and assumptions
- documenting justification of actions to be implemented in accordance with professional standards
- dealing with unplanned events
- analysing the operation of heating, ventilation and air conditioning (HVAC) air and hydronic systems
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- preparing to analyse the operation of HVAC air and hydronic systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC air systems, safe working practices and relevant standards, codes and regulations, including:
 - air distribution principles:
 - air diffuser selection
 - factors affecting the design of ductwork systems
 - types of ductwork systems
 - static, velocity and total pressure
 - laminar and turbulent flow

- moody diagram
- parameters that control cost
- pressure loss:
 - friction and dynamic
 - colebrook - White formula
 - in ducts and friction charts
 - in fittings and loss co-efficient
 - fitting selection criteria
 - diffuser pressure loss
- system sizing:
 - velocity method
 - equal friction method
 - static regain method
 - balanced pressure drop method
 - circular to rectangular equivalent
 - standard duct sizes and gauges
 - balancing
- heat and leakage losses:
 - heat gain/loss calculation
 - bare vs. insulated
 - leakage
- overview of noise in duct systems:
 - noise sources in duct systems
 - attenuation
 - impact on design
 - methods of control
- fans:
 - types and characteristics
 - fan laws
 - system effect
 - fan selection
 - fan and system curves
- air systems:
 - dual and single duct constant volume
 - variable volume
 - induction units
 - multi-zone
 - diversity factors
- HVAC systems
- HVAC hydronic systems, safe working practices and relevant standards, codes and

regulations, including:

- systems operation
 - closed/open systems
 - pump head/lift and static head (high-rise building)
 - system friction losses
 - nett positive suction head
 - system curves
- pumps:
 - types
 - selection criteria
 - performance characteristics
 - bladder tanks
 - coil characteristics
 - heat exchangers: plate, shell and tube, and tube in tube
 - flow measurements: types
 - flow switchers
 - builders: types and performance characteristics
 - cooling towers: elementary cooling thermodynamics and types
- valves - flow control devices:
 - types and applications
 - throttling characteristics
 - flow measurements
 - selection and applications
- piping systems:
 - balancing and commissioning
 - air venting
 - water treatment
 - vacuum breaking and air breaks
- relevant industry standards
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory

requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to analyse the psychrometric performance of heating, ventilation and air conditioning/refrigeration (HVAC/R) systems.

It includes analysing HVAC/R system to provide solutions to psychrometric performance issues. It also includes working safely, gathering and analysing psychrometric performance data, applying problem-solving techniques, and developing and documenting results and solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0042 Solve problems in ELV single path circuits

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Assessment Requirements for UEERA0002 Analyse the psychrometric performance of HVAC/R systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the psychrometric performance issues
- forming effective strategies for analysing refrigeration and air conditioning systems performance
- obtaining psychrometric performance parameters, specifications and performance requirements appropriate to each situation
- evaluating the results of the analysis
- documenting analysis details of all findings, calculations and assumptions
- documenting justification of actions to be implemented in accordance with professional standards
- dealing with unplanned events
- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- heating, ventilation and air conditioning/refrigeration (HVAC/R) psychometrics, safe working practices and relevant standards, codes and regulations, including:
 - fundamentals and terms:
 - sensible heat factor (conditioned space and grand total)
 - quantity of air
 - effective surface temperature
 - bypass factor
 - coil characteristics:

- processes
- sensible cooling
- cooling and dehumidification
- sensible heating
- spray processes:
 - saturation efficiency
 - processes
 - adiabatic/evaporative cooling
 - cooling and humidification
 - sensible cooling
 - chemical dehumidification process: dehumidification and heating
 - cooling tower characteristics: humidification and cooling
 - indirect evaporative cooling process
- system analysis:
 - partial load
 - reheat control
 - bypass control
 - volume control
 - dump back systems
 - low velocity coils
- psychrometric formulae and charts:
 - properties of air
 - gas constants
 - derivation of air constants
 - combined gas laws
 - Dalton's law of partial pressures
 - carrier's equation
 - psychrometric property tables
 - air mixing equations
 - air quantity equations
- problem-solving techniques
- psychrometric physical and thermodynamic properties of gas-vapor mixtures, including psychrometric principles
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- typical psychrometric performance issues.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the thermodynamic performance issues
- forming effective strategies for analysing refrigeration and air conditioning systems performance
- obtaining thermodynamic performance parameters, specifications and performance requirements appropriate to each situation
- evaluating the results of the analysis
- documenting analysis details of all findings, calculations and assumptions
- documenting justification of actions to be implemented in accordance with professional standards
- dealing with unplanned events
- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- refrigeration systems, safe working practices and relevant standards, codes and regulations, including:
 - major components, type and functions:
 - evaporators
 - compressors
 - expansion devices
 - ancillary components
 - refrigerants

- system operation and performance:
 - thermodynamic properties of refrigerants
 - pressure enthalpy charts
 - refrigerant cycle
 - refrigerant cycle represented on pH charts
 - introduction to refrigerating effect, heat of compression, heat rejected on high side, co-efficient of performance, liquid sub-cooling suction superheating
 - effects on performance of changing operating pressures, liquid sub-cooling, suction superheating
- application of refrigeration:
 - introduction to industrial refrigeration, specific system component types and refrigerants
 - scope of commercial refrigeration, specific system component types and refrigerants
- refrigerated enclosures and cabinets:
 - merchandising and display cabinets:
 - deep freeze meat
 - dairy
 - fruit and vegetable
 - multi-deck display
 - single deck
 - well type
 - island cases
 - glass door
 - reach door
 - reach in merchandisers
 - defrosting methods
 - cold rooms and freezer rooms
 - types and construction
 - insulation
 - vapour barrier
 - frost heave
 - interior fittings
 - location of equipment
 - defrosting methods
 - cold tracking
 - trace heating
 - storage conditions
 - temperature
 - relative humidity
 - air velocity

- air patterns
- load limits
- air conditioning systems
- introduction to air conditioning systems, safe working practices and relevant standards, codes and regulations, including:
 - WHS/OHS requirements:
 - Building Code of Australia (BCA) requirements
 - AS 1668 The use of ventilation and air conditioning in buildings parts 1 and 2
 - AS/NZS 3666 Air-handling and water systems of buildings
 - noise and vibration
 - air quality
 - sick building syndrome
 - operating requirements:
 - ventilation
 - air distribution
 - terminal velocity
 - temperature
 - relative humidity
 - air quality
 - noise
 - basic psychrometrics
 - operating modes:
 - ventilation
 - evaporative cooling
 - ventilation and cooling
 - ventilation and heating
 - dehumidification
 - dehumidification and reheat
 - humidification
 - operating terminology/characteristics:
 - throw and drop
 - primary and secondary air
 - coanda effect
 - heating, ventilation and air conditioning (HVAC) system components and functions:
 - fans
 - ducting
 - registers
 - dampers
 - filters
 - cooling coils

- heating coils
- induction units
- fan coil units
- terminal units
- humidifiers, pumps and sprayers
- hydronic systems and components
- applications and construction of air conditioning systems:
 - applications
 - residential, commercial, low and high rise, industrial ventilation and air conditioning
 - packaged plant
 - split systems (wall and floor console, ceiling fan coil), wall fascia, roof top and reverse cycle option central station plant
 - all air systems, constant volume variable temperature, constant temperature variable volume, and air/water systems
 - all water system, multi-zoning, thermal storage systems
 - basic air conditioning system diagrams
 - duct layout
 - hydronic layout
 - unit/conditioner drawings
- HVAC control systems:
 - basic principles
 - terminology
 - symbols and diagrams
 - basic applications
- problem-solving techniques
- relevant HVAC/R manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant workplace documentation
- relevant workplace policies and procedures
- typical thermodynamic performance issues.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational

situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to analyse vibration and noise in refrigeration and air conditioning systems.

It includes analysing refrigeration and air conditioning system to provide solutions to noise, sound and vibration issues. It also includes working safely, gathering and analysing data, applying problem-solving techniques, and developing and documenting results and solutions for use in design work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare refrigeration and air conditioning system to analyse noise and vibration in

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed
- 1.3** Extent of the noise and vibration issue is determined from performance specifications, situation reports and consultations with relevant person/s
- 1.4** Work activities are planned to meet scheduled timelines in consultation with others involved in the work

- 1.5 Effective strategies are formed to ensure solution development and implementation is carried out efficiently
- 2 **Analyse refrigeration and air conditioning system noise and vibration**
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Noise, vibration and thermodynamic analytical solutions are applied to refrigeration and air conditioning system
 - 2.3 Parameters, specifications and performance requirements in relation to refrigeration and air conditioning system are obtained in accordance with workplace procedures
 - 2.4 Approaches to analysing noise and vibration parameters are carried out to provide the most effective solution
 - 2.5 Unplanned events are dealt with safely in accordance with workplace procedures and regulatory requirements in a manner that minimises risk to personnel and equipment
 - 2.6 Refrigeration and air conditioning system work quality is monitored against performance agreement and/or workplace or industry standards
- 3 **Document actions taken and report on noise and vibration analysis**
 - 3.1 Solutions to noise and vibration issues are evaluated to determine their effectiveness and modified, as required, in accordance with workplace procedures
 - 3.2 Refrigeration and air conditioning system analysis is documented and includes details of findings calculations and assumptions
 - 3.3 Refrigeration and air conditioning system analysis is reported to appropriate person/s to determine appropriate action to be taken based on findings
 - 3.4 Justification for findings and any actions to be undertaken in relation to the equipment is documented for inclusion in work/project or development records in accordance with industry standards and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Analysing noise, sounds and vibration must include at least the following:

- two different refrigeration and air conditioning systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ138A Analyse vibration and noise in refrigeration and air conditioning systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the noise and vibration issues
- forming effective strategies for analysing refrigeration and air conditioning systems performance
- obtaining noise and vibration parameters, specifications and performance requirements appropriate to each situation
- evaluating the results of the analysis
- documenting analysis details of all findings, calculations and assumptions
- documenting justification of actions to be implemented in accordance with professional standards
- dealing with unplanned events
- applying problem-solving procedures, including using appropriate theorems
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- noise and vibration in refrigeration and air conditioning systems, safe working practices and relevant standards, codes and regulations, including:
 - fundamentals of sound:
 - frequency
 - decibels
 - octave bands
 - direct sound
 - velocity

- sound pressure level
- sound power level
- sound meters
- noise and people:
 - physical measurement of sound
 - weighting networks
 - NR curves
 - noise damage to hearing
 - evaluate daily noise exposures
 - peak noise levels
 - attenuation for hearing protectors
 - excess noise levels permissible
 - noise abatement Acts
 - advanced noise and vibration control
- sound in confined and unconfined spaces:
 - inverse square laws
 - direct and reflective sound
 - reverberation time
 - Sabine's formula
 - absorption coefficients of surfaces
 - types of absorbers and their operation
 - insulation performances of partitions
- identification and analysis of problems:
 - one-dimensional sound waves
 - standing waves
 - energy in a sound wave
 - sources
 - effects of air turbulence
 - transmitters
 - amplifiers
 - absorptivity
 - reflectivity
 - room characteristics
 - acoustic design in buildings
 - fan and air noise transmission in ducts
- methods of control:
 - natural attenuation
 - sound absorbing materials and placement
 - duct lining

- lined plenums
- lined duct splitters
- duct attenuators
- white noise
- vibration isolators
- acoustic specifications:
 - attenuator ratings
- sound insulation:
 - plant room breakout
 - controlling plant room noise
- duct borne noise:
 - sound power spectra for fans
 - noise attenuation in ducts and fittings
 - reducing fan noise transmission
 - regeneration noise
 - sources of regenerated noise
 - use tables to estimate regenerative noises
 - breakout situations
 - fan noise breakout
 - list methods of controlling breakout
- controlling the cost:
 - economical use of attenuation
- vibration:
 - simple harmonic motion (SHM)
 - period
 - frequency
 - amplitude
 - estimate frequencies for fans, pumps and refrigeration plant
 - estimate transmission of vibration
 - vibration control for building structures
 - use transmissibility graphs to select springs, vibration eliminators and pads
 - types of isolation materials and mounting devices
 - select isolation and mounting devices
 - inertia blocks
- noise and vibration analysis computer software packages
- relevant job safety assessments or risk mitigation processes
- relevant technique, process or measurement methods to obtain sound, noise and vibration data, including problem-solving procedures and appropriate theorems
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply safety awareness and regulatory and industry standard requirements for ammonia refrigerant.

It includes safety and legal requirements when handling, using and storing ammonia refrigerant.

The skills and knowledge in this unit will be applied by those managing, supervising or working in or near a location that contains refrigeration equipment using ammonia refrigerant. These could include managers, supervisors, maintenance staff, cleaners, employees and refrigeration and air conditioning technicians.

Dangerous goods and work health and safety (WHS)/occupational health and safety (OHS) legislative requirements apply to this unit.

Pre-requisite Unit

Not applicable.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work with

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for

- ammonia refrigerant** a given work area are identified and applied
- 1.2 Work area access permits are obtained from appropriate person/s in accordance with workplace procedures and legislative requirements
 - 1.3 Electrical and non-electrical isolation are identified and carried out to prevent creation of hazards from loss of machine/system/process control in accordance with workplace procedures
 - 1.4 Tools and equipment needed for the work are checked for safety and correct functionality in accordance with workplace procedures and regulatory requirements
- 2 Apply safe work practices to ammonia refrigerant**
- 2.1 Ammonia refrigerant workplace procedures, legislative requirements and work instructions for controlling risk are followed
 - 2.2 Accidents, events, fires and emergencies are responded to in accordance with workplace procedures and legislative requirements within scope of own responsibility in a manner that minimises risk to personnel and equipment
- 3 Follow workplace procedures for hazard identification and risk control of ammonia refrigerant**
- 3.1 Ammonia refrigerant hazards are identified, risk assessed and control measures implemented and monitored through active participation in the consultation process with work supervisor and other person/s
 - 3.2 WHS/OHS incident records are completed in accordance with regulatory requirements and workplace procedures
 - 3.3 Ammonia refrigerant workplace instructions and training are followed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Applying safety awareness and legal requirements for ammonia refrigerant must include the following:

- safe handling, storage and transport of ammonia refrigerant cylinders
- labelling requirement for ammonia refrigerant cylinders and systems containing ammonia refrigerant
- personal protective equipment (PPE) required for the safe handling of ammonia refrigerant

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ178A Apply safety awareness and legal requirements for ammonia refrigerant.

Assessment Requirements for UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, workplace procedures and practices, including:
 - using risk control measures
 - following workplace procedures for hazard identification and risk control of ammonia refrigerant
- applying safe working practices to safely handle and store ammonia refrigerant cylinders
- applying working procedures and instructions as they apply to risk control measures
- completing required documentation dealing with accidents and emergencies within the scope of responsibility
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying ammonia (R717) refrigerant safety data sheets (SDS)/material safety data sheets (MSDS) and workplace emergency response procedures
- participating in consultation processes, identifying hazards and implementing and monitoring control measures
- preparing to enter workplace, including using work permits, clearances and isolation permissions
- taking remedial action within workplace emergency response procedures and job role.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- ammonia (R717) refrigerant SDS/MSDS
- emergency procedures and incident management requirements and procedures
- hazardous goods, segregation, storage and handling of ammonia refrigerant
- refrigerant disposal requirements

- relevant acts, regulations, codes of practice and industry standard requirements
- relevant ammonia cylinder safe handling and storage requirements
- relevant job safety assessments or risk mitigation processes, including safety management and risk management
- relevant WHS/OHS legislated, regulations and codes of practice related to hazards using ammonia refrigerant in refrigeration and air conditioning systems
- relevant workplace documentation
- relevant workplace policies and procedures, including specific safety procedures and work instructions related to working with refrigeration and air conditioning systems containing ammonia refrigerant
- safe work practices with ammonia refrigerant, including:
 - flammability of ammonia
 - physical effects of ammonia
 - properties of ammonia.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, emergency response plan, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply safety awareness and legal requirements for carbon dioxide (CO²) refrigerant.

It includes applying safety and legal requirements when handling, using and storing CO² refrigerants.

The skills and knowledge in this unit will be applied by those managing, supervising or working in or near a location that contains refrigeration equipment using CO² refrigerant. These could include managers, supervisors, maintenance staff, cleaners, employees and refrigeration and air conditioning technicians

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

Assessment Requirements for UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying safe working practices to carbon dioxide (CO²) refrigerant safety data sheets (SDS)/material safety data sheets (MSDS)
- applying safe working practices to safely handle and store CO² refrigerant cylinders
- completing required documentation
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- participating in consultation processes, identifying hazards and implementing and monitoring control measures
- preparing to enter the workplace, including the use of work permits and clearances and isolation permissions
- taking remedial action within workplace emergency response procedures and job role.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- benefits of using CO² as a refrigerant (R744)
- CO² cylinder handling and storage requirements
- CO² refrigerant properties
- chlorofluorocarbon (CFC)/hydrofluorocarbon (HFC) phase out
- emergency procedures and incident management requirements and procedures
- refrigerant 2T Hazchem codes
- relevant CO² refrigeration system manufacturer specifications
- relevant industry standards, codes and practice requirements

- relevant job safety assessments or risk mitigation processes, including personal protective equipment (PPE)
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- safe working practices with CO² refrigerant
- SDS/MSDS.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply safety awareness and legislative requirements for Class A2, A2L and A3 flammable refrigerants.

It includes applying safety and relevant legislation to safely handle and store flammable refrigerants.

Dangerous goods and ozone protection, work health and safety (WHS)/occupational health and safety (OHS), and synthetic greenhouse gas management legislative requirements apply to this unit.

The skills and knowledge in this unit will be applied by those managing, supervising or working in or near a location that contains refrigeration or air conditioning equipment using flammable refrigerant. These could include managers, supervisors, maintenance staff, cleaners, employees and refrigeration and air conditioning technicians

Pre-requisite Unit

Not applicable

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to work with flammable refrigerants**
 - 1.1** WHS/OHS requirements, legislative requirements and workplace procedures for a given work area are identified, obtained and applied
 - 1.2** Work area access permits are obtained from relevant person/s in accordance with workplace procedures
 - 1.3** Preparations for electrical and non-electrical isolation to prevent hazards from loss of machine/system/process control are conducted in accordance with WHS/OHS and workplace procedures
 - 1.4** Tools and equipment required for work are checked for safety and correct functionality in accordance with workplace procedures and relevant industry standards
- 2 Apply safe working practices to flammable refrigerants**
 - 2.1** WHS/OHS risk control measures, legislative requirements and workplace procedures for carrying out the work are followed
 - 2.2** Workplace procedures for dealing with accidents, fires and emergencies are followed in accordance with WHS/OHS, legislative requirements and workplace procedures
- 3 Follow workplace procedures for hazard identification and risk control of flammable refrigerants**
 - 3.1** Hazards are identified and risk control measures implemented and monitored in consultation with relevant person/s
 - 3.2** Hazards in the work area are recognised and reported to relevant person/s in accordance with workplace procedures
 - 3.3** WHS/OHS records of incidents are completed in accordance with relevant industry standards and workplace procedures
 - 3.4** Workplace instructions and training are followed in accordance workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Applying safety awareness and legal requirements for flammable refrigerants must include the following:

- class A2, A2L and A3 refrigerants
- safe handling, storage and transport of flammable refrigerant cylinders
- labelling requirement for flammable refrigerant cylinders and systems containing flammable refrigerant
- personal protective equipment (PPE) required for the safe handling of flammable refrigerant

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ174A Apply safety awareness and legal requirements for flammable refrigerants.

Assessment Requirements for UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying safe working practices to safely handle and store flammable refrigerant cylinders
- applying work procedures and instructions as they apply to risk control measures
- dealing with accidents and emergencies within the scope of responsibility
- dealing with unplanned events
- following workplace procedures for hazard identification and risk control of flammable refrigerants
- participating in consultation processes, identifying hazards and implementing and monitoring control measures
- preparing to enter the workplace, including using work permits and clearances and isolation permissions
- preparing to work with flammable refrigerants.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- emergency procedures and incident management requirements and procedures
- first aid
- problem-solving techniques
- refrigerant disposal requirements
- relevant acts, regulations, code of practice and industry standard requirements
- relevant cylinders and storage requirements
- relevant environmental issues
- relevant flammable refrigerant types and applications
- relevant manufacturer specifications

- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- types of Class A2, A2L and A3 flammable refrigerants.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0008 Audit HVAC/R control systems for compliance with regulations and standards

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to audit heating, ventilation and air conditioning/refrigeration (HVAC/R) control systems for compliance with regulations and standards.

It includes working safely, setting up and conducting evaluation measurements, evaluating performance from measured parameters, and documenting results and recommending any resulting corrective actions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0021 Design control systems for refrigeration or heating, ventilation and air conditioning systems

UEERA0060 Produce HVAC/R control system diagrams

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to audit HVAC/R control systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and understood
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for work
- 1.3** Examination and testing areas are checked for safety hazards and risk control measures implemented in accordance with WHS/OHS requirements and workplace procedures
- 1.4** Relevant documentation is obtained and interpreted to determine the performance/certification requirements of the system to be assessed in accordance with workplace procedures and relevant industry standards
- 1.5** Advice is sought from the work supervisor to ensure the

- work is coordinated effectively with others
- 1.6** Tools, testing devices and materials required to carry out work are obtained and checked for correct operation and safety
- 2 Audit HVAC/R control systems**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Need to test and measure live work is determined in accordance with WHS/OHS requirements and workplace procedures
- 2.3** Circuits/machines/plant are checked and isolated, as required, in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Performance and energy efficiency requirements of HVAC/R system and assessment methods are applied to the audit process in accordance with workplace procedures
- 2.5** Control system examination and tests for particular parameter/s are conducted in accordance with relevant test methods and workplace procedures
- 2.6** Control system examination and tests are carried out methodically and results noted in accordance with workplace procedures
- 2.7** Unplanned situations are dealt with safely and with the approval of relevant person/s
- 2.8** Audit is carried out without damage to systems, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete auditing work and document results**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Examination and test results are evaluated and non-compliance issues identified in accordance with workplace procedures
- 3.4** Examination test results and comments on non-compliance issues are documented and reported to relevant person/s in accordance with workplace

procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

auditing HVAC/R control systems must include at least the following:

- two different HVAC/R control systems
- four different control scenarios

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ148A Audit HVAC/R control systems for compliance with regulations and standards.

Assessment Requirements for UEERA0008 Audit HVAC/R control systems for compliance with regulations and standards

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- interpreting compliance documents
- setting up and conducting appropriate examinations and tests
- identifying non-compliance defects
- reporting examination and test results and non-compliance issues clearly and accurately
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- auditing heating, ventilation and air conditioning/refrigeration (HVAC/R) control systems for compliance with regulations and standards
- completing auditing work and documenting results
- dealing with unplanned situations
- preparing to audit HVAC/R control systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC/R control system audits, safe working practices and relevant standards, codes and regulations, including:
 - review of HVAC/R system components
 - performance requirements of control applications from available system specifications and design briefs
 - descriptions of operation
 - measurements and recordings of system performance, as required to confirm plant control compliance with desired conditions
 - comparison of system specifications, control strategies, design briefs and recorded test results with current HVAC/R energy management principles to establish the economy of operation of HVAC/R plant

- preparation a detailed report outlining the results of investigation and stating suggested control system adjustments, alterations and modifications to improve the performance of the plant
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant systems for compliance with regulations and relevant industry standards
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0009 Audit energy use for commercial HVAC/R systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to audit energy use for commercial heating, ventilation and air conditioning/refrigeration (HVAC/R) systems.

It includes assessing the energy used by commercial HVAC/R systems in relation to its performance for improving efficiency and/or certification as meeting energy efficiency industry standards. It also includes safe working practices, determining efficiency requirements, setting up performance and energy tests, evaluating results and documenting test outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0039 Evaluate and report on building services energy management systems

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to audit energy use for a commercial HVAC/R application

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and workplace procedures for a given work area are identified and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 HVAC/R system assessment and testing area are checked for safety hazards and risk control measures implemented in accordance with safety policy and workplace procedures

- 1.4 Relevant documentation is obtained and read to determine performance/certification assessment requirements
 - 1.5 Advice is sought from the work supervisor to ensure work is coordinated effectively with others
 - 1.6 Tools, testing devices and materials needed to carry out the work are obtained and checked for correct operation and safety
- 2 Audit energy use for a commercial HVAC/R application**
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Circuits/apparatus/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.3 HVAC/R system performance and energy efficiency requirements and assessment methods are applied to the audit process
 - 2.4 HVAC/R apparatus assessment and tests are set up in accordance with established test methods and workplace procedures for each parameter being audited
 - 2.5 HVAC/R system assessment and tests are carried out methodically and results and required actions systematically noted
 - 2.6 Unexpected situations are dealt with safely in accordance with workplace procedures with the approval of an authorised person/s in a manner that minimises risk to personnel and equipment
 - 2.7 Auditing is carried out without damage to systems, circuits, the surrounding environment or services using sustainable energy practices
- 3 Document auditing activities and results**
 - 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Assessment and test results are evaluated, non-compliance issues identified, and appropriate actions determined and documented

- 3.4 Assessment test results and recommendations on non-compliance issues are documented and reported to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Auditing energy use must include at least the following:

- two different commercial HVAC/R systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ147A Audit energy use for commercial HVAC/Refrigeration systems.

Assessment Requirements for UEERA0009 Audit energy use for commercial HVAC/R systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- interpreting performance/certification requirements correctly
- setting up and conducting appropriate system assessments and tests
- identifying non-compliance issues
- reporting assessment and test results and non-compliance issues and recommendations appropriately
- dealing with unplanned events
- analysing results from test data, including:
 - analysing electricity tariffs and implications
 - analysing total consumption versus peak load
 - comparing against industry standards
 - reviewing current practices against ideal
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- auditing energy use for commercial heating, ventilation and air conditioning/refrigeration (HVAC/R) system, including:
 - documenting auditing activities results and appropriate actions
- planning audit energy use for a commercial HVAC/R application.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC/R energy audits, safe working practices and relevant standards, codes and regulations, including:
 - identification of major energy consuming plant:

- review of HVAC/R system components
- methods of energy conservation:
 - review of energy conserving strategies
 - house keeping
 - time schedules
 - good maintenance practices:
 - filters, fans, appropriate set points and dead bands
 - HVAC/R system control:
 - night cycle
 - optimum stop/start
 - purge cycles
 - chiller/boiler/cooling tower sequencing
 - economy cycles (based on temperature or enthalpy)
 - supply air reset
 - condenser water temperature reset
 - electrical load control:
 - power demand control
 - load limiting
 - load shedding
 - set point relaxation
 - ventilation cycles
- tests and data collection procedures:
 - use of building management system for data collection (trending)
 - use of data recorders (loggers)
 - monitoring of building operations generally
- analysis of results from test data:
 - comparison against standards (BOMA)
 - revision of current practices against ideal
 - total consumption vs. peak load
 - electricity tariffs and implications
- methods of reducing energy usage:
 - plant retrofits
 - controls - application of strategies
 - plant - fixed OA to economy, boiler to electric reheat, constant volume to variable air volume (VAV) and cost-benefit (payback)
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation

- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0010 Commission complex heating, ventilation and air conditioning (HVAC) systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up, adjust and commission complex heating, ventilation and air conditioning (HVAC) and refrigeration systems for optimum performance.

It includes working safely, testing and analysing system parameters, adjusting equipment and controls, following procedures and documenting final operating parameters and settings.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to commission

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS procedures are obtained and implemented in

- complex HVAC systems** accordance with workplace procedures
- 1.2 WHS/OHS risk control measures and procedures for work are followed
 - 1.3 Safety hazards not previously identified are risk assessed and documented and risk control measures implemented
 - 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 1.5 System operating parameters are identified by reviewing system specifications and component technical data
 - 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
 - 1.7 Preparatory work is checked to ensure damage has not occurred and is compliant with requirements
 - 1.8 Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 1.9 Circuits are checked as being isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Commission complex HVAC systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Testing/measuring devices are connected and set up in accordance with requirements for a particular system
 - 2.3 Measurements and adjustments are made to equipment components and controls to provide optimum system performance in accordance with system specifications and regulatory requirements
 - 2.4 Decisions for dealing with unexpected situations are made from discussions with appropriate person/s, job specifications and requirements
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Commissioning is carried out efficiently without waste

- of materials or damage to apparatus, the surrounding environment or services applying sustainable energy principles
- 3 Complete and report commissioning activities**
- 3.1** WHS/OHS risk control work completion measures and procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Adjustment settings and results of commissioning work are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning complex HVAC systems must include at least at least the following:

- two different types of complex HVAC systems incorporating multiple major components (i.e. compressors, condenser or evaporators), circuits or systems and associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ123A Commission complex (HVAC) heating, ventilation and air conditioning systems.

Assessment Requirements for UEERA0010 Commission complex heating, ventilation and air conditioning (HVAC) systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying system design operating parameters
- measuring and adjusting system components and controls to provide optimum system performance
- ensuring system operates within regulatory requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - applying sustainable energy principles and practices
 - hazard identification and reporting
 - implementing risk control measures
- commissioning complex heating, ventilation and air conditioning (HVAC) systems
- completing and reporting on commissioning activities
- determining need to test or measure live work
- isolating circuits
- preparing to commission complex HVAC systems
- using relevant tools, equipment, testing and measuring devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex HVAC system commissioning, safe working practices and relevant standards, codes and regulations, including:
 - commissioning fundamentals:

- building specifications/requirements/responsibilities
- design and as installed drawings
- building codes
- local government regulations
- design conditions
- pre-commissioning checks
- calibration of instruments
- commissioning procedures
- data collection, recording and documentation
- reporting procedures
- air systems:
 - factors affecting the design of ductwork systems
 - types of ductwork systems
 - static, velocity and total pressure
 - air testing and balancing
 - air flow
 - pressure
 - temperature
- fans:
 - types and characteristics
 - fan laws
 - fan and system curves
 - fan testing
- air balancing:
 - equipment, instruments and procedures
 - leakage testing
- overview of noise in duct systems:
 - noise sources in duct systems
 - attenuation
 - methods of control
- system capacity calculations
- hydronic systems:
 - hydronic instruments
 - fluid flow
 - pumps: pump curves and system curves
 - pump testing
 - capacity calculations
- plant and equipment:
 - controls

- heat exchangers
- chillers
- boilers
- cooling towers
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
- relevant workplace documentation
- relevant workplace policies and procedures
- system operating parameters.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0011 Commission complex refrigeration systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up, adjust and commission complex refrigeration systems for optimum performance.

It includes working safely, testing and analysing system parameters, adjusting equipment and controls, following workplace procedures and documenting final operating parameters and settings.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

- UEECD0007 Apply work health and safety regulations, codes and practices in the workplace
- UEECD0019 Fabricate, assemble and dismantle utilities industry components
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to commission complex refrigeration

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS procedures are obtained and implemented in accordance with workplace procedures

systems

- 1.2 WHS/OHS risk control measures and procedures for work are followed
 - 1.3 Safety hazards not previously risk assessed are documented and risk control measures implemented
 - 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 1.5 System operating parameters are identified by reviewing system specifications and component technical data
 - 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
 - 1.7 Preparatory work is checked to ensure damage has not occurred and is compliant with requirements
 - 1.8 Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 1.9 Circuits are checked as being isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Commission complex refrigeration systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Testing/measuring devices are connected and set up in accordance with requirements for a particular system
 - 2.3 Measurements and adjustments are made to equipment components and controls to provide optimum system performance in accordance with system specifications and regulatory requirements
 - 2.4 Decisions for dealing with unexpected situations are made from discussions with appropriate person/s, job specifications and requirements
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Commissioning is carried out efficiently without waste of materials or damage to apparatus, the surrounding

- environment or services applying sustainable energy principles
- 3 Complete and report commissioning activities**
- 3.1** WHS/OHS risk control work completion measures and procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Adjustment settings and results of commissioning work are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning complex refrigeration systems and equipment must include at least the following:

- two different types of complex refrigeration systems incorporating multiple major components, including:
 - compressors
 - condensers
 - evaporators
 - circuits
 - systems and associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ125A Commission complex refrigeration systems and equipment.

Assessment Requirements for UEERA0011 Commission complex refrigeration systems and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying system operating parameters
- measuring and adjusting system components and controls to provide optimum system performance
- ensuring system operates within regulatory requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including:
 - applying safe working practices
 - applying sustainable energy principles and practices
 - hazard identification and reporting
 - implementing risk control measures
- commissioning complex refrigeration systems
- completing and reporting on commissioning activities
- determining need to test or measure live work
- isolating circuits
- preparing to commission complex refrigeration systems
- using relevant tools, equipment testing and measuring devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex refrigeration systems commissioning, safe working practices and relevant standards, codes and regulations, including:
 - commissioning fundamentals:

- building specifications/requirements/responsibilities
- design and 'as-installed' drawings
- building codes
- local government regulations
- design conditions
- pre-commissioning checks
- calibration of instruments
- commissioning procedures
- data collection and recording, and documentation
- reporting procedures
- air systems (excluding air balancing):
 - instruments
 - airflow
 - pressure
 - temperature
 - fan testing
 - leakage testing
 - system capacity calculations
- hydronic systems:
 - hydronic instruments
 - fluid flow
 - pumps: pump curves and system curves
 - pump testing
 - capacity calculations
- refrigeration systems:
 - AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - codes of practice
 - pressure testing
 - evacuation
 - charging
 - control setting
 - commissioning reports
 - system performance and capacity
- plant and equipment:
 - controls
 - heat exchangers
 - chillers
 - boilers
 - cooling towers
- safe working practices and relevant standards, codes and regulations

- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0012 Commission complex refrigeration/air conditioning control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to set up, adjust and commission complex control systems for refrigeration or air conditioning optimum performance.

It includes applying safe working practices, testing and analysing system parameters, adjusting equipment and controls, following procedures and documenting final operating parameters and settings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems
- UEERA0033 Diagnose faults in complex HVAC/refrigeration control systems
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to commission complex control systems for refrigeration and air conditioning

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS procedures are obtained and implemented in accordance with workplace procedures
- 1.2** WHS/OHS risk control measures and procedures for work are followed
- 1.3** Safety hazards not previously identified are documented

and risk control measures implemented

- 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 1.5 System operating parameters are identified by reviewing system specifications and component technical data
 - 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
 - 1.7 Preparatory work is checked to ensure damage has not occurred and is compliant with requirements
 - 1.8 Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 1.9 Circuits are checked as being isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Commission complex control systems for refrigeration and air conditioning**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Testing/measuring devices are connected and set up in accordance with requirements for a particular system
 - 2.3 Measurements and adjustments are made to equipment components and controls to provide optimum system performance in accordance with system specifications and regulatory requirements
 - 2.4 Decisions for dealing with unexpected situations are made from discussions with appropriate person/s, job specifications and requirements
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Commissioning is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services applying sustainable energy principles

- 3 Complete and report commissioning activities**
- 3.1** WHS/OHS risk control work completion measures and procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Adjustment settings and results of commissioning work are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning complex refrigeration and air conditioning control systems must include at least the following:

- two different complex control systems for refrigeration or air conditioning

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ126A Commission complex refrigeration/air conditioning control systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0012 Commission complex refrigeration/air conditioning control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying system operating parameters
- measuring and adjusting system components and controls to provide optimum system performance
- ensuring system operates within regulatory requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - applying sustainable energy principles and practices
 - hazard identification and reporting
 - implementing risk control measures
- commissioning complex control systems for refrigeration/air conditioning
- completing and reporting commissioning activities
- determining need to test or measure live work
- isolating circuits
- preparing to commission complex control systems for refrigeration and air conditioning
- using relevant tools, equipment, testing and measuring devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex refrigeration/heating, ventilation and air conditioning (HVAC) control system commissioning, safe working practices and relevant standards, codes and regulations, including:

- commissioning fundamentals:
 - building specifications/requirements/responsibilities
 - design and 'as-installed' drawings
 - building codes
 - local government regulations
 - design conditions
 - pre-commissioning checks
 - calibration of instruments
 - commissioning procedures
 - data collection, recording and, documentation
 - reporting procedures
- control fundamentals:
 - control terminology
 - refrigeration system characteristics
 - HVAC system characteristics
 - control system characteristics
 - control system components
 - control system diagrams and symbols
 - product knowledge
- commissioning various types of control equipment:
 - electrical:
 - sensors
 - controllers
 - flow control devices
 - control systems diagrams
 - electronic:
 - sensors
 - controllers
 - control system diagrams
- digital control systems:
 - system diagrams
 - control diagrams
 - configuration
 - programming
 - initialisation
 - EMS and BMS
 - supervisory control and data acquisition (SCADA) system
 - lan and Bacnet
- relevant manufacturer specifications

- relevant plant and equipment
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures
- system operating parameters.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0013 Commission refrigeration/air conditioning hydronic systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to commission, set up and adjust hydronic systems for refrigeration and/or air conditioning optimum performance.

It includes applying safe working practices, testing and analysing system parameters, adjusting equipment and controls, following workplace procedures and documenting final operating parameters and settings.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to commission

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS procedures are obtained and implemented in

hydronic systems for refrigeration/air conditioning

accordance with workplace procedures

- 1.2 WHS/OHS risk control measures and procedures for work are followed
- 1.3 Safety hazards not previously identified are risk assessed and documented and risk control measures implemented
- 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.5 System operating parameters are identified by reviewing system specifications and component technical data
- 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 1.7 Preparatory work is checked to ensure damage has not occurred and is compliant with requirements
- 1.8 Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
- 1.9 Circuits are checked as being isolated in accordance with WHS/OHS requirements and workplace procedures

2 Commission hydronic systems for refrigeration/air conditioning

- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2 Testing/measuring devices are connected and set up in accordance with requirements for a particular system
- 2.3 Measurements and adjustments are made to equipment components and controls to provide optimum system performance in accordance with system specifications and regulatory requirements
- 2.4 Decisions for dealing with unexpected situations are made from discussions with appropriate person/s, job specifications and requirements

- 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Commissioning is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services applying sustainable energy principles
- 3 **Complete and report commissioning activities**
 - 3.1 WHS/OHS risk control work completion measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Adjustment settings and results of commissioning work are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Commissioning refrigeration and air conditioning hydronic systems must include at least the following:

- two different hydronic systems for refrigeration and/or air conditioning systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ124A Commission refrigeration/ air conditioning hydronic systems.

Assessment Requirements for UEERA0013 Commission refrigeration/air conditioning hydronic systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying system operating parameters
- measuring and adjusting system components and controls to provide optimum system performance
- ensuring system operates within regulatory requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - applying sustainable energy principles and practices
 - hazard identification and reporting
 - implementing risk control measures
- commissioning hydronic systems for refrigeration and/or air conditioning systems
- completing and reporting commissioning activities
- determining need to test or measure live work
- isolating circuits
- preparing to commission hydronic systems for refrigeration/air conditioning
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- hydronic system commissioning, safe working practices and relevant standards, codes and regulations, including:
 - commissioning fundamentals:

- building specifications/requirements/responsibilities
- design and 'as-installed' drawings
- building codes
- local government regulations
- design conditions
- pre-commissioning checks
- calibration of instruments
- commissioning procedures
- data collection, recording and documentation
- reporting procedures
- hydronic systems operation:
 - closed/open systems
 - pump head/lift and static head (high-rise building)
 - system friction losses
 - nett positive suction head
 - system curves
- pumps:
 - types
 - selection criteria
 - performance characteristics
 - pump curves and system curves
 - pump testing
 - capacity calculations
 - bladder tanks
 - coil characteristics
 - heat exchangers: plate, shell and tube, and tube in tube
 - flow measurements: types
 - flow switchers
 - cooling towers: elementary cooling thermodynamics and types
- valves - flow control devices:
 - types and applications
 - balancing valves
 - throttling characteristics
 - flow measurements
 - selection and applications
- piping systems:
 - balancing and commissioning
 - air venting
 - water treatment

- vacuum breaking and air breaks
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0014 Design ammonia refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design ammonia refrigerated systems.

It includes designing ammonia refrigerated systems based on a design brief and customer requirements, applying relevant industry standards, selecting components and documenting system design.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

UEERA0016 Design commercial refrigeration systems and select components

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0042 Solve problems in ELV single path circuits
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design ammonia refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Scope of the refrigeration system is determined from design specifications and/or in consultation with relevant person/s
 - 1.3 Safety systems are identified, obtained and applied in accordance with relevant industry standard
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
 - 1.5 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design ammonia refrigeration systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant ammonia refrigeration system analysis, components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4 Equipment required is selected in accordance with the design specifications and workplace procedures
 - 2.5 Location of components is documented in accordance with workplace procedures and operation of system functions
 - 2.6 System design draft is checked for compliance with the design brief and regulatory requirements
 - 2.7 System design is documented for submission to relevant person/s for approval
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for engineering computer applications design**
- 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace

procedures

- 3.3 Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
- 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing ammonia refrigeration systems must include at least two different systems of the following:

- two single-stage, or
- two multi-stage, or
- one single-stage and one multi-stage

Designing ammonia refrigeration systems must include at least the following:

- one major component, including:
 - condenser
 - compressors
 - evaporator
 - flash chamber/flash intercooler
- associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ181A Design ammonia refrigerated systems.

Assessment Requirements for UEERA0014 Design ammonia refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing ammonia refrigeration systems
- preparing to design ammonia refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- ammonia refrigeration system design, components and piping design requirements, safe working practices and relevant standards, codes and regulations, including:
 - technical standards, codes and regulations:
 - environmental and safety considerations in the use and disposal of ammonia refrigerant:
 - toxicity of ammonia, the effects on human health and the legislative limitations imposed on ammonia refrigerant as a result
 - flammability of ammonia, concentration and lower explosive limit (LEL)
 - environmental effects
 - safe disposal
 - safety data sheets (SDS)/material safety data sheets (MSDS) samples

- registration requirements for transport and on-site use
- relationship between ammonia system refrigerant charge and dangerous goods storage regulations
- engine ventilation requirements and determination of ventilation rates
- scrubbers for elimination of the harmful effects of ammonia
- ammonia refrigeration system design requirements:
 - applications of ammonia refrigerant (NH₃) in industrial refrigeration:
 - introduction to industrial ammonia refrigeration applications and systems
 - applications in industrial refrigeration: cool and cold storage, food processing, beverage manufacturing plants, fertilizer plants and second compression stage of CO₂ systems
 - application in environment control and air conditioning: large scale reticulated water/secondary refrigerant systems
 - advantages and disadvantages of ammonia refrigerant compared with other natural and synthetic refrigerants
 - properties, application and limitations of ammonia refrigerant:
 - general classification of ammonia refrigerant according to AS/NZS 1677 Refrigerating systems SAA refrigeration code refrigerating systems
 - common contaminants in ammonia refrigeration systems, water, oil, non-condensable and the effects of same on cycle efficiency and system wear
 - refrigeration machine oils soluble in ammonia, oil type, applications and reactions with water
 - thermal and transport properties of ammonia in comparison with other natural and synthetic refrigerants, including the behaviour in a vapour compression cycle
 - application concepts and principles:
 - single stage vapour compression cycles with dry expansion refrigerant feed
 - single and dual stage vapour compression cycles with liquid overfeed
 - single stage vapour compression cycles with screw compressors and liquid overfeed
 - cascade ammonia/CO₂ systems with dry expansion and liquid overfeed
 - single and dual stage vapour compression cycles with gravity flooded refrigerant feed
 - single and dual stage vapour compression cycles with ammonia used as a volatile secondary refrigerant
 - dual stage vapour compression cycles with multiple (>2) saturation temperature levels
 - automatic defrost principles, including off-cycle air defrost, ambient air defrost, hot gas defrost, electric defrost and water defrost
 - selection and sizing of ammonia pumps for liquid overfeed systems
 - selection and sizing of high pressure and low-pressure vessels
 - refrigerant pipe sizing using ammonia refrigerant
 - selection of suitable refrigerant oil

- ammonia refrigeration system components and piping:
 - corrosion and material selection:
 - materials compatibility table
 - thermal and other properties of materials in use
 - pipe material and jointing methods/materials
 - compressors
 - pumps, impellers and seals
 - isolation and control valves
 - heat exchangers
 - pipe and insulation materials, pipe stresses and pipe suspension methods:
 - mild steel pipe
 - stainless steel pipe
 - sharp tested pipe
 - post-installation insulation (in situ foaming, formed insulation and closed cell flexible insulation)
 - pre-insulated pipe material
 - vapour barrier – importance and maintenance
 - heat exchangers:
 - finned air coolers or evaporators - induced draught; forced draught; stainless steel/aluminium; mild steel galvanized; all aluminium; stainless steel/AlMg3; all stainless steel; description of what materials are used where and for what reason; various refrigerant feed methods including advantages/disadvantages i.e. top feed, bottom feed, vertical up flow/down flow of air; fin spacing; fin thickness and impact of geometry on fluid pressure drops
 - condensers – evaporative, air cooled, air cooled adiabatically assisted, water cooled shell and tube, water cooled plate/plate, water cooled plate and shell, cascade shell and tube, cascade plate/plate, cascade plate and shell, material selection for condensers, and importance of discharge temperature for condenser design
 - cooling towers
 - intercoolers and economisers of the closed type, sizing of liquid sub-cooling coils and tube bundles
 - liquid coolers or evaporators – plate/plate, plate/shell, shell and tube, material selections, refrigerant feed methods and oil management
 - screw compressor oil coolers – plate/plate type, shell and tube type, water cooled, refrigerant cooled and surface enhancement options
 - heat recovery – shell and tube de-superheaters, plate/plate de-superheaters and heat recovery condensers of various types
 - system control and monitoring:
 - compressor capacity control – pressure and temperature signals
 - room temperature and humidity control – understanding the principle of cooling and re-heating air streams to control absolute moisture contents

- control of condensers – optimisation of overall plant C.O.P
- floating condensing pressures
- control of fluid temperatures within the system – oil, secondary refrigerants and sub-cooling
- control of flows – thermostatic expansion valves, low pressure floats, high pressure floats, motorised valves, electronic expansion valves, hand regulating valves, and oil return systems between compressor oil separators and compressors
- pressure controllers - evaporating pressure controllers, thermostatic controllers, hot gas bypass valves, crankcase pressure regulators, overflow valves, ammonia pump pressure control, flow controllers and defrost pressure controllers
- defrost control
- programmable logic controller (PLC) control systems
- supervisory control and data acquisition (SCADA) systems
- water treatment and desiccant dehumidifiers:
 - condenser water treatment – purpose and legislative requirement
 - treatment of secondary refrigerant loops including monitoring
 - desiccant dehumidifiers and their role in infiltration minimisation, defrost control and energy savings
- equipment selection:
 - use computer software and manufacturers’ data to select major components of an ammonia refrigeration plant
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0015 Design carbon dioxide refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design carbon dioxide (CO²) refrigerated systems.

It includes applying refrigeration systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system design.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0016 Design commercial refrigeration systems and select components

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

- UEECD0019 Fabricate, assemble and dismantle utilities industry components
- UEECD0042 Solve problems in ELV single path circuits
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design CO² refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Scope of the refrigeration system is determined from design specifications and/or consultations with relevant person/s
 - 1.3 Safety and system are identified, obtained and applied in accordance with relevant industry standards
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
 - 1.5 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design CO² refrigeration systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant CO² refrigeration system analysis, components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the installation specifications
 - 2.4 Equipment required is selected in accordance with the design specifications and workplace procedures
 - 2.5 Location of components is documented in accordance workplace procedures and operation of system functions
 - 2.6 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.7 System design is documented for submission to relevant person/s for approval
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for design**
- 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures

- 3.3** Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing CO₂ refrigeration systems must include at least the following:

- two of the following:
 - two sub-critical or
 - two trans-critical or
 - one sub-critical and one trans-critical
- major components:
 - cooler
 - condenser
 - compressor
 - evaporator
- associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ187A Design carbon dioxide refrigerated systems.

Assessment Requirements for UEERA0015 Design carbon dioxide refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing carbon dioxide (CO²) refrigeration systems
- preparing to design CO² refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, and performance criteria and range of conditions and include knowledge of:

- CO² refrigeration system design requirements, components and piping design requirements, safe working practices and relevant standards, codes and regulations, including:
 - technical standards, regulations and codes for carbon dioxide refrigeration systems:
 - standard philosophy and format
 - standards, regulations and codes that apply to CO₂ refrigeration systems
 - equipment manufacturer's specifications
 - CO² refrigeration system design requirements:
 - possible areas of applications of CO₂ refrigeration systems:
 - mobile air conditioner
 - heat pump water heater

- commercial refrigeration
- thermodynamic properties of CO₂:
 - CO₂ phase diagram
 - CO₂ properties tables and chart
- conventional refrigeration cycle versus CO₂ refrigeration cycle:
 - T-s and p-h diagram representations
 - isentropic efficiency
 - volumetric efficiency
- types of CO₂ refrigeration system configurations:
 - sub-critical operation
 - trans-critical operation
 - cascade systems
- performance analysis of CO₂ refrigeration systems
 - sub-critical cycle
 - trans-critical cycle
 - cascade systems
- CO₂ refrigeration system components and piping:
 - design preliminaries:
 - system operating parameters
 - project specifications
 - equipment selection criteria
 - selection tables, charts and catalogues
 - heat exchanger selection:
 - selection of evaporators
 - selection of condensers
 - selection of coolers
 - compressor selection
 - liquid expansion devices selection
 - system load balance point
 - refrigeration line design and sizing
 - automatic controls
 - safety devices
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0016 Design commercial refrigeration systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design commercial refrigeration systems and select components.

It includes applying processes and methods of refrigeration and food storage technology, refrigeration system components and piping, and safety and regulatory requirements. It also includes following design specifications and customer requirements, documenting system designs and obtaining approval for engineering computer applications design.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

- UEECD0019 Fabricate, assemble and dismantle utilities industry components
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design commercial refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS procedures are identified, obtained and implemented in accordance with workplace procedures

- 1.2 Scope of the refrigeration system is identified from design specifications
 - 1.3 System safety, regulatory and compliance requirements are identified and applied
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameters of the system in accordance with relevant documentation
 - 1.5 Design development work is planned in consultation with relevant person/s involved to meet scheduled timelines
- 2 Design commercial refrigeration systems**
- 2.1 WHS/OHS risk control measures and procedures are followed in accordance with workplace procedures
 - 2.2 Relevant refrigeration, food storage, technology refrigeration system components, piping and performance standards are applied to the system design in accordance with relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4 Equipment required is selected in accordance with design specifications and workplace procedures
 - 2.5 Location of components in the system is documented in accordance with workplace procedures and operation of system functions
 - 2.6 System design draft is checked for compliance in accordance with design brief and relevant industry standards
 - 2.7 System design is documented and submitted to relevant person/s for approval in accordance with workplace procedures
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for commercial refrigeration systems design**
- 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace

procedures

- 3.3 Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
- 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing commercial refrigeration systems must include at least the following:

- two different commercial refrigeration systems with one of the following:
 - condenser
 - compressor
 - evaporator
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ132A Design commercial refrigeration systems and select components.

Assessment Requirements for UEERA0016 Design commercial refrigeration systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing commercial refrigeration systems
- preparing to design commercial refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commercial refrigeration system design, safe working practices and relevant standards, codes and regulations, including:
 - food spoilage and possible causes:
 - physical damage
 - animal activity
 - chemical breakdown
 - enzyme activity
 - microorganisms
 - effects of temperature change
 - effects of humidity change

- effects of freezing on fresh produce
- effects of slow freezing time
- effect of refreezing
- food preservation:
 - removing or taking out a reactant
 - removing or inactivating the catalyst
 - reducing temperature
 - changing the reaction system
 - irradiation
- microorganisms:
 - conditions for growth
 - potentially hazardous foods
 - cross-contamination
- identification of food spoilage:
 - recognition and suggest possible cause
 - physical damage
 - animal activity
 - chemical breakdown
 - enzyme activity
 - microorganisms
- types of heat processing techniques:
 - heat processing using steam and water
 - blanching
 - pasteurisation
 - sterilisation
 - evaporation
 - heat processing using hot air
 - dehydration
 - baking and roasting
- types of chilling processing techniques:
 - chilling and controlled atmosphere storage
 - freezing
 - freeze drying and freeze concentration
 - modified atmosphere combined with low temperature cryovac
- equipment manufactures specifications and practices
- refrigeration system components and piping selection, safe working practices and relevant standards, codes and regulations, including:
 - relevant industry practices:
 - AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - AS/NZS 3666 Air-handling and water systems of buildings

- ozone protection regulations
- IIR ammonia data book
- ANSI/IIR standards
- ANSI/ASHRAE mechanical refrigeration and IIR
- bulletins and standards
- equipment manufacturer's specifications and practices
- calculation of capacity in heat exchangers:
 - $Q = UA (LMTD)$
 - $Q = mc\Delta t$
 - $Q = m \Delta h$
- evaporators:
 - commercial types and applications
 - coil bypass factor
 - effects of evaporator TD on space humidity
 - effects of air circulation on product conditions
 - selection criteria and selection tables
- condensers:
 - commercial types and applications
 - effects of ambient conditions
 - condenser control
 - heat rejection factor
 - condenser TD
 - selection criteria and selection tables
- compressors:
 - types and applications
 - capacity
 - displacement
 - volume flow rate
 - theoretical capacity
 - total volumetric efficiency
 - effect of operating conditions, including suction
 - pressure drop and superheating
 - actual capacity
 - power
 - theoretical requirement
 - effects of operating conditions
 - actual requirements
 - post defrost loads
 - pull down torque requirements, high and medium

- and low back pressure compressors
- selection tables, motor selection
- liquid expansion devices:
 - types, operation and applications
 - effects from sub-cooling
 - distributor types, operation and applications
 - selection tables
 - system load balance point
 - graphical representation
 - line sizing and design
 - velocity tables
 - pressure drop in lines and fittings
 - oil migration stabilisation
 - refrigerant velocity
 - effect of varying system capacity
 - oil traps
 - risers
 - double risers
 - liquid migration
 - design for parallel components and multiplex systems
- automatic controls:
 - fin spacing, suction temp to evaporator suction
 - hot-gas bypass valves
 - electronic control of valves and programmable logic controllers (PLC)
 - refrigerant regulating valves
 - solenoid valves
 - condenser pressure regulating valves
 - evaporator pressure regulating valves
 - crankcase pressure regulating valves
 - cycling controls
 - pressure-stats
 - thermostats
 - defrost controls
 - monitoring and alarm controls
 - refrigeration automation systems
 - control strategies
 - control modes
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements

- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0017 Design complex air conditioning systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design complex air conditioning systems and select equipment.

It includes applying processes and methods of complex air conditioning systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0022 Design heating, ventilation and air conditioning (HVAC) systems and select components

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design complex air conditioning systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for the work

- 1.3 Scope of the refrigeration system is determined from the design brief and/or consultations with relevant person/s
 - 1.4 Design development work is planned in accordance with workplace procedure for timelines in consultation with others involved
- 2 Design complex air conditioning systems**
 - 2.1 Relevant complex air conditioning processes and methods are applied to the design
 - 2.2 Alternative concepts for design are evaluated in accordance with the design brief
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.5 System design is documented for submission to relevant person/s for approval
 - 2.6 Unplanned events are dealt with in accordance with problem solving techniques and workplace procedures
- 3 Obtain approval for complex air conditioning systems design**
 - 3.1 System design is presented to customer and/or relevant person/s
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
 - 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing a complex air conditioning system must include at least the following:

- one major component, including:
 - air handling plant
 - compressors
 - condenser
 - evaporators
- circuits and/or systems
- associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ143A Design complex air conditioning systems and select equipment.

Assessment Requirements for UEERA0017 Design complex air conditioning systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing complex commercial refrigeration system
- preparing to design complex air conditioning system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex heating, ventilation and air conditioning (HVAC) system design, safe working practices and relevant standards, codes and regulations, including:
 - HVAC load estimating of multiple zone and multi-storey buildings:
 - system design parameters:
 - human comfort
 - system requirements in accordance with AS 1668 The use of ventilation and air conditioning in buildings SAA refrigeration code
 - heat transfer calculations for complex structures and building components
 - heat and radiation transfer calculations through complex glass structures including various internal and external shading devices
 - indoor air quality

- olfs and decipols
- complex shading:
 - solar data, azimuth and altitude angles
 - shading from adjacent structures
- computer software:
 - heat load estimating
 - building thermal performance analysis and simulation software
- advanced psychrometrics:
 - complex psychrometric processes:
 - revise sensible cooling and heating and evaporative (adiabatic) cooling
 - cooling and dehumidification
 - cooling and dehumidification with high latent load
 - cooling and dehumidification all outdoor air
 - cooling and dehumidification all outdoor air with dehumidified air requirements less than supply air
 - cooling with evaporative humidification
 - cooling with near isothermal humidification
 - spray process to include cooling and dehumidification, cooling and humidification with heated spray water, heating and humidification
 - partial load processes
 - reheat
 - bypass of, RA only and mix of RA and OA
 - variable air volume
 - variable coil effective surface temperature
 - split coil, horizontal, vertical and intertwined
 - system performance:
 - saturation efficiency of sprayers
 - system capacity calculated from air quantity and enthalpy change
 - required plant capacity and airflow rates:
 - effects of coil bypass factor and ADP
 - calculation of dehumidified air quantity, using both TSH and ERSH methods
 - recap on psychrometrics formulae and charts:
 - properties of air
 - gas constants
 - derivation of air constants
 - combined gas laws
 - Dalton's law of partial pressures
 - carrier's equation
 - psychrometric property tables
 - psychrometric charts

- air mixing equations
- air quantity equations
- indirect evaporative coolers
- analysis of cooling coil selection and performance
- psychrometric analysis of:
 - air conditioning in tropics
 - all outdoor air
 - LCV/HWF systems
 - psychrometric analysis using equations and tables
- air conditioning system design:
 - design parameters for multi-storey building:
 - customer and objective
 - customer concept of environment desired
 - economic
 - client brief
 - relevant design criteria:
 - building purpose, location, orientation and shape
 - external environment ambient conditions
 - internal load diversity
 - thermal capacity behaviour
 - thermal load (full and partial)
 - zoning and building usage:
 - space and building
 - occupancies, single purpose and multi-purpose
 - system selection criteria:
 - economics
 - environment
 - control requirements
 - existing structures
 - new structures
 - system components
 - space for equipment and system
 - selection of appropriate system
 - system and applications:
 - design features, engineering procedures and controls
 - direct expansion - self-contained room/zone, heat pump, multi-zone fan-coils and central station
 - all water - room fan-coil
 - all-air - constant volume variable temperature, face and bypass, reheat, constant temperature variable volume, constant volume induction, dual-duct and

- dual-conduit
- air water - induction unit and primary air fan-coil
- HVAC energy conservation techniques:
 - heat recovery systems
 - night cycle
 - optimum stop/start
 - purge cycles
 - chiller/boiler/cooling tower sequencing
 - economy cycles (based on temperature or enthalpy)
 - supply air reset
 - supply water reset
 - condenser water temperature reset
 - power demand control
 - load limiting
 - load shedding
 - set point relaxation
 - ventilation cycles
 - plant - fixed OA to economy, boiler to electric reheat and constant volume to variable air volume (VAV)
 - cost-benefit (payback)
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0018 Design complex commercial refrigeration systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design complex commercial refrigeration systems and select equipment.

It includes applying processes and methods of complex commercial refrigeration systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0016 Design commercial refrigeration systems and select components

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design complex commercial

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied

refrigeration system

- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Scope of the proposed refrigeration system is determined from the design brief and/or consultations with relevant person/s
- 1.4** Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design complex commercial refrigeration system**
 - 2.1** Relevant commercial refrigeration processes and methods are applied to the design
 - 2.2** Alternative concepts for design are evaluated in accordance with the design brief
 - 2.3** Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4** System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.5** System design is documented and submitted to relevant person/s for approval in accordance with workplace procedures
 - 2.6** Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for complex commercial refrigeration system design**
 - 3.1** System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2** Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3** Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
 - 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Designing a complex commercial refrigeration system must include at least the following:
- one multiple major component, including:
 - compressors
 - condenser
 - evaporators
 - circuits and/or systems
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ141A Design complex commercial refrigeration systems and select equipment.

Assessment Requirements for UEERA0018 Design complex commercial refrigeration systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing complex commercial refrigeration system
- preparing to design complex commercial refrigeration system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex commercial refrigeration system design, safe working practices and relevant standards, codes and regulations, including:
 - commercial refrigeration system types:
 - medium and low temperature applications
 - operating conditions
 - system operating and service requirements
 - refrigerant types
 - components
 - multiple evaporator systems
 - multiple temperature systems

- multiple compressor (rack) systems
- two stage compressors
- multiplex systems
- defrost requirements and methods
- electric defrost systems
- hot gas defrost systems
- cool gas defrost systems
- manufacturer's data:
 - rating tables
 - selection tables
 - catalogues
- operating characteristics:
 - effects of temperature glide with blended refrigerants
 - p-H charts
 - refrigerating effect
 - heat of compression
 - heat rejected on high side of the system
 - required mass flowrate of refrigerant
 - volume flowrate at various points in system
 - theoretical compressor power
 - required condenser capacity
- refrigerant flow controls:
 - refrigerant regulating valves
 - solenoid valves
 - expansion valves
 - pressure regulating valves
- automatic systems controls:
 - cycling controls
 - pressure-stats
 - thermo-stats
 - defrost controls
 - monitoring and alarm controls
 - energy management systems
 - refrigeration automation system
 - control strategies
 - control modes
- system design:
 - required cooling capacity per day
 - running time and required system cooling capacity

- system capacity control for peak and low load
- refrigeration system diagrams
- refrigerant, equipment, major component, controls, piping and accessory selection
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational suitable situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0019 Design complex control systems for refrigeration or heating, ventilation, air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design complex control systems for heating, ventilation and air conditioning/refrigeration (HVAC/R) systems.

It includes applying processes and methods of complex control systems for a HVAC/R system, safety and relevant industry standards; developing alternative design schemes based on design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0021 Design control systems for refrigeration or heating, ventilation and air conditioning systems

UEERA0060 Produce HVAC/R control system diagrams

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design complex HVAC/R control systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3** Scope of the HVAC/R system is determined from the

- design brief and/or consultations with relevant person/s
- 1.4** Design development work is planned in accordance with workplace procedure for timelines in consultation with others involved
- 2 Design complex HVAC/R control systems**
- 2.1** Relevant complex control processes and methods are applied to the design
- 2.2** Alternative concepts for design are evaluated in accordance with the design brief
- 2.3** Safety, functionality and budgetary considerations are incorporated in the design specifications
- 2.4** System design draft is checked for compliance in accordance with the design brief and relevant industry standards
- 2.5** System design is documented for submission to relevant person/s for approval
- 2.6** Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for complex HVAC/R control systems design**
- 3.1** System design is presented to customer and/or relevant person/s in accordance with workplace procedures
- 3.2** Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
- 3.3** Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing control systems for HVAC/R must include at least the following:

- two different complex control systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ146A Design complex control systems for refrigeration or heating, ventilation, air conditioning systems.

Links

Assessment Requirements for UEERA0019 Design complex control systems for refrigeration or heating, ventilation, air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing complex heating, ventilation and air conditioning/refrigeration (HVAC/R) control systems
- preparing to design complex HVAC/R control systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex HVAC/R control system design, safe working practices and relevant standards, codes and regulations, including:
 - advanced HVAC/R control system design:
 - control diagrams:
 - Australian standard and non-standard symbols as used in a variety of typical HVAC/R systems
 - control diagrams
 - electric/electronic control diagrams
 - electrical installation documents

- pneumatic diagrams
- direct digital control (DDC) diagrams
- controls/electrical power circuit interface
- nomographs
- extraction of specific information relating to the operation and control of plant from a variety of typical HVAC/R control diagrams
- development of control diagrams to required standards given specific system operating parameters
- control design requirements:
 - standard and statutory requirements
 - economy of operation (energy management)
 - the desired or most appropriate system operating logic for a specified HVAC/R system
 - appropriate mode of control for a specified HVAC/R system
 - control system type selection for specific applications with due regard to plant size, application, operating environment, available control power supply options, economy and computability to existing or proposed plant and control system
 - components required to assemble and operate the control system of a specified HVAC/R system
- HVAC/R system energy conservation methods:
 - HVAC/R system control:
 - night cycle
 - optimum stop/start
 - purge cycles
 - chiller/boiler/cooling tower sequencing
 - economy cycles (based on temperature or enthalpy)
 - supply air reset
 - condenser water temperature reset
 - electrical load control:
 - power demand control
 - load limiting
 - load shedding
 - set point relaxation
 - ventilation cycles
- building management systems:
 - functions of a building management system:
 - autonomous functions
 - input/output (I/O)
 - general I/O
 - installation management items
 - energy management

- risk management
- information processing
- objectives
- building running costs
- smoke control as per AS 1668.1 The use of ventilation and air conditioning in buildings - Fire and smoke control in buildings
- building management system hardware:
 - system architecture
 - communication devices
 - substations
 - personal computers
 - interfaces with other systems
- I/O functions:
 - digital - I/O
 - digital output with status feedback
 - analogue input/output
 - sensors
 - alarms
- control sequences
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0020 Design complex industrial refrigeration systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design complex industrial refrigeration systems and select equipment.

It includes applying system processes and methods of industrial refrigeration systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0025 Design industrial refrigeration systems and select components

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0016 Design commercial refrigeration systems and select components

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning

installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to design complex industrial refrigeration system**
 - 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
 - 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
 - 1.3 Scope of the refrigeration system is determined from the design brief and/or consultations with relevant person/s
 - 1.4 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design complex industrial refrigeration system**
 - 2.1 Relevant industrial refrigeration system processes and methods are applied to the design
 - 2.2 Alternative concepts for design are evaluated in accordance with the design brief
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.5 System design is documented and submitted to relevant person/s for approval in accordance with workplace procedures
 - 2.6 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for complex industrial refrigeration system design**
 - 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
 - 3.4 Quality of work is monitored in accordance with

workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing a complex industrial refrigeration system must include at least the following:

- one multiple major component, including:
 - compressors
 - condenser
 - evaporators
 - circuits and/or systems
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ142A Design complex industrial refrigeration systems and select equipment.

Assessment Requirements for UEERA0020 Design complex industrial refrigeration systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- dealing with unplanned events
- applying relevant industrial refrigeration system processes and methods
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing complex commercial refrigeration system
- preparing to design complex industrial refrigeration system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- complex industrial refrigeration system design, safe working practices and relevant standards, codes and regulations including:
 - AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - ANSI/IIAR standards
 - ANSI/ASHRAE standards
 - IIAR bulletins
- moderate and low temperature industrial refrigeration systems:
 - direct, flooded and pumped liquid recirculation systems
 - evaporators
 - multi-staged compression

- direct staging
- cascade staging
- compound compressors
- de-superheaters and liquid injection
- direct expansion intercoolers
- open and closed intercoolers
- basic designs of accumulators/intercooler vessels
- oil cooling methods
- oil stabilisation, return and oil recovery in flooded systems
- multiple evaporators and multiple compressors:
 - parallel evaporators
 - multiple temperature systems
 - evaporator pressure regulators
 - temperature control methods
 - parallel compressors
 - pipe work layout
 - methods of establishing pressure drop in dry and wet suction lines
- indirect refrigeration systems:
 - classification according to AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - applications
 - evaporators
 - heat exchangers, types, construction and selection
 - secondary refrigerants
 - brines
 - antifreeze solutions
- flooded systems:
 - applications
 - equipment
 - accumulators
 - level controls
 - liquid recirculation pumps
 - liquid pressure relief valve
- cryogenic systems:
 - applications and equipment
 - system components
 - refrigerants
 - design safety
 - economics
 - cascade systems

- basic control sequences:
 - maintaining evaporator conditions
 - staging and suction pressure control
 - maintaining condenser conditions
 - control of intermediate pressure, methods of industrial refrigeration compressor capacity control
- system design:
 - required cooling capacity per day
 - running time and required system cooling capacity
 - system capacity control for peak and low load
 - refrigeration system diagrams
 - refrigerant, equipment, major component, controls, piping and accessory selection
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0021 Design control systems for refrigeration or heating, ventilation and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design control systems for heating, ventilation and air conditioning/refrigeration (HVAC/R) systems.

It encompasses applying processes and methods of HVAC/R control systems components, safety and relevant industry standards. It also includes following design specifications and customer requirements, and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0060 Produce HVAC/R control system diagrams

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design control systems for HVAC/R

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Scope of the HVAC/R system is determined from design specifications and/or in consultations with relevant person/s
- 1.3** Safety and systems are identified, obtained and applied in accordance with relevant industry standards

-
- 1.4** Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
- 1.5** Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design control systems for HVAC/R**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
- 2.2** Relevant control system components are applied to developing the system design in accordance with workplace procedures and relevant industry standards
- 2.3** Safety, functionality and budgetary considerations are incorporated into the design
- 2.4** Control equipment required is selected in accordance with design specifications and workplace procedures
- 2.5** Location of components are documented in accordance with workplace procedures and operation of system functions
- 2.6** Control system design draft is checked for compliance in accordance with the design brief and relevant industry standards
- 2.7** Control system design is documented and submitted to relevant person/s for approval
- 2.8** Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for control systems for HVAC/R systems design**
- 3.1** Control system design is presented and explained to customer and/or relevant person/s
- 3.2** Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
- 3.3** Final design is documented and approval obtained from relevant person/s
- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing control systems for HVAC/R must include at least the following:

- two different HVAC/R systems, including one of the following:
 - condenser
 - compressor
 - evaporator
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ135A Design control systems for refrigeration or heating, ventilation and air conditioning systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0021 Design control systems for refrigeration or heating, ventilation and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing control systems for heating ventilation and air conditioning/refrigeration (HVAC/R) systems
- preparing to design control systems for HVAC/R.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC/R design control systems, system operating requirements, integration of electrical, electronic, pneumatic and digital controls, safe working practices and relevant standards, codes and regulations, including:
 - control systems:
 - control terminology
 - control system characteristics
 - control system diagrams and symbols
 - types of control equipment:
 - electrical:

- classification of circuits
- two position control
- floating control
- sensors
- controllers
- flow control devices
- control systems diagrams
- electronic:
 - operating principles
 - sensors
 - controllers
 - control system diagrams
- pneumatic:
 - control fundamentals:
 - pneumatic control terminology
 - definitions
 - control basics:
 - air supply
 - pilot bleed system
 - signal amplifier
 - sensing elements
 - relays and switches
 - air supply system:
 - air drying methods
 - pressure regulating valves
 - pressure reducing valves
 - system controllers:
 - thermostats
 - sensors
 - actuators
 - dampers
 - system control configuration:
 - sequence control
 - limit control
 - changeover control
 - compensated control
 - recycling control
 - pneumatic – electric control
 - control systems

- digital control systems:
 - computer-based control fundamentals
 - definitions
 - principles
- controller configuration:
 - equipment
 - zone level controllers
 - system level controllers
- controller software:
 - operating software
 - application software
- controller programming:
 - system diagrams
 - control diagrams
 - configuration
 - programming
 - initialisation
 - EMS and BMS
 - supervisory control and data acquisition (SCADA) system
 - lan and Bacnet
- applications:
 - refrigeration systems
 - HVAC systems:
 - air handling system controls
 - ventilation
 - heating
 - building airflow system control
 - airflow control
 - single and multi-zones
 - chiller boiler and distribution system
 - logic analysis
 - energy management
 - asset management
 - life cycle
 - supervisory:
 - introduction building management
 - remote building control interface and modem
- problem-solving techniques
- relevant industry standards, codes of practice, regulations and industry practices

- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0022 Design heating, ventilation and air conditioning (HVAC) systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design heating, ventilation and air conditioning (HVAC) systems and select components.

It includes applying processes and methods of HVAC systems, components and piping, safety and relevant industry standards. It also includes following design specifications and customer requirements, and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design HVAC systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied

1.2 Scope of the refrigeration system is determined from design specifications and/or in consultations with

relevant person/s

- 1.3** Safety and systems are identified, obtained and applied in accordance with relevant industry standards
 - 1.4** Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
 - 1.5** Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design HVAC systems**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Relevant refrigeration and food storage technology, refrigeration system components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3** Safety, functionality and budgetary considerations are incorporated in the installation design
 - 2.4** Equipment required is selected in accordance with design specifications and workplace procedures
 - 2.5** Location of components are documented in accordance with workplace procedures and operation of system functions
 - 2.6** System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.7** System design is documented and submitted to relevant person/s for approval
 - 2.8** Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for HVAC design**
- 3.1** System design is presented and explained to customer and/or relevant person/s
 - 3.2** Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3** Final design is documented and approval obtained from

relevant person/s

- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing HVAC systems must include at least the following:

- two different HVAC systems, including at least one of the following:
 - condenser
 - compressor
 - evaporator
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ134A Design heating, ventilation and air conditioning (HVAC) systems and select components.

Assessment Requirements for UEERA0022 Design heating, ventilation and air conditioning (HVAC) systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing heating, ventilation and air conditioning (HVAC) systems
- preparing to design HVAC systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commercial HVAC system design, safe working practices and relevant standards, codes and regulations, including:
 - design parameters for single-storey buildings (e.g. offices, restaurants, hotels and bars):
 - customer and objective
 - customer concept of environment desired
 - economics
 - client brief
 - relevant design criteria:
 - building purpose, location, orientation and shape

- external environment ambient conditions
- internal load diversity
- thermal capacity behaviour
- thermal load (full and partial)
- zoning and building usage:
 - space and building
 - occupancies, single purpose and multi-purpose
- system selection criteria:
 - economics
 - environment
 - control requirements
 - existing structures
 - new structures
 - system components
 - space for equipment and system
 - selection of appropriate system, equipment, ductwork and components
- systems and applications:
 - design features, engineering and selection procedures for direct expansion air conditioning systems:
 - air conditioning split systems and package units
 - free blow and ducted fan coil units
 - cooling, heat pump and electric heating
 - air conditioning system components and piping selection
- air conditioning system components and piping selection, safe working practices and relevant standards, codes and regulations, including:
- relevant industry practices:
 - AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - AS/NZS 3666 Air-handling and water systems of buildings
 - ozone protection regulations
 - ANSI/IIAR standards
 - ANSI/ASHRAE mechanical refrigeration and IIAR
 - bulletins and standards
 - equipment manufacturer's specifications and practices
- calculation of capacity in heat exchangers:
 - $Q = UA (LMTD)$
 - $Q = mc\Delta t$
 - $Q = m \Delta h$
- evaporators
 - commercial types and applications
 - coil bypass factor

- effects of evaporator TD on space humidity
- effects of air circulation on product conditions
- selection criteria and selection tables
- condensers:
 - commercial types and applications
 - effects of ambient conditions
 - condenser control
 - heat rejection factor
 - condenser TD
 - selection criteria and selection tables
- compressors
 - types and applications
 - capacity
 - displacement
 - volume flow rate
 - theoretical capacity
 - total volumetric efficiency
 - effect of operating conditions, including suction
 - pressure drop and superheating
 - actual capacity
 - power
 - theoretical requirement
 - effects of operating conditions
 - actual requirements
 - post defrost loads
 - pull down torque requirements, high and medium and low back pressure compressors
 - selection tables and motor selection
- liquid expansion devices:
 - types, operation and applications
 - effects from sub-cooling
 - distributor types, operation and applications
 - selection tables
 - system load balance point encompassing:
 - graphical representation
 - line sizing and design
 - velocity tables
 - pressure drop in lines and fittings
 - oil migration stabilisation

- refrigerant velocity
- effect of varying system capacity
- oil traps
- risers
- double risers
- liquid migration
- design for parallel components and multiplex systems
- automatic controls:
 - fin spacing, suction temp to evaporator suction
 - hot-gas bypass valves
 - electronic control of valves and programmable logic controllers (PLC)
 - refrigerant regulating valves
 - solenoid valves
 - condenser pressure regulating valves
 - evaporator pressure regulating valves
 - crankcase pressure regulating valves
 - cycling controls
 - pressure-stats
 - thermostats
 - defrost controls
 - monitoring and alarm controls
 - refrigeration automation systems
 - control strategies
 - control modes
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0023 Design hydrocarbon refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to Design hydrocarbon refrigerated systems.

It includes applying processes and methods of hydrocarbon refrigeration systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system design.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0016 Design commercial refrigeration systems and select components

UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0042 Solve problems in ELV single path circuits
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design hydrocarbon refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied

- 1.2 Scope of the refrigeration system is determined from design specifications and/or in consultation with relevant person/s
 - 1.3 Safety and systems are identified, obtained and applied in accordance with relevant industry standards
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
 - 1.5 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design hydrocarbon refrigeration systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant hydrocarbon refrigeration system analysis, hydrocarbon refrigeration system components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the installation design
 - 2.4 Equipment is selected in accordance with the design specifications and workplace procedures
 - 2.5 Location of components is documented in accordance workplace procedures and operation of system functions
 - 2.6 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.7 System design is documented for submission to relevant person/s for approval
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for hydrocarbon refrigeration systems design**
- 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures

- 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
- 3.3 Final design is documented and approval obtained from relevant person/s
- 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing hydrocarbon refrigeration systems must include at least the following

- two different hydrocarbon refrigerated systems

Each hydrocarbon refrigerated system design must include at least one of the following:

- major component, including:
 - condenser
 - compressor
 - evaporator
- associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ177A Design hydrocarbon refrigerated systems.

Assessment Requirements for UEERA0023 Design hydrocarbon refrigerated systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing hydrocarbon refrigeration systems
- preparing to design hydrocarbon refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- hydrocarbon refrigeration systems design, components and piping design requirements, safe working practices and relevant standards, codes and regulations, including:
 - technical standards, regulations and codes for hydrocarbon refrigeration systems:
 - standard philosophy and format
 - standards, regulations and codes that apply to hydrocarbon refrigeration systems
 - equipment manufactures specifications
 - hydrocarbon refrigeration system design requirements:
 - applications of hydrocarbon refrigeration systems:
 - domestic refrigerators
 - commercial refrigeration

- thermodynamic properties of hydrocarbon
 - hydrocarbon phase diagram
 - hydrocarbon properties tables and chart
- hydrocarbon refrigeration cycle:
 - Ph diagram representation
 - expansion, evaporation, compression and condensation processes
- performance analysis of hydrocarbon refrigeration systems:
 - refrigerating effect
 - heat of rejection
 - heat of compression
 - coefficient of performance
 - effects of suction superheating on cycle efficiency
 - effects of liquid sub-cooling on cycle efficiency
- actual hydrocarbon refrigeration cycles:
 - superheating inside and outside the refrigerated space
 - liquid-suction heat exchangers
 - pressure drop in piping due to friction and dynamic losses
- hydrocarbon refrigeration system components and piping:
 - design preliminaries:
 - system operating parameters
 - project specifications
 - equipment selection criteria
 - selection tables, charts and catalogues
 - materials used with hydrocarbon refrigerants
 - heat exchanger selection:
 - selection of evaporators
 - selection of condensers
 - compressor selection
 - liquid expansion devices selection
 - system load balance point
 - refrigeration line design and sizing
 - automatic controls
 - safety:
 - safety data sheets (SDS)/material safety data sheets (MSDS) for hydrocarbon refrigerants
- problem-solving techniques
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0024 Design hydronic systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design hydronic systems and select equipment.

It includes applying processes and methods of hydronic systems, safety and relevant industry standards; developing alternative design schemes based on a design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

Or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design hydronic systems and select equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 Scope of the proposed hydronic system is determined from the design brief and/or consultations with relevant person/s

- | | | |
|---|------------|--|
| | 1.4 | Design development work is planned in accordance with workplace procedure for timelines in consultation with others involved |
| 2 Design hydronic systems and select equipment | 2.1 | Relevant hydronic system processes and methods are applied to the design |
| | 2.2 | Alternative concepts for design are evaluated in accordance with the design brief |
| | 2.3 | Safety, functionality and budgetary considerations are incorporated in the design specifications |
| | 2.4 | System design draft is checked for compliance in accordance with the design brief and relevant industry standards |
| | 2.5 | System design is documented for submission to relevant person/s for approval |
| | 2.6 | Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures |
| 3 Obtain approval for hydronic system design and equipment selection | 3.1 | System design is presented to customer and/or relevant person/s |
| | 3.2 | Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures |
| | 3.3 | Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures |
| | 3.4 | Quality of work is monitored in accordance with workplace procedures and relevant industry standards |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing hydronic systems must include at least the following:

- two different hydronic systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ145A Design hydronic systems and select equipment.

Assessment Requirements for UEERA0024 Design hydronic systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- designing hydronic systems and selecting equipment
- preparing to design hydronic systems and select equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- heating, ventilation and air conditioning/refrigeration (HVAC/R) hydronic system design, safe working practices and relevant standards, codes and regulations, including:
 - hydronic system design fundamentals:
 - principles of fluid flow
 - properties of fluids
 - flow of ideal fluids
 - fluid flow equipment
 - Bernoulli Theorem
 - fluid flow in pipes
 - pressure loss and static head – calculation:

- flow throughout system
- pressure throughout system
- friction losses
- pressure loss charts for: copper, steel and unplasticised polyvinyl chloride (uPVC)
- dynamic losses
- fitting pressure losses
- fitting interaction
- total losses
- calculating system (static and dynamic) head
- pump performance and selection:
 - pump classification and types
 - pump performance terminology, discharge, head, power, efficiency, speed and net positive suction head required
 - pump performance curves
 - pump laws
 - system head and 'K' factor
 - balance points
 - energy considerations
 - pump cavitation
 - calculation of net positive suction head available
 - series and parallel operation
- pipe sizing:
 - maximum friction rate
 - erosion and equipment life
 - industry standards
 - recommended system water velocities
 - economic balance - first cost and operating cost
- hot water systems:
 - boilers
 - coils
 - expansion tanks
 - pumps and characteristics curves
 - control valves, types and flow diagrams
 - air purge points
 - water treatment
 - pipe anchors and expansion joints
- chilled water systems:
 - chillers
 - coils
 - expansion tanks

- pumps and characteristics curves
- control valves, types and flow diagrams
- air purge points
- water treatment
- pipe anchors and expansion joints
- HVAC/R hydronic systems:
 - systems operation
 - closed/open systems
 - pump head/lift and static head (high-rise building)
 - system friction losses
 - nett positive suction head
 - system curves
- pumps:
 - types
 - selection criteria
 - performance characteristics
 - bladder tanks
 - coil characteristics
 - heat exchangers: plate, shell and tube, and tube in tube
 - flow measurements: types
 - flow switchers
 - builders: types and performance characteristics
 - cooling towers: elementary cooling thermodynamics and types
- valves - flow control devices:
 - types and applications
 - throttling characteristics
 - flow measurements
 - selection and applications
- hydronic system configuration and design:
 - piping configurations
 - single pipe closed circuit
 - two pipe closed circuit
 - direct return
 - three pipe closed circuit with reversed return
 - three-way diverting valves
 - risers and headers
 - component location
- evaluation of piping configurations:
 - capital cost

- owning and operating costs
- noise vibration
- maintenance
- future expansion
- commissioning and balancing
- operating characteristics
- cavitation
- system pipe sizes:
 - pipe dynamic and friction losses for different materials
 - fitting pressure losses for different materials
 - thermal heat losses
 - bare, insulated and underground pipes
- air conditioning system design
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals

UEERA0025 Design industrial refrigeration systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design industrial refrigeration systems and select components.

It includes applying processes and methods of refrigeration and food storage technology, industrial refrigeration system components and piping, safety and relevant industry standards. It also includes following design specifications and customer requirements, and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0016 Design commercial refrigeration systems and select components

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design industrial refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Scope of the refrigeration system is determined from

- design specifications
- 1.3 Safety and systems are identified, obtained and applied in accordance with relevant industry standards
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameter of the system required in accordance with design specifications and workplace documentation
 - 1.5 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design industrial refrigeration systems**
- 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 2.2 Relevant refrigeration and food storage technology, refrigeration system components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the installation design
 - 2.4 Equipment required is selected in accordance with the design specifications and workplace procedures
 - 2.5 Location of components are documented in accordance with workplace procedures and operation of system functions
 - 2.6 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.7 System design is documented and submitted to relevant person/s for approval
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for industrial refrigeration design**
- 3.1 System design is presented and explained to customer and/or relevant person/s
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures

- 3.3** Final design is documented and approval obtained from relevant person/s
- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing industrial refrigeration systems must include at least the following:

- two different industrial systems with one of the following:
 - condenser
 - compressor
 - evaporator
 - associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ133A Design industrial refrigeration systems and select components.

Assessment Requirements for UEERA0025 Design industrial refrigeration systems and select components

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively,
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing industrial refrigeration systems
- preparing to design industrial refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- industrial refrigeration systems design and component selection, fundamentals, safe working practices and relevant standards, codes and regulations including:
 - relevant industry practices:
 - AS/NZS 1677 Refrigerating systems SAA refrigeration code
 - AS/NZS 3666 Air-handling and water systems of buildings
 - ozone protection regulations
 - IIR ammonia data book
 - ANSI/IIR standards
 - ANSI/ASHRAE mechanical refrigeration and IIR bulletins and standards (list will be provided by Rama)
 - equipment manufacturer's specifications and practices

- operating characteristics:
 - pH charts
 - refrigerating effect, relate back to air and fluid coolers
 - heat of compression, relate back to screw, rotary and reciprocating compressors
 - heat rejected high side of the system, relate back to air cooled, evaporative, and water-cooled condensers
 - variable liquid refrigeration systems and liquid oversee systems
 - required mass flow rate of refrigerant and volume flow rate at various points in system
 - theoretical compressor power
 - required condenser capacity
- major system components:
 - refrigerants, including R717 and R22
 - secondary refrigerants
 - component lubricant refrigerant compatibility
 - evaporators
 - condensers and cooling towers
 - compressors
 - expansion valves
 - interconnecting piping and
 - isolating valves
 - pilot-operated valves
 - defrost system components for air, water, recycled water, hot gas and electric methods
 - refrigerant accumulators and liquid pumps
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0026 Design mechanical ventilation/exhaust systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design mechanical ventilation/exhaust systems and select equipment.

It includes applying processes and methods of mechanical ventilation/exhaust systems, safety and relevant industry standards; developing alternative design schemes based on design brief and customer requirements; and documenting system designs.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0022 Design heating, ventilation and air conditioning (HVAC) systems and select components

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

- 1 Prepare to design mechanical ventilation/exhaust systems and select equipment**

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS processes and procedures for a given work area are identified, obtained and applied

- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
 - 1.3 Scope of the proposed mechanical ventilation/exhaust system is determined from the design brief and/or consultations with relevant person/s
 - 1.4 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design mechanical ventilation/exhaust systems and select equipment**
 - 2.1 Relevant mechanical ventilation/exhaust processes and methods are applied to the design
 - 2.2 Alternative concepts for design are evaluated in accordance with the design brief
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the design specifications
 - 2.4 System design draft is checked for compliance in accordance with the design brief and relevant industry standards
 - 2.5 System design is documented for submission to relevant person/s for approval
 - 2.6 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for mechanical ventilation/exhaust systems design and equipment selection**
 - 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final design is documented and approval obtained from relevant person/s in accordance with workplace procedures
 - 3.4 Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

designing mechanical ventilation and exhaust systems must include at least the following:

- two different mechanical ventilation and exhaust systems

Assessment Requirements for UEERA0026 Design mechanical ventilation/exhaust systems and select equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- developing outlines of alternative designs
- developing the design within the safety, regulatory, functional requirements and budget limitations
- documenting and presenting design effectively
- successfully negotiating design alteration requests
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing mechanical ventilation/exhaust systems and select equipment
- preparing to design mechanical ventilation/exhaust systems and select equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- exhaust systems design, safe working practices and relevant standards, codes and regulations, including:
 - relevant codes and regulations:
 - health and safety
 - noise
 - smoke
 - fire
 - hazard identification
 - system types:
 - applications

- application flow charts
- system requirements
- hazard identification
- effluent types and removal
- relationship with smoke spill systems
- supply air dilution applications
- natural ventilation applications
- fan assisted exhaust applications
- replenishment of exhaust air
- system components
- duct design:
 - static, velocity and total pressure
 - pressure drop
 - fouling
 - transitions
 - elbows
 - fan position and mounting
 - noise and noise attenuation
 - requirements for access and maintenance
 - system integrity
- fan and motor selection:
 - applications
 - suitable fan types
 - motor rating and suitability
 - balancing the fan duct system
 - flame proofing
- filters and filter selection:
 - types and applications
 - capture velocity
- outlet design and location:
 - prevailing winds
 - position relative to air intakes
 - weather and bird proofing
- cycling/operation control:
 - applications
 - code/regulation requirements
 - monitoring of contaminants
 - contaminant detection
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes

- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0027 Design secondary refrigerant systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to design secondary refrigerant systems.

It includes designing secondary refrigerant systems based on a design brief and customer requirements, applying relevant industry standards, selecting components and documenting system design.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0016 Design commercial refrigeration systems and select components

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0042 Solve problems in ELV single path circuits

- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design secondary refrigerant system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Scope of the refrigeration system is determined from

- design specifications and/or in consultation with relevant person/s
- 1.3 Safety and system are identified, obtained and applied in accordance with relevant industry standards
 - 1.4 Work supervisor and/or customer/s are consulted to determine functions and parameters of the system required in accordance with design specifications and workplace documentation
 - 1.5 Design development work is planned in accordance with workplace procedures for timelines in consultation with others involved
- 2 Design secondary refrigerant systems**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant secondary refrigeration system analysis, components and piping are applied to developing the system design in accordance with workplace procedures and relevant industry standards
 - 2.3 Safety, functionality and budgetary considerations are incorporated in the installation specifications
 - 2.4 Equipment is selected in accordance with the design specifications and workplace procedures
 - 2.5 Location of components is documented in accordance workplace procedures and operation of system functions
 - 2.6 System design draft is checked in accordance with the design brief and relevant industry standards
 - 2.7 System design is documented for submission to relevant person/s for approval
 - 2.8 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
- 3 Obtain approval for engineering computer applications design**
- 3.1 System design is presented to customer and/or relevant person/s in accordance with workplace procedures
 - 3.2 Requests for alterations to the design are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3 Final design is documented and approval obtained from

relevant person/s in accordance with workplace procedures

- 3.4** Quality of work is monitored in accordance with workplace procedures and relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing secondary refrigeration systems must include at least the following:

- two of the following:
 - two multi-stage cascade, or
 - two liquid recirculation, or
 - one multi-stage and one liquid recirculation
- major components, including:
 - heat exchanger
 - condenser
 - compressor
 - accumulator
 - pump
- associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ183A Design secondary refrigerant systems.

Assessment Requirements for UEERA0027 Design secondary refrigerant systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding required operating functions and parameters from the design specification
- developing the design within the safety, regulatory and functional requirements and budget limitations
- documenting and presenting design effectively
- negotiating design alteration requests successfully
- obtaining approval for final design
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk controls
- designing secondary refrigeration systems
- preparing to design secondary refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- secondary refrigeration system design, components and piping design, safe working practices and relevant standards, codes and regulations, including:
 - technical standards, regulations and codes for secondary refrigeration systems:
 - environmental and safety considerations in the use and disposal of secondary refrigerants:
 - toxicity and food compatibility
 - flammability
 - environmental effects
 - safe disposal
 - safety data sheets (SDS)/material safety data sheet (MSDS) samples
 - registration requirements for transport and on-site use

- secondary refrigeration systems design requirements:
 - applications of secondary refrigeration systems in refrigeration
 - introduction to secondary refrigeration
 - applications in industrial refrigeration: cold storage, food processing and climatic test chamber
 - application in commercial refrigeration: supermarkets and small commercial systems
 - advantages and disadvantages of secondary refrigerants over the direct use of primary refrigerants
- properties, application and limitations of available secondary refrigerants:
 - general classification of secondary refrigerant types – single phase, volatile and phase change
 - general types of single phase secondary refrigerants available: glycols, alcohols, brines, hydrocarbons, silicone oils and water
 - common types of volatile and phase change secondary refrigerants available: CO₂ and ice slurries
 - thermal and transport properties of most widely used single phase secondary refrigerants (MEG, PG, ethyl alcohol, CaCl₂, potassium brines)
 - pump selection for viscous fluids
- application concepts and principles:
 - main and loop circuits, use of variable speed pumps and overflow valves
 - buffer and storage tanks, benefits and disadvantages
 - loop temperature control and loop pump selection
 - control valve options: regulating and on/off, two-way and three-way, mixing and diverting
 - expansion and contraction of components, compensation for pipe expansion and effect of pipe pre-insulation
 - expansion and contraction of secondary refrigerant, use of membrane expansion tanks versus open expansion tank
 - air purging
- secondary refrigeration system components and piping:
 - corrosion and material selection:
 - materials compatibility table
 - thermal and other properties of materials in use
 - pipe material and jointing methods/materials
 - pumps, impellers and seals
 - isolation and control valves
 - heat exchangers
 - pipe and insulation materials:
 - metal pipe
 - plastic pipe

- post-installation insulation (in situ foaming, formed insulation and closed cell flexible insulation)
- pre-insulated pipe material
- vapour barrier – importance and maintenance
- heat exchangers:
 - plate heat exchangers, brazed, welded, semi-welded and gasketed; design considerations in conjunction with primary refrigerant, flooded, direct expansion, and pump circulated primary refrigerant
 - shell and tube and plate and shell heat exchangers
 - fan coil units
- system control:
 - primary pump speed and staging control
 - maintenance of minimum flow and control valve pressure head
 - overflow valves
 - secondary loop temperature control
 - room humidity and temperature control with fan-coil units
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace budget, quality, policies and procedures
- relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0028 Determine noise and vibration encountered in HVAC/R applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine noise and vibration encountered in heating, ventilation and air conditioning/refrigeration (HVAC/R) applications.

It includes measuring sound, noise and vibration encountered in HVAC/R systems. It also includes working safely, using problem-solving procedures, applying appropriate theorems and providing interpretations derived from measurements and calculations and justification for such interpretations.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare HVAC/R system to determine noise and vibration encountered in application

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are obtained and applied
- 1.2** WHS/OHS risk control work preparation measures and workplace procedures are followed
- 1.3** Nature of the problem is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
- 1.4** Advice is sought from the work supervisor to ensure the work is coordinated effectively with others
- 1.5** Sources of equipment and products required for HVAC/R work are established in accordance with workplace procedures

- 1.6** Tools, equipment and testing devices needed to carry out HVAC/R work are obtained and checked for correct operation and safety
- 2 Determine HVAC/R application noise and vibration measurements**
- 2.1** WHS/OHS risk control work measures and workplace procedures are followed
- 2.2** Need to test or measure active HVAC/R systems is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 2.3** HVAC/R systems are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4** Relevant technique or process methods are used to determine noise and vibration measurement encountered in HVAC/R application
- 2.5** Unexpected situations are dealt with safely in accordance with workplace procedures and with the approval of authorised person/s in a manner that minimises risk to personnel and equipment
- 2.6** Measurements are taken without damage to HVAC/R apparatus, circuits, the surrounding environment or services using sustainable energy practices with minimum waste and re-work
- 3 Document HVAC/R application noise and vibration measurements and calculations**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3** Justification for alternative approach to determine noise and vibration measurements is documented and appropriate person/s notified in accordance with workplace procedures
- 3.4** Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Providing sound, noise and vibration measurements must include at least the following:

- two HVAC/R applications

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ131A Determine noise and vibration encountered in HVAC/R applications.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0028 Determine noise and vibration encountered in HVAC/R applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying the dynamic characteristics of systems/materials and the effects due to different operating parameters
- using established measurement methods
- taking relevant measurements accurately
- interpreting measured values appropriately
- providing correct interpretation of data taken from measurements and calculations
- dealing with unplanned events
- applying problem solving procedures including using appropriate theorems
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- determining noise and vibration encountered in heating, ventilation and air conditioning/refrigeration (HVAC/R) applications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- noise and vibration fundamentals, safe working practices and relevant standards, codes and regulations, including:
 - fundamentals of sound:
 - properties of sound: wavelength, amplitude, frequency, period, velocity, sound (intensity, pressure and power) and decibels
 - sound pressure level
 - sound power level
 - addition of sound levels
 - loudness and weighting networks

- sound spectrum and octave bands
- single value representation of sound spectrum
- noise rating (NR) curves
- sound meters
- fundamentals of vibration:
 - terminology: spring-mass system, spring in series and/or parallel, stiffness, effective stiffness, viscous frictional coefficient, mass, period, frequency (angular, natural, damped and forced), amplitude, static deflection, damping ratio, damping factor and frequency ratio
 - simple harmonic motion (SHM)
 - damped vibration
 - forced vibration
 - maximum amplitude and resonance
 - transmissibility and isolation efficiency
 - vibration isolators
- relevant HVAC/R manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant techniques, processes or measurement methods to obtain sound, noise and vibration data, including problem-solving procedures and appropriate theorems
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0029 Develop heat exchanger design specifications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop heat exchanger design specifications.

It includes working safely, applying refrigeration parameters, gathering and analysing data, and developing and documenting results and solutions for work/project and/or development records.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0004 Analyse vibration and noise in refrigeration and air conditioning systems

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop specifications for exchanger designs

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and procedures are followed in preparation for the work
- 1.3 Scope of analysis to develop specifications is determined from design brief, relevant reports and/or consultations with relevant person/s
- 1.4 Activities are planned in accordance with workplace procedures for timelines in consultation with others involved in the work

- 1.5 Strategies are formed to ensure analysis is carried out in accordance with workplace procedures and relevant industry standards
- 2 Develop specifications for exchanger designs**
 - 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Relevant refrigeration parameters are applied to developing heat exchanger specifications in accordance with workplace procedures and relevant industry standards
 - 2.3 Parameters and performance requirements in relation to refrigeration systems are obtained in accordance with workplace procedures and relevant industry standards
 - 2.4 Refrigeration parameters are analysed to provide effective solutions in accordance with workplace procedures
 - 2.5 Unplanned events are dealt with in accordance with problem-solving techniques and workplace procedures
 - 2.6 Quality of work is monitored in accordance with workplace procedures and relevant industry standards
- 3 Document specifications for exchanger design**
 - 3.1 Analysis, findings, calculations and assumptions are documented in accordance with workplace procedures
 - 3.2 Specifications for heat exchanger are developed from analysis findings and in accordance with workplace procedures
 - 3.3 Developed specification and analysis is reported to relevant person/s for endorsement in accordance with workplace procedures
 - 3.4 Justification for findings and actions undertaken in relation to the design is documented in accordance with workplace procedures and relevant industry standards for work/project and/or development records

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing specifications for heat exchangers • two different designs must include at least the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ149A Develop heat exchanger design specifications.

Assessment Requirements for UEERA0029 Develop heat exchanger design specifications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- interpreting compliance documents
- setting up and conducting appropriate examinations and tests
- identifying non-compliance defects
- reporting examination and test results and non-compliance issues clearly and accurately
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- developing specifications for exchanger designs
- documenting specifications for exchanger designs
- identifying analysis, findings, calculations and assumptions
- preparing to develop specifications for exchanger designs
- reporting findings and actions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- heat exchanger design, safe working practices and relevant standards, codes and regulations, including:
 - advanced thermodynamics:
 - heat transfer:
 - modes of heat transfer
 - conduction through a flat plate, series flat plates, thick and thin wall pipe, and composite pipes (e.g. lagged pipes and drums)
 - convection at a flat surface or tube
 - radiation from a flat surface or tube for black or grey bodies
 - combined conduction and convection through single or multiple flat plates or thin wall tubes

- combined convection and radiation
- combined conduction, convection and radiation such as fluid in a tank (convection to wall), through wall and/or insulation
- (conduction) to outside air (convection and radiation)
- heat exchangers - parallel, counter flow and cross flow
- refrigeration/heat pump:
 - basic principles and terminology
 - vapour compression cycle
 - performance criteria
 - types of refrigerant - designation, properties advantages and disadvantages
 - refrigerant properties using the p-h diagram
 - ideal vapour compression cycle on the p-h diagram
 - energy balance and heat transfers in compressor, evaporator and condenser
 - actual vapour compression cycle and variations from the ideal
 - pressure loss in lines and non-ideal compression
 - superheating and subcooling with or without suction/liquid heat exchanger
 - Carnot principle applied to refrigerator and heat pump
 - principles of evaporative refrigeration, absorption refrigeration, air cycle refrigeration and thermo-electric refrigeration
- heat exchanger design:
 - concepts
 - design parameters and limitations
 - construction material and components
 - testing requirements
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0030 Develop specifications and prepare drawings for HVAC/R projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop specifications and prepare drawings for heating, ventilation and air conditioning/refrigeration (HVAC/R) system projects.

It includes working safely, following a design brief for HVAC/R systems, selecting system components, operating within established project budget, and developing project specifications and design drawings.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0061 Produce HVAC/R system design drawings

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to develop HVAC/R specifications and prepare drawings

2 Develop HVAC/R specifications and

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified and applied
- 1.2 Extent of the project scope is determined from design brief and/or relevant documentation and from discussions with appropriate person/s
- 1.3 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved in the work
- 1.4 Information technology and software tools and equipment needed for the HVAC/R work are obtained in accordance with workplace procedures
- 2.1 Sources of components and materials needed for the HVAC/R project are determined and selected for their

prepare drawings

availability, suitability for purpose and cost in accordance with workplace policies and procedures

- 2.2 HVAC/R specifications are developed to include necessary performance requirements for components and system
- 2.3 Risk management strategies for the HVAC/R project are sought and obtained for incorporating in the specification
- 2.4 Appropriate information technology and software tools are used to develop HVAC/R specifications and produce drawings based on standard protocols
- 2.5 HVAC/R project specifications and drawings are reviewed against project inputs and adjusted to rectify any anomalies
- 2.6 HVAC/R project specifications and drawings are documented in accordance with workplace policies and procedures
- 2.7 Solutions to unplanned situation are provided in accordance with workplace policies
- 2.8 HVAC/R work quality is monitored against performance agreement and/or organisational or industry standards

3 Obtain approval for HVAC/R specifications and drawings

- 3.1 HVAC/R project specifications and drawings are presented and discussed with relevant person/s
- 3.2 Alterations to the project specifications and drawings resulting from the presentation/discussion are negotiated with relevant person/s in accordance with organisation policies
- 3.3 Final HVAC/R project specifications and drawings are documented and approval obtained from appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing HVAC/R specifications and preparing drawings must include at least the following:

- two different HVAC/R projects

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ139A Develop specifications and prepare drawings for HVAC/Refrigeration projects.

Assessment Requirements for UEERA0030 Develop specifications and prepare drawings for HVAC/R projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the project requirements accurately
- establishing source and availability of components appropriately, including the performance requirements of components and the system and risk management strategies in the specifications
- negotiating alterations to the project specifications and drawings successfully
- documenting project specifications and drawings in accordance with organisation policies and procedures
- obtaining approval for the completed project specifications and drawings
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- developing specifications and preparing drawings for heating, ventilation and air conditioning/refrigeration (HVAC/R) system projects, including:
- using appropriate information technology in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- specification development - specification writing; safe working practices and relevant standards, codes and regulations, including:
 - purpose and nature of specification
 - performance based specifications
 - prescriptive specifications
 - acceptable evidence of compliance
 - additional service required with the supply of equipment

- dealing with suppliers and manufacturer's
- documenting specification
- computer-aided drafting (CAD):
 - specific procedures:
 - creating symbols for library files
 - program specific commands
 - speed enhancement
 - configuring the digitising tablet
 - methodology for creating layers:
 - name
 - colour
 - line type
 - methodology for drawing variables:
 - limits
 - grid
 - snap
 - dimensions
 - text
 - units
 - ISO drawing sheets
 - advanced drawings
 - multiple three-dimensional views:
 - setting up environment on screen
 - top view
 - front and side views
 - three-dimensional views
 - movement through space:
 - draw on any created views
 - relocate coordinate system as necessary
 - creation of views:
 - creation of three-dimensional geometric shapes
 - creation of three-dimensional complex view by:
 - manipulation of drawing planes
 - location of geometric shapes
 - editing:
 - use of function to facilitate modification of geometric shapes in completion of a three-dimensional view
 - display of three-dimensional view:
 - wire line
 - solid face

- isometric
- perspective
- orthographic:
- saving:
 - use of assembly drawing file for plotting
- design brief requirements
- information technology
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and information technology currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults and replace faulty components in refrigeration and air conditioning control systems, interconnecting circuits and equipment operating at voltages up to 1000 volt (V) alternating current (a.c.).

Competency in this unit requires the ability to work safely, diagnose faults, apply fault-finding procedures, conduct repairs, replace components and complete required service documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the commissioning and repair of refrigeration and air conditioning system.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit may require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V a.c. or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify faults

2 Diagnose faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2 Details of the air conditioning or refrigeration system fault are obtained from documentation, client and/or from supervisor to establish scope of work to be completed
- 1.3 Advice is sought from supervisor, as required, to ensure work is coordinated with others
- 1.4 Sources of materials required for work are accessed in accordance with workplace procedures
- 1.5 Tools, equipment and testing devices are obtained in accordance with workplace procedures and checked for operational safety
- 2.1 Need to test or measure live electrical work on an operating system is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2 Circuits/machines and/plant are checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
- 2.3 Fault finding, using measured and calculated values of system and component parameters, is undertaken methodically in accordance with workplace procedures
- 2.4 Faults, beyond the scope of refrigeration and air conditioning system work, are identified and reported in

accordance with workplace procedures

- 2.5 Control system components are dismantled, where necessary, and parts safely stored to protect them against loss or damage in accordance with workplace procedures
- 2.6 Faulty components are rechecked and fault status is confirmed
- 2.7 Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
- 2.8 Fault-finding activities are completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures

3 Repair faults

- 3.1 Arrangements are made in accordance with workplace procedures for authorised person/s to rectify faults that are beyond the scope of refrigeration and air conditioning work
- 3.2 Equipment is checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
- 3.3 Materials required are obtained in accordance with workplace procedures
- 3.4 Repairs are completed without damage to other components or apparatus using sustainable energy principles in accordance with workplace procedures
- 3.5 Effectiveness of repair work is tested in accordance with workplace procedures
- 3.6 Air conditioning and refrigeration control system is reassembled, given a final test and prepared for return to service in accordance with workplace procedures

4 Complete and report fault-finding and rectification activities

- 4.1 Work area is cleaned and made safe in accordance with workplace procedures
- 4.2 Report is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in air conditioning and refrigeration control systems must include at least the following:

- two refrigeration and/or air conditioning control system
- four faults:
 - open circuit
 - short circuit
 - incorrect connections
 - insulation failure
 - unsafe condition
 - control apparatus/component failure
 - related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ170A Diagnose and rectify faults in air conditioning and refrigeration control systems.

Assessment Requirements for UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - using risk control measures
- completing and reporting fault-finding and rectification activities
- diagnosing and rectifying faults in refrigeration and air conditioning control systems, including:
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - finding at least four faults
 - providing report for rectifications undertaken
 - rectifying faults without damage
 - using approved methodical fault-finding techniques
- implementing legislation, industry standards, codes of practice and regulations
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- diagnose and rectify faults in refrigeration and air conditioning control systems, including:
 - control systems and components
 - method and procedures of finding, rectifying and recording control system faults
 - refrigeration and air conditioning direct digital control applications and basic operation
 - refrigeration and air conditioning electrical/electronic control types, applications, operation, installation/replacement, setting, adjustment and testing

- refrigeration and air conditioning pneumatic control applications and basic operation
- refrigeration and air conditioning process characteristics and control parameters
- system responses to parameter changes
- refrigeration and air conditioning direct digital control applications and basic operation
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- WiFi/router controls for variable air volume (VAV) and remote access controls for refrigeration and air conditioning.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in complex air conditioning/refrigeration systems.

It includes working safely, interpreting technical data and applying knowledge of complex refrigeration/air conditioning system operating parameters to logical fault-finding processes. It also includes implementing fault rectification, safety and functional testing, and completing and reporting fault diagnosis and rectification activities and outcomes.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS requirements and procedures are identified, obtained and implemented

- 1.2 WHS/OHS risk control measures and procedures are followed in preparation for work
 - 1.3 Hazards are monitored and any not previously identified are documented and risk control measures implemented in consultation with relevant person/s
 - 1.4 The extent of faults are determined from reports/documentation and discussions with relevant person/s
 - 1.5 Relevant person/s is consulted to ensure work is coordinated with others on the worksite
 - 1.6 Tools, equipment and testing devices required to diagnose faults are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Diagnose and rectify faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 2.3 Circuits/machines/plant are checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
 - 2.4 Logical diagnostic methods, measurements and estimations are applied to diagnose complex refrigeration/air conditioning system faults in accordance with system operational parameters and requirements
 - 2.5 Suspected fault sources are tested to confirm if they are the source of system problems
 - 2.6 Fault causes are identified and appropriately competent person/s engaged to rectify the fault where it is outside the scope of the refrigeration and air conditioning system
 - 2.7 Faults in system components are rectified to return refrigeration/air conditioning system to its operational standard
 - 2.8 System is tested to verify that the system operates as

intended and to specified requirements and industry standards

- 2.9 Methods for resolving unexpected situations are discussed, as required, with appropriate person/s in accordance with job specifications and requirements
- 2.10 Methods for resolving unexpected situations are selected on the basis of safety and specified work outcomes
- 2.11 Diagnosis and rectification activities are conducted without waste of materials, damage to apparatus, the surrounding environment and/or services using sustainable energy practices

3 Complete and report fault diagnosis and rectification activities

- 3.1 WHS/OHS work completion risk control measures and procedures are followed
- 3.2 Worksite is made safe in accordance with workplace safety procedures
- 3.3 Fault diagnosis and rectification activities are documented in accordance with workplace procedures
- 3.4 Appropriate person/s is notified that system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults must include at least four faults in the following complex refrigeration/air conditioning systems:

- multiple major components (i.e. compressors, condenser or evaporators)
- circuits or systems and associated components and controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ112A Diagnose and rectify faults in complex air conditioning/refrigeration systems.

Assessment Requirements for UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the cause of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system controls
- verifying that the system operates correctly
- dealing with unplanned events
- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- completing and reporting fault diagnosis and rectification activities
- determining need to test or measure live work
- isolating circuits/machines/plant
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex refrigeration and air conditioning system fault finding and repair, safe working practices and relevant standards, codes and regulations, including:
 - fault-finding techniques including:
 - factors to consider in clarifying the nature of a fault:
 - initial fault report

- confirmation of symptoms of the fault
- comparison of symptoms with normal operation
- effect to cause reasoning — assumptions of possible causes
- methods for testing assumptions encompassing:
 - visual inspection
 - sectional testing
 - split-half tests
 - component isolation
- dealing with intermittent faults
- causes of intermittent faults are vibration, shock, changes in temperature and electromagnetic interference
- refrigeration system analysis, including:
 - pressure enthalpy definitions:
 - high pressure and low-pressure refrigerants
 - triple point of new refrigerants
 - glide of trinary blends
 - differential evaporation of refrigerant blends
 - variable refrigerant volume
- refrigeration cycle, including:
 - expansion process
 - vaporising process
 - compression process
 - condensing process
 - compression ratio
- enthalpy processes, including:
 - co-efficient of performance
 - effect of suction temperature on cycle efficiency
 - effect of condensing temperature on cycle efficiency
- actual refrigerating cycles, including:
 - design operating conditions
 - effects of superheating suction vapour
 - superheating without useful cooling
 - superheating that produces useful cooling
 - superheating in suction piping outside the refrigerated space
 - superheating the vapour inside the refrigerated space
 - effects of subcooling the liquid
 - effects liquid - suction heat exchangers
 - effects of pressure losses resulting from friction
- refrigeration cycle faults, including:
 - symptoms and causes

- measurements and fault confirmation tests
- air conditioning system analysis, including:
 - psychrometric chart, including:
 - properties, definitions and units
 - plotting conditions:
 - RA, SA, OA and MA
 - psychrometric processes, including:
 - heating
 - cooling only
 - cooling and dehumidification
 - cooling, dehumidification and reheat
 - design operating conditions, including:
 - indoor and outdoor wet and dry bulb temperatures
 - volume flow rate supply, return and outdoor air
 - air conditioning system faults, including:
 - symptoms and causes
 - measurements and fault confirmation tests
 - power and control system analysis, including:
 - power and control circuit diagrams
 - sequence of operation
 - manufacturers diagrams, specifications and instructions
 - power and control circuit faults:
 - symptoms and causes
 - measurements and fault confirmation tests
 - relevant measurements and estimations
 - relevant risk mitigation processes
 - relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
 - safe working practices
 - relevant workplace policies and procedures
 - relevant workplace documentation.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0033 Diagnose faults in complex HVAC/refrigeration control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in complex heating, ventilation and air conditioning (HVAC) or refrigeration control systems.

It includes applying safe working practices, interpreting technical data and applying knowledge of complex refrigeration or HVAC control system operating parameters to logical fault-finding processes. It also includes implementing fault rectification, safety and functional testing; and completing and reporting fault diagnosis and rectification activities and outcomes.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0032 Diagnose and rectify faults in complex air conditioning/refrigeration systems

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to diagnose and rectify faults

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS requirements and workplace procedures are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and procedures are followed
- 1.3 Hazards not previously identified are documented and risk control measures devised and implemented in consultation with relevant person/s

- 1.4 Extent of faults are determined from reports/documentation and/or discussions with relevant person/s
 - 1.5 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite
 - 1.6 Tools, equipment and testing devices required to diagnose faults are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Diagnose and rectify faults**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Need to test and measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 2.3 Circuits/machines/plant are checked and isolated in accordance with workplace procedures and WHS/OHS requirements
 - 2.4 Logical diagnostic methods, measurements and estimations are applied to diagnose control system faults in accordance with system operating parameters and operational requirements
 - 2.5 Suspected fault sources are tested to confirm source of system problems
 - 2.6 Fault causes are identified and appropriately competent person/s engaged to rectify the fault where it is outside the scope of the control system
 - 2.7 Faults in system components are rectified to return the refrigeration or HVAC system to its operational standard
 - 2.8 System is tested to verify that the system operates as intended and to specified requirements and operational standards
 - 2.9 Methods for resolving unplanned events are discussed with appropriate person/s in accordance with job specifications and requirements
 - 2.10 Methods for resolving unplanned situations are selected

on the basis of safety and specified work outcomes

- 2.11** Diagnosis and rectification activities are conducted without waste of materials, damage to apparatus, the surrounding environment and/or services using sustainable energy practices
- 3 Complete and report fault diagnosis and rectification activities**
- 3.1** WHS/OHS work completion risk control measures and workplace procedures are followed
- 3.2** Worksite is made safe in accordance with workplace safety procedures
- 3.3** Fault diagnosis and rectification activities are documented in accordance with workplace procedures
- 3.4** Appropriate person/s is notified that system faults have been rectified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Diagnosing and rectifying faults in complex HVAC and refrigeration control systems must include at least the following:

- four faults in complex refrigeration or HVAC control systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ122A Diagnose faults in complex HVAC /refrigeration control systems.

Assessment Requirements for UEERA0033 Diagnose faults in complex HVAC/refrigeration control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying logical diagnostic methods
- using fault scenarios to test the cause of system faults
- identifying faults and competency needed to rectify them
- rectifying faults in system controls
- verifying that the system operates correctly
- documenting fault rectification
- dealing with unplanned events
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- determining need to test or measure live work
- diagnosing faults in complex refrigeration or heating, ventilation and air conditioning (HVAC) control systems
- isolating circuits/machines/plant
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- complex HVAC/refrigeration control systems, fault finding, safe working practices and relevant standards, codes and regulations, including:
 - control fundamentals, including:
 - control terminology

- refrigeration system characteristics
- HVAC system characteristics
- control system characteristics
- control system components
- control system diagrams and symbols
- product knowledge
- types of control equipment, including:
 - electrical:
 - classification of circuits
 - two position control
 - floating control
 - sensors
 - controllers
 - flow control devices
 - control systems diagrams
 - electronic:
 - operating principles
 - sensors
 - controllers
 - control system diagrams
- digital control systems, including:
 - computer-based control fundamentals:
 - definitions
 - principles
 - controller configuration:
 - equipment
 - zone level controllers
 - system level controllers
 - controller software:
 - operating software
 - application software
 - controller programming:
 - system diagrams
 - control diagrams
 - configuration
 - programming
 - initialisation
 - EMS and BMS
 - supervisory control and data acquisition (SCADA) system

- lan and Bacnet
- control systems applications, including:
 - refrigeration
 - air conditioning:
 - air handling system controls
 - ventilation
 - heating
 - building airflow system control
 - airflow control
 - singles and multi-zones
 - chiller/boiler and distribution system control (chilled water, boiler and distribution systems)
 - diagnostic methods, measurements and estimations
 - faults within scope of work
 - relevant manufacturer specifications
 - relevant WHS/OHS legislated requirements, including:
 - risk control measures
 - relevant workplace documentation
 - relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to establish heat loads for commercial refrigeration and/or air conditioning applications.

It includes determining heat loads for commercial refrigeration and air conditioning applications using quick selection, short-form paper and computer-based methods and documenting results.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to determine heat loads for commercial refrigeration and/or air conditioning applications

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for commercial refrigeration/air conditioning work
- 1.3** Extent of heat load analysis is determined from project specifications and discussions with appropriate person/s
- 1.4** Activities are planned to meet scheduled timelines in consultation with other person/s involved in commercial refrigeration/air conditioning work
- 1.5** Effective strategies are determined to ensure solution

- development and implementation is carried out efficiently in accordance with workplace procedures
- 2 Determine heat loads for commercial refrigeration and/or air conditioning applications**
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out commercial refrigeration/air conditioning work is followed
- 2.2** Specifications of commercial refrigeration and/or air conditioning system operating parameters are applied when performing heat load estimations
- 2.3** Parameters, specifications and performance requirements in relation to commercial refrigeration and/or air conditioning system are set in accordance with workplace procedures
- 2.4** Appropriate approaches to determine the heat loads are carried out to provide most effective solutions
- 2.5** Unplanned events are dealt with safely and effectively consistent with regulatory requirements and workplace procedures in a manner that minimises risk to personnel and equipment
- 2.6** Work quality is monitored in accordance with performance agreement and/or workplace or industry standards
- 3 Complete and report heat loads for commercial refrigeration and /or air conditioning applications**
- 3.1** Heat load estimations are documented, including details of findings, calculations and assumptions, in accordance with workplace procedures
- 3.2** Completed heat loads are submitted to appropriate person/s to be checked for accuracy and compliance with project specifications and evaluated to determine whether performance requirements are met
- 3.3** Heat load estimations are reported to relevant person/s to determine appropriate action to be taken based on findings

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining heat loads for commercial refrigeration and/or air conditioning applications must include at least the following:

- one quick selection short-form paper and/or one computer-based method for a refrigeration and/or air conditioning system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ129A Establish heat loads for commercial refrigeration and/or air conditioning applications.

Links

Assessment Requirements for UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- establishing system parameters for heat load
- selecting appropriate head load calculation tools
- identifying heat loads accurately
- using calculation methods accurately
- documenting heat loads correctly
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices requirements, including using risk control measures
- applying sustainable energy principles and practices
- determining heat loads for commercial refrigeration and air conditioning applications
- planning to determine heat loads for commercial refrigeration/air conditioning applications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commercial refrigeration heat load estimating commercial refrigeration applications, safe working practices and relevant standards, codes and regulations, including:
 - heat transfer:
 - factors affecting heat transfer
 - insulation material characteristics
 - vapour barriers (seals)
 - ambient conditions
 - composite walls (heat flows)
 - types of common insulation

- thermal conductivity
- film factors
- cabinet construction and design:
 - deep freeze case
 - meat case
 - dairy case
 - fruit and vegetable case
 - drink cabinets
- air change load:
 - room volumes
 - room usage (average, medium and heavy)
 - heat removed from cooling air to refrigerated conditions
 - air curtains
 - temperature differences
 - door opening sizes
 - Tamm's equation
- product load:
 - sensible heat
 - latent heat
 - heat of respiration
 - storage temperatures
 - unit running times
 - humidity
 - air flows
 - stacking of products
 - freeze, chill and thaw times
- total freezer/cool room loads:
 - wall load
 - air change load
 - product load
 - miscellaneous
 - total load, safety factor and unit running times
 - floor loads in cool rooms
 - door opening loads (ASHRAE and RADS methods)
 - door opening loads (for trucks)
- process cooling loads
 - cooling chemical reactions
 - energy balance methods
 - sensible and latent cooling of gases

- sensible and latent cooling of water vapour in gas streams
- computer programs
- commercial air conditioning heat load estimating
- heat load estimating for commercial air conditioning applications, safe working practices and relevant standards, codes and regulations, including:
 - heat flow in buildings:
 - conduction
 - convection
 - radiation
 - heat paths
 - thermal storage
 - different methods of calculations:
 - ASHRAE
 - carrier
 - finite difference
 - U values
 - film coefficients
 - solar heat:
 - direct
 - diffuse
 - sol air temperature
 - sun position calculations
 - design conditions:
 - outdoor
 - monthly/daily corrections
 - comfort/critical
 - indoor
 - effective temperature
 - thermal comfort
 - space characteristics

 - responsible use
- relevant commercial refrigeration and air conditioning manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications,

regulations, codes of practice and operation manuals.

UEERA0035 Establish the basic operating conditions of air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine operating conditions of air conditioning systems.

It includes working safely; determining air temperature, air flow rates and relative humidity using measurement and calculation methods.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the commissioning, service and repair of air conditioning systems.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to determine operating conditions of air conditioning system**
 - 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
 - 1.2** Safety hazards which have not previously been identified are assessed, reported and advice on risk control measures is sought from supervisor
 - 1.3** System design operating conditions are obtained from documentation or supervisor to determine scope of work to be undertaken
 - 1.4** Advice is sought from the supervisor to ensure work is coordinated effectively with others
 - 1.5** Materials required for the work are identified and obtained in accordance with workplace procedures
 - 1.6** Tools, equipment and testing devices needed to determine operating conditions are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Determine operating conditions of air conditioning system**
 - 2.1** Measuring system operating parameters are implemented in accordance with job requirements and workplace safety procedures
 - 2.2** Air conditioning system is checked and isolated in accordance with workplace procedures
 - 2.3** Actual and specified range of operating conditions are determined from measured and calculated values as they apply to air conditioning system in accordance with workplace procedures
 - 2.4** Methods for dealing with unplanned situations/events are discussed with appropriate person/s and documented
 - 2.5** Unexpected situations are dealt with safely and with the approval of relevant person/s
 - 2.6** Operating conditions for air conditioning system are determined without damage to apparatus, circuits, the surrounding environment or services using relevant workplace sustainable energy practices in accordance with workplace procedures
- 3 Complete work and report**
 - 3.1** Worksite and equipment are cleaned and made safe in accordance with workplace procedures

- 3.2 Operating conditions are documented, including identification of any parameter that is not within the specified range for the of air conditioning system, in accordance with workplace procedures
- 3.3 Supervisor is notified of completion of work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining operating conditions of air conditioning system must include at least the following:

- using measurement and calculation methods of air side components of air conditioning systems, including:
 - air dry and wet bulb temperatures
 - air velocity
 - relative humidity
 - volume flow rates across a grille/register

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ104A Establish the basic operating conditions of air conditioning systems.

Assessment Requirements for UEERA0035 Establish the basic operating conditions of air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying safe working practices and relevant industry standards, codes of practice and regulations
- applying sustainable energy principles and practices
- completing work documentation and reporting requirements
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining the basic operating conditions of an air conditioning systems, including the air dry and wet bulb temperatures, relative humidity, air velocity and volume flow rates across a grille/register and documenting operating conditions
- identifying operating parameters not within specified range of the air conditioning system
- interpreting measurements
- selecting and using appropriate measuring devices
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating condition of air conditioning system, including:
 - air conditioning industry classifications, applications and common types of systems
 - air conditioning processes
 - air velocity, units of measurement, measuring devices (anemometer only), applications and taking readings
 - air volume flow rate and its units of measurement
 - basic air conditioning heat loads and check figures

- factors effecting human comfort and the comfort zone
- hazards and risk control measures
- psychrometrics, composition of air and basic psychrometric chart properties and plotting points
- risk management principles, processes and safe working practices
- safety data sheets (SDS)/material safety data sheets (MSDS)
- sustainable energy principles and practices
- temperature and relative humidity, scales, measuring devices and taking readings
- ventilation needs, methods and applications
- volume flow rate calculations
- relevant industry standards, codes of practice, regulations and WHS/OHS legislated requirements
- relevant manufacturer specifications
- relevant risk mitigation processes
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0036 Establish the basic operating conditions of vapour compression systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to determine operating conditions of vapour compression system.

It includes working safely; determining refrigerant pressures and temperatures, and relevant air and water temperatures using measurement and calculation methods. It also includes working with the three states of matter at each point in the refrigeration cycle (liquid, vapour and liquid-vapour mixture).

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the commissioning, service and repair of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to determine operating condition of vapour compression system

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Safety hazards which have not previously been identified are assessed, reported and advice on risk control measures is sought from supervisor
- 1.3** System design operating conditions are obtained from documentation or supervisor to determine scope of work to be undertaken
- 1.4** Advice is sought from the supervisor to ensure work is coordinated effectively with others
- 1.5** Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices needed to determine operating conditions are obtained and checked for correct operation and safety in accordance with workplace procedures

2 Determine operating condition of vapour compression system

- 2.1** System operating conditions, including refrigerant pressures and temperatures and ambient temperatures, are measured in accordance with job requirements and workplace safety procedures
- 2.2** Compression system is checked and isolated in accordance with workplace procedures
- 2.3** Actual and specified range of operating conditions are determined from measured and calculated values as they apply to vapour compression system in accordance with workplace procedures

- 2.4 Methods for dealing with unplanned situations/events are discussed with appropriate person/s and documented
 - 2.5 Unplanned events are dealt with safely and with the approval of a relevant person/s
 - 2.6 Operating conditions for vapour compression system are determined without damage to apparatus, circuits, the surrounding environment or services using relevant workplace sustainable energy practices in accordance with workplace procedures
- 3 Complete work and report**
- 3.1 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 3.2 Operating conditions are documented, including identification of any parameter that is not within the specified range for the vapour compression system, in accordance with workplace procedures
 - 3.3 Supervisor is notified of completion of work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining operating conditions of vapour compression system must include at least the following:

- measurement and basic calculation methods of vapour compression system whether used for refrigeration or air conditioning
- suction and discharge pressures
- ambient, evaporator and condensing temperatures
- evaporator and condenser temperature difference

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ103A Establish the basic operating conditions of vapour compression systems.

Assessment Requirements for UEERA0036 Establish the basic operating conditions of vapour compression systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying safe working practices and relevant industry standards, codes of practice and regulations
- applying sustainable energy principles and practices
- completing documentation and reporting requirements
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining operating conditions of vapour compression system
- documenting operating conditions
- identifying conditions of a refrigerant at various locations in the vapour compression system
- measuring and calculating actual and specified range of operating condition values, including recording measurements
- selecting and using appropriate measuring devices correctly
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating condition of vapour compression systems, including:
 - basic vapour compression systems operation and major components
 - common refrigerant metering devices, including capillary tube, thermostatic expansion (TX) valve, electronic expansion valve, function, types and applications
 - condenser function, types and applications
 - cooling tower function, types and applications
 - evaporator function, types and applications

- hazards and risk control measures
- heat and heat transfer
- liquid receiver function, types and applications
- pressure, scales and measurement devices
- refrigerant conditions, including saturation, superheat, sub-cooling and pressure/temperature relationships
- refrigerant leak detector types, applications, hazards and safe working practices, care and maintenance, and leak detection procedures
- refrigeration compressor function, types and applications
- refrigeration compressor oil function, types and applications
- risk management principles and processes
- safe handling techniques, including safety data sheets (SDS)/material safety data sheets (MSDS)
- sensible and latent heat
- service gauge manifold hose fitting, purging, pressure reading and removal
- service gauge types, applications, care and maintenance, reading and calibration
- sustainable energy principles and practices
- system access fittings types, care, maintenance and connection
- temperature and relative humidity, scales and measurement devices
- vapour compression system operating conditions and pressure, temperature, state and enthalpy graphs
- vapour compression system symbols/diagrams, design ambient and storage/space conditions
- working safely with refrigeration vapour compression system relevant industry standards, codes of practice, regulations and WHS/OHS legislated requirements
- relevant manufacturer specifications
- relevant risk mitigation processes
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0037 Establish the basic operating conditions of vapour compression systems - appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to establish the operating condition of a vapour compression system in a self-contained refrigerated appliance.

Competency in this unit requires the ability to work safely; prepare for and establish operational conditions of vapour compression systems, including determining refrigerant pressures and relevant air temperatures using measurement and calculation methods; as well as completing all required documentation.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit may require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to determine operating conditions of vapour compression system

1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures

1.2 Safety hazards, which have not previously been identified are reported in accordance with workplace procedures, and advice on risk control measures is sought from supervisor

1.3 Details on work are obtained from documentation and/or from supervisor to establish the scope of work to be completed

1.4 Advice is sought from supervisor, as required, to ensure work is coordinated with others

1.5 Sources of materials required for work are identified and accessed in accordance with workplace procedures

1.6 Tools, equipment and testing devices to establish the operating conditions of appliance's vapour compression system are obtained and checked for operational safety

2 Determine operating condition of a vapour compression system

2.1 Measuring systems operating parameters are used in accordance with workplace procedures and WHS/OHS requirements

2.2 Appliance vapour compression system is checked and isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements

2.3 Actual and specified range of operating conditions of vapour compression system is established from measured and calculated values in accordance with workplace procedures

2.4 Unplanned situations are responded to in accordance with workplace procedures and discussed with relevant person/supervisor in a manner that minimises risk to personnel and equipment

- 2.5 Operating conditions of vapour compression system are determined without damage to appliance, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete work and report activities
- 3.1 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
- 3.2 Operating condition of a vapour compression system is documented in accordance with workplace procedures, including identification of any parameter that is not within the specified range for the system
- 3.3 Supervisor is notified of completion of work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining operating conditions of a vapour compression system must include the following:

- suction and discharge pressures
- ambient, evaporator and condensing temperatures
- evaporator and condenser temperature difference

Assessment Requirements for UEERA0037 Establish the basic operating conditions of vapour compression systems - appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying legislation, industry standards, codes of practice and regulations
- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including
 - applying risk control measures
 - identifying hazards
 - implementing safe working practices
- completing work and reporting requirements
- determining operating conditions of appliance vapour compression systems, including:
 - selecting and using appropriate measuring devices
 - recording measurements
 - using calculation methods
 - identifying conditions of refrigerant at various locations in appliance vapour compression system
 - documenting operating conditions
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- using manufacturer specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- operating conditions of vapour compression systems used in refrigerated appliances, including:
 - domestic refrigeration
 - vapour compression system

- heat
- temperature and relative humidity
- sensible and latent heat
- pressure
- refrigerant conditions
- vapour compression cycle
- leak detectors
- service gauges
- refrigeration compressors
- condensers and related components
- evaporators and related components
- common refrigerant metering devices
- basic operating conditions
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - safe working practices
 - potential hazards
 - risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to establish the thermodynamic parameters of refrigeration and air conditioning system.

It includes determining thermodynamic parameters of refrigeration and air conditioning system using measurement and calculation methods and documenting results.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set

procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to determine thermodynamic parameters of refrigeration and air conditioning system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for refrigeration and air conditioning system work
- 1.3** Refrigeration and air conditioning system operating conditions are obtained from documentation or work supervisor to determine the scope of work to be undertaken
- 1.4** Advice is sought from the work supervisor to ensure refrigeration and air conditioning system work is coordinated effectively with others
- 1.5** Tools, equipment and testing devices needed to determine the refrigeration and air conditioning system operating conditions are obtained and checked for

- correct operation and safety
- 2 Determine the thermodynamic parameters of refrigeration and air conditioning system**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out refrigeration and air conditioning system work are followed
 - 2.2 Measurement of thermodynamic system operating parameters is conducted in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.3 System is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 Actual and specified range of thermodynamic parameters are determined from measured and calculated values as they apply to refrigeration or air conditioning system in accordance to workplace procedures
 - 2.5 Unexpected situations are discussed with appropriate person/s, responded to in accordance with workplace procedures and documented in a manner that minimises risk to personnel and equipment
 - 2.6 Thermodynamic parameters are determined without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Document the thermodynamic parameters**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 3.3 Thermodynamic parameters are documented, including identification of any parameter that is not within the specified range for the refrigeration and air conditioning system
 - 3.4 Work supervisor is notified of work completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Determining thermodynamic parameters of refrigeration and air conditioning systems must include at least the following:

- using measurement and calculation methods of a refrigeration or air conditioning system, including:
 - temperature
 - pressure
 - relative humidity
 - enthalpy

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ127A Establish the thermodynamic parameters of refrigeration and air conditioning systems.

Assessment Requirements for UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- selecting and using appropriate measuring devices correctly
- interpreting measurements
- using calculation methods accurately
- identifying parameters not within the specified range
- documenting thermodynamic parameters correctly
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) workplace procedures requirements, including the use of risk control measures
- applying sustainable energy principles and practices
- planning to determine thermodynamic parameters of refrigeration and air conditioning system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- thermodynamic parameters of refrigeration and air conditioning systems, engineering mathematics fundamentals and refrigeration science, including:
 - arithmetic:
 - rational and irrational numbers, surds
 - International System of Units (SI) units and conversion using unity brackets
 - laws of indices (base 10), scientific and engineering notation
 - estimations, errors and approximations, and significant figures
 - algebra:
 - substitution

- +, -, x on simple polynomials and simple indices
- expanding brackets
- factorising quadratics, common factors and difference of two squares
- simplifying algebraic fractions
- transposition of engineering formulae
- solving one variable equations
- simple algebraic division
- geometry:
 - Pythagoras Theorem
 - angles: degrees, radians and parallel lines cut by a transverse
 - triangles: sum of angles, and properties of equilateral and isosceles triangles
 - congruent triangles
 - similar triangles: ratio of corresponding sides
 - sin, cos, tan: ratios of a right-angled triangle
 - sine and cosine rules
 - circles: circumference, arcs, chords, tangents and circle theorems
 - area and perimeter mensuration on above figures
- coordinate geometry:
 - 2-D plane; x-y axes and s-t axes
 - graph of linear function, $y = ax + b$ and functional notation, $y = f(x)$
 - straight line given slope and one point or given two points
 - linear equations: solving algebraically and geometrically
 - solving two linear functions simultaneously, algebraically and geometrically
 - line segment: length and mid-point
- engineering mechanics:
 - mass/density
 - weight
 - forces
 - specific gravity
 - equilibrium
 - momentum
 - friction loss
 - velocity and speed
 - energy in all forms
 - mechanical advantage
 - efficiency
 - pressure/stress
- molecular theory:
 - changes of state

- sublimation
- expansion and contraction
- electron flow
- state of aggregation
- internal potential energy
- phase change diagrams
- thermodynamics:
 - temperature scales
 - conservation of energy
 - specific heat
 - sensible, latent and super heat
 - properties of steam
 - enthalpy
 - heat energy/temperature relationship
 - heat balance on a body
 - heat transfer
 - conductivity
 - calorimetry
 - peltier effect
 - 1st and 2nd law of thermodynamics
- gas laws and liquids:
 - pressure
 - Boyles law
 - Charles law
 - volumetric relationship
 - psychrometrics
 - latent heat of vaporisation
 - relative humidity
 - air conditioning processes
 - dynamic pressure loss
 - velocity and static pressure
 - bourdon tubes
 - density and relative density
 - Archimedes principle
 - Bernoulli's equation
 - manometers
 - absorption refrigeration
 - centrifugal compression
 - external work of a liquid

- pressure volume diagrams
- isothermal and adiabatic processes
- polytropic processes
- Dalton's law of partial pressure
- vapour compression:
 - pressure/enthalpy relationship
 - entropy
 - characteristics of evaporation and condensation
 - compression and pressure drop phases
 - co-efficient of performance
 - theoretical/practical cycles
 - characteristics of refrigerants
 - theoretical power input
 - pressure losses
 - heat exchange
 - effects of condensing condition changes
 - sub-cooling and superheating
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0039 Evaluate and report on building services energy management systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate and report on building services energy management systems, plant and machinery.

It includes working safely, setting up and conducting evaluation measurements, evaluating energy use from measured parameters, and reporting results, including recommending any resulting corrective actions.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to evaluate and report on energy management

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS procedures are obtained and implemented in accordance with workplace procedures
- 1.2** WHS/OHS risk control measures and procedures for work are followed
- 1.3** The extent of evaluation is determined from building services, plant and machinery specifications and discussed with relevant person/s
- 1.4** Advice is sought from work supervisor to ensure work is coordinated effectively with others

- 1.5** Tools, testing devices and materials required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Evaluate energy management**
 - 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2** Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 2.3** Energy management of building services, plant and machinery is applied to the evaluation process
 - 2.4** Energy evaluation tests for each parameter under scrutiny are conducted in accordance with workplace procedures and test methods
 - 2.5** Energy evaluation tests are conducted methodically and results/comments systematically noted
 - 2.6** Unplanned situations are dealt with safely with the approval of authorised person/s
 - 2.7** Evaluation is conducted without damage to systems, circuits, the surrounding environment and/or services using sustainable energy practices
- 3 Report on energy management**
 - 3.1** WHS/OHS work completion risk control measures and procedures are followed
 - 3.2** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3** Results of energy management evaluation, including recommendations and justification for improvements, are documented
 - 3.4** Energy evaluation report is forwarded to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating and reporting on building services energy management systems must include at least the following

- two different types of building services, plant and machinery

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ136A Evaluate and report on building services energy management systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0039 Evaluate and report on building services energy management systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent of the evaluation
- setting up and conducting appropriate examinations and tests
- reporting evaluation, including recommendation for improving energy efficiency
- dealing with unplanned events
- applying environmental and sustainable energy principles and practices
- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- determining need to test or measure live work
- implementing energy management procedures for a building
- performing energy evaluation tests
- preparing to evaluate and report on energy management.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- energy management fundamentals, safe working practices and relevant standards, codes and regulations, including:
 - typical energy sources and characteristics:
 - supply authorities
 - standard units of measurement
 - electricity

- steam
- hot water
- high temperature hot water
- town gas
- liquefied petroleum gas (LPG)
- solar
- waste heat
- petrol
- diesel
- energy usage:
 - office lighting
 - air conditioning systems
 - refrigeration systems
 - security systems
 - computer systems
 - standby/emergency systems
 - lifts and escalators
- energy auditing process:
 - energy costs and tariffs
 - energy consumption
 - predicting future costs
 - plotting consumption trends
 - historical data
 - collecting information using surveys
 - comparisons of actual to recorded usage
 - energy balance
 - instrumentation
 - building management systems
 - estimating savings potential
- system operation for energy efficiency:
 - types of systems
 - efficiency in building structures
 - operation of a vehicle fleet
 - proportion total energy consumption against individual systems
 - passive building design
 - preventative maintenance procedures
 - monitoring building management systems
 - operation of major and minor plant
 - inappropriate energy management procedures

- building plant control systems
- Australian Standards/local authority requirements
- case studies
- implementing energy management procedures for a building:
 - recording base year data
 - climatic conditions for locality
 - establishing energy costs and tariffs
 - building and systems surveys
 - payback period
 - survey analysis
 - energy conservation procedures
 - informing stockholders
 - recommendations and documentation
 - implementation issues
 - monitoring, evaluation and follow up
- building management systems
- building management systems, safe working practices and relevant standards, codes and regulations, including:
 - functions of a building management system:
 - autonomous functions
 - input/output (I/O)
 - general I/O
 - installation management items
 - energy management
 - risk management
 - information processing
 - objectives
 - building running costs
 - smoke control in accordance with AS 1668.1 The use of ventilation and air conditioning in buildings - Fire and smoke control in buildings
 - building management system hardware:
 - system architecture
 - communication devices
 - substations
 - personal computers
 - interfaces with other systems
 - input and output functions:
 - digital I/O
 - digital output with status feedback
 - analogue I/O

- sensors
- alarms
- energy management:
 - night cycle
 - optimum stop/start
 - time and event programs
 - night purge
 - outside air percentage control
 - enthalpy control
 - power demand control
 - duty cycle
 - presence detection
 - lighting control
- information processing functions:
 - computer systems
 - central system management
 - programs
 - system configuration and security
 - operator - machine interface
 - data points
- risk and maintenance management:
 - system files
 - fire and intruder control
 - access control
- building services, plant and machinery specifications
- energy evaluation tests
- relevant manufacturer specifications
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0040 Evaluate and report on the indoor air quality of buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate and report on the indoor air quality in buildings.

It includes working safely, setting up and conducting evaluation measurements, evaluating air quality from measured parameters, and reporting results, including recommending any resulting corrective actions.

Permits may be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set

procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to evaluate and report on air quality in buildings

2 Evaluate air quality in buildings

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) procedures are obtained and implemented in accordance with workplace procedures
- 1.2** WHS/OHS risk control measures and workplace procedures for work are followed in preparation for the work
- 1.3** The extent of evaluation is determined from building ventilation/air conditioning specifications, internal/external environmental factors and discussions with relevant person/s
- 1.4** Advice is sought from work supervisor to ensure work is coordinated effectively with others
- 1.5** Tools, testing devices and materials required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1** WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2 Need to test and measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
 - 2.3 Air quality requirements and regulations in buildings are applied to the evaluation process
 - 2.4 Air quality evaluation tests for each parameter under scrutiny are conducted in accordance with workplace procedures and test methods
 - 2.5 Air quality evaluation tests are conducted methodically and results/comments systematically noted
 - 2.6 Unplanned situations are dealt with safely with the approval of authorised person/s
 - 2.7 Evaluation is conducted without damage to systems, circuits, the surrounding environment and/or services using sustainable energy practices
- 3 Report on air quality buildings**
- 3.1 WHS/OHS work completion risk control measures and workplace procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Results of air quality evaluation, including unacceptable conditions and recommendations for improvement, are documented
 - 3.4 Energy evaluation report is forwarded to appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating and reporting on indoor air quality • two different types of buildings with or

must include at least the following:

without air conditioning

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ137A Evaluate and report on the indoor air quality of buildings.

Assessment Requirements for UEERA0040 Evaluate and report on the indoor air quality of buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent of the evaluation
- setting up and conducting appropriate examinations and tests
- reporting evaluation, including recommendation for improving energy efficiency
- dealing with unplanned events
- applying environmental and sustainable energy principles and practices
- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- determining need to test or measure live work
- documenting results of air quality evaluation
- evaluating and reporting on air quality in buildings
- performing air quality evaluation tests
- preparing to evaluate and report on air quality in buildings
- resolving indoor air quality problems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- indoor air quality, evaluation and reporting of a building's indoor air quality, safe working practices and relevant standards, codes and regulations including:
 - indoor air quality factors:
 - interactive nature of pollutants

- comfort criteria
- source of odours
- pathway from source to occupants
- occupant activities
- impact on productivity
- causes of indoor air quality problems:
 - moisture
 - mould and mildew
 - bacterial growths
 - asbestos and other particulates
 - volatile chemicals produced in the building
 - chemical products
- heating, ventilation and air conditioning (HVAC) systems:
 - types of HVAC systems
 - system components
 - duct cleaning
 - system commissioning
 - operation of system
 - damper adjustment
- measurements:
 - common parameters to measure
 - measurement devices available
 - instrument calibration
 - analysing and interpreting results
 - laboratory tests
 - standards
 - evaluation and reporting of indoor air quality
- resolving indoor air quality problems:
 - conducting indoor air quality investigations
 - the walk-through
 - building history
 - HVAC system information
 - occupant interviews
 - troubleshooting
- indoor air quality management:
 - building indoor air quality profile
 - location of potential indoor air quality problems
 - procedures to control indoor air quality
 - communication

- response to complaints
- equipment preventive maintenance
- chemical inventory
- relevant manufacturer specifications
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0041 Evaluate new and alternative technologies applicable to electrotechnology applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate new and alternative technologies applicable to electrotechnology applications.

It includes working safely and comparing manufacturer's technical data for alternative or new technologies with specifications for a proposed project.

It also includes conducting evaluation tests, evaluating systems/components from technical data and/or measured parameters, and reporting findings for use in design work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to evaluate and report on alternative and new technologies

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures are obtained and implemented in accordance with workplace procedures

- 1.2 WHS/OHS risk control measures and procedures for work are followed
 - 1.3 The extent of evaluation is determined from proposed project specifications and discussions with relevant person/s
 - 1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others
 - 1.5 Tools, testing devices and manufacturer technical data required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2 Evaluate alternative and new technologies**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed
 - 2.2 Electrotechnology disciplines applicable to the alternative/new technology being considered are applied to the evaluation process
 - 2.3 Manufacturer's technical data for alternative/new technologies is compared with proposed project specifications, budget and regulations
 - 2.4 Evaluation tests for each component under scrutiny are conducted in accordance with WHS/OHS requirements and established test methods
 - 2.5 New and alternative technologies are evaluated methodically and results/comments systematically noted
 - 2.6 Unplanned situations are dealt with safely with the approval of authorised person/s
 - 2.7 Evaluation is conducted without damage to systems, circuits, the surrounding environment and/or services using sustainable energy practices
- 3 Report on use of alternative and new technologies**
- 3.1 WHS/OHS work completion risk control measures and procedures are followed
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Results of the evaluation, including recommendations and justifications for adoption/rejection of the

alternative and new technologies, are documented for use in design work

- 3.4** Report is forwarded to appropriate person/s for endorsement in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating alternative and new technologies must include at least two different proposed projects in any of the following electrotechnology disciplines:

- automated systems
- computer systems
- electrical
- electronics
- industrial electronics and control
- refrigeration and air conditioning
- renewable energy (RE)

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ150A Evaluate new and alternative technologies applicable to electrotechnology applications.

Assessment Requirements for UEERA0041 Evaluate new and alternative technologies applicable to electrotechnology applications

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent of the evaluation
- comparing manufacturer's technical data for alternative or new technologies with proposed project specifications, budget and regulations accurately
- reporting evaluation, including recommendations and justifications for adoption or rejection of the alternative and new technologies evaluated
- dealing with unplanned events
- applying environmental and sustainable energy principles and practices
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - implementing risk control measures
- conducting evaluation tests
- determining need to test or measure live work
- evaluating performance benefits and limitations of new and developed technologies for given applications
- making and documenting recommendations and justifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- new and alternative technology sources, processes for their adoption, safe working practices and relevant standards, codes and regulations including:
 - sources of information on alternative or new technologies:
 - industry organisations

- industry technical journals
- government and private research papers/literature
- manufacturers' bulletins
- comparison of technical data from different manufacturers
- evaluating performance benefits and limitations of new and developed technologies for given applications, encompassing:
 - capital cost-benefits
 - operations efficiency
 - risk hazardous and issues related to environmental and health and safety
 - functionality
- processes to facilitate adoption:
 - research; analyses; reporting; recommending; and utilising a range of techniques, processes and technologies
- proposed project specifications, budget and regulations
- relevant manufacturer specifications
- relevant test methods
- relevant tools, testing devices and manufacturer technical data
- relevant WHS/OHS legislated requirements, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to evaluate thermodynamic and fluid parameters of refrigeration systems.

It includes working safely, setting up and conducting evaluation measurements, evaluating thermodynamic and fluid parameters from measured parameters, and reporting results for use in design work.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to evaluate fluid and thermodynamic parameters of refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS procedures are obtained and implemented in accordance with workplace procedures

1.2 WHS/OHS risk control measures and workplace

procedures for work are followed

1.3 The extent of evaluation is determined from specifications for the refrigeration system and discussed with relevant person/s

1.4 Advice is sought from work supervisor to ensure work is coordinated effectively with others

1.5 Tools, testing devices and materials required for work are obtained and checked for correct operation and safety in accordance with workplace procedures

2 Evaluate parameters of refrigeration systems

2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

2.2 Need to test and measure live work is determined in accordance with workplace procedures and WHS/OHS requirements

2.3 Fluid and thermodynamic parameters are applied to the evaluation process

2.4 Energy evaluation tests for each parameter under scrutiny are conducted in accordance with workplace procedures and test methods

2.5 Fluid and thermodynamic parameter evaluation tests are conducted methodically and results/comments systematically noted

2.6 Unplanned situations are dealt with safely with the approval of authorised person/s

2.7 Evaluation is conducted without damage to systems, circuits, the surrounding environment and/or services using sustainable energy practices

3 Report on evaluation of fluid and thermodynamic parameters of refrigeration systems

3.1 WHS/OHS work completion risk control measures and workplace procedures are followed

3.2 Worksite is cleaned and made safe in accordance with workplace procedures

3.3 Results of fluid and thermodynamic parameters evaluation are documented for use in design work

3.4 Energy evaluation report is forwarded to appropriate

person/s for endorsement in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Evaluating and reporting fluid and thermodynamic parameters must include at least the following:

- two types of refrigeration systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ165A Evaluate thermodynamic and fluid parameters of refrigeration systems.

Assessment Requirements for UEERA0042 Evaluate thermodynamic and fluid parameters of refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the extent of the evaluation
- setting up and conducting appropriate examinations and tests
- documenting evaluation results for use in design work
- dealing with unplanned events
- applying environmental and sustainable energy principles and practices
- applying relevant legislation, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- determining need to test or measure live work
- documenting results of evaluation
- evaluating fluid and thermodynamic parameters of refrigeration systems
- performing fluid and thermodynamic evaluation tests
- preparing to evaluate fluid and thermodynamic parameters of refrigeration systems
- reporting on evaluation of fluid and thermodynamic parameters of refrigeration systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- thermodynamics and fluid fundamentals, refrigeration engineering mathematics, safe working practices and relevant standards, codes and regulations, including:
 - matrices:
 - the operations: addition (subtraction), scalar multiplication and matrix multiplication up to 3x3 matrices

- identity matrix and inverse matrix
- elementary algebraic manipulation of matrices
- solve up to three equations (linear) in three unknowns using inverse matrices and determinants
- quadratic functions:
 - graphs of quadratic functions represented by parabolas and significance of the leading coefficient
 - zeros represented graphically
 - quadratic equations by factoring and quadratic formula
 - simultaneously linear and quadratic equations algebraically and geometrically
 - engineering mathematics - B
- exponential and logarithmic functions:
 - laws of indices
 - graph of $f(x) = kabx$, emphasising $a = 10, e$
 - definition of the logarithm to any base
 - graph of $f(x) = k \log_a bx$, emphasising $a = 10, e$
 - solve exponential and simple log equations using indices, logs, calculator and graphically
 - change of log base, emphasising 10 and e
 - growth and decay
- trigonometric functions:
 - the ratios: sin, cos, tan, cosec, sec and cot
 - degrees, radians
 - graphs of $k f(ax + b)$ where $f(x) = \sin x, \cos x, \tan x$, and significance of k, a, b , for example $V = V_m \sin(\omega t + \phi)$
 - trigonometric identities
- energy and humanity:
 - need for energy and relationship between energy usage and standard of living
 - energy conversion - typical processes and efficiencies
 - sources of energy
 - solar energy - direct heating, photosynthesis, solar cells, power tower, hydrogen for solar energy, ocean thermal energy collector, solar ponds, wind and wave energy, and hydro-electric power
 - geothermal energy
 - tidal energy
 - nuclear energy - fission and fusion, burner and breeder reactors
 - stored fuel reserves
 - fuel conservation - reduction in wastage, recycling, greater usage efficiency and use of waste heat
 - thermodynamics
- basic concepts:

- nature of matter - atoms, molecules, inter-molecular forces, molecular motion and states of matter
- mass and conservation of mass principle
- volume, density, specific volume and relative density
- force, weight and pressure (atmospheric, gauge and absolute)
- temperature (Celsius and Kelvin)
- systems and black box analysis
- reciprocating piston and cylinder mechanism – pressure ratio and compression ratio
- energy:
 - definition and principles
 - potential energy
 - kinetic energy
 - work (linear and rotational), constant and variable force, relationship to pressure and volume change
 - power (linear and rotational)
 - sensible heat - specific heat capacity (constant pressure and constant volume)
 - latent heat
 - chemical energy - energy content of a fuel
 - internal energy
 - energy transfer in closed and open systems
 - definition of a closed system
 - calorimetry as an example of a closed system (with or without phase change)
 - thermodynamics 1
 - non-flow energy equation - typical applications such as stirring with simultaneous heating or cooling
 - definition of an open system
 - mass and volume flow rate and continuity equation
 - steady flow energy equation (negligible change in kinetic or potential energy) leading to the concept of enthalpy - typical applications such as turbines, compressors, boilers and heat exchangers
- gases:
 - definition of a perfect or ideal gas in terms of the molecular model
 - general gas equation
 - characteristic gas equation (equation of state)
 - constant pressure process
 - constant volume process
 - isothermal process
 - polytropic process
 - adiabatic process
- heat engines:

- definition of a heat engine
- essentials of a heat engine - heat source, heat sink, working substance, mechanical power output and working cycle
- energy balance for a heat engine (as a black box) and efficiency
- maximum possible efficiency (Carnot efficiency)
- types of heat engines according to working substance, heat source, mechanical arrangement and working cycle
- typical practical cycles - Stirling, Otto, diesel, dual, two stroke (spark and compression ignition) and Joule cycle
- thermodynamics 1
- heat engine performance:
 - measurement of torque and power output - rope brake, shoe brake, hydraulic dynamometer and electric dynamometer
 - heat supply rate, efficiency and specific fuel consumption
 - measurement of indicated power - mechanical indicator, electric/electronic indicator and Morse test
 - friction power, mechanical efficiency and indicated thermal efficiency
 - volumetric efficiency
 - energy balance
 - performance curves - variable load constant speed, and variable speed constant throttle setting
- basic properties of fluids:
 - description of a fluid and the difference between solids and fluids, liquids and gases, hydraulics and pneumatics
 - chemical properties, reaction with metals, corrosiveness, flammability, toxicity, pollution and environmental
 - effects
 - dissolves gases and particles in liquids (slurries)
 - foaming of liquids: basic properties and units - mass, volume, density, specific volume, relative density, force and weight, pressure (absolute, atmospheric and gauge), temperature (Celsius and Kelvin), viscosity and surface tension
 - vapour pressure of a liquid - saturation vapour pressure
 - temperature and pressure effects on the basic properties
 - ideal/perfect gases and liquids
 - gas laws for ideal gases
 - fluid mechanics 1
- components:
 - pipes, channels, tubes and ducts (rigid and flexible)
 - valves - gate, globe, non-return/foot, needle, ball, plug cock, diaphragm, pressure regulating/reducing and safety
 - valves

- filters and strainers for gases and liquids
- gauges and instruments - pressure and temperature gauges, liquid level gauges, thermometers, thermocouples, manometers and piezometers
- pipe fittings - elbows/bends, enlargement/contractions, coupler/unions and tees
- tanks and vessels - storage tanks, pressure vessels, header and surge tanks, and weirs/dams/reservoirs
- nozzles/spray heads
- flow measurement instruments - venturi and orifice meters, pitot tube, rotameter and anemometer (fan/hot wire)
- pumps/compressors and motors/turbines
- actuators - linear (cylinders) and rotary
- selection of equipment and instruments considering properties and compatibility
- fluid statics:
 - pressure at a point, direction of pressure on a surface
 - pressure variation with depth in a liquid
 - Pascal's Principle
 - manometer/piezometer calculations (vertical and inclined)
 - forces due to fluid pressure on vertical, horizontal and inclined surfaces
 - centre of pressure
 - Archimedes Principle - buoyancy, flotation, apparent weight and centre of buoyancy
 - fluid flow
 - steady and unsteady flow, streamlines and eddies
 - velocity - average or mean and local
 - mass and volume flow rate
 - conservation of mass leading to the Continuity Equation for fluid flow
 - modification of the Continuity Equation for volume flow of liquids or gases with small changes in density
 - Bernoulli Equation for ideal fluids, meaning of pressure, velocity and potential head and total head
 - causes of head loss and modification of the Bernoulli Equation to include a head loss term for real fluids
- fluid power:
 - definition and units for work, torque and power
 - relationship between force, velocity and power and torque, angular velocity and power
 - work done by a gas expanding at constant pressure
 - relationship between fluid power, mass flow rate and head
 - relationship between fluid power, volume flow rate and pressure
 - efficiency of a pump or turbine
 - modification of the Bernoulli Equation to include a pump or turbine in the fluid circuit as well as a head loss term
- forces developed by flowing fluids:

- impulse-momentum equation for fluid flow
- force developed by a jet striking a stationary plate - perpendicular, inclined or curved
- force developed by a jet striking a moving plate or blade
- force developed by a jet striking a series of moving plates or blades - power developed and efficiency
- refrigeration system specifications
- relevant manufacturer specifications
- relevant test methods
- relevant WHS/OHS legislated requirements, including:
 - risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0043 Find and rectify faults in appliance control systems and devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and repair electrical faults in appliance control systems and devices.

It includes working safely, using fault-finding procedures, conducting appliance control systems and devices repairs, and completing required service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to find faults in appliance control system and devices

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Extent of work to be completed is planned from fault and breakdown reports and/or discussions with supervisor/appropriate person/s in accordance with workplace procedures
- 1.3** Advice is sought, as required, from the supervisor to ensure work is coordinated with others
- 1.4** Sources of materials required for work are accessed in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices to locate faults are obtained in accordance with workplace procedures and checked for operational safety

2 Find and repair electrical faults in appliance control system and devices

- 2.1** Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2** Appliance is checked and isolated in accordance with workplace procedures and WHS/OHS requirements
- 2.3** Safety hazards resulting from fault or breakdown are identified and documented, and risk control measures are implemented in accordance with workplace procedures and in consultation with appropriate person/s
- 2.4** Fault finding, using measured and calculated values of circuit/control parameters, is undertaken in accordance with workplace procedures
- 2.5** Appliance is dismantled, where necessary, and parts safely stored to protect them against loss or damage
- 2.6** Suspected faulty control device component or circuit is rechecked and fault status is confirmed
- 2.7** Replacement parts are obtained in accordance with workplace procedures
- 2.8** Effectiveness of repair work is tested in accordance with workplace procedures

- 2.9** Apparatus is reassembled, given a final test and prepared for return to service in accordance with workplace procedures
- 2.10** Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of authorised person/supervisor
- 2.11** Fault-finding and repair activities are completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report fault-finding and repair activities**
- 3.1** Reusable faulty or worn components are tagged and despatched for repair in accordance with workplace procedures
- 3.2** Maintenance and repair work are documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Finding and rectifying faults in appliance control systems and devices must include at least the following:

- two different types of appliances
- four of the following faults:
 - open circuit
 - short circuit
 - incorrect connections
 - insulation failure
 - unsafe condition
 - motor component failure
 - control circuit component failure
 - related mechanical failure

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ154A Find and rectify faults in appliance control systems and devices.

Assessment Requirements for UEERA0043 Find and rectify faults in appliance control systems and devices

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying risk control measures
 - identifying hazards
 - utilising safe working practices
- completing and reporting fault-finding and repair activities
- finding and rectifying faults in appliance control systems and devices, including:
 - completing documentation
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - finding faults
 - planning extent of work from fault/breakdown reports and discussions with supervisor/appropriate person/s
 - rectifying faults
 - using approved methodical fault-finding techniques
- preparing to find and rectify faults in appliance control systems and devices
- using manufacturer specifications.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- finding and rectifying faults in appliance control systems and devices, including:
 - appliance characteristics and control parameters
 - appliance integrated communications components and their function
 - control systems and components, including appliance controls and electrical and/or

- electronic controls
- control terminology
- operation and application of electrical, electronic and mechanical appliance diagnostic tools, including types and construction
- system responses to parameter changes
- types of control
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0044 Find and rectify faults in single phase motors and associated controls

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and repair faults in motors and associated controls connected to single phase, 240 volt (V) supply, in refrigeration and air conditioning systems.

It includes working safely, using fault-finding procedures, conducting repairs to motor and associated control components, and completing required service documentation. The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the commissioning and repair of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to find and rectify faults in single phase motors and associated controls

2 Find and repair faults in single phase motors and associated controls

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

Assessment Requirements for UEERA0044 Find and rectify faults in single phase motors and associated controls

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including hazards and control measures
- disconnecting and reconnecting electrical supply to motors and associated controls
- finding and rectifying faults in single phase motors, related motor starting components and motor protection devices in refrigeration and air conditioning systems
- implementing relevant standards, codes of practice and regulations
- reporting/documenting fault-finding and repair activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- circuit diagrams for single phase motors
- relevant risk mitigation processes while finding and rectifying faults in motors and associated controls, including potential hazards, risk control methods and safe working practices
- relevant standards, codes of practice, regulations and manufacturer specifications
- single phase motor speed control in refrigeration and air conditioning systems, including:
 - inverters - variable speed control (VSC)/variable frequency control (VFC)
 - number of poles
- types and applications of single phase motor starting relays and protection devices used in refrigeration and air conditioning systems, including:
 - current coil relays
 - positive temperature coefficient (PTC) or solid state
 - potential coil relays
 - soft starters
 - thermal disc (Klixon) overloads
- types and applications of single phase motors used in refrigeration and air conditioning

systems, including:

- capacitor start capacitor run (CSCR)
- capacitor start induction run (CSIR)
- electronic commutator (EC)
- permanent split capacitor (PSC)
- resistance start induction run (RSIR)
- shaded pole
- typical faults in single phase motors and associated controls for refrigeration and air conditioning systems, including:
 - control circuit component failure
 - incorrect wiring connections
 - motor bearing failure
 - open-circuit winding
 - short circuit, including insulation failure to frame
 - shunted short, including insulation failure within winding.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

UEERA0045 Find and rectify faults in three phase motors and associated controls

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to find and repair faults in motors and associated controls connected to three phase, 415 volts (V) supply, in refrigeration and air conditioning systems.

It includes working safely, using fault-finding procedures, conducting repairs to motor and associated control components, and completing required service documentation. The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the commissioning and repair of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including hazards and control measures
- disconnecting and reconnecting electrical supply to motors and associated controls
- finding and rectifying faults in three phase motors, related motor starting components and motor protection devices in refrigeration and air conditioning systems
- implementing relevant standards, codes of practice and regulations
- reporting and documenting fault-finding and repair activities.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- circuit diagrams for three phase motors
- relevant risk mitigation processes while finding and rectifying faults in motors and associated controls, including potential hazards, risk control methods and safe working practices
- relevant standards, codes of practice, regulations and manufacturer specifications
- three phase motor speed control in refrigeration and air conditioning systems, including:
 - inverters variable speed control (VSC)/variable frequency control (VFC)
 - number of poles
- types and applications of three phase motor starting and protection devices used in refrigeration and air conditioning systems, including:
 - direct online (DOL)
 - soft starters
 - STAR/DELTA
 - thermal overloads
- types and applications of three phase motors used in refrigeration and air conditioning systems, including:

- DELTA connected
- STAR connected
- typical faults in three phase motors and associated controls for refrigeration and air conditioning systems, including:
 - control circuit component failure
 - incorrect wiring connections
 - motor bearing failure
 - open-circuit winding
 - short circuit, including insulation failure to frame
 - shunted short, including insulation failure within winding.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0046 Install and commission ammonia refrigeration systems, components and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and commission ammonia refrigeration system, components and associated equipment.

It includes installing and commissioning refrigeration equipment using ammonia as the refrigerant. It also includes applying safe working practices and refrigeration principles that apply to ammonia, interpreting plans and specifications, commissioning and completing the necessary commissioning documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation and commissioning of refrigeration systems using ammonia refrigerant.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

UEERA0053 Install, commission, service and maintain medium temperature systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install ammonia refrigeration system

2 Install and commission ammonia refrigeration system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards not previously identified are reported, assessed and advice on risk control measures sought from the project engineer
- 1.3** Nature of work is obtained from documentation or from project engineer to determine the scope of work to be undertaken
- 1.4** Advice is sought from the project engineer to ensure refrigeration work is coordinated effectively with others
- 1.5** Sources of materials required for work are determined in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety
- 2.1** Measuring system operating parameters are conducted in accordance with WHS/OHS requirements and workplace procedures
- 2.2** Major components and pipe work are installed in accordance with relevant industry standards, codes of practice and regulations
- 2.3** Pressure testing is conducted at a pressure compatible with ammonia and in accordance with industry standards and practices
- 2.4** Precautions are taken to prevent damage to components while pressure testing the system

- 2.5 Leaks are located and rectified using testing methods appropriate to the refrigeration system and in accordance with industry standards and practices
 - 2.6 Refrigeration system is evacuated in accordance with industry standards and practices
 - 2.7 Refrigeration system is charged safely with ammonia and lubricants in accordance with industry standards and practices
 - 2.8 Refrigeration pre-operational checks are carried out on operating and safety controls in accordance with manufacturer specifications
 - 2.9 Refrigeration system is commissioned and adjustments made to operating and safety controls
 - 2.10 Temperature reduction of cool rooms and freezers are undertaken in accordance with industry standards and practices
 - 2.11 Refrigeration maintenance is carried out and includes inspection and cleaning of strainers and filters and collection of oil sample for analysis
 - 2.12 Training is conducted for person/s responsible for the refrigeration system operation and maintenance
- 3 Complete and report on commissioning of ammonia refrigeration system**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Contaminated refrigerant and lubricant are dealt with in accordance with legislative/regulatory requirements
 - 3.3 Refrigeration operation condition and commissioning data are documented and includes parameters not within the specified range for the system
 - 3.4 Refrigeration mechanical and electrical commissioning documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and commissioning ammonia refrigeration system must include at least the following:

- determining:
 - suction and discharge pressures
 - ambient, evaporator and condensing temperatures
 - evaporator and condenser temperature difference
 - critical point of ammonia (R717)

Charging and discharging must include the following:

- ammonia (R717) system with refrigerant and lubricant in a safe and environmentally responsible manner
-

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ180A Install and commission ammonia refrigeration systems, components and associated equipment.

Assessment Requirements for UEERA0046 Install and commission ammonia refrigeration systems, components and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislative, industry standards and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- conducting refrigeration system operation and maintenance
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- discharging/charging refrigerant/lubricants and pressure testing the system without damage to components
- documenting operating conditions correctly
- identifying the conditions of the ammonia (R717) refrigerant at various locations in the vapour compression and liquid recirculation system
- installing, connecting, securing and aligning components and equipment and ensuring that equipment and pipe work is compliant with relevant industry standards, codes of practice and regulations
- locating and rectifying leaks
- optimising system performance and efficiency
- pressure testing entire system at the appropriate design test pressures
- pressure testing, charging/discharging refrigerant/lubricants and determining the operating conditions of ammonia vapour compression and liquid recirculation refrigeration system
- recording measurements
- removing system contaminants and evacuating
- selecting and using appropriate measuring devices correctly
- using calculation methods accurately
- using methodical and efficient commissioning techniques in accordance with workplace procedures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- cool room and freezer construction, including:
 - commissioning procedures
 - construction materials
 - construction methods
 - defrost methods
 - underfloor heating
- installation and commissioning techniques for ammonia refrigeration systems
- insulation and vapour barrier, including insulation materials and vapour barriers
- refrigeration control system testing and adjustment, including:
 - central programmable logic controller (PLC) system
 - defrost methods and controls
 - flow controls
 - refrigerant level controls
 - refrigerant pressure controls
 - temperature controls
- refrigerant piping, including:
 - hydraulic shock
 - installation principles
 - material compatibility
 - pipe sizing principles
 - pressure testing/evacuation
 - relief valves
 - welding
- relevant job safety assessments or risk mitigation processes
- relevant legislative, industry standards and practices
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including reports on installation and commissioning of ammonia refrigeration systems
- relevant workplace policies and procedures, including workplace emergency response plan
- testing and commissioning ammonia refrigeration systems, including:
 - air cooled condensers
 - compressors
 - direct contact freezing
 - evaporative condensers
 - evaporators (air/fluid cooling)

- high pressure receivers
- secondary refrigerants
- start-up and shutdown procedures
- water cooled condensers.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to installing and commissioning, as well as determining the operating conditions of ammonia vapour compression and liquid recirculation systems
- applicable documentation, including workplace procedures, emergency response plan, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0047 Install and commission carbon dioxide refrigeration systems, components and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and commission carbon dioxide (CO²) refrigeration system, components and associated equipment.

It includes installing and commissioning refrigeration equipment using CO² as a refrigerant excluding self-contained trans-critical systems.

It also includes applying safe working practice and refrigeration principles that apply to CO², following design specifications; testing, locating and rectifying faults and defective components; and completing the necessary installation and commissioning documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation and commissioning of refrigeration systems using CO² refrigerant.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0053 Install, commission, service and maintain medium temperature systems

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install CO² refrigeration components and associated equipment

2 Install CO² refrigeration system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied

1.2 Safety hazards not previously identified are reported, assessed and advice on risk control measures is sought from work supervisor

1.3 Nature of work is obtained from documentation or from work supervisor to determine the scope of work to be undertaken

1.4 Refrigeration component and equipment installation is appropriately sequenced in accordance with job schedule

1.5 Sources of materials required for refrigeration work are obtained in accordance with workplace procedures

1.6 Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety

2.1 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

2.2 Refrigeration components and equipment are installed in accordance with technical industry standards, job specifications and requirements with sufficient access to affect electrical and pipe work connections and maintenance

- 2.3 Refrigeration components and equipment are installed straight and square, in the required locations and within acceptable tolerances
 - 2.4 Pressure testing is conducted at a pressure compatible with CO₂ and in accordance with industry standards
 - 2.5 Leaks are located and rectified using testing methods appropriate to the system and in accordance with industry standards and practices
 - 2.6 Refrigeration system is evacuated to the required level and cleaned of moisture and contaminants in accordance with industry standards and practices
 - 2.7 Unplanned situations are responded to in accordance with workplace procedures, discussed with appropriate person/s and documented in a manner that minimises risk to personnel and equipment
 - 2.8 Installation and tests are carried out without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices
- 3 Commission CO₂ refrigeration system**
- 3.1 Commissioning work is appropriately sequenced in accordance with job specification
 - 3.2 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
 - 3.3 Extent of the system and location of system components is determined from site inspection and/ or job specifications and diagrams
 - 3.4 System control settings and operating parameters are determined from job specifications and requirements
 - 3.5 Tools, equipment and testing devices needed to commission a CO₂ refrigerant system are obtained and checked for correct operation and safety
 - 3.6 Refrigeration system is charged safely with refrigerant grade CO₂ and compatible lubricants in accordance with industry standards and practices
 - 3.7 Refrigeration actual and specified range of operating conditions are determined from measured and calculated values as they apply to CO₂ vapour compression and

volatile secondary (liquid recirculation/cascade) system in accordance with workplace procedures

- 3.8 Pre-commissioning checks are undertaken to ensure components are in place and secure in accordance with manufacturer specifications and industry standards
 - 3.9 Need to test or measure live operating CO₂ system is determined in accordance with WHS/OHS requirements and workplace safety procedures
 - 3.10 CO₂ refrigeration system pressure controls, valves, pumps and regulators are adjusted to their required settings
 - 3.11 Testing/measuring devices are used to observe the operation of refrigeration system and fine adjustments of controls are made as required in accordance with manufacturer specifications
 - 3.12 Commissioning is conducted efficiently, without waste of materials or damage to apparatus, the surrounding environment or services and using sustainable energy practices
- 4 Complete work and relevant documentation**
- 4.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 4.2 Final check of the installed components and equipment is made to verify that it complies with relevant industry standards and job requirements
 - 4.3 'As-installed' refrigeration components and equipment are documented and appropriate person/s notified in accordance with workplace established procedures
 - 4.4 Commissioning results are documented and include final operating parameters of the refrigeration system

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, connecting and commissioning CO₂ refrigeration system, components and associated equipment must include at least the following:

- major components:
 - compressors
 - cascade condensers
 - evaporators
 - liquid recirculation pump/s
- associated equipment:
 - refrigerant piping
 - refrigerant flow controls
 - cycling controls
 - safety controls
 - relief valves
 - isolation valves
 - monitoring and inspection accessories

Note: Steel pipe welding competency is not covered by this unit.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ186A Install and commission carbon dioxide refrigeration systems, components and associated equipment.

Assessment Requirements for UEERA0047 Install and commission carbon dioxide refrigeration systems, components and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- installing carbon dioxide (CO²) refrigeration system components, pipe work and associated equipment
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- discharging/charging refrigerant/lubricants and pressure testing the system without damage to components
- documenting operating conditions correctly (commissioning)
- identifying the conditions of the CO² refrigerant at various locations in the vapour compression and volatile secondary (liquid recirculation) system
- installing, connecting, securing and aligning components and equipment and ensuring that equipment and pipe work is compliant with relevant industry standards, codes of practice and regulations
- locating and rectifying leaks
- optimising system performance and efficiency
- pressure testing entire system at the appropriate design test pressures using dry nitrogen
- reading and interpreting drawings to pipe work layouts and apparatus locations
- recording measurements
- removing system contaminants and evacuating
- selecting and using appropriate measuring devices correctly
- using calculation methods accurately
- using methodical and efficient commissioning techniques.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- installation and commissioning procedures for CO₂ refrigeration systems, including:
 - materials and installation procedures:
 - material selection
 - copper pipe standards
 - steel pipe standards
 - pipe connections
 - pipe supports hangers and connections
 - arrangement of isolation valves
 - location of relief valves
 - commissioning:
 - pressure testing
 - evacuation and dehydration
 - charging refrigerant and lubricant
 - system testing and adjustment
 - documentation
- operating conditions of CO₂ vapour compression and volatile secondary (liquid recirculation/cascade) system/s
- relevant industry standards and practices
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0048 Install and commission flammable refrigerant air conditioning and refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install and commission Class A2, A2L and A3 flammable refrigerant air conditioning and refrigeration systems, components and associated equipment in accordance with legislative, standard and code requirements. It includes working safely and installing equipment, components and piping to job specifications. It also includes completing pre-commissioning tests, starting the system, ensuring correct refrigerant charge, adjusting components and controls to efficient operation, completing installation and commissioning documentation.

Some flammable refrigerants, for example, fluorocarbons like R32, are controlled under the national Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995. Therefore, to undertake this unit, the learner must have a relevant Trainee Refrigerant Handling Licence if it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence if it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

UEERA0053 Install, commission, service and maintain medium temperature systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install and commission flammable refrigerant refrigeration and air conditioning systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards not previously identified are noted and risk control measures implemented
- 1.3** Scope of work is determined from documentation and/or relevant person/s to establish work to be undertaken
- 1.4** Component, equipment installation and commissioning work are sequenced in accordance with job schedule
- 1.5** Relevant person/s is consulted to ensure the work is coordinated with others involved
- 1.6** Materials required to install pipe work are obtained in accordance with workplace procedures and job specifications
- 1.7** Tools, equipment and testing devices required to install and commission components and equipment are obtained in accordance with workplace procedures and checked for correct operation and safety

- 1.8** System control settings and operating parameters are determined from job specifications
- 1.9** Preparatory work is scheduled to ensure no damage has occurred in accordance with workplace procedures and relevant industry standards
- 2 Install flammable refrigerant refrigeration and air conditioning systems**
 - 2.1** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.2** Components and equipment are installed with sufficient access to affect electrical and pipe work connections and maintenance in accordance with relevant legislation, standards and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 2.3** Components and equipment are installed in the required locations and within acceptable tolerances in accordance with relevant legislation, standards and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 2.4** Refrigerant tubing and fittings are silver brazed with dry nitrogen to prevent contamination in accordance with relevant legislation, standards and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 2.5** Unplanned situations from installation of components and equipment are dealt with in accordance with workplace procedures
 - 2.6** Quality checks of pipe work, pressure testing and repair of leaks are conducted in accordance with relevant legislation, standard and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 2.7** Components and equipment are installed efficiently without waste of materials or damage/contamination to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Commission flammable refrigerant refrigeration and air conditioning**
 - 3.1** Installed system's pipe work and components are evacuated to the required level in accordance with relevant legislation, standards and code requirements

- systems** and manufacturer instruction
- 3.2** System is charged with flammable refrigerant to the required level in accordance with relevant legislation, standard and code requirements, manufacturer instructions and job specification
 - 3.3** Refrigeration system pressure controls, valves and regulators are adjusted in accordance with relevant legislation, standard and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 3.4** Testing/measuring devices are used to observe operation of the refrigeration system and fine adjustments of controls made, as required, in accordance with relevant legislation, standard and code requirements, manufacturer instructions, job specifications and workplace procedures
 - 3.5** Unplanned situations are dealt with safely and with the approval of relevant person/s
 - 3.6** Commissioning is conducted efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 4 Complete installation and commissioning work**
- 4.1** Worksite is cleaned and made safe in accordance with workplace procedures
 - 4.2** Final check of the installed components and equipment is made in accordance with relevant industry standards and job specifications
 - 4.3** 'As installed' components and equipment are documented and relevant person/s notified in accordance with workplace procedures
 - 4.4** Results of commissioning and final operating parameters are documented and relevant person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing and commissioning major components and associated equipment must include at least the following:

- two refrigeration and/or air conditioning systems operating with a flammable refrigerants refrigerant

Major components must include at least the following:

- refrigeration compressors
- condensers
- condensing units
- evaporators

Associated equipment must include at least the following:

- refrigerant flow controls
- cycling controls
- safety controls
- on-site leak detection equipment
- ventilation systems
- spark isolation systems and electrical isolation
- monitoring equipment
- inspection accessories

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ176A Install and commission hydrocarbon refrigeration systems, components and associated equipment.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0048 Install and commission flammable refrigerant air conditioning and refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- commissioning flammable refrigerants systems
- completing installation and commissioning reports and documentation
- dealing with unplanned events
- discharging/recovering and charging refrigerant/lubricants safely and without damage to components
- evacuating the system to the required level safely and without damage to components
- identifying the conditions of the refrigerant at various locations
- installing flammable refrigerants refrigeration and air conditioning systems
- installing, connecting, securing and aligning components and equipment
- locating and rectifying leaks
- preparing to install and commission flammable refrigerants refrigeration and air conditioning systems
- pressure testing the system to the required level safely and without damage to components
- reading and interpreting drawings to pipe work layouts and apparatus locations
- recording measurements
- selecting and using appropriate measuring devices correctly
- using commissioning techniques
- using sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- relevant codes, regulations and standards

- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant site arrangements, including pipe work requirements and equipment location
- relevant special features for flammable refrigerant systems, including component compatibility, refrigerant leakage and enclosures
- relevant system diagrams
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace quality, policies and procedures
- sustainable energy principles and practices
- system commissioning requirements and procedures
- system, pipe work and component installation requirements and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to installing and commissioning flammable refrigerant air conditioning and refrigeration system
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0049 Install and start up single head split air conditioning and water heating heat pump systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to position, assemble, install, start up and decommission single head split air conditioning systems and water heating heat pump split systems, up to a maximum of 18 kilowatt (kW) refrigeration capacity.

It includes following standards, codes of practice, regulatory requirements and routine procedures to install equipment, connect pipe work, pressure test, evacuate, perform functional checks and complete required documentation.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0064 Recover, pressure test, evacuate, charge and leak test refrigerants - split systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to assemble, install and start up split air conditioning and water heat pump system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Safety hazards which have not previously been identified are assessed, reported and advice on risk control measures sought from supervisor
- 1.3** Work activities are sequenced in accordance with job schedule
- 1.4** Relevant person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.5** Layout of pipe work to be installed is determined from job/task details, including manufacturer specifications and diagrams
- 1.6** Materials needed to carry out the work are obtained in accordance with workplace procedures and checked against job/task requirements
- 1.7** Tools, equipment and testing devices are obtained in accordance with workplace procedures and checked for operation and safety
- 1.8** Appropriately licensed electrician is confirmed to carry out electrical work for the air conditioning and water heat pump system
- 1.9** Appropriately licensed plumber is confirmed to carry out mains water piping work for the heat pump hot water system
- 1.10** Preparatory work is checked to ensure no damage has occurred and complies with job/task requirements in

- accordance with workplace procedures
- 2 Assemble, install and start up split air conditioning and water heat pump system**
- 2.1** Split air conditioning and water heat pump system components are positioned and assembled in accordance with workplace procedures, manufacturer instructions and industry standards
- 2.2** Interconnecting refrigerant piping/tubing is prepared and installed in accordance with workplace procedures, manufacturer instructions and industry standards
- 2.3** Components are pressure tested and evacuated in strict accordance with manufacturer instructions, industry standards and codes of practice
- 2.4** Condensate drains are prepared and installed to the units in accordance with workplace procedures, manufacturer instructions, industry standards and local regulatory requirements
- 2.5** The refrigerant service valves are opened on the pre-charged outdoor unit to enable the refrigerant to enter the evacuated pipe work and the connected unit in strict accordance with manufacturer instructions and industry standards
- 2.6** Unplanned situations are discussed with relevant person/supervisor, documented and dealt with safely in accordance with workplace procedures
- 2.7** Quality checks of installation and start-up are undertaken in accordance with workplace procedures
- 2.8** Notification is given to relevant person/s that the split air conditioning and water heat pump system is ready for electrical and/or mains water connection in accordance with workplace procedures
- 2.9** Split air conditioning and water heat pump work is carried out efficiently without waste of materials or damage to apparatus, circuits, the surrounding environment or services using relevant workplace sustainable energy principles in accordance with workplace procedures
- 3 Test single head split air conditioning and water heat pump system**
- 3.1** Split air conditioning and water heat pump system performance is inspected and tested in accordance with workplace procedures to ensure compliance with industry technical standards, manufacturer specifications

- and job/task requirements
- 3.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 3.3 Work completion is documented and appropriate person/s notified in accordance with workplace procedures
- 4 Decommission split air conditioning and water heat pump system**
- 4.1 Refrigerant is pumped down and/or recovered from indoor unit, interconnecting refrigerant piping/tubing is removed, and indoor and outdoor refrigerant circuits are sealed in accordance with workplace procedures, manufacturer instructions and industry standards
 - 4.2 Licensed electrician is engaged in accordance with workplace procedures to isolate and disconnect electrical supply and cabling from air conditioning and water heat pump system
 - 4.3 Indoor and outdoor refrigerant pipework, water pipework, condensate drains and electrical conduits/cables are unmounted in accordance with workplace procedures
 - 4.4 Unplanned situations are discussed with appropriate person/s, documented and dealt with safely in accordance with workplace procedures
 - 4.5 Split air conditioning and water heat pump work is carried out efficiently without waste of materials or damage to apparatus, circuits, the surrounding environment or services using relevant workplace sustainable energy principles
 - 4.6 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 4.7 Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assembling, installing, starting up and decommissioning single head split air conditioning and water heat pump system (hot water or swimming pool) up to a maximum of 18 kW refrigeration capacity must include at least the following:

- condensate drain installation
- decommissioning
- evacuation
- functional performance check
- installation/regulatory documentation
- pipe work connection
- pressure test
- refrigerant pipework installation
- use of safe working procedures and industry standards and code of practice
- unrestricted licensed electrician
- appropriately licensed plumber
- leak testing and fitting of caps to all refrigerant access ports, which could allow refrigerant to escape into the environment

Electrical connection must be carried out by:

Mains water connection must be carried out by:

Making area/worksite safe must include at least the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ105A Position, assemble and start up single head split air conditioning and water heating heat pump systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0049 Install and start up single head split air conditioning and water heating heat pump systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying safe working practices and relevant legislation, industry standards, codes of practice and regulations
- applying sustainable energy principles and practices
- assembling, installing and starting up split air conditioning and/or water heat pump system
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- decommissioning split air conditioning and/or water heat pump system
- determining job/work task requirements and applying workplace procedures, including making equipment/worksite safe
- documenting work activities
- giving notification to appropriate person/s for electrical connections to be completed
- implementing risk control measures
- inspecting and testing single head split air conditioning and/or water heat pump system and documenting performance to manufacturer specifications, including undertaking functional performance checks
- making equipment and worksites safe through leak testing and fitting of caps to refrigerant access ports to stop refrigerant escaping into the environment
- positioning and assembling system components to specifications
- installing and connecting refrigerant piping
- installing and connecting condensate drain piping
- preparing to assemble, install and start up a single head split air conditioning system and/or water heat pump system with a maximum cooling/heating capacity of less than 18 kilowatt (kW)
- pressure testing and evacuating system using manufacturer instructions.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- condensate drain pipe work installation and connections
- refrigerant pipe work installation and connections
- relevant A1 and A2L class refrigerant, systems, piping, tools and equipment
- relevant codes of practice, industry standards, regulations and WHS/OHS legislated requirements, including:
 - AS/NZS 5141 Residential heating and cooling systems - Minimum applications and requirements for energy efficiency, performance and comfort criteria
 - AS/NZS 5149.3 Refrigerating systems and heat pumps - Safety and environmental requirements - Installation site
 - AS/NZS 5149.4 Refrigerating systems and heat pumps - Safety and environmental requirements - Operation, maintenance, repair and recovery
 - Australia and New Zealand Refrigerant Handling Code of Practice - Part 2 Systems other than self-contained low charge systems
 - Ozone Protection and Synthetic Greenhouse Gas Management Regulations
- relevant manufacturer specifications and instructions relevant risk mitigation processes, including safe working practices and risk control measures
- relevant workplace documentation
- relevant workplace policies and procedures
- role of licensed electrician/plumber
- split air conditioning and water heat pump (maximum plant capacity for each system is 18 kW), including:
 - decommissioning split system requirements and procedures installing split systems, including manufacturer instructions, location, mounting and connecting pipe work
 - single head split air conditioning system (up to 18 kW) types, applications, major components, controls, operation and operating conditions
 - split system start-up, including manufacturer instructions, pressure testing, evacuation, checking refrigerant charge, adding refrigerant, leak detection and checking function and performance.
 - split water heating heat pump system (up to 18 kW) types, applications, major components, controls, operation and operating conditions
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the

time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0050 Install refrigerant pipe work, flow controls and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to install refrigerant piping/tubing, fittings, flow controls and accessories for refrigeration and air conditioning systems in buildings and premises in accordance with relevant regulations, industry standards, codes of practice, manufacturer instructions, and industry and workplace requirements.

It includes working safely; applying industry standards; routing pipe work to specified locations; connecting installations, components and accessories; and documenting work.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation and repair of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit may require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install pipe work, flow controls and accessories

2 Install pipe work, flow controls and accessories

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2 Safety hazards which have not previously been identified are noted, assessed and risk control measures implemented in accordance with workplace procedures
- 1.3 Pipe work, flow control and accessory installation are sequenced in accordance with workplace procedures and job schedule
- 1.4 Work details are determined from documentation and/or supervisor to establish scope of work to be completed
- 1.5 Pipe work routes are planned within the constraints of the building structure, including heritage specifications, in accordance with workplace procedures
- 1.6 Supervisor is consulted, as required, to ensure work is coordinated with others
- 1.7 Materials to install pipe work, flow controls and accessories are obtained and checked against job requirements in accordance with workplace procedures
- 1.8 Tools, equipment and testing devices to install pipe work, flow controls and accessories are obtained and checked for operational safety
- 2.1 Circuits, machines and plant are checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
- 2.2 Pipe work, flow controls and accessories are installed with sufficient access for connections and maintenance in accordance with workplace procedures, industry

standards and job specification

- 2.3** Pipe work, flow controls and accessories are installed straight and square, in required locations and within acceptable tolerances in accordance with workplace procedures
 - 2.4** Dry nitrogen is used to prevent contamination while silver brazing refrigerant tubing and fittings in accordance with workplace procedures
 - 2.5** Problematic situations from installation of pipe work, flow controls and accessories are resolved in accordance with workplace procedures
 - 2.6** Checks on quality of pipe work, flow controls and accessories are undertaken, including pressure testing and repair of leaks, in accordance with workplace procedures and relevant industry standards
 - 2.7** Adjustment of settings and replacement of flow controls are undertaken, as required, in accordance with workplace procedures
 - 2.8** Pipe work, flow controls and accessories are installed without waste of materials, damage or contamination to apparatus, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete pipe work, flow controls and accessories installation**
- 3.1** Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2** Final check of installed pipe work is made to verify that it complies with workplace and industry requirements
 - 3.3** 'As-installed' pipe work, flow controls and accessories are documented and supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing refrigerant pipe work, flow controls and accessories must include at least two different types of refrigeration and/or air conditioning systems, including the following:

- pipe work that includes suction lines, liquid lines, discharge lines and control lines
- flow controls that include both liquid and vapour flow controls - mechanical and electronic
- accessories that include pipe work fittings, hand valves, isolation valves, solenoid valves, check valves, reversing valves, filter/dryers, sight glasses, accumulators and oil separators

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ106A Install refrigerant pipe work, flow controls and accessories.

Assessment Requirements for UEERA0050 Install refrigerant pipe work, flow controls and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying legislation, relevant industry standards, codes of practice and regulations
- applying manufacturer specifications
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - identifying hazards
 - using risk control measures
- completing pipe work, flow controls and accessories installation
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- implementing safe working practices
- installing refrigerant pipe work, flow controls and accessories for refrigeration and air conditioning systems, including:
 - checking operation, adjusting settings and replacement of flow controls
 - preventing pipe work contamination
 - connecting pipe work, flow controls and accessories to comply with requirements
 - ensuring pipe work, flow controls and accessories will not leak under pressure
 - placing and securing flow controls and accessories
 - reading and interpreting drawings related to pipe work layouts and apparatus locations
 - routing, placing and securing pipe work to comply with requirements
- preparing to install pipe work, flow controls and accessories.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- installation of pipe work, flow controls and accessories requirements and practices for

refrigeration and air conditioning systems, including:

- environmental and building regulation responsibilities, including those of working in and around heritage and environmental protection sites
- operation, replacement and adjustment of refrigerant flow controls
- pressure testing refrigerant pipe work
- refrigerant liquid flow controls and distributors, including capillary, thermostatic expansion valve, thermoelectric expansion valve, electronic expansion valve, low side floats, high side floats and liquid level controllers
- refrigerant pipe work accessories, including pipe work fittings, hand valves, isolation valves, solenoid valves, check valves, reversing valves, filter/dryers, sight glasses, accumulators, oil separators and pressure relief devices
- refrigerant vapour flow controls, including evaporator pressure regulators, crankcase pressure regulators, condenser bypass valves and electronic valves/controllers
- refrigeration pipe work, including appropriate piping arrangements for refrigerant lines, including discharge lines, liquid lines and suction lines
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - safe working practices
 - potential hazards
 - risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment

specifications, regulations, codes of practice and operation manuals.

UEERA0051 Install, commission, service and maintain air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to safely and effectively install, commission, service and maintain air conditioning systems.

It includes the ability to source relevant data and schematics; install components, pipe work, accessories and controls to create a functional air conditioning system. It covers selecting, installing and terminating interconnecting and controller cables between the sensor/s, controller/s, indoor and outdoor units of residential and small commercial systems; replacing damaged cables on equipment operating at voltages up to 500 volt (V) alternating current (a.c.) after its main switch with like-for-like cables; commissioning the system to ensure it operates at the specified design conditions, locating and rectifying faults and carrying out routine maintenance procedures.

The skills and knowledge of this unit of competency will be applied by refrigeration and air conditioning technicians during the installation, commissioning and servicing of air conditioning systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working

aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install air conditioning systems

2 Select, install and terminate low voltage (LV) and extra-low voltage (ELV) cables for refrigeration or air conditioning installations

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS risk control measures and procedures for carrying out the work are obtained and implemented in accordance with workplace procedures
 - 1.2 Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
 - 1.3 Components, piping, accessories, controls and consumables for the installation work are obtained and checked against job requirements in accordance with industry standards and codes of practice
 - 1.4 Tools, equipment and testing devices to complete work are obtained in accordance with workplace procedures and checked for operational safety in accordance with workplace procedures
- 2.1 Cable conductor sizes are selected to meet the equipment manufacturer specifications, current-carrying capacity requirements and voltage-drop

- 2.2 Reasons for selections made, including calculations, are documented in accordance with established procedures
 - 2.3 Cables are installed to comply with technical standards and job specifications and requirements with sufficient access to affect terminations
 - 2.4 Cables and conductors are terminated at accessories in accordance with manufacturer specifications and regulatory requirements
 - 2.5 Safety inspection of installed cables and testing of installed circuits are undertaken and any defects are rectified
 - 2.6 'As-installed' cables/wiring are documented and appropriate person/s notified in accordance with established procedures
- 3 Install non-ducted split air conditioning systems**
- 3.1 All required major components are securely mounted in the locations identified by the documentation or the supervisor in accordance with workplace procedures
 - 3.2 Refrigerant pipe work and associated components are installed according to specifications ensuring all connections and tube cleanliness are in accordance with requirements and workplace procedures
 - 3.3 Pressure testing of the installed components and pipe work is conducted to the required level for the type of refrigerant being used in accordance relevant codes of practice and industry standards
 - 3.4 Leaks are located and rectified employing appropriate methods in accordance with relevant codes of practice and industry standards
 - 3.5 Air conditioning system is evacuated to remove moisture and other contaminants in accordance with relevant codes of practice and industry standards
 - 3.6 Vacuum drop test is carried out to verify all moisture and other contaminants have been removed from the system in accordance with relevant codes of practice and industry standards
 - 3.7 Power and control circuit wiring is checked to ensure it conforms to circuit diagram specifications and system is electrically safe to energise in accordance with relevant

codes of practice and industry standards

4 Install ducted split air conditioning systems

- 4.1** Major components are securely mounted in the locations identified by the documentation or the supervisor in accordance with workplace procedures
- 4.2** Flexible ductwork, associated fittings and flow control devices are installed according to specifications ensuring all connections are in accordance with workplace procedures and industry standards
- 4.3** Refrigerant pipework and associated components are installed ensuring all connections and tube cleanliness is maintained at all times in accordance with workplace procedures and manufacturer specifications
- 4.4** Pressure testing of the installed components and pipe work is conducted to the required level for the type of refrigerant being used in accordance with relevant industry standards and workplace procedures
- 4.5** Leaks are located and rectified employing appropriate methods in accordance with industry standards and codes of practices
- 4.6** Air conditioning system is evacuated to remove moisture and other contaminants in accordance with industry standards, relevant codes of practices and workplace procedures
- 4.7** Vacuum drop test is carried out to verify all moisture and other contaminants have been removed from the system in accordance with industry standards, relevant codes of practices and workplace procedures
- 4.8** Power and control circuit wiring is checked to ensure it conforms to circuit diagram specifications and system is electrically safe to energise in accordance with industry standards, relevant codes of practices and workplace procedures

5 Commission air conditioning systems

- 5.1** Air conditioning system is charged with the appropriate type and quantity of refrigerant in accordance with industry standards, relevant codes of practices and workplace procedures
- 5.2** Measurements are obtained and recorded to confirm that the refrigerant charge is optimal in accordance with the system's design and manufacturer specifications

- 5.3** Control devices installed in the air stream for air flow quantity and distribution control are adjusted in accordance with the system's design and manufacturer specifications
- 5.4** Measurements are obtained and recorded to confirm that air flow quantities and distribution is optimal in accordance with the system's design and manufacturer specifications
- 6 Locate and rectify faults and carry out maintenance on air conditioning systems**
- 6.1** Fault diagnosis is carried out in accordance with industry standards, relevant codes of practices and workplace procedures
- 6.2** Fault-finding and rectification processes are carried out effectively without damage to the system and components in accordance with relevant codes of practice, industry standards and workplace procedures
- 6.3** System is returned to an operational state in accordance with workplace procedures and manufacturer specifications
- 6.4** Components that require routine maintenance are identified and regularly maintained in accordance with relevant timeframes, industry standards and workplace procedures
- 7 Complete work and report activities**
- 7.1** WHS/OHS risk control measures continue to be applied in accordance with workplace procedures
- 7.2** Worksite and equipment are cleaned and made safe in accordance with workplace procedures
- 7.3** Refrigerant usage is recorded in accordance with relevant industry regulations and codes of practice
- 7.4** Supervisor is notified of task completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting, installing and terminating LV and ELV cables for air conditioning installations must include the following applications:

- interconnecting and controller cables between the sensor/s, controller/s, indoor and outdoor units of residential and small commercial air conditioning systems
- replacing damaged cables on air conditioning equipment operating at voltages up to 500 V a.c. after its main switch with like-for-like cables

Selecting, installing and terminating LV and ELV cables for air conditioning installations must include the following cable types:

- circular thermoplastic sheathed (TPS)
- data cables
- flat TPS
- flexible cables
- shielded cables
- thermoplastic insulated (TPI) cable
- high wall split air conditioning system
- ceiling cassette split air conditioning system
- ceiling suspended split air conditioning system
- ducted split air conditioning system
- ducted package air conditioning system

Installing, commissioning, servicing and maintaining split air conditioning systems must include at least one of the following:

Installing, commissioning, servicing and maintaining ducted air conditioning systems must include at least one of the following:

Electrical supply to the installed air conditioning system must include one of the following:

- single phase 240 V
- three phase 415 V

Fault finding and rectification of an air conditioning system must include at least two of the following mechanical faults:

- incorrect refrigerant charge
- restriction within refrigerant circuit, including filter drier and refrigerant metering device (RMD)
- non-condensables
- incorrect low side superheat
- incorrect high side sub-cooling
- component failure, including compressor not pumping

Fault finding and rectification of an air conditioning system must include at least two of the following electrical faults:

- open circuit, including load, conductor and/or control
- incorrect circuit wiring

Carrying out maintenance on air conditioning systems must include all of the following

- earthing short, including load circuit has connected with casing and/or frame
- shunted short, including load is internally shorted causing lower resistance
- incorrect phase rotation
- high wall split air conditioning system
- ducted split air conditioning system
- ducted package unit air conditioning system

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEERA0051 Install, commission, service and maintain air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- commissioning a ducted air conditioning system
- installing a ducted split air conditioning system
- installing a non-ducted split air conditioning system
- locating and rectifying mechanical faults and electrical faults on air conditioning systems
- maintaining air conditioning systems
- recording values and reporting completion of work
- selecting, installing and terminate low voltage (LV) and extra-low voltage (ELV) cables for refrigeration or air conditioning installations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- air distribution, including:
 - air control damper types and applications
 - common fan types and applications
 - duct fitting types and applications
 - noise and vibration control methods
 - purpose of zoning, including advantages and disadvantages
 - relevant legislation, industry standards, codes of practice and regulations
 - rigid and flexible duct types and applications
 - supply and return air diffuser/grille types and applications
- basic ducted split system selection for a residential application, including:
 - application of industry recognised check figures watts per square metre (W/m²) and

manufacturers data

- basic ductwork dimensioning employing a duct calculator
- drawing a basic ductwork layout map
- manufacturers design specifications and effects of operating the air conditioning system outside these conditions, including high/low ambient temperature and high relative humidity
- cable selection based on the existing cable, current-carrying capacity requirements, including:
 - *AS/NZS 3008 Electrical installations – Selection of cables – Cables for alternating voltages up to and including 0.6/1 kV* used to select conductor size based on the maximum current requirement for a given installation condition, including any applicable derating factors
 - types of cables and applications
- cable selection based on voltage-drop requirements, including:
 - *AS/NZS 3000* requirements for maximum voltage-drop in an installation
 - calculation of the expected voltage-drop in a given circuit
 - relevant tables in *AS/NZS 3008 Electrical installations – Selection of cables – Cables for alternating voltages up to and including 0.6/1 kV* for unit values of voltage-drop
 - selecting cables to satisfy voltage drop requirements in addition to current-carrying capacity requirements
- commissioning air conditioning systems requirements and procedures, including:
 - basic air balancing techniques
 - techniques to determine operating values for a reverse cycle high wall split air conditioning system
- common items identified on a preventative maintenance schedule, including the following air conditioning system types:
 - high wall splits
 - package units
 - split ducted
- defrost (de-ice) operation, including activation and termination conditions
- equipment installation requirements and procedures, including:
 - location considerations for outdoor and indoor units, including exposure, prevailing winds and noise regulations
 - maintaining structural integrity, including weight being applied and cutting of trusses/beams
 - maintenance of fire rating integrity
 - reading and interpreting manufacturer instructions
 - relevant legislation, industry standards, codes of practice and regulations
 - requirements for condensate removal and/or drainage
- fault finding and rectification of air conditioning systems requirements and procedures, including:
 - typical controller fault codes and use of manufacturer's data
 - symptoms and rectification of typical abnormal system conditions:

- defrost initiation or termination failure
 - earthing short, including load circuit has connected with casing and/or frame
 - high side sub-cooling too low/too high
 - incorrect phase rotation and scroll compressors
 - inefficient compressor, including reduced pumping capacity
 - inverter failure, including manufacturers recommended testing procedure
 - low side superheat too low/too high
 - non-condensables
 - open circuit
 - refrigerant overcharge and undercharge
 - restricted filter drier
 - shunted short, including load is internally shorted causing lower resistance
- package units, including construction, applications and installation
 - reading and interpreting single phase wiring and pipe work schematics for a typical cooling only room air conditioner
 - reading and interpreting single phase wiring and pipe work schematics for a typical reverse cycle high wall split air conditioner
 - reading and interpreting three phase wiring and pipe work schematics for a typical reverse cycle package unit
 - relevant standards, codes and requirements applicable to the installation of cables
 - techniques for installing cables and wiring systems encompassing:
 - application of wiring accessories
 - cable and conductor terminations
 - drawing-in, placing and fixing of cables
 - inspecting and testing installed and terminated cables to ensure they comply with continuity and insulation resistance and are safe to connect to the supply
 - maintaining fire rating integrity
 - typical cable routes through buildings, structures and premises
 - ventilation, including:
 - fresh air requirements in accordance with relevant industry standards
 - common methods, including natural, supply and exhaust
 - relevant legislation, industry standards, codes of practice and regulations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals

UEERA0052 Install, commission, service and maintain low temperature systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to safely and effectively install, commission, service and maintain low temperature cabinets and freezer rooms employing a single evaporator and single condensing unit.

It includes the ability to source relevant data and schematics; install components, pipe work, accessories and controls to create a functional low temperature system; commission the system to ensure it operates at the specified design conditions; locate and rectify faults; and carry out routine maintenance procedures.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation, commissioning and servicing of low temperature refrigeration systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install low temperature cabinet or freezer room systems

2 Install low temperature cabinet or freezer room systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS risk control measures and procedures for carrying out the work are obtained and implemented in accordance with workplace procedures
- 1.2** Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
- 1.3** Components, piping, accessories, controls and consumables for the installation work are obtained and checked against job requirements in accordance with industry standards and codes of practice
- 1.4** Tools, equipment and testing devices to complete work are obtained in accordance with workplace procedures and checked for operational safety in accordance with workplace procedures
- 2.1** Major components are securely mounted in the locations identified by the documentation or supervisor in accordance with workplace procedures
- 2.2** Refrigerant pipe work and associated components are installed according to specifications ensuring all connections and tube cleanliness are in accordance with job requirements and workplace procedures

- 4.2** Fault-finding and rectification processes are carried out effectively without damage to the system and components and in accordance with relevant codes of practice, industry standards and workplace procedures
- 4.3** System is returned to an operational state in accordance with workplace procedures and manufacturer specifications
- 4.4** Components that require routine maintenance are identified and regularly maintained in accordance with relevant timeframes, industry standards and workplace procedures
- 5 Complete work and report activities**
- 5.1** WHS/OHS risk control measures continue to be applied in accordance with workplace procedures
- 5.2** Worksite and equipment are cleaned and made safe in accordance with workplace procedures
- 5.3** Refrigerant usage is recorded in accordance with relevant industry regulations and codes of practice
- 5.4** Supervisor is notified of task completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, commissioning, servicing and maintaining low temperature cabinets and freezer rooms must include one of the following:

Condensing unit employed on low temperature refrigeration system must include one of the

- low temperature refrigerated freezer room with a single evaporator
- low temperature upright or under-bar refrigerated cabinet with a single evaporator
- directly mounted single condensing unit
- remotely mounted single condensing unit

following:

Refrigerant metering device employed on low temperature refrigeration systems must include one of the following:

- electronic expansion valve
- externally equalised thermostatic expansion valve
- internally equalised thermostatic expansion valve
- single phase 240 V
- three phase 415 V

Electrical supply to the installed low temperature refrigeration systems must include one of the following:

- component failure, including compressor not pumping
- incorrect control setting
- incorrect high side sub-cooling
- incorrect low side superheat
- incorrect refrigerant charge
- non-condensables
- restriction within refrigerant circuit, including filter drier and refrigerant metering device (RMD)
- earthing short, including load circuit has connected with casing or frame
- incorrect circuit wiring
- open circuit, including load, conductor or control
- shunted short, including load is internally shorted causing lower resistance

Fault finding and rectification of low temperature refrigeration systems must include at least two of the following mechanical faults:

Fault finding and rectification of low temperature refrigeration systems must include at least two of the following electrical faults:

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEERA0052 Install, commission, service and maintain low temperature systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying relevant requirements, legislation, standards, codes of practice and industry procedures
- commissioning a low temperature system
- installing a low temperature system
- locating and rectifying mechanical faults and electrical faults on a low temperature cabinet or freezer room system
- maintaining a low temperature cabinet or freezer room system
- recording values and reporting completion of work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- freezer room protection components encompassing purpose of implosion ports and floor, door and drain heaters
- common items identified on a preventative maintenance schedule for a low temperature cabinet and freezer room
- commissioning typical general-purpose low temperature refrigeration systems requirements and procedures, including:
 - techniques to determine operating values of a low temperature system
 - techniques to determine operating values of a cycling and safety control settings for a low temperature system
 - typical initiation and termination settings for electric element and hot gas defrost methods
- definition and purpose of hazard analysis and critical control points (HACCP)
- defrost methods, including electric element and hot gas defrost employing a time initiated

- and pressure or temperature terminated control
- fault finding and rectification of low temperature systems requirements and procedures, including:
 - symptoms and rectification of typical abnormal system conditions:
 - defrost initiation or termination failure
 - earthing short, including load circuit has connected with casing and/or frame
 - high side sub-cooling too low/too high
 - inefficient compressor
 - low side superheat too low/too high
 - non-condensables
 - open circuit
 - refrigerant overcharge and undercharge
 - restricted air flow through condenser
 - restricted air flow through evaporator
 - restricted filter drier/thermostatic expansion valve (TEV) strainer
 - shunted short, including load is internally shorted causing lower resistance
 - typical controller fault codes and use of manufacturers' data
 - low temperature display cabinet types, construction and applications, including solid door cabinets, glass door displays and under-bars
 - low temperature freezer rooms, including construction and ancillary fittings
 - low temperature merchandiser types, construction and applications, including island and reach-in
 - reading and interpreting single phase wiring and pipe work schematics for a typical low temperature cabinet or freezer room employing electric element or hot gas defrost
 - reading and interpreting three phase wiring schematics for a typical low temperature freezer room employing electric element or hot gas defrost
 - requirements for condensate removal/drainage
 - typical range of products stored in low temperature cabinets/freezer rooms and required storage conditions, including frozen food and ice cream products
 - refrigeration equipment installation requirements and procedures, including:
 - maintenance of fire rating integrity
 - relevant legislation, industry standards, codes of practice and regulations
 - self-contained and remote installations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0053 Install, commission, service and maintain medium temperature systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to safely and effectively install, commission, service and maintain medium temperature cabinets and cool rooms employing a single evaporator and single condensing unit. It includes the ability to source relevant data and schematics; install components, pipe work, accessories and controls to create a functional medium temperature system; commission the system to ensure it operates at the specified design conditions; locate and rectify faults; and carry out routine maintenance procedures.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation, commissioning and servicing of medium temperature refrigeration systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to install medium temperature cabinet or cool room systems

2 Install medium temperature cabinet or cool room systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS risk control measures and procedures for carrying out the work are obtained and implemented in accordance with workplace procedures
- 1.2** Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
- 1.3** Components, piping, accessories, controls and consumables for the installation work are obtained and checked against job requirements in accordance with industry standards and codes of practice
- 1.4** Tools, equipment and testing devices to complete work are obtained in accordance with workplace procedures and checked for operational safety in accordance with workplace procedures
- 2.1** Major components are securely mounted in the locations identified by the documentation or supervisor in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installing, commissioning, servicing and maintaining medium temperature cabinets and cool rooms must include one of the following:

- medium temperature upright or under-bar refrigerated cabinet with a single evaporator
- medium temperature refrigerated cool room with a single evaporator

Condensing unit employed must include one of

- directly mounted single condensing unit
- remotely mounted single condensing unit

the following:

Refrigerant metering device employed must include one of the following:

- electronic expansion valve
- externally equalised thermostatic expansion valve
- internally equalised thermostatic expansion valve

Electrical supply to the installed medium temperature refrigeration systems must include one of the following:

- single phase 240 V
- three phase 415 V

Fault finding and rectification of medium temperature refrigeration systems must include at least two of the following mechanical faults:

- component failure, including compressor not pumping
- incorrect control setting
- incorrect high side sub-cooling
- incorrect low side superheat
- incorrect refrigerant charge
- non-condensables
- restriction within refrigerant circuit, including filter drier and refrigerant metering device (RMD)

Fault finding and rectification of medium temperature refrigeration systems must include at least two of the following electrical faults:

- earthing short, including load circuit has connected with casing or frame
- incorrect circuit wiring
- open circuit, including load, conductor and/or control
- shunted short, including load is internally shorted causing lower resistance

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEERA0053 Install, commission, service and maintain medium temperature systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying relevant requirements, legislation, standards, codes of practice and industry procedures
- commissioning a medium temperature refrigeration system
- installing a medium temperature refrigeration system
- locating and rectifying mechanical faults and electrical faults on a medium temperature cabinet or cool room system
- maintaining a medium temperature cabinet or cool room system
- recording values and reporting completion of work.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- commissioning typical general-purpose medium temperature refrigeration system requirements and procedures, including:
 - techniques to determine operating values for a medium temperature system operating with a 2°C product
 - typical cycling and safety control settings for a 2°C product temperature, 6K evaporator td
 - typical cycling and safety control settings for a 2°C product temperature, 6K evaporator td
 - typical initiation and termination settings for forced off-cycle defrost method
- common items identified on a preventative maintenance schedule for a medium temperature cabinet or cool room
- definition and purpose of hazard analysis and critical control points (HACCP)

- defrost methods, including natural off-cycle defrost and forced off-cycle defrost employing a time initiated and time terminated control
- fault finding and rectification of medium temperature systems requirements and procedures, including:
 - symptoms and rectification of typical abnormal system conditions:
 - earthing short (load circuit has connected with casing or frame)
 - high side sub-cooling too low/too high
 - inefficient compressor
 - low side superheat too low/too high
 - non-condensables
 - open circuit
 - refrigerant overcharge and undercharge
 - restricted air flow through condenser
 - restricted air flow through evaporator
 - restricted filter drier/thermostatic expansion valve (TEV) strainer
 - shunted short, including load is internally shorted causing lower resistance
 - typical controller fault codes and use of manufacturers data
- medium temperature cool rooms, including construction and ancillary fittings
- medium temperature display cabinet types, construction and applications, including solid door cabinets, glass door displays, countertops, under-bars and open decks
- medium temperature merchandiser types, construction and applications, including single deck, multi-deck, island, reach-in and serviced
- off-cycle pump-down, including thermostat controlling liquid line solenoid valve purpose and components required
- range of products stored in medium temperature cabinets and cool rooms and required storage conditions, including fresh meat, dairy, delicatessen, mixed drinks, fruit and vegetables
- reading and interpreting single phase wiring and pipe work schematics for a typical medium temperature cabinet or cool room incorporating basic off-cycle, including thermostat controlling compressor
- reading and interpreting single phase wiring and pipe work schematics for a typical medium temperature cabinet or cool room incorporating off-cycle pump-down, including thermostat controlling liquid line solenoid valve
- reading and interpreting three phase wiring schematics for a typical medium temperature cool room incorporating off-cycle pump-down, including thermostat controlling liquid line solenoid valve
- refrigeration equipment installation requirements and procedures, including:
 - maintenance of fire rating integrity
 - relevant legislation, industry standards, codes of practice and regulations
 - self-contained and remote installations
- requirements for condensate removal/drainage.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0054 Maintain microbial control of refrigeration and air conditioning systems

Modification History

Release 1: This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to maintain microbial control of refrigeration and air conditioning systems.

It includes quality assurance and risk management compliance processes for maintenance of the air and water systems associated with refrigeration and air conditioning.

It also includes working safely and to technical, quality and risk management industry standards, work specifications, maintenance schedules and sample inspections; evaluating components and completing the necessary maintenance documentation.

The skills and knowledge in this unit will be applied by those cleaning and maintaining refrigeration and air conditioning chilled water, hot water or cooling tower water systems.

Most state/territory jurisdictions have legislative requirements for the management of microbial control in cooling water systems to prevent the growth and transmission of Legionnaires' Disease.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

Not applicable.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to maintain microbial control of air and water systems

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2 Safety hazards which have not been previously identified are noted on risk assessment documents and risk control measures determined and implemented
- 1.3 Maintenance schedule and process compliance requirements are confirmed and appropriately sequenced in accordance with legislative, industry standards and code requirements and established procedures
- 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.5 Location of equipment to be maintained is determined from maintenance schedule, workplace procedures and/or system specifications and diagrams
- 1.6 Resources needed to conduct the maintenance are obtained in accordance with workplace procedures and checked against job requirements
- 1.7 Tools, equipment and testing devices needed to conduct the maintenance work are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Maintain microbial control of air and water systems

- 2.1 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2 Water samples are taken and tested in accordance with legislative, industry standards and code requirements and established methods and routines
- 2.3 Air and water system apparatus to be maintained is inspected and evaluated for compliance with legislative, industry standards and code requirements in accordance

with maintenance schedule.

- 2.4 Non-compliant apparatus/components/samples are documented and arrangements made for their rectification in accordance with workplace procedures
 - 2.5 Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.6 Ongoing checks of quality of maintenance work are undertaken in accordance with workplace procedures
 - 2.7 Maintenance process compliance is performed efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 3 Complete maintenance processes and documentation**
- 3.1 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 3.2 Final checks are made to verify that the maintenance complies with maintenance requirements
 - 3.3 Maintenance completion is documented and appropriate person/s notified in accordance with established procedures and regulations

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

maintaining microbial control of refrigeration and air conditioning systems must include at least the following:

- two different air and water systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ168A Maintain microbial control of refrigeration and air conditioning systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0054 Maintain microbial control of refrigeration and air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislative, industry standards, codes and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining and arranging for corrective action of non-compliant apparatus
- documenting maintenance work
- following maintenance schedule
- following quality assurance and risk management compliance processes
- inspecting and evaluating apparatus for quality assurance and risk compliance
- interpreting maintenance schedule requirements correctly
- planning to maintain microbial control of air and water system
- sampling water condition.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- harmful microbes and the effects if left uncontrolled
- maintenance microbial control of refrigeration and air conditioning system, including:
 - data acquisition
 - inspection techniques
 - maintenance plans
 - plant history cards/files
 - predictive maintenance

- principles and function
- recording methods
- systems and terminology
- methods of controlling harmful microbes, including regular cleaning/decontamination of effected plant, sample testing and approved treatment
- microbial control safe working practices and relevant industry standards, codes of practice and regulations
- relevant air and water system manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes, including safe handling and application of treatment materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- types of air and water systems that require control of harmful microbes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0055 Manage refrigeration and air conditioning projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to manage refrigeration and air conditioning projects.

It includes the management of safety, budget, variations, personnel, resources and critical path timelines and all necessary progress and completion documentation.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work.

Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Determine the scope of the project**
 - 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
 - 1.2** Project deliverables and budget are determined from project planning and relevant documentation and/or discussions with relevant person/s
 - 1.3** Measurable outcomes are identified to evaluate project on completion from project planning and relevant documentation in accordance with contractual agreement
 - 1.4** Plant, materials and skills required to meet project outcomes are determined from project planning and relevant documentation in accordance with contractual agreement
 - 1.5** Workplace procedures are developed for managing contract variations from discussions with relevant person/s in accordance with contractual agreement
- 2 Manage project**
 - 2.1** WHS/OHS requirements and procedures are implemented and monitored
 - 2.2** Achievement of project outcomes is assigned to relevant person/s involved in the project
 - 2.3** Project risks are identified and project plan strategies implemented to ensure outcomes are achieved in accordance with relevant industry standards, WHS/OHS requirements, contractual agreement and workplace procedures
 - 2.4** Procurement processes, timelines and supply of plant and materials are monitored in accordance with workplace procedures
 - 2.5** Project progress is monitored in accordance with schedule, quality requirements and budget
 - 2.6** Conflict issues at worksite between stakeholders, clients and regulators are identified and managed in accordance with workplace procedures
 - 2.7** Variations are managed in accordance with workplace procedures and contractual agreement
 - 2.8** Project records are maintained and forwarded to relevant person/s

3 Complete project

- 3.1 Project outcomes, implemented risk strategies, contract variations, safety record and budget are reviewed in accordance with contractual agreement
- 3.2 Project completion acceptance is sought from relevant person/s and handover documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Managing a refrigeration and air conditioning project must include the following:

- an industry accepted medium-sized refrigeration or air conditioning project

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ040B Manage refrigeration and air conditioning projects.

Assessment Requirements for UEERA0055 Manage refrigeration and air conditioning projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- establishing the scope of the project accurately
- ascertaining the input to a project
- developing effective management processes
- managing resources and variations effectively
- resolving conflicts
- adopting risk management strategies
- maintaining records and submitting progress reports
- meeting project outcomes
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- completing projects
- managing projects.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- refrigeration and air conditioning project management methods and techniques, safe working practices and relevant standards, codes and regulations, including:
 - defining project parameters, including:
 - project scope; project stakeholders and clients; project phases and the relationship between phases; time requirements and limitations; resource requirements and limitations; quality requirements and limitations
 - time management, including:
 - time management concepts and standard practices for ensuring a project runs to time
 - financial management, including:

- financial management concepts; standard practices for managing project finances; project budgets; costs, variations and estimations; invoicing against project phases/deliverables and acquittals
- quality management, including:
 - quality management concepts; standard practices for managing quality within a project
- human resource management, including:
 - human resource management concepts and standard practices for managing personnel within a project
- communication management, including:
 - communication management concepts and standard practices for managing communication within a project
- risk management and contingencies, including:
 - risk management concepts; standard practices for managing risk within a project; internal risks; external risks; risk minimisation; risk removal and contingencies
- procurement management, including:
 - procurement management concepts and standard practices for managing procurement
- physical resource management, including:
 - types of physical resource, including equipment, technology, information, facilities; physical resource management concepts and standard practices for managing physical resources
- contracts, including:
 - understanding project contracts; standard practices for working to contract specifications; contract format; contract content; legal obligations of contract parties; and accompanying documentation, including contract schedules
- performance assessment and continuous improvement, including:
 - standard performance assessment practices and standard continuous improvement practices
- engineering ethics principles
- customer/client relations, including:
 - importance of customer/client relations
 - interpersonal skills that enhance customer/client
 - dispute resolution
 - customer/client relations strategies
- refrigeration and air conditioning industry sector customs and practices, including:
 - technical aspects of project planning and management encompassing:
 - method of ensuring equipment meets specified performance requirements
 - performance/cost-benefit analysis
 - equipment procurement
 - typical approaches to planning and management
 - successful planning techniques

- best practice management methods and styles
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0056 Monitor and adjust refrigeration energy management systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to monitor and adjust refrigeration energy management systems.

It includes setting up and adjusting energy management systems on refrigeration systems for effective energy use. It also includes working safely, testing and analysing system parameters, adjusting equipment and controls, following workplace procedures, and documenting final operating parameters and settings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to monitor and adjust energy management systems on refrigeration system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified and applied
- 1.2** WHS/OHS risk control measures and workplace procedures are followed in preparation for refrigeration system work
- 1.3** Safety hazards not previously identified are noted on job safety assessment and established risk control measures

- implemented
- 1.4 Appropriate person/s is consulted to ensure refrigeration system work is coordinated effectively with others involved on the worksite
 - 1.5 Refrigeration system energy parameters are identified by reviewing system specifications and component technical data
 - 1.6 Tools, equipment and testing devices needed to carry out work are obtained and checked for correct operation and safety
 - 1.7 Preparatory work is checked to ensure no damage has occurred and complies with job requirements
 - 1.8 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace safety procedures
 - 1.9 Circuits are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2 Monitor and adjust energy management systems on refrigeration system**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out refrigeration system work are followed
 - 2.2 Testing/measuring devices are connected and set up in accordance with job requirements and refrigeration system
 - 2.3 Monitoring and adjustments are made to equipment components and controls to provide effective energy use in accordance with refrigeration system specifications and regulatory requirements
 - 2.4 Unplanned situations are responded to in accordance with workplace procedures, discussions with appropriate person/s and job specifications and requirements in a manner that minimises risk to personnel and equipment
 - 2.5 Refrigeration system monitoring and adjusting is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy principles
- 3 Complete and report monitoring adjusting**
- 3.1 WHS/OHS risk control work completion measures and

activities

workplace procedures are followed

- 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.3 Monitoring and adjustment settings are documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Monitoring and adjusting refrigeration and energy management systems must include at least the following:

- two different types of energy management systems for refrigeration systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ121A Monitor and adjust refrigeration energy management systems.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERA0056 Monitor and adjust refrigeration energy management systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- identifying system energy parameters
- monitoring and adjusting system components and controls to provide effective energy use
- ensuring system energy use is accordance with requirements
- documenting adjustment settings with established procedures
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) workplace procedures and practices requirements, including using risk control measures
- applying sustainable energy principles and practices
- monitoring and adjusting energy management systems on refrigeration system
- planning, monitoring and adjusting energy management systems on refrigeration system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- energy management systems for commercial refrigeration, safe working practices and relevant standards, codes and regulations, including:
 - functions of a commercial refrigeration energy management system, including:
 - general control function
 - inputs
 - outputs
 - communications
 - graphing
 - supervising
 - data logging
 - scheduling

- alarms
- power consumption
- energy management system control components, including:
 - identify components
 - pressure sensors
 - temperature sensors
 - time clocks
 - humidity sensors
 - liquid level sensors
 - leak detector sensor
 - function and operating parameters of components
 - pressure sensors
 - temperature sensors
 - time clocks
 - humidity sensors
 - liquid level sensors
 - leak detector sensors
- installation requirements and considerations, including:
 - installation of controller(s)
 - installation of refrigerant leak detector
 - systems
 - installation of accessory boards
 - installation of pressure transducers and wiring
 - installation of temperature sensors and wiring
 - control wiring considerations
- system design and applications, including:
 - control components to suit given applications
 - system operating parameters
 - pressure sensors
 - temperature sensors
 - time clocks
 - humidity sensors
 - liquid level sensors
 - leak detector sensors
 - defrost
 - alarm panel
- programming a control system, including:
 - display terminal and keypad functions
 - calibration of sensors

- changing original settings
- program a given set of parameters to suit an application
- component testing and fault finding, including:
 - troubleshooting
 - testing of components
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0057 Operate ammonia refrigeration plant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to operate ammonia (R717) refrigerant refrigeration plants.

It includes operating an industrial refrigeration plant using ammonia as the refrigerant. It also includes applying specialised refrigeration principles that apply to ammonia, specifying the normal operating parameters for the plant, rectifying faults and defective components within organisational guidelines, and completing the necessary service documentation.

The skills and knowledge in this unit will be applied by ammonia refrigeration plant operators during the start-up, operation and shutdown of ammonia refrigeration plants.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to operate ammonia refrigerant plant

2 Operate ammonia refrigeration plant

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2 Ammonia refrigerant, refrigeration system and components on which the work is to be carried out are identified
- 1.3 WHS/OHS risk control measures, safety data sheets (SDS)/material safety data sheets (MSDS) and workplace procedures are followed in preparation for refrigeration work
- 1.4 Safety hazards not previously identified are reported and advice on risk control measures is sought from work supervisor
- 1.5 Nature of work is obtained from documentation or work supervisor to determine the scope of work to be undertaken
- 1.6 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.7 Sources of materials required for refrigeration work are accessed in accordance with workplace procedures
- 1.8 Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety
- 1.9 Refrigeration system operating conditions are established from service documentation, supervisor and the application of refrigeration fundamentals
- 2.1 Refrigeration plant is started up in accordance with workplace procedures, industry standards, codes of

practice and regulations

- 2.2 Measurement of refrigeration system operating parameters is conducted in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.3 Supervisor or person in charge is advised of system and components performing outside their operating parameters to facilitate remedial action
 - 2.4 Refrigeration plant remedial action is determined and implemented, as required, in accordance with workplace procedures
 - 2.5 Refrigeration service procedures are completed in accordance with workplace procedures
 - 2.6 Daily processing requirements are calculated to predict demand on refrigeration plant
 - 2.7 Oral and written information on the performance of the refrigeration plant is exchanged formally and informally between the operator and supervisor/production team
 - 2.8 Equipment controls are adjusted to prepare refrigeration plant to meet the load
 - 2.9 Action is taken in a proactive way to maintain the performance of the plant
 - 2.10 Demands on plant consumables are calculated to facilitate the ordering of replacements
 - 2.11 Strategies are developed to meet demand in the event of refrigeration plant equipment malfunction or breakdown
- 3 Complete work and report on ammonia refrigeration plant operations**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Refrigeration plant performance records are maintained and distributed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Operating ammonia refrigeration system conditions must include at least the following:
- starting up
 - determining operating conditions using measurement and calculation methods
 - repairing components
 - shutting down the system
 - checking:
 - suction
 - inter-stage and discharge pressures
 - ambient, evaporator, inter-stage and condensing temperatures
 - evaporator and condenser temperature differences

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ196A Operate Ammonia Refrigeration Plant.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0057 Operate ammonia refrigeration plant

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislative, industry standards and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing necessary service documentation
- conducting servicing procedures in accordance with the schedule
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining plant operating condition, rectifying faults and defective components in accordance within workplace procedures and guidelines
- documenting operating conditions correctly
- identifying anhydrous ammonia (R717) refrigerant safety data sheets (SDS)/material safety data sheets (MSDS) and workplace emergency response procedures
- identifying the conditions of the refrigerant at various locations in the vapour compression and liquid recirculation system
- operating an industrial refrigeration plant using ammonia as the refrigerant
- recording measurements
- selecting and using appropriate measuring devices correctly
- shutting down ammonia refrigerant plant
- starting up ammonia refrigerant plant
- taking remedial action within workplace emergency response procedures and job role
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- adding refrigerant, draining/adding oil and purging non-condensables
- ammonia refrigeration system operation
- hazardous goods, segregation, storage and handling
- refrigeration plant start-up, shutdown and emergency procedures
- refrigeration systems, including:
 - ammonia refrigeration system types, operating principles, major components, flow controls and ancillary components
 - operating conditions of ammonia refrigeration systems
- refrigeration vapour compression system principles, including:
 - heat, heat energy (definition and unit of measurement), enthalpy (definition and unit of measurement) and heat transfer
 - pressure, scale types (imperial, metric and absolute) and their units of measurement, vacuum scales (Pascals and microns), and conversion to/from absolute values and gas laws (Boyles, Charles and Daltons)
 - refrigerant conditions, saturation temperature, saturated liquid saturated vapour, superheated vapour, sub-cooled liquid and pressure temperature relationships
 - sensible and latent heat, definition of latent heat and sensible heat (including units of measurement) and measurement devices
 - temperature and relative humidity, scale types (imperial, metric and absolute) and units of measurement and measurement devices
 - vapour compression cycle, primary system components, and high and low pressure sides
- relevant job safety assessments or risk mitigation processes, including ammonia (R717) refrigerant SDS/MSDS
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures, including workplace emergency response plan
- vapour compression system, including operation and major components.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, emergency response plan, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0058 Plan refrigeration and air conditioning projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to plan refrigeration and air conditioning projects.

It includes establishing budgets, applying critical path analysis, developing workflow strategies, and presenting and negotiating budgets and timelines.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work.

Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to plan project**
 - 1.1** WHS/OHS requirements and workplace procedures for a given work area are identified, obtained and applied
 - 1.2** Techniques for project planning are reviewed and adopted in accordance with workplace procedures
 - 1.3** Project is determined from design brief specifications and/or relevant documentation and discussions with relevant person/s
- 2 Develop project plan proposal**
 - 2.1** Plant, material, labour and relevant costs are sought and obtained from relevant person/s in accordance with workplace procedures
 - 2.2** Project budget is determined from estimated plant, material, labour and relevant costs in accordance with workplace procedures
 - 2.3** Critical path analysis is applied to developing workflow strategies
 - 2.4** Sources and availability of materials and human resources required for project are determined in accordance with workplace procedures
 - 2.5** Risk management strategies are sought, obtained and incorporated in project plan
 - 2.6** Project plan is reviewed and adjusted to rectify any anomalies in accordance with project plan
 - 2.7** Project plan proposal is documented in accordance with workplace procedures
- 3 Obtain approval for project plan**
 - 3.1** Project plan is presented and discussed with relevant person/s
 - 3.2** Alterations to the project plan resulting from the presentation/discussion are negotiated with relevant person/s in accordance with workplace procedures
 - 3.3** Final project plan is documented and approval obtained from relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Planning refrigeration and air conditioning projects must include the following:

- an industry accepted medium-sized refrigeration or air conditioning project

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ069B Plan refrigeration and air conditioning projects.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0058 Plan refrigeration and air conditioning projects

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- determining the project requirements accurately
- establishing a project budget
- developing effective workflow strategies
- documenting project plan proposal
- negotiating alterations to the proposed project plan successfully
- obtaining approval of the final plan
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- refrigeration and air conditioning project planning, developing and documenting refrigeration and air conditioning project proposals, milestones and completion methods and techniques, including:
 - purpose of project planning
 - documents needed to plan a project
 - factors influencing sequence and restraints of project activities
 - critical path and project analysis encompassing:
 - purpose
 - essential data
 - relational sequence of work activities
 - graphical representation methods
 - methods of representing time/rates

- monitoring methods
- refrigeration and air conditioning industry sector customs and practices, safe working practices and relevant standards, codes and regulations
- technical aspects of project planning and management encompassing:
 - method of ensuring equipment meets specified performance requirements
 - performance/cost-benefit analysis
 - equipment procurement
- typical approaches to planning and management
- successful planning techniques
- best practice management methods and styles
- relevant manufacturer specifications
- relevant safe job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0059 Prepare and connect refrigerant tubing and fittings

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Incorrect Performance Criteria numbering in Element 1 fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to prepare and connect refrigeration and air conditioning piping/tubing and fittings.

It includes cutting, bending and connecting copper tubes to copper tubes and to brass and steel fittings by flaring and swaging using compression fittings and silver brazing.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the installation, service and repair of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work.

Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to fabricate tubing and attach fittings for refrigeration and/or air conditioning system

2 Fabricate tubing and attach fittings for refrigeration and/or air conditioning system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards which have not previously been identified are reported and advice on risk control measures is sought from supervisor
- 1.3** Nature of work is obtained from documentation or supervisor to determine scope of work to be undertaken
- 1.4** Advice is sought from supervisor to ensure work is coordinated effectively with others
- 1.5** Materials required for the work are accessed in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices to carry out work are obtained and checked for correct operation and safety
- 2.1** Tasks are completed in accordance with workplace safety procedures
- 2.2** Relevant safe work methods are used to cut, flare, swage, bend and silver braze tubing and fittings as they apply to refrigeration and/or air conditioning systems
- 2.3** Refrigerant tubing and fittings are silver brazed with the use of dry nitrogen to prevent contamination
- 2.4** Fabricated tubing and fittings are prepared without waste of materials or damage/contamination to apparatus, the

surrounding environment or services using relevant workplace sustainable energy practices in accordance with workplace procedures

- 2.5 Quality checks are carried out regularly in accordance with workplace procedures, instructions/or specifications, including dimensions and pressure testing

3 Complete work and report

- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures

- 3.2 Supervisor is notified of task completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Preparing and connecting refrigerant tubing and fittings must include at least the following:

- cutting, flaring, bending and swaging using compression fittings, silver brazing copper tube to copper tube and brass and steel fittings
- piping/tubing and fittings for high-pressure refrigerants

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ102A Prepare and connect refrigerant tubing and fittings.

Assessment Requirements for UEERA0059 Prepare and connect refrigerant tubing and fittings

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Incorrect Performance Criteria numbering in Element 1 fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant industry standards, codes of practice, regulations and work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy principles and practices
- completing documentation and reporting requirements
- identifying and monitoring hazards and using applicable safety data sheets (SDS)/material safety data sheets (MSDS)
- preparing, fabricating and attaching refrigerant tubing and fittings, including:
 - attaching fittings correctly
 - conducting component quality checks
 - cutting, bending and joining refrigerant piping and tubing using appropriate tools and equipment, including compression fittings and high-pressure refrigerants
 - silver brazing copper tubes and fittings using dry nitrogen
- setting up equipment safely.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- copper tube grades, including types, properties, applications and handling
- dissimilar metals, including:
 - aluminium
 - brass

- steel
- stainless steel
- potential hazards with refrigerant tubing and fittings
- refrigerant tubing and fittings techniques, including:
 - annealing
 - bending
 - cutting
 - flaring
 - tube expanding
 - joining
 - silver brazing
 - use of dry nitrogen
- refrigeration copper tube fittings and access valves
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- SDS/MSDS
- sustainable energy principles and practices
- tools and equipment, including care and maintenance.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0060 Produce HVAC/R control system diagrams

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to produce heating, ventilation and air conditioning/refrigeration (HVAC/R) control system diagrams.

It includes applying safe working practices, interpreting technical data and specifications, applying knowledge of HVAC/R control systems drawing protocols, using appropriate drawing tools and documenting design.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0001 Analyse the operation of HVAC air and hydronic systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to produce HVAC/R control system diagrams

2 Produce HVAC/R control system diagrams

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures for a given work area are identified, obtained and applied
- 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for the work
- 1.3 Scope of work is determined from project specifications and/or discussions with relevant person/s
- 1.4 Relevant person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.5 Software tools and equipment required for work are obtained in accordance with workplace procedures
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out the work are followed

- 2.2 Relevant control diagrams and layouts required are determined in accordance with project specifications
 - 2.3 Technical data of control system components is interpreted to determine parameters for inclusion in accordance with project specifications
 - 2.4 Relevant software tools are used to produce diagrams in accordance with project specifications
 - 2.5 Diagrams are checked for accuracy in accordance with project specifications and workplace procedures
 - 2.6 Unplanned events are dealt with in accordance with workplace procedures and safe work practices
- 3 Complete and report HVAC/R control system diagrams**
- 3.1 Completed control diagrams are submitted to relevant person/s for accuracy in accordance with project specifications and workplace procedures
 - 3.2 Alterations, additions and/or corrective instructions are followed and diagrams are re-submitted for final approval in accordance with project specifications and workplace procedures
 - 3.3 Copies of completed diagrams are filed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Producing control system design diagrams must include at least the following:

- two different HVAC/R projects

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ130A Produce HVAC/R control system

diagrams.

Assessment Requirements for UEERA0060 Produce HVAC/R control system diagrams

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the drawing work accurately
- determining appropriate types of diagrams and their layouts correctly
- including appropriate technical data parameters in the diagrams
- checking and correcting diagrams accurately
- filing copies of completed drawing securely
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including using risk control measures
- completing and reporting heating, ventilation and air conditioning/refrigeration (HVAC/R) control system diagrams
- preparing to produce HVAC/R control system diagrams
- producing HVAC/R control system diagrams.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC/R control system fundamentals, safe working practices and relevant standards, codes and regulations, including:
 - control fundamentals:
 - control terminology
 - refrigeration system characteristics
 - HVAC system characteristics
 - control system characteristics
 - control system components
 - control system diagrams and symbols

- product knowledge
- types of control equipment:
 - electrical:
 - classification of circuits
 - two position control
 - floating control
 - sensors
 - controllers
 - flow control devices
 - control systems diagrams
 - electronic:
 - operating principles
 - sensors
 - controllers
 - control system diagrams
- control systems applications:
 - refrigeration
 - air conditioning
 - air handling system controls
 - ventilation
 - heating
 - building airflow system control
 - airflow control
 - singles and multi-zones
 - chiller/boiler and distribution system control (chilled water, boiler and distribution systems)
- relevant manufacturer specifications
- relevant safe job safety assessments or risk mitigation processes
- relevant software tools and equipment
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so;

where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEERA0061 Produce HVAC/R system design drawings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- understanding the extent of the drawing work accurately
- determining appropriate types of drawings and their layouts correctly
- including appropriate technical data parameters in the drawings
- checking and correcting drawings accurately
- filing copies of completed drawings securely
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- completing and reporting heating, ventilation and air conditioning/refrigeration (HVAC/R) design drawings
- preparing to produce HVAC/R design drawings
- producing HVAC/R design drawings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- HVAC/R system drawing, safe working practices and relevant standards, codes and regulations, including:
 - architectural and mechanical drafting conventions encompassing:
 - fire, hydraulic, electrical layout diagrams
 - sketching of pipe work circuits and mechanical services
 - drawing standards and symbols
 - working, detail and assembly drawings
 - ductwork layouts and conventions
 - pipe work layouts and conventions

- computer-aided drawing techniques
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant software tools and equipment
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0062 Recover and charge refrigerants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to recover, pressure test, evacuate and charge refrigerants from refrigeration and air conditioning systems.

It includes recovering refrigerants, pressure testing, evacuating, charging refrigerants into refrigeration systems and completing documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the recovery and charging of refrigerants on refrigeration and air conditioning systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to recover and charge refrigerant

- 1.1 WHS/OHS hazards, risk control methods, relevant industry standards, codes of practice and legislation are obtained and applied in accordance with workplace procedures
- 1.2 Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
- 1.3 Work tasks are sequenced in accordance with job schedule and workplace procedures
- 1.4 Supervisor is consulted to ensure work is coordinated with others in accordance with workplace procedures
- 1.5 Tools, equipment and testing devices to complete the work are obtained and checked for operational safety in accordance with workplace procedures

2 Recover and charge refrigerant

- 2.1 Refrigerant is removed from a functional refrigeration and/or air conditioning system safely, using appropriate recovery and/or reclaim equipment, and is placed into labelled containers in accordance with relevant codes of practice, regulatory requirements and industry standards
- 2.2 Pressure testing is conducted in accordance with relevant codes and standards at a pressure compatible with the type of refrigerant employed in the system and without damage to components in accordance with workplace procedures and industry standards
- 2.3 Leaks are located and rectified using testing methods appropriate to functional refrigeration and/or air conditioning system under test in accordance with relevant codes of practice, regulatory requirements and industry standards
- 2.4 Functional refrigeration and/or air conditioning system is evacuated to required level and cleaned of all moisture and other contaminants in accordance with relevant codes of practice, regulatory requirements and industry standards

- 2.5 Functional refrigeration and/or air conditioning system is charged with appropriate refrigerant in accordance with relevant standards, codes of practice, regulatory requirements and manufacturer specifications
 - 2.6 Problematic situations are resolved in accordance with workplace procedures
 - 2.7 Functional refrigeration and/or air conditioning system is pressure and leak tested, evacuated and charged without waste of materials, damage to apparatus, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures and industry standards
- 3 Complete and report refrigerant recovery and charging**
- 3.1 WHS/OHS work completion risk control measures are applied in accordance with workplace procedures
 - 3.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 3.3 Recovered and/or reclaimed refrigerant and lubricant are dealt with in accordance with relevant industry standards, codes of practice and regulatory requirements
 - 3.4 Completion of work is documented in an auditable logbook and supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide

Unit Mapping Information

No equivalent unit.

Assessment Requirements for UEERA0062 Recover and charge refrigerants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- charging the system with the correct type and quantity of refrigerant
- completing necessary documentation
- documenting work, including refrigerant usage and removal
- evacuating a system to required level
- following manufacturer specifications and manuals
- implementing relevant legislation, industry standards, codes of practice and regulations
- performing a vacuum test
- pressure testing a system to design conditions
- recovering refrigerant from a system
- testing the system for leaks and rectifying as necessary.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements and performance criteria and includes knowledge of:

- evacuation and dehydration, including vacuum pump types, use and care, suitable vacuum measuring instruments, drop testing and evacuation methods, including triple and deep
- pressure testing, including suitable gases, test values in accordance with standards and safe working procedures
- refrigerant charging procedures and methods, including vapour and liquid
- refrigerant recovery, including pump types, procedures for vapour and liquid recovery, disposal of recovered refrigerant and safety issues
- relevant legislation, industry standards, codes of practice and regulations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0063 Recover, pressure test, evacuate, charge and leak test refrigerants - appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to recover refrigerants, conduct pressure and leak tests, and evacuate and charge refrigerants in a self-contained appliance. This includes flammable and non-flammable refrigerants.

Competency in this unit requires the ability to work safely, prepare for and implement the recovery of refrigerants, undertake pressure and leak testing, perform evacuations and charging of refrigeration appliances as well as completing all required documentation.

Individuals will typically work independently to safely handle refrigerants used in appliances.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit may require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to recover refrigerants, pressure and leak test, evacuate and charge refrigeration appliance

2 Recover refrigerants, pressure and leak test, evacuate and charge refrigeration appliance

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Safety hazards which have not previously been identified are noted and risk control measures implemented in accordance with workplace procedures
- 1.3** Extent of work to be completed is determined from documentation and/or discussion with supervisor/appropriate person/s in accordance with workplace procedures
- 1.4** Work is sequenced in accordance with job schedule and workplace procedures
- 1.5** Appropriate person/s is consulted, as required, to ensure work is coordinated with others
- 1.6** Refrigerants, lubricants and cleaning materials are obtained in accordance with workplace procedures
- 1.7** Tools, equipment and testing devices are obtained in accordance with workplace procedures and checked for operational safety
- 2.1** Checks are carried out to ensure system or component parts are isolated, when necessary, in accordance with workplace procedures and WHS/OHS requirements

- 2.2 Circuits, machines and plant are checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
 - 2.3 Refrigerant is removed from appliance safely and is placed into labelled containers in accordance with workplace procedures and regulatory requirements
 - 2.4 Precautions are taken in accordance with workplace procedures to prevent damage to components while pressure testing appliance
 - 2.5 Pressure testing is conducted in accordance with workplace procedures using dry nitrogen at a pressure relative to refrigerant used
 - 2.6 Leaks are located and rectified using testing methods appropriate to the appliance under test in accordance with workplace procedures
 - 2.7 Appliance is evacuated to required level and is cleaned of all moisture and other contaminants in accordance with workplace procedures
 - 2.8 A 'drop test' is used to test effectiveness of evacuation in accordance with workplace procedures using an appropriate electronic vacuum gauge
 - 2.9 Components and lubricants are checked and maintained in accordance with workplace procedures and manufacturer specifications
 - 2.10 Appliance is charged with appropriate refrigerant in accordance with workplace procedures and manufacturer specifications
 - 2.11 Problematic situations are resolved in accordance with workplace procedures and are referred to a supervisor
 - 2.12 Appliance is pressure and leak tested, evacuated and charged without waste of materials or damage to apparatus, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report on refrigerants recovery pressure and leak test and evacuate and charge work**
- 3.1 Worksite and equipment are cleaned and made safe in accordance with workplace procedures

3.2 Contaminated refrigerant is dealt with in accordance with workplace procedures and legislative/regulatory requirements

3.3 Completion of work is documented and an appropriate person/supervisor is notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Recovering, pressure testing, evacuating, charging and leak testing refrigerants must include testing and charging refrigeration or air conditioning appliances using vacuum measuring instruments and include the following:

- recovering refrigerant from an existing appliance that may contain contaminants
- pressure and leak testing a newly installed or repaired appliance
- evacuating an appliance in preparation for charging with refrigerant
- charging an appliance with refrigerant with minimal loss
- flammable and non-flammable refrigerants

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ162A Recover, pressure test, evacuate, charge and leak test refrigerants - appliances.

Assessment Requirements for UEERA0063 Recover, pressure test, evacuate, charge and leak test refrigerants - appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying legislation, industry standards, codes of practice and regulations
- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - identifying hazards
 - implementing safe handling procedures
 - using risk control measures
- completing and reporting on work activities
- preparing to recover refrigerants, pressure and leak test, evacuate and charge refrigeration appliances
- recovering refrigerants, pressure and leak testing, evacuating and charging refrigerant appliance, including:
 - completing documentation
 - conducting pressure testing at appropriate pressure level without damaging components
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - evacuating system to required level
 - evacuating system to required standard using vacuum measuring instruments
 - locating and rectifying leaks
 - removing and storing refrigerant
 - using flammable and non-flammable refrigerants
 - selecting materials and equipment
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- flammable and non-flammable refrigerants
- recover, pressure and leak test, evacuate and charge refrigerant appliances, including:
 - refrigerant properties
 - safe handling practices
 - refrigeration oil recovery and reclaim procedures
 - pressure testing
 - leak detection
 - evacuation and dehydration
 - refrigerant and oil charging
 - system contamination
 - refrigeration component replacement
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - safe working practices
 - potential hazards
 - risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0064 Recover, pressure test, evacuate, charge and leak test refrigerants - split systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to undertake the recovery of refrigerants, perform pressure and leak testing, evacuations and refrigerant charging in split air conditioning and heat pump systems.

It includes working safely; applying relevant regulations, industry standards and codes of practice in recovering refrigerants; performing pressure and leak tests; evacuating and charging with refrigerant split systems; and completing all required documentation.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to recover refrigerant, pressure and leak test, evacuate and charge split systems

1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures

1.2 Safety hazards not previously identified are assessed, reported and advice on risk control measures sought from supervisor

1.3 Nature of the work is obtained from documentation or supervisor to determine the scope of work to be undertaken

1.4 Work activity is appropriately sequenced in accordance with job schedule

1.5 Relevant person/s is consulted to ensure work is coordinated effectively with others involved on the worksite

1.6 Refrigerant, lubricants and cleaning materials for work are obtained in accordance with workplace procedures and checked against job/task requirements

1.7 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety

1.8 Preparatory work is inspected and checked to ensure no damage has occurred and complies with workplace procedures and job/task requirements

2 Recover refrigerant, pressure and leak test evacuate and charge split systems

2.1 Checks are carried out to ensure the system and/or component parts are isolated in accordance with workplace procedures

2.2 Machines, plant and circuits are isolated in accordance with workplace procedures

2.3 Refrigerants are safely removed from split system and placed into labelled containers in accordance with regulatory requirements, industry standards and codes of

practice, and any electrical work is referred to a licensed electrician in accordance with workplace procedures.

- 2.4 Precautions are taken to prevent damage to components while pressure testing the system
- 2.5 Pressure testing is conducted using dry nitrogen at a pressure relative to the refrigerant to be used
- 2.6 Leaks are located and rectified using testing methods appropriate to system under test in accordance with industry standards
- 2.7 Split system is evacuated to required level and system is cleaned of all moisture and other containments in accordance with industry standards and codes of practice
- 2.8 A drop test is performed to test evacuation using an electronic vacuum gauge in accordance with industry standards and codes of practice
- 2.9 Component lubricants are checked and maintained in accordance with manufacturer specifications
- 2.10 Split systems are charged with refrigerant in accordance with manufacturer specifications, industry standards and codes of practice
- 2.11 Problematic situations are resolved in accordance with workplace procedures and reported to supervisor
- 2.12 Split systems are pressure and leak tested, evacuated and charged without waste of materials or damage to apparatus, the surrounding environment or services in accordance with relevant workplace sustainable energy practices

3 Report on refrigerant recovery, pressure and leak test, evacuation and charge work

- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.2 Contaminated refrigerant is dealt with in accordance with workplace procedures and legislative/regulatory requirements
- 3.3 Completion of work is documented and appropriate person/supervisor notified in accordance with workplace

procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

testing and charging split air conditioning systems must include at least the following:

- determining, using measurement and basic calculations methods, the operating conditions of vapour compression split system, including suction and discharge pressures
- ambient, evaporator and condensing temperatures
- evaporator and condenser temperature differences recovering Class A1 and A2L refrigerant from an existing split system, including split single head air conditioning and/or hot water heat pump systems pressure and leak testing a newly installed system
- evacuating newly installed systems in preparation for charging with refrigerant
- charging newly installed systems with Class A1 and A2L refrigerant

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ172A Recover, pressure test, evacuate, charge and leak test refrigerants - split systems.

Assessment Requirements for UEERA0064 Recover, pressure test, evacuate, charge and leak test refrigerants - split systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - identifying hazards
 - risk control measures
 - using personal protective equipment (PPE)
- applying safe working practices and relevant legislation, industry standards, codes of practice and regulations
- completing required documentation, including reporting refrigerant recovery, pressure and leak tests, evacuations, charging refrigerant work and system operating conditions determining basic operating conditions, including:
 - ambient, evaporation and condensing temperatures
 - evaporator and condenser temperature differences
 - suction and discharge pressures
- recovering, pressure testing, evacuating, charging and leak testing refrigerant in newly installed split systems to requirements using appropriate equipment, tools and measurement devices
- starting up system and performing function checks
- selecting, obtaining and checking relevant equipment, materials, tools and testing devices required to carry out the work, including:
 - A1, A2 and A2L class refrigerants, lubricants and charging equipment
 - oxygen-free dry nitrogen cylinder and regulator
 - pressure and temperature measurement devices
 - pressure testing and refrigerant leak testing equipment and tools
 - refrigeration evacuation equipment and measuring equipment suitable for A1, A2 and A2L class refrigerants
 - refrigerant recovery/reclaim equipment suitable for A1, A2 and A2L class refrigerants
 - refrigeration hand and power tools
 - refrigeration service tools

- single head split air conditioning systems
- using lubricants and cleaning materials safely in accordance with safety data sheets (SDS)/material safety data sheets (MSDS).

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- equipment and procedures for working with refrigerants, including:
 - charging refrigerant into a newly installed split system detecting refrigerant leaks (electronic, bubbles and halide for R22)
 - contaminant detection and removal
 - evacuating newly installed split systems
 - pressure testing systems newly installed split systems using dry nitrogen
 - reclaiming/recovering refrigerants using recovery units and recovery cylinders
- heat and heat transfer
- leak detectors types, applications, operation and procedures
- manifold gauges types, applications, operation and procedures
- pressure temperature relationships and charts
- pressure, units and measurement
- refrigerant conditions, including saturation, superheat and sub-cooling
- relative humidity, unit and measurement
- relevant industry standards, codes of practice and regulations, including WHS/OHS legislated requirements
- relevant manufacturer specifications
- relevant risk mitigation processes, including risk control measures
- safe working practices, safe handling and SDS/MSDS
- sensible and latent heat
- split heat pump Class A1, A2 and A2L refrigerant types, properties and applications
- split heat pump refrigerant oil types, properties and applications
- sustainable energy principles and practices, including:
 - environment protection requirements
 - sustainable energy practices
 - sustainable resources
- system access fittings types, applications, operation and procedures
- temperature, units and measurement
- vapour compression cycle, basic operation and major system components.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0065 Repair and service ammonia refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and service ammonia refrigeration systems.

It includes servicing and repairing refrigeration equipment using ammonia as the refrigerant. It also includes applying safe working practice and refrigeration principles that apply to ammonia; following service manuals; testing, locating and rectifying faults and defective components, and completing necessary service documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of refrigeration systems using ammonia refrigerant.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0005 Apply safety awareness and legal requirements for ammonia refrigerant

UEERA0053 Install, commission, service and maintain medium temperature systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service ammonia refrigeration system

2 Service and repair ammonia refrigeration system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2 Safety hazards which have not been previously identified are reported, risk assessed and advice on risk control measures sought from work supervisor
- 1.3 Nature of work is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
- 1.4 Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.5 Sources of materials required for the refrigeration work are accessed in accordance with workplace and procedures
- 1.6 Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety
- 2.1 Measuring system operating parameters are conducted in accordance with WHS/OHS requirements and workplace safety procedures
- 2.2 Refrigeration inspection and checks are carried out to ensure the system or component parts are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Refrigerant is removed from system safely in accordance with regulatory requirements, industry standards and practices
- 2.4 Precautions are taken to prevent damage to components

while pressure testing the refrigeration system

- 2.5 Pressure testing is conducted at a pressure compatible with ammonia and in accordance with industry standards
- 2.6 Refrigeration leaks are located and rectified using testing methods appropriate to the system and in accordance with industry standards and practices
- 2.7 Oil is removed from an operational ammonia refrigeration system in accordance with industry standards and practices
- 2.8 Refrigeration system is charged safely with ammonia and compatible lubricants in accordance with industry standards and practices
- 2.9 Actual and specified range of operating conditions are determined from measured and calculated values as they apply to ammonia vapour compression and liquid recirculation systems in accordance with workplace procedures and industry standards
- 2.10 Unplanned situations are dealt with safely in accordance with workplace procedures and with approval of an authorised person/s in a manner that minimises risk to personnel and equipment
- 2.11 Operating conditions are determined without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices

3 Complete and report servicing and repairing ammonia refrigeration system

- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.2 Contaminated refrigerant and lubricant are dealt with in accordance with legislative/regulatory requirements and industry standards
- 3.3 Operation conditions are documented and include identification of any parameter that is not within the specified range for the system
- 3.4 Work supervisor is notified of the completion of the work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Servicing and repairing ammonia refrigeration systems must include at least the following:
- one ammonia refrigerant refrigeration system, including the following:
 - determining operating conditions using measurement and basic calculation methods:
 - suction and discharge pressures
 - ambient
 - evaporator and condensing temperatures
 - evaporator and condenser temperature differences
 - discharging/recovering refrigerant, replacing components, testing pressure, evacuating, charging and leak testing an ammonia refrigerant system in a safe and environmentally responsible manner

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ179A Repair and service ammonia refrigeration systems.

Assessment Requirements for UEERA0065 Repair and service ammonia refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- decontaminating and evacuating the system
- discharging/charging refrigerant/lubricants and pressure testing the system without damage to components
- documenting operating conditions correctly
- identifying the conditions of the ammonia (R717) refrigerant at various locations in the vapour compression and liquid recirculation system
- locating and rectifying leaks
- recording measurements
- selecting and using appropriate measuring devices correctly
- servicing, pressure testing, charging/discharging refrigerant/lubricants and determining the operating conditions of ammonia vapour compression and liquid recirculation refrigeration system
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- ammonia refrigeration systems and operating conditions, including:
 - cascade systems
 - direct expansion systems

- flooded systems
- liquid recirculation systems
- multi-staged systems
- revision of vapour compression cycle
- single staged systems
- types of ammonia systems
- vapour compression systems
- properties of ammonia
- safe handling of ammonia
- ammonia refrigeration system's major components, flow controls and ancillary components
- relevant job safety assessments or risk mitigation processes hazards associated with ammonia refrigeration systems
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including service manuals and service documentation
- relevant workplace policies and procedures, including workplace emergency response plan
- servicing and repairing techniques for ammonia refrigeration systems, including:
 - adding refrigerant
 - leak detection methods
 - removing refrigerant.
 - servicing procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, emergency response plan, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0066 Repair and service carbon dioxide refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and service carbon dioxide (CO²) refrigeration system.

It includes servicing and repairing refrigeration equipment using CO² as a refrigerant excluding self-contained trans-critical systems. It also includes applying safe working practices and refrigeration principles that apply to CO²; following service manuals; testing, locating and rectifying faults and defective components; and completing the necessary service documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of refrigeration systems using CO² refrigerant.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

UEERA0053 Install, commission, service and maintain medium temperature systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service CO² refrigeration system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied

1.2 Safety hazards not previously identified are assessed, reported and advice on risk control measures sought from work supervisor

1.3 Nature of refrigeration work is obtained from documentation or from work supervisor to determine the scope of refrigeration work to be undertaken

1.4 Advice is sought from work supervisor to ensure refrigeration work is coordinated effectively with others

1.5 Sources of materials required for the work are accessed in accordance with workplace and procedures

1.6 Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety

2 Service and repair CO² refrigeration system

2.1 Measuring refrigeration system operating parameters is conducted in accordance with WHS/OHS requirements and workplace safety procedures

2.2 Inspection and checks are carried out to ensure the refrigeration system or component parts are isolated in accordance with WHS/OHS requirements, industry standards and practices

2.3 Refrigerant is removed from refrigeration system safely in accordance with WHS/OHS requirements, industry standards and practices

2.4 Precautions are taken to prevent damage to components while pressure testing refrigeration system

- 2.5 Pressure testing is conducted at a pressure compatible with CO₂ and in accordance with WHS/OHS requirements, industry standards and practices
 - 2.6 Leaks are located and rectified using testing methods appropriate to the refrigeration system and in accordance with industry standards and practices
 - 2.7 Refrigeration system is evacuated to the required level and cleaned of moisture and other contaminants in accordance with industry standards and practices
 - 2.8 Refrigeration system is charged safely with refrigerant grade CO₂ and compatible lubricants in accordance with industry standards and practices
 - 2.9 Actual and specified range of operating conditions are determined from measured and calculated values as they apply to sub-critical CO₂ vapour compression and liquid recirculation/cascade systems in accordance with workplace procedures
 - 2.10 Unplanned situations are responded to and discussed with appropriate person/s and documented in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - 2.11 Refrigeration operating conditions are determined without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 Complete work and report on servicing CO₂ refrigeration system**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Contaminated refrigerant and lubricant are dealt with in accordance with legislative/regulatory requirements
 - 3.3 Operation conditions are documented and include identification of any parameters that are not within the specified range for the refrigeration system
 - 3.4 Work supervisor is notified of the completion of work in accordance with established procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing and repairing CO₂ refrigeration systems must include at least the following:

- charging and discharging a CO₂ system with refrigerant and lubricant in a safe and environmentally responsible manner, excluding self-contained systems
- determining:
 - suction and discharge pressures
 - ambient, evaporator and condensing temperatures
 - evaporator and condenser temperature difference
 - critical point, triple point, trans-critical and sub-critical refrigerant conditions

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ185A Repair and service carbon dioxide refrigeration systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0066 Repair and service carbon dioxide refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislative, industry standards and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing work and reporting on servicing and repairing sub-critical carbon dioxide (CO²) refrigeration systems
- conducting work observing the relevant legislation, regulations, policies and workplace procedures
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- decontaminating and evacuating the system
- discharging/charging refrigerant/lubricants and pressure testing the system without damage to components
- documenting operating conditions correctly
- identifying the conditions of the CO² refrigerant at various locations in the vapour compression and volatile secondary (liquid recirculation) system
- locating and rectifying leaks
- preparing to service and repair CO² refrigeration systems
- pressure testing, charging/discharging refrigerant/lubricants and determining the operating conditions of CO² vapour compression and volatile secondary (liquid recirculation) system
- recording measurements
- selecting and using appropriate measuring devices correctly
- servicing and repairing CO² refrigeration systems
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- CO² refrigeration systems, including:
 - basic CO² refrigeration system
 - basic liquid recirculation /cascade system employing CO² refrigerant at sub-critical condition
 - benefits of using CO² as a refrigerant
 - thermophysical properties
- operating conditions of CO² refrigeration systems, including:
 - applicable standards and codes
 - CO² refrigeration compressors and lubricants
 - system components, construction and operation
- servicing and repair techniques for CO² refrigeration systems, including:
 - moisture problems with CO² systems
 - refrigerant conditions
 - refrigerant cylinders and regulators
 - service gauges
 - service procedures
 - system standing pressure as a result of power loss.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Links

Companion Volume implementation guides are found in VETNet - -

UEERA0067 Repair and service secondary refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and service secondary refrigeration systems.

It includes maintaining the effective and efficient operation of refrigeration equipment using non-phase changing secondary refrigerant systems. It also includes applying safe working practices, utilising service manuals and refrigeration principles to test and perform maintenance operations to these systems and to locate defective components and repair faults, and completing reports on service and performance outcomes.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of secondary refrigerant systems.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0053 Install, commission, service and maintain medium temperature systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service secondary refrigeration system

2 Carry out secondary refrigeration maintenance requirements

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Type of secondary refrigeration system components and operation are identified
- 1.2 WHS/OHS requirements and workplace procedures and safety data sheets (SDS) are identified and risk control measures implemented, including wearing personal protective equipment (PPE)
- 1.3 Safety hazards not previously identified are assessed, documented and risk control measures devised and implemented
- 1.4 Extent of faults is determined from reports, documentation, observation and discussions with appropriate person/s
- 1.5 Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.6 Tools, equipment and testing devices needed to carry out refrigeration work are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 WHS/OHS requirements, regulations, workplace procedures and risk control measures are followed
- 2.2 Components are checked and isolated in accordance with WHS/OHS requirements and procedures
- 2.3 Refrigeration maintenance tests are performed on the primary cooling source, operating pressures, operating current, refrigerant charge, secondary flow rates and condenser cooling system, and system faults or non-compliance documented to operational

specifications

- 2.4 Refrigeration operational maintenance tests are performed on the secondary refrigerant pumping/circulation devices, pressure and flow rates recorded, and faults or non-compliance to system specification documented
- 2.5 Chemical integrity, including the dilution rate, anti-bacterial and anti-corrosion rates of the secondary refrigerant, is checked using test kit and following approved WHS/OHS procedures, including PPE, and results or non-compliance are documented
- 2.6 Secondary refrigerant pipe work is checked for leaks and stability and its insulation is checked for soundness
- 2.7 Refrigeration system components, evaporators, blowers, other heat exchangers, heat recovery or defrost systems are checked for correct operation and cleanliness
- 2.8 Control system operation, including safety controls and any faults or non-conformity to system specifications are documented in accordance with WHS/OHS guidelines and workplace practices

3 Repair secondary refrigeration system

- 3.1 Justification for solutions used to solve refrigeration system problems is documented in accordance with workplace procedures
- 3.3 Repair work is documented and appropriate person/s notified in accordance with workplace procedures
- 3.4 Repairs to refrigeration system components are performed to achieve compliance to design operation and manufacturer recommendations for effective operation
- 3.5 Refrigeration control system are adjusted, as required, to achieve compliance to design operation and manufacturer recommendations for effective operation
- 3.6 Record of flows, pressures and temperatures obtained before and after repair are compared to refrigeration specifications and contingency measures implemented, as required, to ensure compliance to design operation and manufacturer recommendations for effective operation

4 Complete reports on refrigeration maintenance and repair activities

- 4.1 Work area is cleaned and made safe in accordance with workplace procedures and practices
- 4.2 Refrigeration service/maintenance and repair activities on secondary refrigeration system and relevant non-compliance specification after repair are documented and reported to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing and repairing secondary refrigeration systems must include at least two of the following system types:

- chilled water or glycol/brine system
- condenser water system
- defrost system
- heat recovery system
- thermal storage system

Servicing and repairing secondary refrigeration systems must include the following components:

- cycling controls
- heat exchangers
- primary refrigerant flow controls
- pumps
- safety controls
- evaporators/cooling coils, forced and natural draft
- secondary refrigerant flow controls
- secondary refrigerant piping, insulation and associated equipment

Spparatus must include at least the following:

- chilled water systems (primary system)
- ice bank systems

Systems must include at least the following:

- cool rooms
- freezer rooms
- merchandising and display cabinets
- other commercial or industrial applications

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ182A Repair and service secondary refrigeration systems.

Assessment Requirements for UEERA0067 Repair and service secondary refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislation, industry standards and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- servicing and repairing secondary refrigeration systems, including:
 - applying logical diagnostic methods
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - identifying faults and competency needed to rectify them
 - rectifying faults in system controls
 - using fault scenarios to test the cause of system faults
 - verifying that the system operates correctly.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- applicable standards and codes
- basics of secondary refrigeration systems, including:
 - operation
 - applications
 - types and safe handling of secondary refrigerants,
 - need for use of anti-bacterial and corrosion inhibitor
 - use of personal protective equipment (PPE)
- control system, pressure, temperature and safety

- control valves, balance and operational
- documentation and reports
- maintenance procedures for secondary refrigeration systems
- maintenance requirements, including pumps, chemical integrity of refrigerant, cooling coils/freezing coils operation, leak detection additives, leak testing, pipe work and insulation, control valves and control system
- major components types, location, purpose, operation and safety
- refrigerant disposal Environment Protection Authority (EPA) requirements
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant refrigeration system industry standards and codes of practice
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- repairs to secondary refrigerant systems, including:
 - cooling coils/freezing coils
 - system leaks, pipe work or insulation
 - control valves, control system components
 - chemical integrity of refrigerant
- secondary refrigeration systems
- service and repair of secondary refrigeration systems
- tools and equipment for maintenance work.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0068 Repair and service self-contained carbon dioxide refrigeration and heat pump systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to repair and service self-contained carbon dioxide (CO²) refrigeration and heat pump system.

It includes specialised procedures for servicing and repairing of self-contained refrigeration and heat pump equipment using CO² as a refrigerant. It also includes applying safe working practices and refrigeration principles that apply to CO²; following service manuals; testing, locating and rectifying faults and defective components; and completing the necessary service documentation.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of self-contained refrigeration systems using CO² refrigerant.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0053 Install, commission, service and maintain medium temperature systems

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant
Or

UEERA0089 Service refrigeration appliances

UEERA0006 Apply safety awareness and legal requirements for carbon dioxide refrigerant

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service self-contained CO² refrigeration and heat pump system

2 Service and repair self-contained CO² refrigeration and heat pump system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards not previously identified are reported, risk assessed and advice on risk control measures sought from work supervisor
- 1.3** Nature of work is obtained from documentation or from work supervisor to determine the scope of work to be undertaken
- 1.4** Advice is sought from work supervisor to ensure the work is coordinated effectively with others
- 1.5** Sources of materials required for the refrigeration work are accessed in accordance with workplace and procedures
- 1.6** Tools, equipment and testing devices needed to carry out refrigeration work are obtained and checked for correct operation and safety
- 2.1** Measuring system operating parameters are conducted in accordance with WHS/OHS requirements and workplace safety procedures
- 2.2** Refrigeration inspection and checks are carried out to ensure the system or component parts are isolated in accordance with WHS/OHS requirements and

workplace procedures

- 2.3 Refrigerant is removed from system safely in accordance with regulatory requirements, industry standards and practices
- 2.4 Precautions are taken to prevent damage to components while pressure testing the refrigeration and heat pump system
- 2.5 Pressure testing is conducted at a pressure compatible with CO₂ and in accordance with industry standards and practices
- 2.6 Refrigerant leaks are located and rectified using testing methods appropriate to the system and in accordance with industry standards and practices
- 2.7 Refrigeration and heat pump system is evacuated to the required level and cleaned of all moisture and other contaminants in accordance with industry standards and practices
- 2.8 Refrigeration and heat pump system is charged safely with refrigerant grade CO₂ and compatible lubricants in accordance with industry standards and practices
- 2.9 Actual and specified range of operating conditions are determined from measured and calculated values as they apply to CO₂ vapour compression systems in accordance with workplace procedures and industry standards
- 2.10 Unplanned situations are dealt with safely and in accordance with workplace procedures and approval of authorised person/s in a manner that minimises risk to personnel and equipment
- 2.11 Operating conditions are determined without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices

3 Complete and report servicing and repair of self-contained CO₂ refrigeration and heat pump system work activities

- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.2 Contaminated refrigerant and lubricant are dealt with in accordance with legislative/regulatory and industry

standard requirements

- 3.3 Operation conditions are documented and include identification of any parameter that is not within the specified range for the system
- 3.4 Work supervisor is notified of the completion of work in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing and repairing self-contained CO₂ vapour compression systems must include at least the following:

- domestic refrigerators and freezers
- refrigerated cabinets
- heat pumps
- water heaters
- checking:
 - suction and discharge pressures
 - ambient, evaporator and condensed/gas cooler temperatures
 - evaporator and gas cooler temperature difference
 - critical point, triple point and trans-critical and sub-critical refrigerant conditions of CO₂
- charging and discharging trans-critical CO₂ system with refrigerant and lubricant in a safe and environmentally responsible manner

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ188A Repair and service self contained carbon dioxide refrigeration and heat pump systems.

Assessment Requirements for UEERA0068 Repair and service self-contained carbon dioxide refrigeration and heat pump systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislation, industry standards and practices
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- discharging/charging refrigerant/lubricants and pressure testing the system without damage to components
- documenting operating conditions correctly
- identifying the conditions of the carbon dioxide (CO²) refrigerant at various locations in the vapour compression system in a trans-critical and sub-critical state
- locating and rectifying leaks
- pressure testing, evacuating, charging/discharging refrigerant/lubricants and determining the operating conditions of CO² vapour compression systems
- recording measurements
- selecting and using appropriate measuring devices correctly
- using calculation methods accurately.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- CO² refrigeration compressors and lubricants, including:
 - types, construction and their applications
 - types of compatible compressor oil (Polyolester (POE) and Polyaphalefin (PAO))
 - safe handling of lubricants for CO² applications using safety data sheets (SDS)/material

safety data sheets (MSDS)

- cylinder regulators
- moisture problems with CO² systems
- refrigerant CO² cylinders and regulators
- refrigerant conditions
- refrigeration principles
- relevant industry standards, codes and practices
- relevant job safety assessments or risk mitigation processes, including hazards associated with CO²
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, including service manuals and service documentation
- relevant workplace policies and procedures
- self-contained systems employing CO² refrigerant at trans-critical condition, including:
 - basic operation
 - domestic refrigerators and freezers
 - heat pumps
 - water heaters
 - refrigerated cabinets
 - systems and major components
 - typical applications
- service gauges
- service procedures
- CO² refrigerant, including:
 - benefits of using CO² as a refrigerant
 - thermophysical properties
- servicing tools, equipment and safe working procedures, including:
 - cylinder regulators
 - moisture problems with CO² systems
 - refrigerant CO² cylinders and regulators
 - refrigerant conditions
 - service gauges
 - service procedures
 - system standing pressure as a result of power loss
- system components, construction and operation, including:
 - capillary tubes and accurators
 - CO² evaporator design features
 - CO² sub-cooler design features
 - electronic expansion valves
 - liquid-suction heat exchangers

- pressure relief devices
- refrigerant flow controls
- system standing pressure as a result of power loss.
- trans-critical CO² refrigeration and heat pump systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to servicing, repairing and determining the operating conditions of CO² vapour compression and liquid recirculation/cascade systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0069 Resolve problems in beverage dispensers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair refrigerated beverage dispensers.

It includes working safely and to legislative, industry standards and code requirements; using effective problem-solving techniques by applying knowledge of the components and operations of refrigerated beverage dispensing equipment; completing work and documenting solutions.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of refrigerated beverage dispensing equipment.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to resolve problems in beverage dispensers

2 Resolve problems in beverage dispensers

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with legislative, standard and code requirements and workplace procedures
- 1.2 Hazards not previously identified are noted and risk control measures implemented
- 1.3 Details of the problem are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4 Advice is sought from supervisor, as required, to ensure work is coordinated with others
- 1.5 Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1 Need to test or measure live work is determined in accordance with legislative, standard and code requirements and workplace procedures
- 2.2 Circuits/machines/plant are checked as being isolated, where necessary, in accordance with legislative, standard and code requirements and workplace procedures
- 2.3 Problems are diagnosed using observations, measurements, calculations and comparisons with

- normal operating values of systems and components
- 2.4 Information needed to resolve problems, including system specifications, 'as-installed' drawings, maintenance and service records, are obtained and evaluated against normal operating parameters
 - 2.5 Problems are resolved safely and with the approval of authorised person/s, as required
 - 2.6 Problems are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices
- 3 Complete work and document problem-solving activities**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Justification for solutions used to resolve problems are documented in accordance with workplace procedures
 - 3.3 Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in beverage dispensers must include at least the following:

- three operational problems related to refrigerated beverage dispensers

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ115A Resolve problems in beverage dispensers.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0069 Resolve problems in beverage dispensers

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- completing work and documenting problem-solving activities and justification for the solutions used in refrigerated beverage dispensers
- determining need to test or measure live work
- isolating circuits/machines/plant
- obtaining and assessing relevant information to resolve problem, including:
 - 'as-installed' drawings
 - maintenance and service records
 - system specifications
 - manufacturer specifications and manuals
- preparing to resolve problems in refrigerated beverage dispensers
- resolving problems in refrigerated beverage dispensers effectively
- using methodical fault-finding techniques
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- beverage dispensers, including:
 - applications

- components
- construction
- design features
- system characteristics
- typical layout arrangements
- refrigerated dispensed beverage products, including:
 - beer
 - soft drinks
- wine maintenance schedules
- normal operating parameters of beverage dispensers
- operating and control principles of beverage dispensers
- relevant food safety and hazard analysis and critical control points (HACCP)
- relevant manufacturer specifications
- relevant measurements and calculations
- relevant risk mitigation processes, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
 - safe working practices
- relevant standards, codes and regulations
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system faults and testing methods
- system specifications, 'as-installed' drawings, maintenance and service records.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE)

currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0071 Resolve problems in dairy refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair dairy refrigeration systems.

It includes working safely and to legislative, industry standards and code requirements; using effective problem-solving techniques by applying knowledge of the components and operations of dairy refrigeration systems; completing work and documenting solutions.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of dairy refrigeration systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to resolve problems in dairy refrigeration systems

2 Resolve problems in dairy refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS procedures are identified, obtained and implemented in accordance with legislative, standard and code requirements and workplace procedures
- 1.2 Hazards not previously identified are noted and risk control measures implemented
- 1.3 Details of the problem are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4 Advice is sought from supervisor, as required, to ensure work is coordinated effectively with others
- 1.5 Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1 Need to test or measure live work is determined in accordance with legislative, standard and code requirements and workplace procedures
- 2.2 Circuits/machines/plant are checked as being isolated, as required, in accordance with legislative, standard and code requirements and workplace procedures
- 2.3 Problems are diagnosed using observations, measurements, calculations and comparisons with normal operating values of system and components

- | | | | | | | | |
|--|--|-----|---|-----|--|-----|--|
| 2.4 | Information needed to resolve problems, including system specifications, 'as-installed' drawings, maintenance and service records, are obtained and evaluated against normal operating parameters | | | | | | |
| 2.5 | Problems are resolved safely and with the approval of authorised person/s, as required | | | | | | |
| 2.6 | Problems are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices | | | | | | |
| 3 Complete work and document problem-solving activities | <table border="0"> <tr> <td style="vertical-align: top; padding-right: 20px;">3.1</td> <td>Worksite is cleaned and made safe in accordance with workplace procedures</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">3.2</td> <td>Justification for solutions used to resolve problems is documented in accordance with workplace procedures</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">3.3</td> <td>Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures</td> </tr> </table> | 3.1 | Worksite is cleaned and made safe in accordance with workplace procedures | 3.2 | Justification for solutions used to resolve problems is documented in accordance with workplace procedures | 3.3 | Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures |
| 3.1 | Worksite is cleaned and made safe in accordance with workplace procedures | | | | | | |
| 3.2 | Justification for solutions used to resolve problems is documented in accordance with workplace procedures | | | | | | |
| 3.3 | Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures | | | | | | |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Resolving problems in dairy refrigeration systems must include at least the following:

- three operational problems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ166A Resolve problems in dairy refrigeration systems.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERA0071 Resolve problems in dairy refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- completing work and documenting problem-solving activities and justification for the solutions used in dairy refrigeration systems
- determining need to test or measure live work
- isolating circuits/machines/plant
- obtaining and assessing relevant information to resolve problems, including:
 - 'as-installed' drawings
 - maintenance and service records
 - system specifications
 - manufacturer specifications and manuals
- preparing to resolve problems in dairy refrigeration systems
- resolving problems in dairy refrigeration systems effectively
- using methodical fault-finding techniques
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- dairy refrigeration systems, including:
 - applications

- components
- construction
- design features
- system characteristics
- typical layout arrangements
- dispensed beverage product knowledge
- maintenance schedules
- normal operating parameters of dairy refrigeration systems
- operating and control principles of dairy refrigeration systems
- problem solving in dairy refrigeration systems
- pure food Act and hazard analysis and critical control points (HACCP)
- relevant manufacturer specifications
- relevant measurements and calculations
- relevant standards, codes of practice and regulations
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- risk mitigation processes, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
 - safe working practices
- system faults and testing methods.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications,

regulations, codes of practice and operation manuals.

UEERA0072 Resolve problems in hydronic systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to resolve problems in hydronic systems.

It includes working safely and to industry standards, using effective problem-solving techniques to fault find and repair hydronic systems, completing work and documenting solutions.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of refrigeration and air conditioning equipment with hydronic systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to resolve problems in hydronic systems

2 Resolve problems in hydronic systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with legislative, standard and code requirements and workplace procedures
- 1.2 Hazards not previously identified are noted and risk control measures implemented
- 1.3 Details of the problem are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4 Advice is sought from supervisor, as required, to ensure work is coordinated with others
- 1.5 Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1 Need to test or measure live work is determined in accordance with legislative, standard and code requirements and workplace procedures
- 2.2 Circuits/machines/plant are checked as being isolated, where necessary, in accordance with legislative, standard and code requirements and workplace procedures
- 2.3 Problems are diagnosed using observations, measurements, calculations and comparison with normal

- operating values of systems and components
- 2.4 Information needed to resolve problems, including system specifications, 'as-installed' drawings, and maintenance and service records, are obtained and evaluated against normal operating parameters
 - 2.5 Problems are resolved safely and with the approval of authorised person/s, as required
 - 2.6 Problems are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices
- 3 Complete work and document problem-solving activities**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Justification for solutions used to resolve problems are documented in accordance with workplace procedures
 - 3.3 Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

UEERA0075 Resolve problems in post-mix refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair post-mix refrigeration systems.

It includes working safely and to legislative, industry standards and code requirements; using effective problem-solving techniques by applying knowledge of the components and operations of post-mix refrigeration systems; completing work and documenting solutions.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of post-mix refrigeration systems.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to resolve problems in post-mix refrigeration systems

2 Resolve problems in post-mix refrigeration systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with legislative, standard and code requirements and workplace procedures
- 1.2 Hazards not previously identified are noted and risk control measures implemented
- 1.3 Details of the problem are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4 Advice is sought from supervisor, as required, to ensure work is coordinated effectively with others
- 1.5 Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6 Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1 Need to test or measure live work is determined in accordance with legislative, standard and code requirements and workplace procedures
- 2.2 Circuits/machines/plant are checked as being isolated, where necessary, in accordance with legislative, standard and code requirements and workplace procedures.
- 2.3 Problems are diagnosed using observations, measurements, calculations and comparisons with

normal operating values of systems and components

- | | | | | | | | |
|--|--|------------|---|------------|---|------------|--|
| 2.4 | Information needed to resolve problems, including system specifications, 'as-installed' drawings, maintenance and service records, are obtained and evaluated against normal operating parameters | | | | | | |
| 2.5 | Problems are resolved safely and with the approval of authorised person/s, as required | | | | | | |
| 2.6 | Problems are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices | | | | | | |
| 3 Complete work and document problem-solving activities | <table border="0"> <tr> <td style="vertical-align: top; padding-right: 20px;">3.1</td> <td>Worksite is cleaned and made safe in accordance with workplace procedures</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">3.2</td> <td>Justification for solutions used to resolve problems are documented in accordance with workplace procedures</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">3.3</td> <td>Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures</td> </tr> </table> | 3.1 | Worksite is cleaned and made safe in accordance with workplace procedures | 3.2 | Justification for solutions used to resolve problems are documented in accordance with workplace procedures | 3.3 | Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures |
| 3.1 | Worksite is cleaned and made safe in accordance with workplace procedures | | | | | | |
| 3.2 | Justification for solutions used to resolve problems are documented in accordance with workplace procedures | | | | | | |
| 3.3 | Completion of work tasks are documented and appropriate person/supervisor notified in accordance with workplace procedures | | | | | | |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in post-mix refrigeration systems must include at least the following:

- three operational problems related to post-mix refrigeration systems

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ118A Resolve problems in post mix refrigeration systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0075 Resolve problems in post-mix refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant legislations, industry standards, codes of practice and regulations
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - hazard identification and reporting
 - implementing risk control measures
- completing work and documenting problem-solving activities and justification for the solutions used in post-mix refrigeration systems
- determining need to test or measure live work
- isolating circuits/machines/plant
- obtaining and assessing relevant information to resolve problem, including:
 - 'as-installed' drawings
 - maintenance and service records
 - system specifications
 - manufacturer specifications and manuals
- preparing to resolve problems in post-mix refrigeration systems
- resolving problems in post-mix refrigeration systems effectively
- using methodical fault-finding techniques
- using relevant tools, equipment and testing devices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- dispensed beverage products, including:
 - soft drinks

- spirits
- wine
- maintenance schedules
- normal operating parameters of post-mix refrigeration systems
- operating and control principles of post-mix refrigeration systems
- post-mix refrigeration systems, including:
 - applications
 - characteristics
 - components
 - construction
 - design features
 - typical layout arrangements
- relevant food safety and hazard analysis and critical control point (HACCP)
- relevant manufacturer specifications
- relevant measurements and calculations
- relevant risk mitigation processes, including:
 - environmental and sustainable energy principles and practices
 - risk control measures
 - safe working practices
- relevant standards, codes and regulations
- relevant tools, equipment and testing devices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system faults and testing methods
- system specifications, 'as-installed' drawings, maintenance and service records.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0076 Resolve problems in refrigerated beverage vending cabinets

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair refrigerated beverage vending cabinets.

It includes working safely and to legislative, industry standards and code requirements; using effective problem-solving techniques by applying knowledge of the components and operations of refrigerated beverage vending cabinets; completing work and documenting solutions.

The skills and knowledge in this unit will be applied by refrigeration and air conditioning technicians during the service and repair of refrigerated beverage vending cabinets.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to resolve problems in refrigerated beverage vending cabinets

2 Resolve problems in refrigerated beverage vending cabinets

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance workplace procedures
- 1.2** Hazards not previously identified are noted and risk control measures implemented
- 1.3** Details of the problem are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4** Advice is sought from supervisor, as required, to ensure work is coordinated effectively with others
- 1.5** Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for the work are obtained and checked for correct operation and safety in accordance with workplace procedures
- 2.1** Need to test or measure live work is determined in accordance with legislative, standard and code requirements and workplace procedures
- 2.2** Circuits/machines/plant are checked as being isolated, as required, in accordance with legislative, standard and code requirements and workplace procedures
- 2.3** Problems are diagnosed using observations, measurements, calculations and comparisons with

- normal operating values of system and components
- 2.4 Information needed to resolve problems, including system specifications, 'as-installed' drawings, maintenance and service records, are obtained and evaluated against normal operating parameters
 - 2.5 Problems are resolved safely and with the approval of authorised person/s, as required
 - 2.6 Problems are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices
- 3 Complete work and document problem-solving activities**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Justification for solutions used to resolve problems are documented in accordance with workplace procedures
 - 3.3 Completion of work tasks are documented and an appropriate person/supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Resolving problems in refrigerated beverage vending cabinets must include at least the following:

- three operational problems

UEERA0079 Safely handle refrigerants and lubricants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to Safely handle refrigerants and lubricants used in refrigeration and air conditioning systems.

It includes relevant legislation applicable to the safe handling and storage of refrigerants and lubricants, types and common properties, identification of hazards, and safe filling of refrigerant cylinders.

The skills and knowledge of this unit of competency will be applied by refrigeration and air conditioning technicians during the installation, commissioning and repairing of refrigeration and air conditioning systems.

To undertake this unit, the learner must have a current Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to transfer/decant refrigerants and lubricants

2 Transfer/decant refrigerants and lubricants

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant industry standards, codes of practice and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
- 1.3** Work tasks are sequenced in accordance with job schedule and workplace procedures
- 1.4** Supervisor is consulted to ensure work is coordinated with others in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices to complete the work are obtained and checked for operational safety in accordance with workplace procedures
- 2.1** Checks are carried out to ensure cylinders and/or containers employed in the refrigerant transfer and/or decanting process are fit for purpose and free of contaminants in accordance with workplace procedures and industry standards
- 2.2** Calculations are performed to determine the safe filling capacity of the transfer/storage cylinder/container in accordance with workplace procedures and industry standards
- 2.3** Refrigerants and lubricants are transferred/decanted safely using appropriate equipment, and the cylinders/containers are labelled in accordance with relevant codes of practice and industry standards
- 2.4** Refrigerants and lubricants are transferred/decanted without waste of materials and damage to apparatus, the surrounding environment and services using relevant

- sustainable energy practices in accordance with workplace procedures and industry standards
- 2.5** Leaks are located and rectified using appropriate testing methods in accordance with relevant codes of practice and industry standards
- 3 Complete and report on transfer/decanting of refrigerants and lubricants**
- 3.1** WHS/OHS work completion risk control measures are applied in accordance with workplace procedures
- 3.2** Worksite and equipment are cleaned and made safe in accordance with workplace procedures
- 3.3** Completion of work is documented in an auditable logbook and supervisor notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

No equivalent unit.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0079 Safely handle refrigerants and lubricants

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- determining the safe fill capacity of a refrigerant cylinder
- safely handle refrigerants in accordance with standards, codes and regulatory requirements
- documenting work, including refrigerant usage and removal
- implementing relevant legislation, industry standards, codes of practice and regulations
- testing for refrigerant leaks
- transferring and decanting refrigerant
- transferring lubricant.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements and performance criteria and includes knowledge of:

- compressor lubricant transferring equipment, procedures and requirements
- compressor lubricant types, applications, properties and safe handling
- decanting methods, including pressure differential, including pumping and temperature differential
- environmental impact of climate change, including global warming potential (GWP)
- environmental impact of ozone depletion, including ozone depletion potential (ODP)
- leak detection methods, equipment, procedures and requirements
- properties of an ideal refrigerant
- refrigerant cylinder requirements and safe handling, including recovery cylinders
- refrigerant properties, including classes, types and applications, boiling point, glide, composition, including components and safe handling, including flammability, toxicity and high pressure
- relevant legislation, industry standards, codes of practice and regulations
- relevant risk mitigation processes while handling refrigerants and lubricants, including

- potential hazards, risk control methods and safe working practices
- safe fill ratios and relevant calculations
- system contamination, prevention and removal, including types of contaminants and their effects on the operation of a system
- terms, including primary, secondary, expendable, pure, azeotropic, zeotropic, blends, bubble point, dew point and critical point.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0080 Select basic commercial refrigeration system equipment, components and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select commercial refrigeration system equipment, components and accessories.

It includes selecting commercial refrigeration system equipment and components, pipe work and controls. It also includes selecting refrigerant, condensing unit, evaporator, refrigerant controls, accessories, refrigerant and condensate pipe work, and system controls based on specifications, industry standards and manufacturer catalogues to determine calculated and deemed-to-comply solutions and documenting all selection information.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0081 Select refrigerant piping, accessories and associated controls

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems
and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems
or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0042 Solve problems in ELV single path circuits

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Identify commercial refrigeration system equipment and components**
 - 1.1 Extent and nature of refrigeration installation is determined from job specifications
 - 1.2 Refrigeration system safety and regulatory compliance requirements are identified and applied
- 2 Develop refrigeration pipe work arrangements**
 - 2.1 Location of refrigeration equipment is determined from regulatory requirements, job specifications and site drawings
 - 2.2 Refrigeration piping is arranged to ensure safe and functional operation of the system
 - 2.3 Pipe work is arranged to comply with technical industry standards, job specifications and requirements
- 3 Select commercial refrigeration system equipment and components**
 - 3.1 Pipe and tubing are selected for suitability for the commercial environments it is to be installed
 - 3.2 Pipe and tubing are sized to meet refrigeration parameters and capacity requirements for the refrigerant to be used
 - 3.3 Pipe and tubing quantities are determined from equipment location diagrams and job specifications
 - 3.4 Refrigeration system equipment and components are selected to meet load requirements based on calculated or deemed-to-comply solutions
 - 3.5 Refrigerant liquid expansion valves are selected to meet functional, specified and regulatory requirements
 - 3.6 Automatic control devices are selected to meet functional, specified regulatory requirements, current voltage and ingress protection (IP) ratings
 - 3.7 Evidence is obtained that the selected refrigeration equipment and components comply with job requirements and industry standards
- 4 Document selection of system equipment and components**
 - 4.1 Reasons for selections made including calculations are documented in accordance with workplace procedures

- 4.2 Refrigeration installation arrangements and specifications for selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting commercial refrigeration system equipment and components, pipe work and controls must include at least the following:

- two different refrigeration systems, including:
 - refrigerant
 - condensing unit
 - evaporator
 - refrigerant controls
 - accessories
 - refrigerant and condensate pipe work
 - system controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ190A Select basic commercial refrigeration system equipment, components and accessories.

Assessment Requirements for UEERA0080 Select basic commercial refrigeration system equipment, components and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- arranging pipe work to comply with regulatory and functional requirements
- selecting appropriate type, size and quantity of pipe and tubing
- selecting refrigeration equipment and components that meets load requirements
- selecting automatic control devices that meet functional and regulatory requirements
- documenting pipe work arrangement, specification for items selected and reasons for the selections made
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- basic commercial refrigeration system equipment, components, accessories selection, piping selection, safe working practices and relevant standards, codes and regulations, including:
 - calculation of capacity in heat exchangers:
 - $Q = UA (LMTD)$
 - $Q = mc\Delta t$
 - $Q = m \Delta h$
 - evaporators:
 - commercial types and applications
 - coil bypass factor
 - effects of evaporator TD on space humidity

- effects of air circulation on product conditions
- selection criteria and selection tables
- condensers:
 - commercial types and applications
 - effects of ambient conditions
 - condenser control
 - heat rejection factor
 - condenser TD
 - selection criteria and selection tables
- compressors:
 - types and applications
 - capacity
 - displacement
 - volume flow rate
 - theoretical capacity
 - total volumetric efficiency
 - effect of operating conditions, including suction pressure drop and superheating
 - actual capacity
 - power
 - theoretical requirement
 - effects of operating conditions
 - actual requirements
 - post defrost loads
 - pull down torque requirements, high, medium and low back pressure compressors
 - selection tables, motor selection
- refrigerant flow controls:
 - types, operation and applications
 - effects from sub-cooling
 - distributor types, operation and applications
 - selection tables
- system load balance point:
 - graphical representation
- line sizing and design:
 - quick selection tables
 - velocity tables
 - pressure drop in lines and fittings
 - oil migration stabilisation
 - refrigerant velocity
 - effect of varying system capacity

- oil traps
- risers
- liquid migration
- automatic controls:
 - fin spacing, suction temp to evaporator suction
 - hot-gas bypass valves
 - electronic control of valves programmable logic controller (PLC) control
 - refrigerant regulating valves
 - solenoid valves
 - condenser pressure regulating valves
 - evaporator pressure regulating valves
 - crankcase pressure regulating valves
 - cycling controls
 - pressure-stats
 - thermostats
 - defrost controls
 - monitoring and alarm controls
 - refrigeration automation systems
 - control strategies
 - control modes
- relevant industry standards, including industry practices and technologies
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0081 Select refrigerant piping, accessories and associated controls

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select refrigerant piping, accessories and associated controls.

It includes selecting refrigerant piping, accessories and controls for refrigeration and air conditioning installation to comply with regulations, industry standards and specifications. It also includes developing refrigerant pipe work arrangements; selecting pipe work and fittings, refrigerant flow controls and accessories, and mechanical and electrical control devices based on specifications, industry standards and manufacturer catalogues to determine calculated and deemed-to-comply solutions and documenting selection information.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|---|------------|---|
| 1 Prepare to select refrigerant piping, accessories and associated controls | 1.1 | Extent and nature of the refrigeration installation is determined from job specifications |
| | 1.2 | WHS/OHS and regulatory requirements of the refrigeration system are identified, obtained and applied |
| 2 Develop refrigerant pipe work arrangements | 2.1 | Intended location of refrigeration equipment is determined from job specifications and site drawings or deemed-to-comply arrangements |
| | 2.2 | Pipe work arrangements are developed to ensure safe and functional operation of the refrigerant system in accordance with workplace procedures |
| | 2.3 | Pipe work is arranged to comply with technical industry standards, job specifications and requirements |
| 3 Select refrigerant piping, accessories and associated controls | 3.1 | Suitable pipe and tubing are selected for the environment in which it is to be installed in accordance with industry standards |
| | 3.2 | Pipe and tubing are sized to meet refrigeration parameters and capacity requirements for the refrigerant to be used |
| | 3.3 | Pipe and tubing quantities are determined from equipment location diagrams and job specifications |
| | 3.4 | Refrigeration controls and accessories are selected to meet load requirements based on calculated or deemed-to-comply solutions |
| | 3.5 | Control devices are selected to meet functional and regulatory requirements |
| | 3.6 | Electrical control devices are selected to meet current voltage and ingress protection ratings in accordance with industry standards |
| | 3.7 | Evidence is obtained to confirm the selected refrigeration equipment and control devices comply with job requirements and industry standards |
| 4 Document refrigerant piping, accessories and associated controls selection | 4.1 | Refrigerant piping, accessories and associated control selections, including calculations, are documented in accordance with workplace procedures |

- 4.2 Refrigeration installation arrangement and specifications for selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting refrigerant pipe/tube, accessories and associated controls must include at least two different refrigeration systems and include the following:

- pipe sizes determined using recommended manufacturers specifications and the total equivalent length calculation methods
- refrigeration flow controls
- isolation/access valves
- filter-dryers
- sight glasses
- accessories
- thermostats
- pressure controls
- humidity controls

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ110A Select refrigerant piping, accessories and associated controls.

Assessment Requirements for UEERA0081 Select refrigerant piping, accessories and associated controls

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying environmental and sustainable principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including:
 - using personal protective equipment (PPE)
 - using risk control measures
- arranging pipe work to comply with regulatory and functional requirements
- completing relevant documentation
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- documenting pipe work arrangements, specifications for items selected and reasons for selections made
- preparing and selecting refrigerant piping, accessories and controls for refrigeration and air conditioning installations in accordance with system load and regulatory requirements, industry standards and workplace procedures, including:
 - planning the refrigerant pipe work route and arrangement in accordance with job specifications
 - reading and interpreting drawings and requirements related to the installation
 - selecting appropriate type, size and quantity of piping and tubing
 - selecting control devices that meet functional requirements
 - selecting refrigeration accessories that meets load requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- refrigerant liquid and vapour flow control selection, including expansion valves, solenoids and pressure regulators

- refrigerant piping layout and routing
- refrigerant piping sizing and accessories selection for suction, discharge and liquid lines
- refrigeration and air conditioning controls and capacity control selection, including pressure controls and thermostats
- relevant environmental and sustainable principles and practices, including:
 - environment protection
 - sustainable energy
 - sustainable resources
- relevant drawings and specifications, including:
 - control diagrams
 - equipment installation requirements
 - equipment layouts and drawings
 - equipment manufacturer specifications and symbols
 - job specifications
 - piping diagrams
 - site drawings
 - wiring diagrams
- relevant equipment, including software applications
- relevant industry standards, codes of practice and regulations
- relevant manufacturer instructions
- relevant problem-solving techniques
- relevant refrigerant piping, accessories and controls for refrigeration and air conditioning installations
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0082 Select residential air conditioning system equipment, components and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to select residential air conditioning system equipment, components and accessories.

It includes selecting residential air conditioning equipment, pipe work, air distribution components and controls. It also includes selecting the unitary air conditioning equipment and components, system controls, refrigerant and condensate pipe work based on specifications, industry standards and manufacturer catalogues to determine calculated and deemed-to-comply solutions and documenting all selection information.

The skills and knowledge described in this unit may, in some jurisdictions, require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

No other licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERA0034 Establish heat loads for commercial refrigeration and/or air conditioning applications

UEERA0038 Establish the thermodynamic parameters of refrigeration and air conditioning systems

UEERA0002 Analyse the psychrometric performance of HVAC/R systems and

UEERA0003 Analyse the thermodynamic performance of HVAC/R systems

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace or

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

- UEECD0007 Apply work health and safety regulations, codes and practices in the workplace
- UEECD0019 Fabricate, assemble and dismantle utilities industry components
- UEECD0042 Solve problems in ELV single path circuits
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0036 Establish the basic operating conditions of vapour compression systems
- UEERA0035 Establish the basic operating conditions of air conditioning systems
- UEERA0050 Install refrigerant pipe work, flow controls and accessories
- UEERA0081 Select refrigerant piping, accessories and associated controls
- UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.2 Air conditioning system safety and regulatory compliance requirements are identified and applied
- 2 Develop compliance pipe work arrangements**
 - 2.1 Location of air conditioning equipment is determined from regulatory requirements, job specifications and site drawings
 - 2.2 Air conditioning pipe work is arranged to ensure safe and functional operation of the system
 - 2.3 Air conditioning system pipe work is arranged to comply with technical industry standards, job specifications and requirements
- 3 Select residential air conditioning system equipment and components**
 - 3.1 Pipe and tubing are selected for suitability for the residential environments it is to be installed
 - 3.2 Pipe and tubing are sized to meet air conditioning parameters and capacity requirements for the refrigerant to be used
 - 3.3 Pipe and tubing quantities are determined from equipment location diagrams and job specifications
 - 3.4 Air conditioning unitary equipment and components are selected to meet load requirements based on calculated or deemed-to-comply solutions
 - 3.5 Air distribution components and controls are selected to meet functional, specified and regulatory requirements
 - 3.6 Automatic control devices are selected to meet functional, specified regulatory requirements, current voltage and IP ratings
 - 3.7 Evidence is obtained that the selected air conditioning equipment and components comply with job requirements and industry standards
- 4 Document selection of system equipment and components**
 - 4.1 Reasons for selections made, including calculations, are documented in accordance with workplace procedures
 - 4.2 Air conditioning installation arrangement and specifications for selected items are documented in accordance with workplace procedures and forwarded to appropriate person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Selecting residential air conditioning equipment and components, pipe work, air distribution components and controls must include at least the following:

- two different air conditioning systems, including:
 - unitary air conditioning equipment and components
 - system controls
 - refrigerant and condensate pipe work
 - air distribution system and components

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ191A Select residential air conditioning system equipment, components and accessories.

Assessment Requirements for UEERA0082 Select residential air conditioning system equipment, components and accessories

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- arranging pipe work to comply with regulatory and functional requirements
- selecting appropriate type, size and quantity of pipe and tubing
- selecting air conditioning unitary equipment and components that meets load requirements
- selecting air distribution components and controls that meets load requirements
- selecting automatic control devices that meet functional and regulatory requirements
- documenting pipe work arrangement, specification for items selected and reasons for the selections made
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- air conditioning system equipment, component selection, components and piping selection, safe working practices and relevant standards, codes and regulations, including:
 - residential air conditioning unitary equipment:
 - construction, operation, application and selection of:
 - room air conditioners
 - split systems – wall hang, cassettes and ducted
 - small package units
 - cooling only and reverse cycle
 - line sizing and design:
 - quick selection tables

- velocity tables
- pressure drop in lines and fittings
- oil migration stabilisation
- effect of varying system capacity
- oil traps
- liquid migration
- control systems:
 - construction, operation, application and selection of:
 - cycling and safety controls
 - pressure-stats
 - thermostats
 - de-ice controls
 - air conditioning automation systems
 - control strategies
- air distribution:
 - principles:
 - factors affecting the design of ductwork systems
 - flexible ductwork systems
 - static, velocity and total pressure
 - pressure loss:
 - friction and dynamic
 - in ducts, friction charts
 - in fittings, loss coefficients
 - diffuser pressure loss
 - system sizing:
 - standard duct sizes and gauges
 - duct selection
 - fitting selection
 - air diffuser selection
 - balancing
- relevant industry standards, including industry practices and technologies
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training

Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0083 Service and repair microwave ovens

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service a microwave oven.

Competency in this unit requires the ability to work safely, apply knowledge of servicing and repairing microwave ovens, test appliance functions, locate and rectify faults and defective components, and complete required service documentation.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to service microwave oven

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Extent of work to be completed is determined from service and fault requests and/or discussions with supervisor/appropriate person/s in accordance with workplace procedures
- 1.3** Advice is sought, as required, from supervisor to ensure work is coordinated with others
- 1.4** Sources of materials and parts required for work are identified in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices are obtained in accordance with workplace procedures and checked for operational safety

2 Service microwave oven

- 2.1** Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2** Appliance is checked and isolated in accordance with workplace procedures and WHS/OHS requirements
- 2.3** Safety hazards resulting from defect or fault are identified and documented, and risk control measures are implemented in accordance with workplace procedures and in consultation with appropriate person/s
- 2.4** Appliance is tested and components are inspected for wear or defect in accordance with workplace procedures and manufacturer specifications
- 2.5** Appliance faults and their cause are identified using measured and calculated values of appliance parameters in accordance with workplace procedures
- 2.6** Appliance is dismantled, where necessary, and parts safely stored to protect them against loss or damage in accordance with workplace procedures
- 2.7** Defective, worn or faulty appliance components are rechecked and their status is confirmed
- 2.8** Replacement parts are obtained in accordance with

workplace procedures

- 2.9 Effectiveness of repair work is tested in accordance with workplace procedures
 - 2.10 Microwave oven is reassembled, given a final test and prepared for return to service
 - 2.11 Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
 - 2.12 Servicing activities are completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report fault-finding and repair activities**
- 3.1 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.2 Service report is completed and verified by an appropriate person/supervisor in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

- Servicing and repairing microwave ovens must include at least the following:
- two microwave ovens
 - four defects/faults:
 - higher energy use than previously experienced
 - not heating
 - appliance light not working
 - electric shock received from appliance cabinet

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ173A Service and repair microwave ovens.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0083 Service and repair microwave ovens

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - identifying hazards
 - using risk control measures
- completing and reporting fault-finding and repair activities
- implementing legislation, industry standards, codes of practice and regulations
- preparing to service microwave oven
- servicing microwave oven, including:
 - completing service report
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - determining work from service request
 - finding faults
 - identifying defective components affecting appliance
 - rectifying defects/faults
 - testing appliance functions
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- service microwave oven, including:
 - auto cook facilities
 - microwave cooking basics

- microwave oven performance
- power control systems
- service, fault finding and repair
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0084 Service and repair self-contained flammable refrigerants air conditioning and refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service and repair self-contained air conditioning and refrigeration systems using Class A2, A2L and A3 flammable refrigerants.

It includes servicing and repairing self-contained air conditioning and refrigeration equipment using flammable refrigerant. It also includes working safely; applying refrigeration principles that apply to flammable refrigerant; following service manuals; testing, locating and rectifying faults and defective components; and completing necessary service documentation.

Some flammable refrigerants, for example, fluorocarbons like R32, are controlled under the national Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995. Therefore, to undertake this unit, the learner must have a relevant Trainee Refrigerant Handling Licence if it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence if it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEERA0053 Install, commission, service and maintain medium temperature systems

UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

or

UEERA0089 Service refrigeration appliances

UEERA0007 Apply safety awareness and legal requirements for flammable refrigerants

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service and repair flammable refrigerants refrigeration and air conditioning systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Hazards not previously identified are reported and advice on risk control measures sought from supervisor
- 1.3** Details of the work are obtained from documentation and/or from supervisor to determine the scope of work to be completed
- 1.4** Advice is sought from supervisor, as required, to ensure work is coordinated effectively with others
- 1.5** Materials required for the work are identified and obtained in accordance with workplace procedures
- 1.6** Tools, equipment and testing devices required for the work are obtained and checked for correct operation and

- safety in accordance with workplace procedures
- 2 Repair and service flammable refrigerants refrigeration and air conditioning systems**
- 2.1** Measuring system operating parameters are conducted in accordance with WHS/OHS requirements and workplace safety procedures
 - 2.2** Checks are conducted to ensure system/component parts are isolated, as required, in accordance with workplace procedures and WHS/OHS requirements
 - 2.3** Refrigerant is removed from system safely in accordance with relevant legislation, standards and code requirements, manufacturer instructions and workplace procedures
 - 2.4** Pressure testing is conducted and precautions taken to prevent damage to components in accordance with workplace procedures and WHS/OHS requirements
 - 2.5** Pressure testing is conducted at a pressure compatible with flammable refrigerants in accordance with industry standards and WHS/OHS requirements
 - 2.6** System leaks are located and rectified using testing methods appropriate to the system in accordance with industry standards and workplace procedures
 - 2.7** System is evacuated for an operational flammable refrigerant system in accordance with relevant industry standards and workplace procedures
 - 2.8** System is charged safely with flammable refrigerants and compatible lubricants in accordance with relevant legislation, standards and code requirements, manufacturer instructions and workplace procedures
 - 2.9** Actual and specified range of operating conditions are determined from measured and calculated values as they apply to flammable refrigerants vapour compression systems in accordance with workplace procedures and industry standards
 - 2.10** Methods for dealing unplanned situations are discussed, as required, with relevant person/s for approval and documented in accordance with workplace procedures
 - 2.11** Operating conditions are determined without damage to apparatus, circuits, the surrounding environment and/ or

services using sustainable energy practices

3 Complete and report servicing and repairing flammable refrigerants refrigeration and air conditioning systems

- 3.1** Worksite is cleaned and made safe in accordance with workplace procedures
- 3.2** Contaminated refrigerant and lubricant are dealt with in accordance with legislative/regulatory and industry standards and requirements
- 3.3** Operation conditions are documented and include identification of any parameter that is not within the specified range for the system
- 3.4** Work supervisor is notified of work completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing and repairing self-contained A2, A2L and A3 flammable refrigerant air conditioning and refrigeration systems must include at least the following:

- determining operating conditions using measurement and basic calculation methods, including suction and discharge pressures; ambient, evaporator and condensing temperatures; and evaporator and condenser temperature differences
- recovering refrigerant, replacing components, testing pressure, evacuating, charging and leak testing a flammable refrigerant system in a safe and environmentally responsible manner
- one self-contained flammable refrigerant air conditioning or refrigeration system

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ175A Service and repair self contained hydrocarbon air conditioning and refrigeration systems.

Assessment Requirements for UEERA0084 Service and repair self-contained flammable refrigerants air conditioning and refrigeration systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- charging the system with the appropriate type and quantity of flammable refrigerants
- completing documentation
- completing work and reporting on servicing and repairing flammable refrigerants refrigeration and air conditioning systems
- conducting pressure testing at the appropriate pressure level and without damaging components
- dealing with unplanned events
- evacuating the system to the required standard and using appropriate vacuum measuring instruments
- locating and rectifying leaks
- obtaining and recording measurements
- preparing to service and repair flammable refrigerants refrigeration and air conditioning systems
- removing and storing refrigerant correctly
- selecting appropriate materials and equipment
- servicing and repairing flammable refrigerants refrigeration and air conditioning systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- charging requirements and procedures
- compressor lubricant types, applications and safe handling
- evacuation requirements and procedures

- flammable refrigerant (A2, A2L and A3) types, applications, dangers, safe handling, storage and transport
- flammable refrigerant refrigeration and air conditioning systems, components and operating conditions
- leak detection requirements and procedures
- pressure testing requirements and procedures
- refrigerant removal/recovery and flushing requirements and procedures
- relevant job safety assessments or risk mitigation processes
- relevant legislation, industry standards and codes of practice, including hazards associated with flammable refrigerants
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- system access tools and procedures
- tube joining tools and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEERA0086 Service dishwasher machines

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - identifying hazards
 - using risk control measures
- completing and reporting fault-finding and repair activities
- implementing legalisation, industry standards, codes of practice and regulations
- preparing to service dishwashing machine
- servicing dishwashing machine, including:
 - completing service report
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - determining work from service request
 - finding faults
 - identifying defective components affecting appliance
 - rectifying defects/faults
 - testing appliance functions
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- service dishwashing machines, including:
 - faulty component repair or replacement methods
 - manufacturer parts catalogue and service reports

- regular faults
- types, applications, construction, components and operating characteristics
- typical component wear or defects
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

UEERA0087 Service electrical heating appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service an electrical heating appliance.

Competency in this unit requires the ability to work safely, apply knowledge of electric heating appliances, test heating appliance functions, locate and rectify faults and defective components, and complete all required service documentation.

Individuals will typically work independently to service and repair electric heating appliances.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to service electrical heating appliance

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Extent of work to be undertaken is determined from service and fault requests and/or discussions with supervisor/appropriate person/s in accordance with workplace procedures
- 1.3** Advice is sought, as required, from supervisor to ensure work is coordinated with others
- 1.4** Sources of materials/parts required for work are identified in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices to locate faults are obtained in accordance with workplace procedures and are checked for operational safety

2 Service electrical heating appliance

- 2.1** Need to test or measure live work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2** Appliance is checked and isolated in accordance with workplace procedures and WHS/OHS requirements
- 2.3** Safety hazards resulting from defect or fault are identified and documented, and risk control measures implemented in accordance with workplace procedures and in consultation with appropriate person/s
- 2.4** Appliance is tested and components are inspected for wear or defects in accordance with workplace procedures and manufacturer specifications
- 2.5** Appliance faults and their cause are identified using measured and calculated values of appliance parameters in accordance with workplace procedures
- 2.6** Appliance is dismantled, where necessary, and parts safely stored to protect them against loss or damage in accordance with workplace procedures
- 2.7** Defective, worn or faulty appliance components are rechecked and their status is confirmed

- 2.8** Replacement parts to rectify defects/faults are obtained in accordance with workplace procedures
- 2.9** Effectiveness of repair work is tested in accordance with workplace procedures
- 2.10** Apparatus is reassembled, given a final test and prepared for return to service in accordance with workplace procedures
- 2.11** Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
- 2.12** Servicing activities are completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report fault-finding and repair activities**
- 3.1** Work area is cleaned and made safe in accordance with workplace procedures
- 3.2** Service report is completed and verified by an appropriate person/supervisor in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing electrical heating appliances must include at least the following:

- two appliances:
 - electric stoves
 - ovens
 - hot plates
 - ranges
 - electrical space heaters

- hot water systems
- three defects/faults:
 - heater not operating
 - fan not working
 - timer not working correctly
 - electric shock received from appliance cabinet

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ157A Service electrical heating appliances.

Assessment Requirements for UEERA0087 Service electrical heating appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - identifying hazards
 - using risk control measures
- completing and reporting fault-finding and repair activities
- implementing legislation, industry standards, codes of practice and regulations
- preparing to service electrical heating appliances
- servicing electrical heating appliance, including:
 - completing service report
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - determining nature of work from service request
 - finding faults
 - identifying defective components affecting appliance
 - rectifying defects/faults
 - testing appliance functions
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- service electrical heating appliances, including:
 - faulty components repair or replacement methods
 - heating circuits and controls

- heating principles and applications encompassing resistance, induction and microwave
- manufacturer parts catalogues and service reports
- types of heating appliances, their operating principles and characteristics, including ovens, cook tops, space heaters but excluding microwave ovens
- typical faults
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0088 Service gas heating appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service a gas heating appliance.

Competency in this unit requires the ability to work safely, apply knowledge of gas heating appliances, test appliance functions, locate and rectify faults and defective components, and complete all required service documentation.

Individuals will typically work independently to service and repair gas heating appliances.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to service gas heating appliance

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2** Extent of work to be completed is determined from service and fault requests and/or discussions with supervisor/appropriate person/s in accordance with workplace procedures
- 1.3** Advice is sought, as required, from supervisor to ensure work is coordinated with others
- 1.4** Sources of materials/parts required for work are identified in accordance with workplace procedures
- 1.5** Tools, equipment and testing devices to locate faults are obtained in accordance with workplace procedures and checked for operational safety

2 Service gas heating appliance

- 2.1** Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2** Heating appliance is checked and isolated in accordance with workplace procedures and WHS/OHS requirements

- 2.4** Heating appliance is tested and components are inspected for wear or defects in accordance with workplace procedures and manufacturer specifications
- 2.5** Heating appliance faults and their cause are identified using measured and calculated values of appliance parameter in accordance with workplace procedures
- 2.6** Heating appliance is dismantled, where necessary, and parts safely stored to protect them against loss or damage, in accordance with workplace procedures
- 2.7** Defective, worn or faulty appliance components are rechecked and their status is confirmed

- 2.8 Replacement parts are obtained in accordance with workplace procedures
 - 2.9 Effectiveness of repair work is tested in accordance with workplace procedures
 - 2.10 Apparatus is reassembled, given a final test and prepared for return to service in accordance with workplace procedures
 - 2.11 Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
 - 2.12 Servicing activities are completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report fault-finding and repair activities**
- 3.1 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.2 Service report is completed and verified by an appropriate person/supervisor in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

- Servicing heating appliances must include at least the following:
- two gas heating appliances:
 - stoves
 - ovens
 - hot plates
 - ranges
 - space heaters
 - hot water systems

- four defects/faults:
 - no pilot flame
 - no main jet ignition
 - not hot enough
 - timer not working correctly
 - electric shock received from appliance cabinet
 - gas leaking

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ159A Service gas heating appliances.

UEERA0089 Service refrigeration appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service refrigeration appliances operating on flammable and non-flammable refrigerants.

It includes working safely, locating and rectifying refrigeration appliance faults and defective components, and completing required service documentation.

Individuals will typically work independently to service and repair domestic refrigeration appliances.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit may require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service refrigerated appliance

2 Service refrigerated appliance

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2 Extent of work to be completed is determined from service and fault requests and/or discussions with supervisor/appropriate person/s in accordance with workplace procedures
- 1.3 Advice is sought, as required, from supervisor to ensure work is coordinated with others
- 1.4 Sources of materials and parts required for work are identified in accordance with workplace procedures
- 1.5 Tools, equipment and testing devices to locate faults are obtained in accordance with workplace procedures and checked for operational safety
- 2.1 Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2 Appliance is checked as being isolated, where necessary, in accordance with workplace procedures and WHS/OHS requirements
- 2.3 Safety hazards resulting from defect or fault are identified and documented, and risk control measures are implemented in accordance with workplace procedures and in consultation with appropriate person/s
- 2.4 Appliances are tested and components are inspected for wear or defects in accordance with workplace procedures, manufacturer specifications and industry codes of practice

- 2.5 Appliance faults, and their cause, are identified using measured and calculated values of appliance parameters in accordance with workplace procedures
 - 2.6 Appliance is dismantled, where necessary, and parts are safely stored to protect them against loss or damage in accordance with workplace procedures
 - 2.7 Defective, worn or faulty appliance components are rechecked and their status is confirmed
 - 2.8 Replacement parts to rectify defects/faults are obtained in accordance with workplace procedures
 - 2.9 Effectiveness of repair work is tested in accordance with workplace procedures
 - 2.10 Appliance is reassembled, given a final test and prepared for return to service in accordance with workplace procedures
 - 2.11 Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
 - 2.12 Servicing of refrigerated appliance is completed without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report fault-finding and repair activities**
- 3.1 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.2 Service report is completed and verified by an appropriate person/supervisor in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing refrigerated appliances must include at least the following:

- appliances using flammable and non-flammable refrigerants
- two types of appliances:
 - single door refrigerators
 - two door refrigerators or freezers
 - single door freezers either cyclic defrost or frost free
- four defects/faults:
 - higher energy use than previously experienced
 - not cold enough
 - appliance ices up
 - appliance light not working
 - electric shock received from appliance cabinet

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ155A Service refrigeration appliances.

Assessment Requirements for UEERA0089 Service refrigeration appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - applying safe working practices
 - identifying hazards
 - using risk control measures
- completing and reporting fault-finding and repair activities
- implementing legalisation, industry standards, codes of practice and regulations
- preparing to service refrigerated appliance
- servicing refrigerated appliances, including:
 - completing service report
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
 - determining work from service request
 - finding faults
 - flammable and non-flammable refrigerants
 - identifying defective components affecting appliance
 - rectifying defects or faults
 - testing appliance functions
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- flammable and non-flammable refrigerants
- service appliance refrigeration systems, including:

- appliance refrigeration systems
- capillary systems
- major electrical refrigeration appliances, including refrigerators and freezers
- operational principles of major domestic appliances that use electrical, gas and/or water services that incorporate refrigeration
- operational testing and set-up procedures
- retrofitting of domestic refrigeration systems
- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - potential hazards
 - risk control measures
 - safe working practices
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

UEERA0090 Service room air conditioners

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service room air conditioners.

This unit covers maintaining the effective and efficient operation of self-contained room air conditioners. It includes working safely, applying knowledge of room air conditioners, following service manuals, testing appliance function, locating and rectifying faults and defective components, and completing the necessary service documentation.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to service room air conditioner

2 Service room air conditioner

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2 Extent of air conditioner work to be undertaken is determined from service/fault request and/or discussions with appropriate person/s
- 1.3 Advice is sought from work supervisor to ensure servicing work is coordinated effectively with others
- 1.4 Sources of materials/parts required for the servicing work are determined in accordance with workplace procedures
- 1.5 Tools, equipment and testing devices needed to locate faults are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1 Need to test or measure live work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace safety procedures
- 2.2 Air conditioner appliance is inspected, checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.3 Safety hazards resulting from air conditioner defect or fault are documented and risk control measures devised and implemented in consultation with appropriate person/s

- 2.4 Air conditioner appliances are tested for efficient operation and components affecting efficiency are inspected for wear or defects in accordance with industry standards, manufacturer service manuals and industry codes of practice
 - 2.5 Air conditioner appliance faults and their cause are determined through the application of refrigerated appliances and using measured and calculated values of appliance parameters
 - 2.6 Air conditioner appliance is dismantled, as required, and parts stored to protect against loss or damage
 - 2.7 Defective worn or faulty air conditioner appliance components are rechecked and their status confirmed
 - 2.8 Replacement parts required to rectify defects/faults are sourced and obtained in accordance with workplace procedures
 - 2.9 Effectiveness of the repair is inspected and tested in accordance with workplace procedures
 - 2.10 Air conditioner apparatus is reassembled, tested and prepared for return to service
 - 2.11 Unplanned situations are dealt with safely in accordance with workplace procedures and with the approval of authorised person/s in a manner that minimises risk to personnel and equipment
 - 2.12 Servicing activities are carried out without damage to apparatus, circuits, the surrounding environment or services using sustainable energy practices
- 3 **Complete and report fault-finding and repair activities**
 - 3.1 Work area is cleaned and made safe in accordance with workplace procedures
 - 3.2 Service report is completed and verified by appropriate person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Servicing self-contained room air conditioners must include at least the following:

- two types of room air conditioners
- four of the following defects/faults:
 - higher energy use than previously experienced
 - not cooling/heating enough
 - fan not operating
 - appliance noisy
 - electric shock received from appliance cabinet

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ189A Service room air conditioners.

Assessment Requirements for UEERA0090 Service room air conditioners

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (WHS/OHS) requirements and workplace procedures and practices, including using risk control measures
- applying sustainable energy principles and practices
- completing service report accurately
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining the nature of the work from service request
- finding faults efficiently
- identifying defective components affecting appliance efficiency
- rectifying defects/faults effectively
- servicing room air conditioners
- testing appliance functions effectively.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- component repair/replacement methods
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications, including parts catalogues and service reports
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- self-contained room air conditioners, including types, applications, construction, components and operating characteristics
- typical component wear or defects
- typical faults.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0091 Service small electrical appliances and power tools

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to service small electrical appliances and hand power tools.

It includes working safely, servicing small appliances and power tools, testing appliance functions, locating and rectifying faults and defective components, and completing required service documentation.

Individuals will typically work under supervision as part of a specialist workshop and repair team.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to service small electrical appliance and power tools

- 1.1 WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied in accordance with workplace procedures
- 1.2 Repair work details are obtained from documentation and/or supervisor to determine scope of work to be completed
- 1.3 Advice is sought from supervisor to ensure work is coordinated with others
- 1.4 Sources of materials required for work are accessed in accordance with workplace procedures
- 1.5 Tools, apparatus and testing devices needed to carry out the work are obtained and checked for operational safety

2 Service small electrical appliance and power tools

- 2.1 Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2 Circuits and/or apparatus are checked and isolated in accordance with workplace procedures and WHS/OHS requirements
- 2.3 Apparatus is dismantled in accordance with workplace procedures, manufacturer specifications and/or supervisor's instructions
- 2.4 Component parts are tagged during dismantling to ensure reassembly, and are stored safely to protect against loss or damage
- 2.5 Repairs are completed without damage to other components, apparatus or circuits in accordance with workplace procedures
- 2.6 Apparatus is assembled in sequence with all parts placed securely and connected in accordance with workplace procedures and manufacturer specifications
- 2.7 Unplanned events are responded to in accordance with workplace procedures and referred to supervisor for

direction, as required, in a manner that minimises risk to personnel and equipment

- 2.8** Electrical appliance or power tool repairs are completed without waste of materials or damage to apparatus, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures
- 3 Complete and report service work activities**
- 3.1** Repaired apparatus is forwarded to appropriate person/s for testing in accordance with workplace procedures
- 3.2** Work area is cleaned and made safe in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

- Servicing small electrical appliance and power tools must include the following:
- at least two small appliances:
 - toasters
 - garbage disposal units
 - food mixer/processors
 - small heating appliances (hair dryers)
 - range hoods
 - at least two hand power tools:
 - drills (pistol, hammer and cordless)
 - circular saws
 - mitre saws
 - routers
 - sanders
 - grinders
 - planers
 - cut off machines
 - heat guns
 - removing at least three different types of

components

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ151A Service small electrical appliances and power tools.

Assessment Requirements for UEERA0091 Service small electrical appliances and power tools

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying legislation, industry standards, codes of practice and regulations
- applying relevant work, health and safety (WHS)/occupational health and safety (OHS) requirements, including:
 - using risk control measures
 - implementing safe working practices
- completing and reporting service work activities
- preparing to service small electrical appliances and power tools
- servicing small electrical appliances and power tools, including:
 - following manufacturer service instructions for access to components
 - removing at least three different types of components
 - replacing components to manufacturer requirements
 - terminating internal wiring
 - reassembling apparatus
 - testing apparatus operation
 - dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- servicing small electrical appliances and hand power tools, including:
 - types, applications, operating principles and characteristics
 - motors and drive mechanisms
 - control and over current protection methods and devices
 - typical hand power tool faults

- relevant legislation, industry standards, codes of practice and regulations
- relevant manufacturer specifications
- relevant risk mitigation processes, including:
 - safe working practices
 - potential hazards
 - risk control measures
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to solve problems in low voltage (LV) refrigeration and air conditioning circuits, determine the correct operation of LV alternating current (a.c.) circuits, and provide solutions to refrigeration and air conditioning work functions.

Competency in this unit requires the ability to work safely; use voltage, current and resistance measuring devices; and provide solutions derived from measurements and calculations to predictable problems in single and multiple path circuits.

Individuals will typically work independently or as part of a refrigeration installation and repair team.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) a.c. or 120 V d.c.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to work on LV refrigeration and air conditioning circuits

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Work details are determined from documentation and/or supervisor to establish scope of work to be completed
- 1.3** Supervisor is consulted to ensure work is coordinated with others
- 1.4** Tools, equipment and testing devices required to locate faults are obtained in accordance with workplace procedures and checked for operational safety

2 Solve problems in LV refrigeration and air conditioning circuits

- 2.1** Need to test or measure live electrical work is determined in accordance with workplace procedures and WHS/OHS requirements
- 2.2** Equipment is checked and isolated as required in accordance with workplace procedures and WHS/OHS requirements
- 2.3** Measured and calculated values are used to resolve circuit problems, as they apply to single and multiple path electrical circuits in accordance with workplace procedures
- 2.4** Repair work is carried out in accordance with equipment or manufacturer requirements and workplace procedures
- 2.5** Unexpected situations are resolved in accordance with workplace procedures, safety guidelines and with the approval of an authorised person/supervisor
- 2.6** Fault-finding and repair activities are resolved without damage to apparatus, circuits, the surrounding environment and/or services using relevant sustainable energy practices in accordance with workplace procedures

3 Complete work and document activities

- 3.1** Worksite and equipment are cleaned and made safe in accordance with workplace procedures

- 3.2 Supervisor is notified of completion of work and relevant documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Solving problems in LV refrigeration and air conditioning circuits must include at least the following:

- single source series and a.c. circuits
- single source parallel and a.c. circuits

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ194A Solve problems in low voltage refrigeration and air conditioning circuits.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- altering an existing circuit to comply with specified function and operating parameters
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including hazards and control measures
- completing work and documentation
- developing a circuit to comply with a specified function and operating parameters
- preparing to work on low voltage (LV) refrigeration and air conditioning circuits
- solving problems in single and multiple alternating current (a.c) circuits
- using meters/testers to check for continuity, insulation resistance and obtain resistance, voltage, current and capacitance values.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- circuit protection and isolation
- devices used for circuit protection and circuit isolation, including fuses, circuit breakers, residual current devices (RCDs) and over/under voltage
- factors affecting resistance
- impedance
- parallel circuits and calculating equivalent circuit resistance and current
- power
- relevant standards, codes of practice and regulations
- single phase a.c.
- three phase a.c.
- types of magnetic devices, including relays, contractors, solenoids, transformers and motors
- types of meters/testers suitable for measuring capacitance
- types of meters/testers suitable for measuring current flow

- types of meters/testers suitable for measuring insulation resistance
- types of meters/testers suitable for measuring resistance values and circuit conductivity
- types of meters/testers suitable for measuring voltage
- types, uses and safety considerations of capacitors used in the refrigeration and air conditioning industry
- types, uses, and construction of transformers.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0093 Verify functionality and compliance of appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify functionality and compliance of electrical refrigeration/air conditioning appliances.

It includes testing and visually inspecting electrical refrigeration/air conditioning appliance to verifying that it is safe and complies with requirements. It also includes following procedures for conducting safety and functionality tests, conducting visual inspections, identifying non-compliance defects, documenting results and recommendations, and initiating the rectification of any defect.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECO0004 Participate in appliance servicing work and competency development activities

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

- UEECD0019 Fabricate, assemble and dismantle utilities industry components
- UEECD0042 Solve problems in ELV single path circuits
- UEECD0020 Fix and secure electrotechnology equipment
- UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications
- UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work
- UEERA0059 Prepare and connect refrigerant tubing and fittings
- UEERA0091 Service small electrical appliances and power tools
- UEERA0044 Find and rectify faults in single phase motors and associated controls
- UEERA0043 Find and rectify faults in appliance control systems and devices
- UEERA0089 Service refrigeration appliances
- UEERA0085 Service clothes washing machines and dryers
- UEERA0063 Recover, pressure test, evacuate, charge and leak test refrigerants - appliances
- UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits
- UEERA0037 Establish the basic operating conditions of vapour compression systems - appliances
- UEERE0001 Apply environmentally and sustainable procedures in the energy sector
- UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring
- UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures
- UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply
- UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to verify functionality and compliance of electrical appliance

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards which have not been previously identified are noted and established risk control measures implemented
- 1.3** Appropriate person/s is consulted to ensure the work is coordinated effectively with others involved on the worksite
- 1.4** Inspection and tests are appropriately sequenced in accordance with job schedule
- 1.5** Materials needed for tests and verification are obtained in accordance with workplace procedures and checked against job requirements
- 1.6** Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety

2 Visually inspect appliances

- 2.1** Electrical appliances are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2** Accessories and components are validated as being appropriately rated and meeting functional requirements
- 2.3** Evidence that equipment complies with safety and functional requirements is identified and documented
- 2.4** Unplanned situations are responded to in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- 2.5** Electrical appliance inspection is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

3 Conduct electrical appliance tests

- 3.1** Testing or measuring on live electrical appliance and operating system is conducted in accordance with WHS/OHS requirements and workplace procedures

- 3.2 Appliance is checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 3.3 Electrical tests are conducted to verify that the appliance electrical circuit within the appliance is safe and functions as intended
 - 3.4 Refrigeration/air conditioning tests are conducted to verify that the refrigeration/air conditioning components and pipe work within the appliance are safe and functions as intended
 - 3.5 Testing is carried out efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices
- 4 Report inspection and verification findings**
- 4.1 Appliance is cleaned and made safe in accordance with established procedures
 - 4.2 Non-compliance defects are identified and reported in accordance with established procedures
 - 4.3 Recommendations for rectifying defects are made in accordance with established procedures
 - 4.4 Work completion is documented and appropriate person/s notified in accordance with established procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Verifying functionality and compliance of air conditioner/refrigeration system appliances must include at least the following:

- two types of appliances, including:
 - conducting visual inspection of appliances
 - conducting all electrical tests

Electrical testing must include at least the following:

- conducting all refrigeration tests
- isolation testing
- insulation resistance of equipment
- resistance of the internal circuits of equipment
- polarity of supply and equipment
- continuity of earthing
- correct electrical connections load current
- pressure test apparatus/circuits
- leak test apparatus/circuits
- evacuation test apparatus/circuits
- compressor efficiency
- controls tests
- refrigerant charge
- operating pressures
- system operation system capacity

Refrigeration/air conditioning testing must include at least the following:

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ161A Verify functionality and compliance of appliances.

Assessment Requirements for UEERA0093 Verify functionality and compliance of appliances

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including using of risk control measures
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- verifying compliance and functionality of electrical refrigeration/air conditioning appliances, including:
 - acting within regulatory limits
 - conducting electrical tests safely and correctly
 - conducting refrigeration/air conditioning tests safely and correctly
 - identifying non-compliant defects from test results
 - identifying visual defects
 - recommending appropriate corrective actions
 - reporting electrical inspection and verifying findings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- mandatory testing and verification requirements
- refrigeration/air conditioning appliance efficiency
- refrigeration/air conditioning appliance electrical testing techniques, including testing and compliance verification methods
- relevant refrigeration/air conditioning appliance manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- visual inspection methods.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to verify the functionality and compliance of refrigeration and air conditioning installations.

It includes testing and visual inspection for verifying that a refrigeration and air conditioning system and components are safe and complies with requirements and functions as intended. It also includes working safely, conducting compliance tests, conducting visual inspections, identifying non-compliance defects and completing mandatory reporting requirements. Individuals will typically work remotely without direct supervision or as part of a commissioning, service or maintenance team.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning or electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Those holding the Full Refrigeration and Air Conditioning Refrigerant Handling Licence issued by the Australian Refrigeration Council, or a Certificate III in Refrigeration and Air-conditioning trade qualification or equivalent meet the requirements of this unit and its prerequisite requirements.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECO0010 Participate in refrigeration and air conditioning work and competency development activities

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0042 Solve problems in ELV single path circuits

UEECD0020 Fix and secure electrotechnology equipment

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEECD0016 Document and apply measures to control WHS risks associated with electrotechnology work

UEERA0044 Find and rectify faults in single phase motors and associated controls

UEERA0045 Find and rectify faults in three phase motors and associated controls

UEERA0059 Prepare and connect refrigerant tubing and fittings

UEERA0036 Establish the basic operating conditions of vapour compression systems

UEERA0035 Establish the basic operating conditions of air conditioning systems

UEERA0050 Install refrigerant pipe work, flow controls and accessories

UEERA0081 Select refrigerant piping, accessories and associated controls

UEERA0031 Diagnose and rectify faults in air conditioning and refrigeration control systems

UEERA0092 Solve problems in low voltage refrigeration and air conditioning circuits

UEERA0079 Safely handle refrigerants and lubricants

UEERA0062 Recover and charge refrigerants

UEERA0053 Install, commission, service and maintain medium temperature systems

UEERA0052 Install, commission, service and maintain low temperature systems

UEERA0051 Install, commission, service and maintain air conditioning systems

UEERE0001 Apply environmentally and sustainable procedures in the energy sector

UEERL0004 Disconnect - reconnect electrical equipment connected to low voltage (LV) installation wiring

UEERL0005 Locate and rectify faults in low voltage (LV) electrical equipment using set procedures

UEERL0001 Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply

UEERL0002 Attach cords, cables and plugs to electrical equipment for connection to 1000 V a.c. or 1500 V d.c.

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to verify refrigeration and air conditioning installation

2 Visually inspect the refrigeration and air conditioning installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS hazards, risk control methods, relevant standards, codes and legislation are obtained and applied
- 1.2** Safety hazards which have not previously been identified are noted on job safety assessment and established risk control measures implemented
- 1.3** Appropriate person/s is consulted to ensure the verification work is coordinated effectively with others involved on the worksite
- 1.4** Location of refrigeration and air conditioning system components are determined from specifications and diagrams
- 1.5** Refrigeration and air conditioning inspection and tests are appropriately sequenced in accordance with job schedule
- 1.6** Materials needed for the tests and verification are obtained in accordance with workplace procedures and checked against job requirements
- 1.7** Tools, equipment and testing devices needed to verify compliance are obtained in accordance with workplace procedures and checked for correct operation and safety
- 2.1** Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures

- 2.2 Pipe work is checked for appropriate type and size
 - 2.3 Pipe work accessories and components are validated as being suitably located, securely fixed and suitably protected from damage or corrosion
 - 2.4 Refrigeration and air conditioning system components and accessories are validated as being appropriately rated in accordance with manufacturer and design specifications
 - 2.5 Evidence that equipment complies with safety and functional requirements is cited in accordance with workplace procedures
 - 2.6 Unexpected situations are responded to in a manner that minimises risk to personnel and equipment, discussed with appropriate person/s and documented in accordance with workplace procedures
 - 2.7 Visual inspection is carried out efficiently without waste of materials, damage to or contamination of apparatus and the surrounding environment or services using sustainable energy practices
- 3 Conduct refrigeration and air conditioning compliance tests**
- 3.1 Testing or measuring on live electrical work and operating system is conducted in accordance with WHS/OHS requirements and workplace safety procedures
 - 3.2 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
 - 3.3 Electrical tests are conducted to verify that the electrical circuit within the refrigeration and air conditioning installation is safe and functions as intended
 - 3.4 Refrigeration and air conditioning tests are conducted to verify that the refrigeration equipment and pipe work within the refrigeration installation is safe and functions as intended
 - 3.5 Unexpected situations are responded in a manner that minimises risk to personnel and equipment, discussed with appropriate person/s and documented in accordance with workplace procedures
 - 3.6 Refrigeration/air conditioning testing is carried out

efficiently without waste of materials or damage to apparatus, the surrounding environment or services using sustainable energy practices

4 Report refrigeration and air conditioning inspection and verification findings

- 4.1** Worksite and equipment are cleaned and made safe in accordance with established procedures
- 4.2** Non-compliance defects are identified and reported in accordance with workplace procedures
- 4.3** Recommendations for rectifying defects are made in accordance with workplace procedures
- 4.4** Work completion is documented and appropriate person/s notified in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Inspecting, testing and verifying the functionality and compliance of refrigeration and air conditioning systems must include at least two of the following systems:

- cool rooms/freezer rooms
- merchandising and display cabinets
- residential air conditioning
- package air conditioning

Verification must include conducting the following:

- visual inspections of the system, components, pipe work controls and accessories
- electrical tests, including isolation, testing of insulation resistance of equipment, resistance of the internal circuits of equipment, polarity of supply and equipment, continuity of earthing, and correct electrical connections and load current
- refrigeration tests, including pressure

testing, leak testing, evacuation testing, controls tests, refrigerant charge, and operating pressures and temperatures

Unit Mapping Information

This unit replaces and is equivalent to UEENEEJ109A Verify functionality and compliance of refrigeration and air conditioning installations.

Assessment Requirements for UEERA0094 Verify functionality and compliance of refrigeration and air conditioning installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including:
 - using risk control measures
 - using personal protective equipment (PPE)
- acting within regulatory limits, implementing legislation, industry standards, codes of practice and regulations
- applying sustainable energy principles and practices
- completing reporting in accordance with workplace procedures
- conducting all refrigeration tests safely and correctly, including:
 - pressure testing, leak testing, evacuation testing, controls tests, refrigerant charge, operating pressures and system operation
- conducting electrical tests safely and correctly, including:
 - isolation, testing of insulation resistance of equipment, resistance of the internal circuits of equipment, polarity of supply and equipment, continuity of earthing, and correct electrical connections and load current
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- identifying non-compliant defects from test results
- identifying visual defects
- planning refrigeration and air conditioning installation compliance inspections and testing
- reading and interpreting drawings and requirements related to the installation
- recommending appropriate corrective actions
- selecting, obtaining and checking relevant equipment, materials, tools and testing devices required to carry out the work
- using manufacturer specifications and manuals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- refrigeration and air conditioning installation functionality tests and verification methods
- refrigeration and air conditioning installation tests and verification methods, including visual inspections, mandatory tests and verification requirements
- refrigeration testing requirements and procedures, including:
 - controls
 - leak test
 - operating pressures and temperatures
 - pressure test
 - refrigerant charge
- vacuum electrical testing requirements and procedures, including:
 - isolation and tagging off
 - continuity of earthing: correct electrical connections
 - isolation testing: insulation resistance of equipment
 - load current
 - polarity of supply and equipment
 - resistance of the internal circuits of equipment
 - insulation resistance of the equipment
- relevant environmental and sustainable principles and practices, including:
 - environment protection
 - sustainable energy
 - sustainable resources
- relevant equipment, materials, tools and testing devices, including:
 - air pressure and flow measurement and testing devices
 - electrical measuring and testing devices, including multimeters, megohm meters (insulation resistance tester) and ammeters
 - pressure testing and leak testing equipment and tools, including oxygen-free dry nitrogen cylinder and regulator
 - refrigerant pressure and temperature measuring and testing devices
 - refrigerant PPE
 - refrigeration and electrical hand and power tools
 - vacuum pump and electronic vacuum measuring device
- relevant industry standards, codes of practice and regulations
- relevant installation specifications and drawings
- relevant job safety assessments or risk mitigation processes, including electrical safe working practices
- relevant refrigeration and air conditioning manufacturer specifications and instructions

- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- verifying compliance and functionality of refrigeration and air conditioning installations.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.
- As well as meeting these Assessment Conditions, to achieve competency in this unit, the assessment must include an assessment of the Performance Evidence and Knowledge Evidence under the direct supervision of the Registered Training Organisation's Assessor who meets the requirements specified above.

UEERA0095 Recover refrigerant from stationary self-contained end of life decommissioned equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to recover refrigerant from stationary self-contained end of life decommissioned equipment. It applies to those engaged in the scrapping, recycling and/or disposal of stationary self-contained refrigeration and air conditioning equipment.

It includes working safely and recovering non-flammable and flammable refrigerants from stationary self-contained end of life decommissioned refrigeration and air conditioning equipment into designated cylinders for disposal using relevant tools and equipment. It also includes applying the legal requirements to handle refrigeration and air conditioning equipment and to handle, store and dispose of refrigerants. It does not include the recovery of ammonia or carbon dioxide (CO²) refrigerants.

Refrigerants to be recovered may be flammable, non-flammable or a mixture of both and difficult to accurately identify. To prevent the possibility of ignition, the equipment and procedures used to recover the refrigerant should be those required for flammable refrigerants when the refrigerant has been identified as flammable or it is unknown.

To undertake this unit, the learner must have a Trainee Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted.

The skills and knowledge described in this unit require a national Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting the refrigerant or manufacturing, installing, commissioning, servicing, maintaining or decommissioning refrigeration and air conditioning equipment.

The skills and knowledge described in this unit may, in some jurisdictions, also require a licence or permit to practice in the workplace subject to regulations for undertaking refrigeration and air conditioning work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1. Prepare to recover refrigerant

2. Recover refrigerant from decommissioned stationary refrigeration/air conditioning equipment

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS procedures for refrigerant recovery are identified and applied in accordance with workplace procedures and regulatory requirements
 - 1.2 WHS/OHS risk control measures and workplace procedures are followed in preparation for work
 - 1.3 Refrigeration/air conditioning systems are inspected, including refrigerant access points and refrigerant type, and the nature of work to be undertaken is confirmed in accordance with scope of work and manufacturer specifications
 - 1.4 Materials, tools, equipment, testing devices, signage and personal protective equipment (PPE) required to recover the refrigerant are identified, obtained and checked for correct operation in accordance with the refrigerant type and flammability
- 2.1 Recovery equipment is connected to the system through service gauge lines using tools and fittings to prevent/minimise refrigerant loss in accordance with workplace procedures, manufacturer instructions and regulatory requirements
 - 2.2 Recovery cylinder weight and pressure is measured and recorded to ensure refrigerant recovered is accepted in accordance with workplace procedures and regulatory requirements

- 2.3 Refrigerant is recovered from system by operating and monitoring the recovery equipment in accordance with manufacturer instructions
 - 2.4 Recovery equipment, including service gauge lines and recovery cylinder, are shut down and disconnected when the refrigerant is recovered in accordance with manufacturer instructions
 - 2.5 Recovery cylinder weight is measured and the quantity of the refrigerant recovered is recorded in accordance with regulatory requirements
- 3. Complete work and relevant documentation**
- 3.1 Worksite, tools and equipment are cleaned, checked and made safe in accordance with workplace procedures and manufacturer instructions
 - 3.2 Tools, equipment and recovery cylinder refrigerant are securely stored in accordance with regulatory requirements and workplace procedures
 - 3.3 WHS/OHS issues are reported to relevant person/s in accordance with workplace procedures
 - 3.4 Documentation is completed and provided to relevant person/s in accordance with workplace procedures and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Work environments must include the following:

- scrapping, recycling and/or disposal of decommissioned stationary self-contained refrigeration and air conditioning equipment

Recovery equipment and procedures must:

- be the same as for a flammable refrigerant if:
 - refrigerant is unknown; or,
 - there is a suspicion that it is flammable

- Standards must include the following:
- refrigerant handling codes of practice
 - AS/NZS ISO 817 Refrigerants – Designation and safety classification
 - AS/NZS 5149.4 Refrigerating systems and heat pumps - Safety and environmental requirements - Operation, maintenance, repair and recovery
- Legislation must include the following:
- Ozone Protection and Synthetic Greenhouse Gas Legislation Amendment Act (or Bill) and regulations
 - federal/state/territory WHS/OHS legislation
 - federal/state/territory transport of dangerous goods legislation
- Documentation, including reporting formats, must include the following:
- Australian Refrigeration Council’s (ARC) reporting requirements
 - equipment manufacturer’s specifications and instructions
 - Australian Institute of Refrigeration, Air Conditioning and Heating (AIRAH) Refrigerant Guide
 - AIRAH’s Flammable Refrigerants Safety Guide and Fact Sheets
- Equipment and tools must include a minimum of the following:
- one decommissioned stationary refrigeration unit and one decommissioned stationary air conditioning unit:
 - one unit must contain non-flammable refrigerant and one unit must contain flammable refrigerant
 - refrigeration hand tools
 - recovery units and cylinders suitable for the non-flammable refrigerants
 - recovery units and cylinders suitable for the flammable refrigerants
 - soap/water ‘bubbles’ leak detection fluid
 - refrigerant pressure/temperature chart
 - scales for weighing recovery cylinder
 - digital thermometers
 - manifold gauges suitable for the refrigerant types
- Measuring and test equipment must include the following:
- PPE suitable for handling refrigerants, including safety glasses, gloves and safety shoes
 - safety data sheets (SDS) for refrigerants
 - safe work method statements (SWMS)
- Safety systems and PPE must include the following:
- refrigeration/air conditioning manufacturer websites to access equipment specifications
- Software/systems must include the following:

Unit Mapping Information

Assessment Requirements for UEERA0095 Recover refrigerant from stationary self-contained end of life decommissioned equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying environment protection and sustainable energy and resources principles and practices
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including:
 - correct use of personal protective equipment (PPE)
 - applying risk control measures
- cleaning, checking and making safe the worksite, tools and equipment
- completing relevant documentation and reporting to relevant person/s
- complying with relevant legislative, regulatory/licensing, standards and code requirements, manufacturer recommendations/instructions and industry practices
- fitting access valves to the system and connecting service gauges
- identifying the refrigeration/air conditioning unit's refrigerant access points and the refrigerant type from the equipment nameplate or manufacturer specifications
- identifying, obtaining and checking relevant equipment, tools and materials required to work with non-flammable and flammable refrigerants, including:
 - recovering unit and recovery cylinder
 - servicing gauges
 - using refrigeration hand tools
- measuring and recording the quantity of the refrigerant recovered
- measuring and recording the recovery cylinder's weight to ensure it can accept the refrigerant to be recovered
- recovering flammable and non-flammable refrigerant from refrigeration or air conditioning systems using appropriate equipment and tools
- storing tools, equipment and recovery cylinder securely.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- leak detectors and 'bubbles' leak detection procedure
- recovery cylinders, including:
 - care and maintenance
 - identifying service access valves
 - leak testing with 'bubbles'
 - ratings for various applications, including non-flammable and flammable refrigerants
 - relevant documentation and records
 - safe handling, storage and transportation
 - tare and refrigerant weight
 - types, markings and labelling
- refrigerants, including:
 - current refrigerants used, including R12, R134a, R22, R407C, R410a, hydrocarbons and flammable synthetics (R32)
 - environmental issues
 - identifying the refrigerants from system's nameplate and manufacturer specifications
 - indicators that the unit may contain flammable refrigerant
- refrigerant oils, including:
 - absorption of refrigerant
 - types
- recovery units, including:
 - basic operation of unit
 - care and maintenance
 - identifying service access valves
 - non-flammable and flammable refrigerant recovery procedures
 - non-flammable and flammable refrigerant types
 - safety precautions
- service gauges, including:
 - manifold gauges:
 - basic types and use for recovering refrigerant
 - care and maintenance
 - hose shut-off valves and adaptors
 - system access fittings:
 - fitting bullet valves and piercing pliers
 - hazards and related safe working practices
 - types

- typical locations, connection and operation
- using service gauges:
 - pressure readings
 - service gauge manifold hose fitting
 - service gauge manifold hose removal
- working safely with refrigerants and refrigerant oils, including:
 - relevant PPE and safety signage
 - relevant workplace and WHS/OHS procedures, including risk assessment and control measures
 - safe handling procedures
 - flammable and non-flammable refrigerant handling reporting requirements
 - relevant legislation, standards and codes
 - safety data sheets (SDS).

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0097 Install, commission, service and maintain variable refrigerant flow air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to safely and effectively install, commission, service and maintain variable refrigerant flow (VRF) air conditioning systems.

It includes sourcing relevant data and schematics; installing components, pipe work, accessories and controls; commissioning the system to ensure it operates at the specified design conditions; locating and rectifying faults; and, carrying out maintenance tasks.

VRF systems are commonly found in commercial applications. They contain one or more outdoor units with multiple indoor units. Each indoor unit typically has its own metering device and shares a common pipework system. They are either heat pump or heat recovery systems. Heat pump systems will only allow indoor units to operate in the same mode (either heating or cooling). A heat recovery system will allow each indoor unit to operate in a different mode (either heating or cooling) from the same system by the use of a branch box.

The skills and knowledge in this unit of competency will be applied by refrigeration and air conditioning technicians during the installation, commissioning and servicing of VRF air conditioning systems.

The skills and knowledge described in this unit require a current national Trainee or Full Refrigerant Handling Licence as it includes work on refrigeration and air conditioning equipment that carries the risk of a fluorocarbon refrigerant being emitted while decanting, manufacturing, installing, commissioning, servicing, maintaining or decommissioning activities are being carried out.

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to refrigeration, air conditioning and electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEERA0051 Install, commission, service and maintain air conditioning systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on variable refrigerant flow (VRF) air conditioning systems

2 Install VRF air conditioning systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS risk control measures and procedures for carrying out the work are obtained and implemented in accordance with workplace procedures and regulatory requirements
- 1.2** Work details are determined from documentation and/or supervisor to establish scope of work to be completed in accordance with workplace procedures
- 1.3** Relevant manufacturer specifications and worksite plans are interpreted and incorporated in work planning
- 1.4** Components, piping, accessories, controls and consumables for the work are obtained and checked against job requirements in accordance with Australian Standards and codes of practice
- 1.5** Tools, equipment and testing devices to complete work are obtained and checked for operational safety in accordance with workplace procedures
- 2.1** The location and orientation of branching and support of pipe work is determined and laid out in accordance with system design
- 2.2** Major components are securely mounted in the locations identified by the documentation or the supervisor in accordance with workplace procedures and regulatory requirements
- 2.3** Refrigerant pipework and associated components are

installed and tube cleanliness is maintained at all times in accordance with workplace procedures, Australian Standards and manufacturer specifications

- 2.4 Condensate pipework is installed and tested in accordance with design, Australian Standards and manufacturer specifications
- 2.5 Communication wiring is checked to ensure it conforms to manufacturer circuit diagram, specifications and Australian Standards
- 2.6 Pressure testing of the installed components and pipe work is conducted to the required level for the type of refrigerant being used in accordance with relevant Australian Standards, codes of practices and workplace procedures
- 2.7 Leaks are located and rectified employing appropriate methods in accordance with relevant Australian Standards, codes of practices and workplace procedures
- 2.8 Air conditioning system is evacuated to remove moisture and other contaminants in accordance with relevant Australian Standards, codes of practices and workplace procedures
- 2.9 Vacuum drop test is carried out to verify all moisture and other contaminants have been removed from the system in accordance with relevant Australian Standards, codes of practices and workplace procedures

3 Commission VRF air conditioning systems

- 3.1 Extra refrigerant charge quantity is documented in accordance with Australian Standards and manufacturer specifications
- 3.2 Measurements are obtained using manufacturer diagnostic tools and recorded to confirm system operation is in accordance with the system's design and manufacturer specifications
- 3.3 Measurements are obtained and recorded to confirm that operating voltage and current are within manufacturer specifications

4 Locate and rectify faults on VRF air conditioning systems

- 4.1 Fault diagnosis processes are carried out in accordance with manufacturer processes and specifications, relevant Australian Standards, codes of practices and workplace procedures

- 4.2 Required repairs are identified and reported in accordance with manufacturer processes, relevant Australian Standards, codes of practices and workplace procedures
- 4.3 Routine maintenance requirements are identified in accordance with relevant Australian Standards and workplace procedures
- 5 Complete work and report activities**
 - 5.1 WHS/OHS risk control measures continue to be applied in accordance with workplace procedures and regulatory requirements
 - 5.2 Worksite and equipment are cleaned and made safe in accordance with workplace procedures
 - 5.3 Required documentation is completed in accordance with relevant regulations, Australian Standards and codes of practice
 - 5.4 Supervisor is notified of task completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

Newly created unit.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERA0097 Install, commission, service and maintain variable refrigerant flow air conditioning systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- installing and commissioning multi head variable refrigerant flow (VRF) air conditioning systems in accordance with manufacturer specifications
- using manufacturer diagnostic tool to assist in finding two of the following faults on a variable refrigerant flow air conditioning system (Note: one fault to be applied to the VRF system on each occasion):
 - contaminants in the system
 - incorrect refrigerant charge
 - faulty pressure and temperature sensors
 - communication errors
 - faulty fan motors
 - faulty refrigerant metering device (RMD)
 - insufficient airflow
- completing required documentation and record keeping
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying relevant manufacturer specifications, Australian Standards, regulation and codes of practice.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- VRF air conditioning systems including:
 - different types, their components and application
 - operating principles (cooling, heat pump and heat recovery)
 - control principles

- operation in the heating and cooling cycles
- accessing manufacturer specifications and instructions
- VRF pipework including:
 - refrigerant pipe layout and installation requirements including:
 - pipe diameter, length and wall thickness
 - pipe branch orientation and connections
 - expansion and contraction of pipework
 - piping support
 - condensate and traps
 - technique for condensate flow testing
- VRF wiring including:
 - separation of power and communications cabling
 - communication wiring requirements and component addressing
- requirements for branch box installation location
- requirements for installation of multiple outdoor VRF units
- working with refrigerants in VRF systems including:
 - checking and adding charge of refrigerant
 - procedure to check system valves are open during pressure test and evacuation
 - refrigerant leakage concentration levels permitted in enclosed spaces
- symptoms of typical faults and repair techniques including:
 - contaminants in the system
 - incorrect refrigerant charge
 - faulty pressure and temperature sensors
 - communication errors
 - faulty electronically commutated (EC) motors
 - faulty refrigerant metering device (RMD)
 - insufficient airflow
- maintenance requirements specific to VRF systems
- commissioning requirements specific to VRF systems
- manufacturer programs and tools including:
 - built-in self-commission test
 - plug-in diagnostic tools.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, Australian Standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERA0098 Inspect, test and repair fire and smoke control features of mechanical services systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package. It replaces and is not equivalent to UEERA0096 Inspect, test and repair fire and smoke control features of mechanical services systems.

Modifications made in this release include:

- Performance criteria 1.8, 3.9, 4.4 and 4.5 added
- Compliance with legislation, regulation, and industry standards added to Performance Evidence
- Minor amendments made to Knowledge Evidence
- Content added to Companion Volume Implementation Guide (CVIG) to support implementation of Knowledge Evidence requirements.

Application

This unit involves the skills and knowledge required to inspect, test and repair all safety measures relating to fire and smoke control features of mechanical services systems.

Mechanical services refers to equipment required to operate or switch off as an active part of a building's fire and smoke hazard management system, not limited to the following: vents and dampers including fire, smoke and air dampers, smoke and heat vents, motorised relief openings, windows and shutters, and outdoor intakes; fire and smoke curtains; exhaust systems, including kitchen exhaust systems; fire fan control panel and fire indicator panel; fire isolated exit pressurisation systems; smoke exhaust systems; system shutdown; and smoke reservoirs.

It includes relevant Australian Standards and Building Code responsibilities and statutory requirements of building owners, contractors and service technicians related to fire and smoke control features of mechanical services systems.

This unit is suitable for trade and post trade training in the refrigeration and air conditioning sectors.

Although this unit does not include designing systems, it includes understanding the different types of systems and their installation, relevant parts of the associated Australian Standards, the Building Code of Australia and Building Regulations. Refer to the UEE Electrotechnology Companion Volume Implementation Guide for a list of Standards relevant to this unit.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 V alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, skills and knowledge described in this unit require a relevant contract of training, such as an Australian Apprenticeship.

Additional licences, permits and/or other conditions may apply in some jurisdictions subject to regulations related to fire and smoke control features of mechanical services systems work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Permits may also be required for some work environments, such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEERA0051 Install, commission, service and maintain air conditioning systems

Competency Field

Refrigeration and air-conditioning

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct safety checks and routine service activities

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** WHS/OHS risk control measures and procedures for carrying out the work are obtained and implemented in accordance with workplace procedures
- 1.2** Relevant legislation, codes and standards are identified and obtained
- 1.3** Facility specific approved design, drawings, baseline data and other relevant information as required are identified and obtained
- 1.4** Routine service or inspection cycle or schedule and responsibilities are determined in compliance with statutory requirements and standards
- 1.5** Log-sheet of safety and/or operational checks, inspections, tests and routine service action

- requirements are obtained or created
- 1.6** Details of any reported defects are obtained
 - 1.7** Required tools, instruments, equipment and resources are determined
 - 1.8** Personnel required to complete system testing are organised and scheduled allowing sufficient time to meet work instructions
- 2 Perform safety measures inspections and tests**
- 2.1** Inspection and test tools, instruments or equipment are obtained
 - 2.2** Tools, instruments and equipment for correct operation and calibration if required are checked
 - 2.3** Safety measures inspections and tests on individual components or sections and systems are performed
 - 2.4** Inspections and tests in compliance with legislation, codes, standards and OHS/WHS requirements and responsibilities are carried out
- 3 Carry out safety measures routine service**
- 3.1** Routine service work in compliance with legislation, codes, standards and OHS/WHS requirements and responsibilities are carried out
 - 3.2** Equipment, machines and plant are isolated and checked where necessary in strict accordance with WHS/OHS requirements
 - 3.3** Routine service tasks are carried out according to regulatory requirements without compromising the integrity of the building or environmental requirements
 - 3.4** Routine service personnel required to perform the tasks are coordinated in an efficient and effective manner
 - 3.5** Responsibility boundaries with other routine service participants are observed
 - 3.6** Unexpected situations are addressed by reference to job specifications, building management procedures and discussion with appropriate personnel
 - 3.7** Defects and faults are identified and reported, and rectification recommended
 - 3.8** Plant, systems and equipment are checked for correct

- operation on completion of routine service tasks
- 3.9** System devices/components are reset and reinstated as fully operational
- 4 Develop and maintain records**
- 4.1** Notes and/or complete checklists of the inspections, tests and routine service carried out are prepared in accordance with regulatory requirements and timeframes
- 4.2** Notes, checklists and updated log sheets are collated and readily accessible on site
- 4.3** Safety checks, routine service and yearly condition reports are signed off and reports submitted to building manager and/or owner
- 4.4** Tools and equipment are checked for faults, wear or damage and rectified or problems reported according to workplace requirements
- 4.5** Client site is left in clean and tidy condition

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Essential operating conditions include:

- planning, implementing and applying a building's routine service program of fire and smoke control features of mechanical services systems on more than one occasion and in two different facilities

Unit Mapping Information

This unit replaces and is not equivalent to UEERA0096 Inspect, test and repair fire and smoke control features of mechanical services systems.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERA0098 Inspect, test and repair fire and smoke control features of mechanical services systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package. It replaces and is not equivalent to UEERA0096 Inspect, test and repair fire and smoke control features of mechanical services systems.

Modifications made in this release include:

- Performance criteria 1.8, 3.9, 4.4 and 4.5 added
- Compliance with legislation, regulation, and industry standards added to Performance Evidence
- Minor amendments made to Knowledge Evidence
- Content added to Companion Volume Implementation Guide (CVIG) to support implementation of Knowledge Evidence requirements.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- implementing WHS/OHS workplace procedures and practices including the use of risk control measures
- completing all work in compliance with relevant legislation, regulation, and industry standards
- reading and interpreting a cause-and-effect chart
- testing air handling changeover under fire/smoke conditions
- testing fire isolated stairwells and escape routes protected by air-pressurisation systems
- testing of mechanical services required to shut down under fire/smoke conditions
- using test instruments
- carrying out performance testing
- reporting defects, faults and recommending timeframes and solutions
- signing off and submitting documentation
- carrying out scheduled routine service at required intervals.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of (note: additional information related to some items below is contained in the UEE Companion Volume

Implementation Guide):

- types of safety measures and typical defects and faults
- types of buildings and Safety Measures requirements based on occupancy permit
- relevant legislation, regulation, and industry standards Building Code of Australia relevant to smoke hazard management systems
- statutory requirements and responsibilities in relation to safety measures
- routine service participants and responsibilities
- routine service, inspection and testing standards and requirements at various intervals
- documentation types and their purpose
- fire and smoke control features of mechanical services requirements, methods, applications, systems and equipment
- inspection and test tools, instruments and equipment types, applications, operation, use and care
- individual components or sections and systems safety measure inspection and test methods
- how to read and interpret a cause-and-effect chart.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including: regulations, codes of practice, industry standards, workplace procedures, equipment specifications, relevant facility specific designs, drawings, baseline data or records and operation manuals.

UEERE0001 Apply environmentally and sustainable procedures in the energy sector

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply environmentally sustainable procedures in the energy sector.

It includes identifying and applying sustainable methods of work practice that minimise energy and material usage and to apply energy reduction strategies in the energy sector workplace.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable.

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify sustainable work practice

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Activities are planned, prepared and sequenced to ensure work health and safety (WHS)/occupational health and safety (OHS) policies and workplace procedures are followed in accordance with work requirements

1.2 Relevant personnel are consulted to ensure work is

- coordinated effectively with others
- 1.3 Materials required for the work are obtained and checked in accordance with workplace procedures and compliance with work requirements
 - 1.4 Location that activities are to be undertaken is determined from job requirements
 - 1.5 Workplace environmental risks and resource efficiency issues are identified
- 2 Apply sustainable work practice**
- 2.1 WHS/OHS policies and workplace procedures for undertaking administrative functions are followed
 - 2.2 Energy assessment is undertaken in accordance with requirements to implement techniques which produce energy reduction directly or indirectly
 - 2.3 Approval is obtained for suggested improvements to energy efficient methods and components from relevant person/s before any contingencies are implemented
 - 2.4 Unplanned events or conditions are responded to in accordance with workplace procedures in a manner that minimises risk to personnel, equipment and environment
 - 2.5 On-going checks of the quality of the work are undertaken in accordance with established procedures
 - 2.6 Work is carried out efficiently without unnecessary waste of materials or damage to the surrounding environment while using sustainable work practices which minimise wastage of energy and materials either directly or indirectly
- 3 Complete workplace documentation**
- 3.1 Documentation/reports are completed to ensure detailed promotional activities requirements are met
 - 3.2 Suggestions are made to relevant person/s for improvement/s to workplace practices to minimise energy and materials wastage
 - 3.3 Workplace documentation is completed in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK142A Apply environmentally and sustainable procedures in the energy sector.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0001 Apply environmentally and sustainable procedures in the energy sector

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) and environmental requirements
- applying sustainable energy principles and work practice in daily work activities
- completing relevant workplace documentation
- coordinating work with others
- identifying and obtaining materials required for work
- identifying environmental risks and resource efficiency issues
- dealing with unplanned events in accordance with workplace procedures in a manner that minimises risk to personnel, equipment and environment
- demonstrating the application of environmental and sustainable procedures in the energy sector, including:
 - undertaking an energy assessment
 - selecting energy efficient methods and components
 - reviewing environmentally and sustainable procedures and documenting suggestions for improvements to relevant person/s
 - obtaining approval from appropriate personnel before any contingencies are implemented.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- sustainable work practices, including:
 - economic benefits of sustainable initiatives
 - effects of neglecting sustainable work practice
 - international and national greenhouse imperatives
 - legislative requirements

- notion of sustainable work practice
- the greenhouse effect - causes and consequences
- the role of regulators and similar bodies
- techniques for reducing carbon produced energy and hence greenhouse gases, including:
 - domestic, commercial and industrial strategies
 - energy efficient retrofits (overview)
 - renewable energy (RE) technologies (overview)
- trade-related technologies and methods
- relevant risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and technology currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEERE0006 Conduct periodic maintenance of remote area power supply battery banks

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct periodic maintenance of remote area power supply (RAPS) battery banks where the exposed voltage is not greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

It includes preparing for, completing and reporting on maintenance of RAPS battery banks.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEERE0019 Maintain safety and tidiness of remote area power supply systems

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEERE0023 Work safely with remote area power supply systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to conduct periodic maintenance of RAPS battery banks

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures for a RAPS plant are identified and applied in accordance with workplace procedures

1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work

1.3 Risks/hazards are identified, assessed, reported to relevant person/s and control measures implemented

1.4 Nature and location of RAPS system is identified from relevant documentation or from relevant person/s to determine the scope of work

1.5 Instructions for coordinating work with relevant personnel and the local community is obtained from relevant person/s and applied

1.6 Materials required for the work are identified and accessed in accordance with workplace procedures

1.7 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Maintain RAPS systems battery banks

2.1 Workplace risk control measures and procedures are applied

2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace procedures

2.3 Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures

2.4 RAPS system battery banks are tested in accordance with relevant workplace procedures

- 2.5 Battery bank maintenance, including performance measurements and repairs, is completed safely in accordance with workplace routines and procedures
 - 2.6 Known types of battery functional faults are identified using fault-finding procedures
 - 2.7 Non-routine events are referred to relevant person/s for directions in accordance with workplace procedures
 - 2.8 Maintenance and repair work is completed minimising waste of materials, energy, damage to apparatus, circuits, the surrounding environment and services
 - 2.9 Quality checks are conducted in accordance with workplace procedures
- 3 Complete maintenance work on battery banks and report outcomes**
- 3.1 Workplace risk control measures and procedures are applied
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Maintenance issues are referred to the local community in accordance with workplace procedures
 - 3.4 Battery bank performance measurements are reported to relevant person/s in accordance with maintenance reporting procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK103A Conduct periodic maintenance of remote

area power supply battery banks.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0006 Conduct periodic maintenance of remote area power supply battery banks

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- measuring and recording specific gravity of electrolyte
- measuring and recording cell voltages
- visually inspecting batteries for low electrolyte levels, electrolyte leakage, and corroded terminals and connections
- topping up low electrolyte levels
- identifying electrolyte leaks
- cleaning corroded terminals and connections and treating with an anticorrosive
- reporting all maintenance activities
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- checking isolation of circuits/machines/systems
- coordinating work with relevant person/s and the local community
- determining live testing/measurement requirements
- identifying and accessing materials, tools, equipment and testing devices
- maintaining remote area power supply (RAPS) battery banks, including:
 - conducting quality checks.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- RAPS systems battery bank maintenance techniques, including:
 - basic battery maintenance encompassing:

- scope of regular testing, checking and corrective actions
- measurement of specific gravity and voltages of battery cells
- checking and topping up electrolyte levels
- checking for acid leakage, cracks in battery casing, corrosion of battery terminals and connections
- cleaning of terminal connections and treating with an anticorrosive
- battery bank performance measurement
- methods for identification of battery bank faults
- relevant battery manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practice in relation to conducting periodic maintenance of RAPS battery banks
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0007 Conduct periodic maintenance of remote area power supply generator sets

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct periodic maintenance of remote area power supply (RAPS) generator sets where the exposed voltage is not greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

It includes preparing for, completing and reporting on maintenance of RAPS generator sets.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEERE0019 Maintain safety and tidiness of remote area power supply systems

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEERE0023 Work safely with remote area power supply systems

and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to conduct periodic maintenance on generator sets

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) procedures for a RAPS plant are identified and applied
- 1.2 Risk control measures are applied in accordance with workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed, reported to relevant person/s and control measures implemented
- 1.4 Nature and location of RAPS system is identified from relevant documentation or from relevant person/s to determine the scope of work
- 1.5 Instructions for coordinating work with relevant personnel and the local community is obtained from relevant person/s and applied
- 1.6 Materials required for the work are identified and accessed in accordance with workplace procedures
- 1.7 Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Maintain RAPS systems generator sets

- 2.1 Workplace risk control measures and procedures are applied
- 2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace procedures
- 2.3 Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.4 RAPS system generator sets are tested in accordance with relevant workplace procedures
- 2.5 Generator set maintenance, including performance

measurements and repairs, is completed safely in accordance with workplace routines and procedures

- 2.6 Known types of generator set functional faults are identified using fault-finding procedures
 - 2.7 Non-routine events are referred to relevant person/s for directions in accordance with workplace procedures
 - 2.8 Maintenance and repair work is completed minimising waste of materials, energy, damage to apparatus, circuits, the surrounding environment and services
 - 2.9 Quality checks are conducted in accordance with workplace procedures
- 3 **Complete maintenance work of generator sets and report outcomes**
 - 3.1 Workplace risk control measures and procedures are applied
 - 3.2 Worksite is cleaned and made safe in accordance with workplace procedures
 - 3.3 Maintenance issues are referred to the local community in accordance with workplace procedures
 - 3.4 Generator set performance measurements are reported to relevant person/s in accordance with maintenance reporting procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Maintaining RAPS generator sets must include at least the following:

- two different systems, including:
 - where the generator set is charged from a generator set and a photovoltaic (PV) array and at least one similar RAPS system where the generator set is charged

from a wind generator

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK104A Conduct periodic maintenance of remote area power supply generator sets.

Assessment Requirements for UEERE0007 Conduct periodic maintenance of remote area power supply generator sets

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- coordinating work with relevant personnel and the local community
- determining live electrical work testing/measurement requirements
- checking isolation of circuits/machines/systems
- identifying and accessing materials, tools, equipment and testing devices
- maintaining remote area power supply (RAPS) generator sets measuring and recording generator no-load and load voltages
- measuring and recording generator output for three load conditions
- checking drive engine coolant and oil level
- visually inspecting drive engine for coolant and oil leaks
- checking condition of drive engine oil, oil filter and air filter
- identifying need to change drive engine oil, oil filter and air filter
- changing drive engine oil, oil filter and air filter
- topping up low coolant and oil levels
- identifying the cause of any coolant and oil leaks
- reporting all maintenance activities
- dealing with unplanned events.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include

knowledge of:

- RAPS system generator sets maintenance techniques, including:
 - basic generator set maintenance encompassing:
 - checking of radiator and oil level
 - periodic oil change
 - periodic air, oil and fuel filter change
 - maintaining logbooks for maintenance regime
 - generator set performance measurement
 - methods for identification of generator set faults
 - maintenance reporting requirements
 - relevant generator set manufacturer specifications
 - relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
 - relevant WHS/OHS legislated requirements
 - relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment Requirements for UEERE0008 Conduct periodic maintenance of remote area power supply photovoltaic arrays

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- measuring and recording array no-load and load voltages together with ambient temperature
- measuring and recording array output for three load conditions
- visually inspecting array modules and support structure for physical damage
- visually inspecting array connections and cables
- identifying array defects and faults
- reporting all maintenance activities
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- checking for damage or de-lamination
- checking isolation of circuits/machines/systems
- cleaning of photovoltaic (PV) modules
- coordinating work with relevant personnel and the local community
- determining live electrical work testing/measurement requirements
- identifying and accessing materials, tools, equipment and testing devices
- maintaining remote area power supply (RAPS) PV arrays, including maintaining logbooks and maintenance regime.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- RAPS systems PV array maintenance techniques encompassing:
 - cleaning of PV modules
 - checking for damage or de-lamination
 - checking of module connections, connecting cable and integrity of the array structure
 - maintaining logbooks and maintenance regime
- relevant RAPS system manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practice in relation to conducting periodic maintenance of RAPS PV array
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Assessment Requirements for UEERE0009 Conduct periodic maintenance of remote area power supply wind generators

Modification History

Release 2. This minor update is the second release of this unit of competency in the UEE Electrotechnology Training Package.

Typographic error in prerequisite option requirements fixed.

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- measuring and recording generator no-load and load voltages
- measuring and recording generator output for three load conditions
- visually inspecting generator and support structure for physical damage
- visually inspecting generator connections and cables
- identifying generator defects and faults
- reporting all maintenance activities
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- checking isolation of circuits/machines/system
- coordinating work with relevant personnel and the local community
- determining live testing/measurement requirements
- identifying and accessing materials, tools, equipment and testing devices
- maintaining remote area power supply (RAPS) wind generators.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- RAPS systems wind generator maintenance techniques, including:
 - wind generator minor maintenance encompassing:
 - checking the integrity of support structure
 - tension of stay wires
 - visual inspection of wind generator operation

- maintaining logbooks and maintenance regime
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to conducting periodic maintenance of RAPS wind generators
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0013 Develop strategies to address environmental and sustainability issues in the energy sector

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop strategies to address environmental and sustainability issues in the energy sector.

It includes determining, developing and documenting environmental and sustainability issues strategies in the energy sector.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Determine environmental and sustainability issues

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2** Hazards are identified, WHS/OHS risks are assessed, and control measures and workplace procedures are

- implemented in preparation for work
- 1.3 Scope of the environmental and sustainability issues are determined from performance specifications, situation reports and in consultation with relevant person/s
 - 1.4 Activities are planned to meet scheduled timelines in consultation with person/s involved in the work
 - 1.5 Strategies are determined, and solutions developed and implemented in accordance with workplace procedures
- 2 Develop environmental and sustainability strategies**
- 2.1 WHS/OHS risk control measures and workplace procedures for carrying out work are followed
 - 2.2 Environmental sustainability principles are applied to develop strategies to address greenhouse gas and sustainability issues
 - 2.3 Parameters, specifications and performance requirements in relation to environmental and sustainability issues are determined in accordance with workplace procedures
 - 2.4 Resolving environmental and sustainability issues is analysed to provide most effective solutions
 - 2.5 Unplanned events are dealt with safely and effectively in accordance with regulatory requirements and workplace policies
 - 2.6 Quality of work is monitored in accordance with performance agreement and/or workplace procedures or industry standards
- 3 Document environmental and sustainability strategies**
- 3.1 Strategies to resolve environmental and sustainability issues are tested to determine their effectiveness and modified, as required
 - 3.2 Adopted strategies are documented and instructions for implementation and risk control measures developed
 - 3.3 Competent person/s required to implement strategies to environmental and sustainability issues are identified and coordinated in accordance with regulatory requirements and workplace policies
 - 3.4 Justification for strategies used to address environmental and sustainability issues is documented and included in

work/project records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Addressing environmental and sustainability issues must include the following:

- developing engineering strategies for at least two energy sector problems

Typical sustainability issues are those encountered in meeting sustainability performance standards and must include at least the following:

- reducing needs for energy use
- reducing causes of greenhouse gas emissions
- revising energy system operating parameters
- dealing with energy system efficiencies

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK132A Develop strategies to address environmental and sustainability issues in the energy sector.

Links

Assessment Requirements for UEERE0013 Develop strategies to address environmental and sustainability issues in the energy sector

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and include:

- applying problem-solving techniques
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- applying sustainable energy principles and practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- determining the extent of the energy sector problems/issues
- developing strategies to address environmental and sustainability issues
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- forming effective strategies for solution development and implementation
- obtaining energy system/component parameters, specifications and performance requirements appropriate to each issue.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- common issues/problems in a sustainable energy sector environment
- efficient and sustainable energy use and supply, including techniques for reducing the greenhouse gas intensity of energy supply
- environmental and sustainability strategies
- greenhouse best practice in industrial processes and waste management, including types and methods of reducing greenhouse gas emissions from industry

- greenhouse gas emissions profile
- problem-solving techniques
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, equipment and facilities currently used in industry
- resources that reflect current industry practices in relation to developing strategies to address environmental and sustainability issues
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals

UEERE0014 Develop strategies to address sustainability issues for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to develop strategies to address sustainability issues for electrical installation.

It includes identifying, developing and documenting strategies to address sustainability issues. It also includes developing strategies to address greenhouse gases and sustainability issues for residential, commercial and industrial electrical installations; gathering and analysing data and applying problem-solving techniques.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify sustainability issues for electrical installation

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

- 1.2 Hazards are identified, risks are assessed and control measures implemented
 - 1.3 Extent of sustainability issues are determined from performance specifications, situation reports and in consultation with relevant person/s
 - 1.4 Work activities are planned to meet scheduled timelines in consultation with relevant person/s
 - 1.5 Strategies are determined to ensure solution development and implementation is completed
- 2 Develop strategies to address electrical installation sustainability issues**
 - 2.1 WHS/OHS risk control measures and procedures for carrying out the work are followed
 - 2.2 Sustainability principles are applied to develop strategies to address greenhouse gas emissions
 - 2.3 Parameters, specifications and performance requirements of sustainability issues are determined in accordance with workplace procedures
 - 2.4 Solutions for sustainability issues are analysed and selected
 - 2.5 Unplanned situations are responded to in accordance with regulatory requirements and workplace procedures
 - 2.6 Quality of work is monitored against workplace procedures
- 3 Document strategies for electrical installation sustainability issues**
 - 3.1 Solutions to sustainability issues are tested for effectiveness and modified, as required
 - 3.2 Final solutions are documented, including instructions for implementation, and relevant person/s notified in accordance with workplace procedures
 - 3.3 Person/s authorised and qualified to implement solutions to sustainability issues is consulted in accordance with workplace procedures
 - 3.4 Solutions used to solve sustainability issues are justified and documented in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK152A Develop strategies to address sustainability issues for electrical installations

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0014 Develop strategies to address sustainability issues for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- understanding the extent of the electrical installation energy problem/s
- forming effective strategies for solution development and implementation
- obtaining energy system/component parameters, specifications and performance requirements appropriate to each problem
- testing solutions to energy problems
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards
- dealing with unplanned events
- analysing and selecting solutions for sustainability issues
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- applying sustainable energy principles and practices
- consulting authorised person/s qualified in implementing solutions for sustainability issues
- identifying, developing and documenting strategies to address sustainability issues
- meeting scheduled timeframes.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical installation energy sustainability strategies, including:
 - energy management, legislation and regulation encompassing:
 - energy management
 - climate change
 - greenhouse effect/greenhouse gases
 - standards and codes

- legislation and regulations
- energy audits
- electrical motors, pumps and fans encompassing:
 - motor construction, components and losses
 - motor efficiency (AS/NZS 1359.5 Rotating electrical machines - General requirements - Three-phase cage induction motors - High efficiency and minimum energy performance standards requirements)
- appliances encompassing:
 - energy star ratings
 - washing machines
 - clothes dryers
 - dishwashers
 - televisions and computers
 - standby management strategies
- energy efficient lighting encompassing:
 - lighting efficiency
 - efficient lighting design
 - ballasts
 - lighting controls
- water heating encompassing:
 - water heating systems and losses
 - electric, gas, oil, heat pump and solar water heater design
 - control strategies
- space heating and cooling encompassing:
 - space heating systems and losses
 - space cooling systems and losses
 - heating - electric, gas, oil, heat pump and solar heater design
 - cooling – direct expansion, chilled water and ventilation
 - control strategies
- solar energy encompassing:
 - system design fundamentals
 - solar photovoltaic (PV) design elements
 - solar PV system performance
 - analysis of system capital and operating cost performance
- quality assurance
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures

- solution development and implementation techniques and strategies
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0015 Implement and monitor energy sector environmental and sustainable policies and procedures

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to implement and monitor energy sector environmental and sustainable policies and procedures.

It includes preparing, planning, implementing, monitoring and completing environmentally sustainable work practice management policies and procedures. It also includes collecting, interpreting and applying environmental management information, identifying environmental impacts and assessing risks.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Plan to implement and monitor environmentally sustainable work procedures

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Works schedule/s, drawings, plans and material lists are obtained and analysed in accordance workplace procedures

- 1.2 Work is prioritised and sequenced following consultation with others for time, quality and in accordance with workplace procedures
 - 1.3 Relevant environmental standards and workplace procedures for work are distributed to relevant personnel and relevant worksites
 - 1.4 Work health and safety (WHS)/occupational health and safety (OHS) hazards are identified, risks assessed, and control measures implemented and monitored in accordance with workplace procedures
 - 1.5 Personnel, equipment, tools and personal protective equipment (PPE) required for work are identified, scheduled, coordinated and confirmed safe and in working order
 - 1.6 Risk management process is applied to work to minimise energy wastage in accordance with workplace procedures
 - 1.7 Items for installation are sourced in accordance with sustainable energy practices and consultation and agreement of relevant person/s
- 2 Implement and monitor environmentally sustainable work procedures**
- 2.1 Sustainable energy practices are implemented and monitored in consultation with relevant person/s in accordance with time, quality and minimum waste, and workplace procedures and relevant industry standards are followed
 - 2.2 Unplanned event/situation/s are identified and responded to in accordance with relevant industry standards
 - 2.3 Quality checks of the work are undertaken in accordance with relevant industry standards and workplace procedures
- 3 Complete and review environmental and sustainable energy procedures**
- 3.1 Work is checked against work schedule for anomalies to be reported and solutions identified in accordance with workplace procedures
 - 3.2 Worksite is rehabilitated, cleaned up and confirmed safe in accordance with workplace procedures
 - 3.3 Tools, equipment, surplus resources and materials are

cleaned, checked and returned to storage in accordance with workplace procedures

- 3.4 Materials suitable for recycling and/or reuse are identified and stored for use or disposal in accordance with sustainable energy practices and workplace procedures
- 3.5 Implementing and monitoring of sustainable work practices are reviewed and updated in accordance with workplace procedures
- 3.6 Relevant work permit/s are signed off and the work completed/returned to service and advice provided to client/customer in accordance with requirements
- 3.7 New targets for energy minimisation are in accordance with sustainable energy practices and workplace procedures
- 3.8 Successful strategies are promoted and, where possible, participants rewarded

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK145A Implement and monitor energy sector environmental and sustainable policies and procedures.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0015 Implement and monitor energy sector environmental and sustainable policies and procedures

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- applying sustainable energy practices
- dealing with unplanned events/situations in accordance with workplace procedures in a manner that minimises risk to personnel and equipment
- implementing and monitoring participative arrangements for the management of environmentally sustainable work practice
- implementing and monitoring the procedures for environmentally sustainable work practice
- implementing and monitoring the procedures for identifying hazards, assessing risks and controlling risks
- implementing and monitoring the procedures for maintaining environmentally sustainable work practice records
- implementing and reviewing sustainable energy procedures
- planning, implementing and monitoring environmentally sustainable work procedures
- providing environmentally sustainable work practice information to the work group.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- environmentally sustainable work principles, including:
 - relevant environmental legislation
 - sustainable practice
 - effects of neglecting sustainable practice
 - benefits of sustainable initiatives
 - techniques for reducing the use of carbon-based energy sources and hence greenhouse gas emissions

- domestic, commercial and industrial strategies
- trade-related technologies and methods
- renewable energy (RE) technologies
- energy efficient retrofits
- implementing and monitoring, including:
 - principles and practice of effective sustainable practice management
 - workplace sustainable work practice non-compliance, range and selection of control measures
 - organisational systems and policies and procedures
 - impact of characteristics and composition of the workforce on sustainable practice management
 - sustainable work practice management to other organisational management policies, procedures and systems.
 - analysis of work environment and sustainable work practice interventions
 - analysis of relevant workplace data
 - ability to assess resources needed for risk control
- relevant manufacturer specifications
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities, equipment and personal protective equipment (PPE) currently used in industry
- resources used should reflect current industry practices in relation to implementing and monitoring policies and procedures for environmentally and sustainable electrotechnology work practice
- applicable documentation, including workplace procedures, equipment specifications,

regulations, relevant industry standards, codes of practice and operation manuals.

UEERE0018 Maintain and repair remote area power generation facilities

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to maintain and repair remote area power generation facilities.

It includes preparing for, conducting and reporting on maintenance and repair of remote area power generation facilities.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEECD0019 Fabricate, assemble and dismantle utilities industry components

UEECD0051 Use drawings, diagrams, schedules, standards, codes and specifications

UEERE0019 Maintain safety and tidiness of remote area power supply systems

UEERE0023 Work safely with remote area power supply systems

UEERE0007 Conduct periodic maintenance of remote area power supply generator sets
and

UEECD0043 Solve problems in direct current circuits

or

UEECD0044 Solve problems in multiple path circuits

UEECD0046 Solve problems in single path circuits

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to maintain and repair remote area power generation facilities

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements for a remote area power generation facility are identified and applied in accordance with workplace routines and procedures
- 1.2** Risks are identified, assessed and control measures applied in accordance with workplace procedures prior to commencing work
- 1.3** Risks/hazards are identified, assessed, reported to relevant person/s and control measures implemented
- 1.4** Nature and location of remote area power station facility is obtained from documentation or from relevant person/s to determine the scope of work
- 1.5** Advice on coordinating work with others and the local community is obtained from relevant person/s and applied
- 1.6** Sources of materials required for work are identified and accessed in accordance with workplace routines and procedures
- 1.7** Tools, equipment and testing devices required for work are obtained and checked for correct operation and safety

2 Maintain and repair remote area power generation facilities

- 2.1** Workplace risk control measures and procedures are applied
- 2.2** Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2** Inspection repairs, replacements and/or adjustments are completed on items listed in the maintenance schedule and in accordance with workplace procedures
- 2.3** Fuel, coolant, oil and other fluid spills are cleaned and area made safe in accordance with workplace procedures

- 2.4 Batteries are serviced and/or replaced as specified in the maintenance schedule and in accordance with workplace procedures
 - 2.5 Consumables are removed and disposed of in accordance with environmentally safe procedures
 - 2.6 Non-routine events are referred to relevant person/s for directions in accordance with workplace procedures
 - 2.7 Quality checks are conducted in accordance with instructions and workplace procedures
- 3 Report maintenance and repair of remote area power generation facilities**
- 3.1 Workplace risk control measures and procedures are applied
 - 3.2 Maintenance issues beyond the scope of work are referred to relevant person/s in accordance with workplace procedures
 - 3.3 Work completed is reported to relevant person/s in accordance with maintenance reporting and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK116A Maintain and repair remote area power generation facilities.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0018 Maintain and repair remote area power generation facilities

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- understanding the location and nature of the work required
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- determining scope of work from documentation and/or relevant person/s
- identifying and accessing materials, tools, equipment and testing devices
- coordinating work with relevant person/s
- checking isolation of circuits/machines/systems
- correctly inspecting, repairing, replacing and adjusting items listed in the maintenance schedule
- maintaining and repairing remote area power generation facilities
- servicing batteries and battery packs in a community power station
- cleaning fluid spills appropriately
- removing and disposing of consumable following environmentally safe procedures
- conducting quality checks
- dealing with unplanned events
- applying environmentally safe work practices
- completing relevant documentation/reporting.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- remote area essential services power plant, including:
 - minor service and maintenance procedures of diesel-powered generation equipment in accordance with a prepared schedule encompassing:
 - types and grades of inspections, repairs, replacement and/or adjustments under a maintenance schedule:
 - replacement items/materials, including engine oil, oil filters, fuel filters, engine

- coolant system filters, air cleaners and fan belts
- inspection and repair items, including leakages from fuel system, coolant system and lubricating oil system
- cleaning of fluid spills
- environmentally safe procedures for removal and disposal of consumables
- servicing batteries and battery packs in a community power station in accordance with the prepared maintenance schedule encompassing:
 - hazards associated with batteries
 - types of batteries and their application in a community power station (starting battery set and switchboard (nicad) batteries)
 - battery maintenance techniques
- schedule regular servicing and maintenance encompassing:
 - engine oil and filter changes
 - fuel filters
 - coolant filters
 - water trap devices
 - drive belt (condition/adjustment)
 - valve adjustments (if applicable)
 - major and minor mechanical servicing by outside agents
 - air cleaner (both dry paper and oil bath types)
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations

- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to maintaining and repairing facilities associated with remote area essential service operations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0019 Maintain safety and tidiness of remote area power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to maintain the safety and tidiness of remote area power supply (RAPS) systems.

It includes preparing to maintain safety and tidiness of RAPS system equipment, completing work and reporting issues.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

UEERE0023 Work safely with remote area power supply systems

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to maintain safety and tidiness of RAPS system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/ occupational health and safety (OHS) requirements and workplace procedures for relevant work area are identified and applied

1.2 Risk control measures are applied in accordance with

- workplace procedures prior to commencing work
- 1.3 Risks/hazards are identified, assessed, reported to relevant person/s and control measures implemented
 - 1.4 Nature and location of the RAPS system is identified from work schedule and relevant person/s to determine the scope of work
 - 1.5 Advice on coordinating work with relevant personnel and the local community is obtained from relevant person/s and applied
 - 1.6 Tools and equipment required for cleaning work are obtained and checked for correct operation and safety
- 2 Maintain RAPS system**
- 2.1 Workplace risk control measures and procedures are applied
 - 2.2 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and conducted in accordance with workplace procedures
 - 2.3 Circuits/machines/system are isolated in accordance with WHS/OHS requirements and workplace procedures
 - 2.4 RAPS system and area are cleaned in accordance with workplace procedures
 - 2.5 Cleaning is completed minimising waste of materials, energy, damage to apparatus, circuits, the surrounding environment and services
 - 2.6 Quality checks are conducted in accordance with workplace procedures
- 3 Complete work and report outcomes**
- 3.1 Workplace risk control measures and procedures are applied
 - 3.2 Cleaning and tidiness issues are reported to the local community in accordance with workplace procedures
 - 3.3 Cleaning work is completed and issues are reported to relevant person/s in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

RAPS system must incorporate a battery bank and at least two of the following:

- generator set
- photovoltaic (PV) array
- RAPS system
- wind generator

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK101A Maintain safety and tidiness of remote area power supply systems.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0019 Maintain safety and tidiness of remote area power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- removing non-remote area power supply (RAPS) equipment
- safely removing insects, spiders and any animals
- safely removing dust and dirt from floors and equipment
- identifying and reporting at least two safety issues
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including:
 - applying relevant risk identification, assessment, reporting and control requirements
 - checking isolation of circuits/machines/system
- completing reporting requirements to relevant person/s and local community
- conducting quality checks
- coordinating work with relevant person/s and the local community
- determining live testing/measurement requirements
- maintaining safety and tidiness of RAPS system.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- RAPS plant area cleaning, and maintaining RAPS systems, including:
 - need for a clean and tidy plant area
 - RAPS system components and associated equipment and their location within the plant area
 - manual fuel pump, if available
 - plant cleaning techniques:
 - fuel and oil

- acid spills
- removal of dust, insects, spiders and animals
- removal of non-RAPS equipment
- techniques for reporting and dealing with cleaning issues
- relevant safe work method statements (SWMS) or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, policies and procedures, including reporting requirements.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to maintaining safety and tidiness of a RAPS system
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0020 Promote sustainable energy practices in the community

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to promote sustainable energy practices in the community.

It includes identifying and promoting sustainable energy practices to others in the community.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Identify sustainable energy practice

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1** Work activities are identified, planned and sequenced to ensure work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace policies and procedures are followed
- 1.2** Relevant person/s is consulted to ensure work is coordinated with others

- | | | |
|---|------------|---|
| | 1.3 | Materials are obtained and checked in accordance with workplace procedures and to comply with job requirements |
| | 1.4 | Work activities are determined from job requirements |
| | 1.5 | Materials necessary to complete work are obtained in accordance with workplace procedures and checked against job requirements |
| 2 Promote sustainable energy practice | 2.1 | WHS/OHS policies and procedures for undertaking administrative functions are followed |
| | 2.2 | Work activities are performed in accordance with job requirements and workplace procedures without damaging the surrounding environment or services |
| | 2.3 | Unplanned events are responded to in accordance with workplace procedures and approval of authorised person/s |
| | 2.4 | Approval is obtained in accordance with established procedures from appropriate person/s before contingencies are implemented |
| | 2.5 | Quality checks of work are undertaken in accordance with workplace procedures |
| 3 Complete the promotion of sustainable energy | 3.1 | Documentation/reports are completed to ensure promotional activity requirements are met |
| | 3.2 | Work completion is communicated to relevant person/s in accordance with workplace procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Promoting sustainable energy practices in the • appliances

community must include at least one of the following disciplines:

- business equipment
- computers
- data communications
- electrical
- electrical machines
- electronics
- fire protection
- instrumentation
- refrigeration and air conditioning
- renewable/sustainable energy
- security technology

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK114A Promote sustainable energy practices in the community.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0020 Promote sustainable energy practices in the community

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- applying sustainable energy practice in the community
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- checking work quality
- completing the promotion of sustainable energy
- determining location of work activities
- documenting promotional work activities after completion
- identifying and promoting sustainable energy practices
- obtaining and checking materials using sustainable energy practices.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- greenhouse reduction strategies, including:
 - greenhouse gas emissions profile encompassing:
 - goals and principles of the National Greenhouse Strategy (NGS)
 - what a greenhouse gas inventory is, why it is required, and the sectors to which it applies
 - uses to which the National Greenhouse Gas Inventory can be applied
 - climate change and its impacts encompassing:
 - the possible impact of climate change in Australia
 - techniques for improving the understanding of climate change
 - techniques for communicating to and educating the general public on greenhouse gas induced climate change

- partnerships for greenhouse action encompassing:
 - actions achievable by each level of government to implement the NGS
 - methods by which the community activity can be engaged in the reduction of greenhouse gas emissions
 - initiatives that can be undertaken by the private sector to reduce greenhouse gas emissions
 - advantages of international partnerships
 - emissions trading system
- efficient and sustainable energy use and supply encompassing:
 - techniques for reducing the greenhouse intensity of energy supply
 - types of renewable energy (RE) sources suitable for use in Australia
 - methods and technique for improving end-use efficiency
- efficient transport and sustainable urban planning encompassing:
 - how integrating land use and transport planning can assist the greenhouse problem
 - how each of the following can be used to mitigate greenhouse gas; travel demand and traffic management strategies; encouraging greater use of public transport, walking and cycling; freight and logistics systems; improving vehicle fuel efficiency and fuel technologies
- greenhouse sinks and sustainable land management encompassing:
 - how enhancing greenhouse sinks and encouraging sustainable forestry and vegetation management can complement the AGS
 - how greenhouse gas emissions are obtained from agricultural production and describe techniques to mitigate the emissions
- models of greenhouse best practice in industrial processes and waste management encompassing:
 - types and methods of reducing greenhouse gas emissions from industry
 - methods of reducing methane emissions from waste treatment and disposal
- adaptation to climate change encompassing:
 - salient points in each of the key sectors that require analysis and the strategies required in the need for adaptation to climate change
- quality assessments
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant promotional materials
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0021 Provide basic sustainable energy solutions for energy reduction in residential premises

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to provide sustainable energy solutions for energy reduction in residential premises.

It includes preparing for and conducting monitoring of energy usage and providing solutions for energy reduction. It also includes completing monitoring activities and reporting.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to monitor energy usage and provide solutions for energy reduction

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Monitoring activities are planned and prepared in accordance with work health and safety (WHS)/occupational health and safety (OHS) policies and workplace procedures and work is sequenced in accordance with requirements

- 1.2 Relevant person/s is consulted to ensure work is coordinated effectively with others
 - 1.3 Materials are obtained and checked in accordance with workplace procedures and job requirements
 - 1.4 Location of monitoring activities is determined from job requirements
- 2 **Undertake monitoring of energy usage and provide solutions for energy reduction**
 - 2.1 WHS/OHS policies and procedures for monitoring activities are applied
 - 2.2 Monitoring activities are conducted in accordance with requirements without damage or distortion to the surrounding environment or services
 - 2.3 Sustainable energy options are determined from energy consumption monitoring activities, measurements and calculations
 - 2.4 Unplanned events or conditions are responded to in accordance with workplace procedures
 - 2.5 Approval is obtained from relevant person/s before any energy reduction solutions are implemented in accordance with workplace procedures
 - 2.6 Quality checks are conducted in accordance with workplace procedures
- 3 **Complete monitoring activities and report**
 - 3.1 Documentation/reports are completed in accordance with administrative requirements
 - 3.2 Relevant person/s is notified of work completion in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK112A Provide basic sustainable energy solutions for energy reduction in residential premises.

Links

Companion Volume implementation guides are found in VETNet - -

Assessment Requirements for UEERE0021 Provide basic sustainable energy solutions for energy reduction in residential premises

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- providing basic sustainable energy solutions for energy reduction in domestic premises
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices, including the use of risk control measures
- applying sustainable energy principles and practices
- completing relevant reporting
- conducting monitoring activities of energy usage
- completing quality checks
- coordinating work with relevant person/s
- identifying and accessing materials, tools, equipment and testing devices
- measuring and calculating energy consumption values in accordance with relevant industry standards
- preparing to monitor energy usage.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- concepts of renewable energy (RE), including:
 - non-technical issues encompassing:
 - current economic, social, environmental and political issues impacting on RE technology
 - energy services/demand encompassing:
 - terminology
 - energy, power, temperature, symbols and units
 - energy conversion and efficiency

- domestic dwelling: energy services and energy demand of individual appliances
- energy efficient appliances
- primary energy and end-use energy
- embodied energy
- solar radiation resource encompassing:
 - terminology
 - units, symbols and conversions
 - sun path diagrams
 - solar contour maps
 - solar window
- solar thermal systems encompassing:
 - terminology
 - components
 - applications
 - types of hot water systems
- photovoltaic (PV) arrays encompassing:
 - terminology
 - current, voltage and power
 - modules: types, efficiency and applications
 - I-V curve
 - irradiance and temperature effects
 - array configurations
- wind energy resource and technology encompassing:
 - terminology, units and symbols
 - wind speed, direction, turbulence, wind and power
 - vertical wind speed profile (wind shear)
 - local terrain roughness
 - isovent maps
 - measuring instruments
 - wind energy conversion systems (WECS)
 - terminology
 - characteristics
 - applications
- micro-hydro resource and technology encompassing:
 - terminology, units and symbols
 - flow rate, head and assessment
 - turbine types and applications
- stand-alone power system configuration encompassing:
 - basic configuration series systems
 - components: functions, efficiencies, regulators, inverters, battery chargers and

generators

- relevant industry standard energy consumption measurements and calculations
- sustainable energy solutions for energy reduction in residential premises
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to providing basic sustainable energy solutions for energy reduction in residential premises
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0023 Work safely with remote area power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to work safely on remote area power supply (RAPS) systems.

It includes preparing to enter a RAPS system, applying safe working practices, and following workplace procedures for hazard identification and risk control in RAPS system areas.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0007 Apply work health and safety regulations, codes and practices in the workplace

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to enter a RAPS system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Hazards/risk control procedures for RAPS systems maintenance are identified and applied
- 1.2 System access permit is obtained from relevant person/s
- 1.3 Preparation for electrical and non-electrical isolation is completed in accordance with workplace procedures

- 1.4 Tools and equipment required for work are checked for safety and correct functionality in accordance with workplace procedures
 - 2 **Apply safe working practices in RAPS system area**
 - 2.1 Workplace risk control measures and procedures are applied
 - 2.2 Safe work practices for RAPS system are applied in accordance with workplace procedures
 - 2.3 Circuits/machines/system are isolated in accordance with work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures
 - 2.4 Safe work practices in RAPS system are applied in accordance with workplace procedures
 - 2.5 Safe working practices are applied minimising waste of materials, energy, damage to apparatus, circuits, the surrounding environment and services
 - 2.6 Quality checks are conducted in accordance with workplace procedures
 - 3 **Follow workplace procedures for hazard identification and risk control in RAPS system areas**
 - 3.1 Risks/hazards are identified, assessed and control measures implemented and monitored through consultation with relevant person/s and the local community
 - 3.2 Workplace hazards are identified and reported to relevant person/s in accordance with workplace procedures
 - 3.3 WHS/OHS incident reports are completed in accordance with regulatory requirements and workplace procedures
 - 3.4 Instructions and training are applied in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Working safely with RAPS system must include at least the following:

- two different systems incorporating the following:
 - battery bank
 - generator set
 - photovoltaic (PV) array
 - one RAPS system with the addition of a wind generator

Unit Mapping Information

This unit replaces and is equivalent to UEENEEK102A Work safely with remote area power supply systems.

Links

Companion Volume implementation guides are found in VETNet - -

<https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0023 Work safely with remote area power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least one occasion and include:

- preparing to enter the remote area power supply (RAPS) system including, permission to enter the area and to isolate RAPS equipment
- applying work procedures and instructions as they apply to risk control measures
- dealing with accidents and emergencies
- participating in consultation processes, identifying hazards and implementing and monitoring control measures
- dealing with unplanned events
- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices in RAPS system, including:
 - completing WHS/OHS incident reports
- conducting RAPS system quality checks
- obtaining and inspecting tools and equipment and reporting faults
- preparing for and checking isolation of circuits/machines/systems.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- RAPS safe working practices, including:
 - general safety encompassing:
 - general safety
 - risk assessment
 - personal protective equipment (PPE)
 - WHS/OHS procedures
 - RAPS safety and risk assessment encompassing:
 - types of hazards in and around RAPS:

- rotating machines
- fuels and oils
- exhaust fumes
- acids and flammable gases from batteries
- measures for dealing with hazards in and around RAPS
- purpose and methods for isolation and de-energisation of power supplies
- correct isolation and de-energisation procedures encompassing:
 - processes for preventing generator from automatically starting
 - isolating photovoltaic (PV) arrays
 - isolating wind driven generators
 - isolating battery
 - isolating inverter power sources
- safety signage encompassing:
 - types of signs
 - location
 - condition
 - suitability
- access to system encompassing:
 - methods for limiting access to plant areas
- reporting
- access to RAPS, including:
 - obtaining access permit/s
- relevant manufacturer specifications
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and PPE currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Links

Companion Volume implementation guides are found in VETNet - -

UEERE0049 Apply safe work practices in the rooftop solar industry

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply safe work practices in the rooftop solar industry.

It includes identifying health and safety legislation, regulations, standards, codes of practice and workplace requirements and their application to relevant workplace tasks.

It also includes working safely at heights, safe manual handling of solar components, asbestos and silica awareness.

Work is performed by teams of two or more persons to install and repair domestic or commercial solar rooftop systems.

The application of the skills and knowledge described in this unit may require a licence, registration or certification to practice in the workplace.

Other conditions may also apply under state and territory legislative and regulatory licensing requirements which must be confirmed prior to commencing this unit.

Pre-requisite Unit

Not Applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to apply safe practices

- 1.1** Legislation, regulations, standards, codes of practice and workplace requirements for the worksite are identified and referred to
- 1.2** Plant, tools, equipment and personal protective equipment (PPE) required for work are determined, obtained and confirmed in working order
- 1.3** Hazards are identified, risks assessed and control measures identified in accordance with workplace and regulatory requirements
- 1.4** Worksite is prepared to minimise risk in accordance with workplace and regulatory requirements

2 Apply safe practices

- 2.1** Legislation, regulations, standards, codes of practice and workplace requirements for the work to be performed are applied and monitored
- 2.2** Manual handling is carried out in accordance with workplace and regulatory requirements
- 2.3** Plant, tools, equipment and PPE are used in accordance with manufacturer, workplace and regulatory requirements
- 2.4** Working at heights is carried out in accordance with workplace and regulatory requirements
- 2.5** Hazard control measures are applied and monitored in accordance with workplace and regulatory requirements
- 2.6** Worksite is maintained to minimise risk in accordance with workplace requirements
- 2.7** Hazards identified during the work are assessed and controlled in accordance with workplace and regulatory requirements
- 2.8** Incidents and emergencies are responded to in accordance with workplace and regulatory requirements

3 Complete work and documentation

- 3.1** Worksite is rehabilitated, cleaned and made safe in accordance with workplace and regulatory requirements
- 3.2** Plant, tools and equipment are cleaned, checked and returned in accordance with workplace requirements

- 3.3** Work records, reports and documentation are completed in accordance with workplace and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

Newly created unit.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0049 Apply safe work practices in the rooftop solar industry

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- applying relevant legislation, regulations, standards, codes of practice and workplace requirements including:
 - work health and safety (WHS)/occupational health and safety (OHS)
 - working at heights
 - manual handling
- identifying typical hazards within the solar industry
- inspecting worksite to determine layout and physical condition of rooftop structures
- applying and reviewing risk control measures to minimise, control or eliminate identified hazards
- monitoring control measures
- obtaining, inspecting and using relevant personal protective equipment (PPE)
- applying workplace procedures for an emergency
- using plant, tools and equipment safely
- applying correct manual handling techniques
- applying current working at heights requirements for the solar industry
- completing relevant work records, reports and documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant legislation, regulations standards, codes of practice and workplace requirements including:
 - WHS/OHS
 - manual handling in the solar industry
 - working at heights in the solar industry
- identifying hazards, assessing risks, and identifying, applying and monitoring control measures in the solar industry

- regulations for working in the vicinity of overhead supplies
- types of manual handling equipment in the solar industry
- working at heights practices in the solar industry including:
 - passive fall prevention systems
 - work positioning systems
 - fall arrest systems
 - clearances to other services
 - layout and physical condition of rooftop structures
- types, inspection and application of PPE
- safe use of plant, tools and equipment including:
 - pre-operational checks
 - post-operational checks
- types of injuries common in the solar industry
- emergency and rescue plan
- asbestos, including:
 - common types of asbestos containing building materials
 - warning signs used to identify the presence of asbestos
 - effects of asbestos on the human body
 - requirements for reporting the presence of asbestos
- silica, including:
 - types of materials that contain crystalline silica (silica dust)
 - methods of releasing silica dust
 - recommended levels of exposure to crystalline silica
 - effects of crystalline silica on the human body
- working safely with electricity, including:
 - hazards of direct current (d.c.) and alternating current (a.c.) electricity
 - effects of electric shock on the body
 - precautions to minimise the chance of electric shock
 - common causes of electrical accidents
 - procedures for emergency involving electricity.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations, where it is appropriate to do so.

Where this is not appropriate, assessment must occur in simulated conditions involving realistic

and authentic activities that replicate operational workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace procedures, relevant industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0050 Identify and isolate multiple supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to identify and isolate multiple supply systems.

It includes identifying locations of multiple supply systems within a premise with or without grid supply, performing shutdown and isolation procedures and returning supply systems to normal operations.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, may be required.

Those holding an 'Unrestricted Electrician's Licence' or equivalent issued in an Australian state or territory meet the prerequisite requirements of this unit.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

demonstrate achievement of the element.

1 Prepare to isolate multiple supply systems

- 1.1** Legislation, regulations, standards, codes of practice and workplace requirements for the worksite are identified and referred to
- 1.2** Scope of work is determined, implications of isolation/s are identified
- 1.3** Site specific information including manuals, drawings, operational information, labelling, shutdown and start up procedures are identified and referred to
- 1.4** Worksite is assessed in accordance with workplace requirements
- 1.5** Hazards are identified, risks assessed and control measures identified and applied
- 1.6** Tools, equipment and personal protective equipment (PPE) required for work are determined, obtained and confirmed in working order
- 1.7** Circuit testing devices are obtained and checked for correct operation and safety in accordance with workplace requirements
- 1.8** Relevant person/s are notified of supply systems shutdown and isolation in accordance with workplace requirements

2 Isolate multiple supply systems

- 2.1** Supply systems shutdown procedures are completed in accordance with site specific information and workplace requirements
- 2.2** Supply systems circuits are tested and confirmed as de-energised and lock-out procedures followed

3 Re-instate multiple supply systems

- 3.1** Supply systems start up procedures are completed in accordance with site specific information and workplace requirements
- 3.2** Supply systems are confirmed as re-energised and tested for correct operation
- 3.3** Incidents or unplanned events are responded to in accordance with workplace requirements
- 3.4** Relevant person/s are notified of re-instatement of supply systems in accordance with workplace

requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

Newly created unit.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0050 Identify and isolate multiple supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion and include:

- applying relevant legislation, regulations, standards, codes of practice and workplace requirements including:
 - work health and safety (WHS)/occupational health and safety (OHS)
- identifying hazards, assessing risks, identifying, applying and monitoring control measures
- assessing worksite including:
 - locating switchboard/s and circuits
 - locating and interpreting site specific information
 - locating inverter energy systems (IES) and supply systems
 - applying awareness of unidentifiable supply systems
 - identifying and locating isolation devices
 - identifying and locating supply systems conductors
- shutting down and isolating supply systems for at least two (2) of the following:
 - renewable energy IES
 - grid connected IES with stand-alone functionality
 - stand-alone IES
 - engine driven
- returning supply systems to normal operation for at least two (2) of the following:
 - renewable energy IES
 - grid connected IES with stand-alone functionality
 - stand-alone IES
 - engine driven
- isolating multiple supply systems in accordance with workplace and regulatory requirements, including:
 - applying safe isolation practices
 - identifying correct isolation device/s
 - identifying live conductors
 - correctly using testing equipment

- confirming systems are isolated
- tagging-out all supplies
- testing re-energised supply systems for correct operation and electrical safety
- confirming documented shutdown and start up procedures are correct including:
 - notifying appropriate person/s of any inconsistencies in the procedures
- dealing with an unplanned event.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant legislation, regulations, standards, codes of practice and workplace requirements including:
 - WHS/OHS
 - hazard, risk assessment and risk control requirements including potential hazards
 - potential injuries caused by multiple supply systems
 - notification to relevant person/s of shutting down and starting up supply systems
 - safe use of tools and equipment including:
 - testing equipment
- electrical isolation including:
 - anti-islanding
 - unidentifiable supply systems
 - need for ensuring the safe isolation of an electrical supply
 - isolation devices used in IES
 - tagging and lockout
 - central protection systems
- characteristics, operations and safety functions of multiple supply systems including:
 - renewable energy IES
 - grid connected IES with stand-alone functionality
 - stand-alone IES
 - engine driven
- types and location of labelling for multiple supply systems
- site specific information including:
 - operational information
 - manuals
 - drawings
 - labelling
 - shutdown procedures and start up procedures
 - notification of inconsistencies in shutdown and start up procedures
- working safely with electricity including:

- hazards of direct current (d.c.) and alternating current (a.c.) electricity
- effects of electric shock on the body
- precautions to minimise the chance of electric shock
- procedures for emergency involving electricity
- common causes of electrical accidents.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations, where it is appropriate to do so.

Where this is not appropriate, assessment must occur in simulated conditions involving realistic and authentic activities that replicate operational workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant and appropriate materials, tools, equipment and PPE currently used in industry
- applicable documentation, including workplace requirements, relevant industry standards, regulations, codes of practice and operation manuals.

UEERE0051 Apply electrical principles to renewable energy design

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to apply electrical principles to renewable energy design.

It includes: working safely; determining the extent and nature of the installation; applying regulation/legislation, industry standards, and codes; reading and interpreting drawings; identifying expertise required for design and installation; calculating cabling, isolation and protection devices; verifying compliance of equipment selected; and completing necessary documentation and record keeping.

This unit supports individuals other than electricians from other electrotechnology disciplines or education pathways to demonstrate the skills and knowledge required to undertake the design of renewable energy systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1 Prepare to contribute to renewable energy installation design**
 - 1.1** WHS/OHS processes and procedures are identified and applied in accordance with workplace procedures
 - 1.2** Drawings and diagrams are interpreted to determine the apparatus, cables and isolation device sizes and types
 - 1.3** Renewable energy system regulations / legislation, Industry Standards, and Codes are identified, interpreted and applied
 - 1.4** Additional expertise or approval required for execution of design is identified
- 2 Apply electrical principles to development of renewable energy design**
 - 2.1** System energy production/yield is calculated in accordance with industry practice
 - 2.2** Cable sizes are calculated in accordance with job requirements and industry standards
 - 2.3** Isolator sizes are calculated in accordance with job requirements and industry standards
 - 2.4** Protection device sizes are calculated in accordance with job requirements and industry standards
 - 2.5** Calculated component sizes are checked against verified designs
 - 2.6** Renewable energy system designs are reviewed to check compliance with Industry Standards, guidelines and codes
 - 2.7** Documentation and record keeping is completed in accordance with workplace procedures and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work

environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit

Assessment Requirements for UEERE0051 Apply electrical principles to renewable energy design

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures and practices
- applying safety principles for electrical systems in buildings and premises
- reviewing renewable energy system designs for compliance with industry standards, guidelines and codes
- interpreting drawings and diagrams to determine the apparatus, cables and isolation device sizes and types
- identifying, interpreting, and applying relevant renewable energy system regulations / legislation, industry standards, and codes
- calculating:
 - cable sizes
 - isolator sizes
 - protection device sizes
 - system energy production/yield
- drawing block diagrams incorporating apparatus, cables, isolators and overcurrent protection
- identifying any additional expertise or approval required for execution of design
- verifying equipment and cable selected complies with standards and job specifications
- completing necessary documentation and record keeping.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- safety and compliance including:
 - hierarchy of Acts, Regulation, Standards and Codes
 - Licensing restrictions
 - electrical isolation requirements and processes

- electrical theory including:
 - definitions of and units of measurement for:
 - voltage
 - current
 - resistance including conductors versus insulators
 - power
 - energy
 - Ohm's law, including:
 - relationship between Voltage, Current and Resistance
 - basic direct current (d.c.) single path circuit
 - voltage and current levels in a basic d.c. single path circuit
 - effects of an open circuit, a closed circuit and a short circuit on a basic d.c. single path
 - relationship between voltage and current from measured values in a simple circuit
 - difference between power and energy, and when is each used
 - simple calculations including:
 - appliance loads
 - energy ratings
- the grid including:
 - high voltage (HV) and low voltage (LV)
 - distribution network service provider (DNSP)
 - electricity bills, tariff structures and demand charges
 - single, two and three phase
 - main switchboard and distribution boards
 - fault currents
- drawings including:
 - drawing types including:
 - single line diagram (SLD)
 - wiring
 - architectural
 - block
 - interpreting site plans
 - interpreting drawing symbols used for renewable energy designs/installations
- basic electrical circuits including:
 - elements of a simple electric circuit (supply, control switch, protection device and load)
 - purpose of each component in the circuit
 - effects of an open circuit, a closed circuit and a short circuit
- types of loads including:
 - resistive
 - inductive
- alternating current (AC - both single and three phase) and direct current (DC), what each is,

- and dangers posed by each
- need for devices to afford electrical protection and the mechanisms used in protection devices including resetting
 - symbols used to represent an electrical energy source, a load, a switch and a circuit protection device in a circuit diagram
 - electrical power, including:
 - power ratings of devices
 - power dissipated in circuit from voltage, current and resistance values
 - definition of ‘power’ in electrical terms (for d.c. or resistive a.c. circuits)
 - using circuit readings determine power using the appropriate equations, symbols and unit abbreviations including the use of multiples and sub multiples
 - series circuits, including:
 - circuit diagram of a single source d.c. series circuit
 - identification of the major components of a series circuit: power supply, loads, connecting leads and switch
 - relationship between voltage drops and resistance in a simple voltage divider network
 - effect of an open circuit on a series connected circuit
 - parallel circuits including:
 - schematic diagram of a single source d.c. parallel circuit
 - identification of the major components of a parallel circuit (power supply, protection device, switch and loads)
 - applications where parallel circuits are used in the electrotechnology industry
 - characteristics of a parallel circuit (load connection, current paths, voltage drops, power dissipation, and effects of an open circuit in a parallel circuit)
 - relationship between currents entering a junction and currents leaving a junction
 - relationship between branch currents and resistances in a two-branch current divider network
 - series/parallel circuits including:
 - schematic diagram of a single source d.c. series/parallel circuit
 - identification of the major components of a series/parallel circuit (power supply, protection device, switch and loads)
 - applications where series/parallel circuits are used in the electrotechnology industry
 - characteristics of a series/parallel circuit (load connection, current paths, voltage drops, power dissipation, and effects of an open circuit in a series/parallel circuit)
 - relationship between voltages, currents and resistances in a bridge network
 - calculation of the total:
 - resistance of a series/parallel circuit
 - current of a series/parallel circuit
 - voltage and the individual voltage drops of a series/parallel circuit
 - techniques for setting up and connecting a single source d.c. series/parallel circuit
 - factors effecting resistance, including:

- effect the change in the type of material (resistivity) has on the resistance of a conductor
- effect the change in 'length' has on the resistance of a conductor
- effect the change in 'cross-sectional area' has on the resistance of a conductor
- effects of temperature change on the resistance of various conducting materials
- effects of resistance on the current-carrying capacity and voltage drop in cables
- techniques for calculation of the resistance of a conductor from factors such as conductor length, cross-sectional area, resistivity and changes in temperature
- power factor
- basic measuring equipment including:
 - multi meter
 - AC/DC clamp meter
 - megohmmeter
- earthing systems including:
 - functional earthing
 - protective earthing and equipotential bonding
 - typical earthing arrangements for electrical installations, including installations with outbuildings
 - multiple earthed neutral (MEN) system including:
 - protective earth-neutral (PEN) conductor
 - main earthing conductor
 - MEN link
 - earth electrode
- switchboards and protection including:
 - switchboard types, application and construction
 - arrangement and identification of switchboard equipment
 - devices for functions of isolation, emergency, mechanical maintenance and functional control
 - circuit breakers including:
 - miniature circuit breaker (MCB)
 - molded case circuit breaker (MCCB)
 - residual current device (RCD)
 - residual current breaker with overcurrent (RCBO)
 - fuses
 - coordination of overload and short circuit protection devices
 - device requirements for protection against over-voltage and under-voltage
 - signage
 - alternate supplies
 - ingress protection (IP) ratings
 - relevant industry standard requirements for switchboards and protection
- cabling including:

- purpose, types and construction of cables used in renewable energy installations
- current carrying capacity of cables
- cable installation methods including:
 - in air
 - open
 - on surface
 - partially surrounded
 - fully surrounded
- typical cable routes through buildings, structures and premises
- mechanical cable protection methods
- cable and conductor terminations
- maintaining fire integrity rating
- voltage drop
- voltage rise
- earth fault-loop impedance
- short circuit performance consideration
- methods to calculate/select cable sizes including:
 - AC and DC cables
 - earthing cables
- relevant industry standard requirements for cables
- techniques for the calculation of energy production/yield
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to applying electrical principles in

renewable energy design

- applicable documentation, including workplace procedures, equipment specifications, regulations, relevant industry standards, codes of practice and operation manuals.

UEERE0052 Assess energy loads and uses for energy efficiency in commercial facilities

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0003 Assess energy loads and uses for energy efficiency in commercial facilities. Modifications include:

- Update to application
- Prerequisite changed
- Element titles amended
- Performance criteria removed and added
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed.

Application

This unit involves the skills and knowledge required to undertake energy audits to assess energy loads of commercial facilities, evaluate the energy efficiency of the facilities and to make recommendations on design implementations.

This unit also applies to office, retail, and multi dwelling residential facilities.

It includes working safely, applying extensive knowledge of commercial electrical installations and components and their operating parameters, gathering and analysing data, applying problem-solving techniques, and developing and documenting engineering solutions.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERE0068 Develop strategies to address sustainability issues for electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to assess energy efficiency of commercial facility

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements are identified and applied
- 1.2** Organisational processes and procedures relevant to energy efficiency assessment are identified, interpreted, and applied
- 1.3** Extent of the energy assessment is determined from analysis of facilities, orientation and floor plans, building structure plans, energy accounts and situation reports in consultation with relevant person/s and in accordance with organisational procedures
- 1.4** Energy assessment activities/audits are planned to meet scheduled timelines in consultation with others involved in the work
- 1.5** Strategies are determined to ensure energy efficient solutions are developed and implemented in accordance with industry standards and organisational procedures

2 Assess and evaluate energy efficiency of commercial facility

- 2.1** Information on energy use, any onsite energy generation and energy costs are gathered and recorded
- 2.2** Main sources of energy use are identified, measured and recorded
- 2.3** Information about activities undertaken at facility, and their impact on energy efficiency, is gathered and recorded
- 2.4** Industry/government initiatives/programs to support energy efficiency are identified and evaluated
- 2.5** Energy loads are considered when developing energy efficient strategies to address and minimise energy use
- 2.6** Parameters, specifications and performance requirements in relation to energy use are set in accordance with organisational procedures

- 2.7** Approaches/strategies to resolving and minimising energy use are analysed to provide the most effective solutions in accordance with organisational procedures
- 2.8** Energy efficiency, cost savings and emission reductions from implementing energy efficiency measures are estimated and documented
- 3 Document energy efficiency assessment of commercial facility**
- 3.1** Proposed solutions/strategies to minimise energy use are tested to determine their effectiveness and modified, as required, in accordance with organisational procedures
- 3.2** Adopted solutions are documented in accordance with organisational procedures, including instructions for implementation that incorporate the risk control measures to be followed
- 3.3** Authorised person/s required to implement solutions are coordinated in accordance with regulatory requirements and organisational procedures
- 3.4** Justification for strategies used to minimise energy use is documented for inclusion in work/project development records in accordance with professional standards and organisational procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Carrying out energy assessments and documenting energy efficiency strategies must include at least two of the following facilities:

- commercial
- office
- large retail
- multi dwelling residential

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0003 Assess energy loads and uses for energy efficiency in commercial facilities.

Assessment Requirements for UEERE0052 Assess energy loads and uses for energy efficiency in commercial facilities

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0003 Assess energy loads and uses for energy efficiency in commercial facilities. Modifications include:

- Update to application
- Prerequisite changed
- Element titles amended
- Performance criteria removed and added
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant organisational procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- performing energy use assessments and identifying efficiency improvements for commercial facilities in accordance with the range of conditions
- documenting and presenting final recommendations.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- relevant WHS/OHS legislated requirements and relevant organisational procedures and practices, job safety assessments or risk control processes and types of personal protective equipment (PPE) to be used when conducting on-site assessments of commercial energy use
- alternative energy production and storage technologies applicable to commercial buildings
- energy ratings and power consumption of appliances and equipment and how they are calculated
- energy types and units of measurement

- key requirements of relevant codes, standards, regulations and government incentive programs for commercial energy efficiency
- major systems and other sources of commercial energy use including:
 - cooking
 - refrigeration
 - washing and drying
 - home entertainment and home office equipment
 - heating and cooling
 - internal and external appliances
 - swimming pools and spas
 - water heating
 - water pumps
 - building management systems
 - use of renewables and energy storage
 - electric vehicles
 - compressed air
 - power factor correction
 - peak demand charge
 - variable speed drives
 - industrial/commercial lighting
 - industrial/commercial ventilation
- methods for interpreting energy bills including: actual and estimated bills, plans and tariffs
- strategies for improving commercial energy efficiency including impact of building design, proximity and orientation on heating/cooling energy use, upgrade options and behavioural changes
- trends in energy use and emissions
- water supply, use, auditing services and design
- greenhouse gas emissions, ecological impacts and resource use
- energy management, legislation and regulation relevant to commercial, multi-dwelling residential, office and retail premises
- energy auditing and practice
- energy management
- power and energy data recording
- lighting services and efficient design
- thermal performance and climate control
- food storage and preparation services and efficient design
- water heating services and efficient design
- entertainment and administration services and efficient design
- cleaning services and efficient design
- pumping systems (and pools) and efficient design
- smart metering solutions

- renewable energy (solar PV/energy storage)
- types and uses of energy measuring tools.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

- lighting services and efficient design
- thermal performance and climate control
- food storage and preparation services and efficient design

- water heating services and efficient design
- entertainment and administration services and efficient design
- cleaning services and efficient design
- pumping systems (and pools) and efficient design
- smart metering solutions
- renewable energy (solar PV/energy storage)
- types and uses of energy measuring tools.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0054 Conduct site survey for grid-connected photovoltaic and battery storage systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to complete site surveys for grid-connected photovoltaic and battery storage systems.

It includes safe work practices, site inspection processes and procedures, service provider responsibilities, consulting with qualified people to assess client energy demand requirements and assessing grid-connected equipment options to meet client requirements and site conditions. It also covers provision of advice to the client on battery storage standards, codes of practices, government/utilities incentive schemes, and information related to the installation of a grid-connected photovoltaic and battery storage systems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to conduct site survey

1.1 Stakeholders are identified and client requirements and expectations for grid-connected system obtained

- 1.2 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures relevant to site survey are obtained and applied
 - 1.3 Equipment and documentation needed for the site inspection are obtained in accordance with workplace procedures
 - 1.4 Requirements for site survey and roles/responsibilities of people involved in site survey, design and installation are discussed with client
 - 1.5 General information about industry standards, building/electrical regulations and codes, and risk minimisation is provided to client
 - 1.6 Advice on the benefits of photovoltaic and battery storage systems and energy management is provided to client
 - 1.7 Current client energy usage data is collected, and future changes identified
 - 1.8 Resources, information sources and other people that will support gathering required site survey information are identified
- 2 Undertake and document site survey**
- 2.1 Site survey for the proposed installation is safely undertaken
 - 2.2 Current and expected future client energy generation needs are discussed, and expectations are clarified
 - 2.3 Site hazards that may impact installation are identified and documented
 - 2.4 Information about site access, building structures, existing electrical infrastructure, available RE resources is gathered and included in report
 - 2.5 Site survey report is prepared and provided to designer in accordance with workplace procedures
 - 2.6 Designer, and other qualified person/s if required, are consulted and briefed on client expectations and requirements
 - 2.7 Designer, and other qualified person/s if required, are consulted and briefed on site access, conditions, risks

and potential installation issues

- 2.8 Options for grid-connected photovoltaic and battery storage equipment to meet site requirements and client expectations are discussed with designer, and other qualified person/s if required
- 2.9 Placement of system components is considered, and any restrictions or issues of concern noted
- 2.10 Final site survey report is prepared after consultation with designer

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEERE0054 Conduct site survey for grid-connected photovoltaic and battery storage systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS), and risk assessment and control procedures
- identifying all relevant stakeholders and qualified personnel required to complete site survey
- communicating effectively with clients to discuss:
 - requirements for site assessment and information to be collected
 - roles/responsibilities of people involved in design, installation and maintenance
 - industry standards, building/electrical regulations and codes, and risk minimisation relevant to the installation
 - benefits and options of photovoltaic and battery storage systems and energy management
- undertaking site survey safely and documenting findings including:
 - potential site hazards that may impact installation
 - site access, layout, distances and building structures
 - solar access and shading
 - gathering information about existing electrical installation and any existing energy generation elements
 - current energy usage including maximum power and energy demand
 - current and expected future energy generation needs including maximum power demand
 - working with qualified personnel as required to complete site survey
 - options for suitable photovoltaic generating systems
 - options for suitable battery storage systems
 - options for placement of system components, any restrictions or issues of concern
 - potential installation problem/s and recommend solutions
- producing final site survey report.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of

the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- relevant WHS/OHS requirements including:
 - risk assessment and mitigation processes
 - safe work method statements (SWMS)/job safety assessments or risk control processes prior to site visit
 - legislated requirements
 - roof access and working at heights
 - electrical safety
- basic energy principles
- relevant manufacturer specifications
- relevant standards, building regulations and codes of practice
- stakeholders, required personnel and roles and responsibilities of people involved in design, installation and maintenance
- methods for identifying and recording existing electrical infrastructure
- relevant local, state and commonwealth requirements
- site survey process and information to be gathered, recorded and analysed
- energy assessment and review including:
 - methods for discussing with client energy use patterns and future plans in energy use
 - methods for collecting energy usage and patterns
 - consideration of appropriate energy efficient appliances and technologies
 - data sources
- energy services required by the electrical installation grid-connected photovoltaic systems including:
 - different equipment types their componentry and configuration
 - factors that impact equipment type selection related to site and usage characteristics
 - basic design, installation, and maintenance requirements
 - connection limitations, requirements
 - basic configuration of a PV array
 - environmental considerations and required approvals
- grid-connected battery storage systems including:
 - methods of battery storage
 - fundamentals of battery storage
 - different energy storage technologies, associated componentry and system configuration
 - factors that impact equipment type selection related to site and usage characteristics
 - life expectancy
 - basic design, installation and maintenance requirements
 - basic operation of battery storage systems and integrated systems
- installation considerations and requirements for grid-connected photovoltaic and battery storage systems

- electrical diagrams for a RE system including:
 - functional block diagrams for typical grid-connected RE system configurations
 - architectural and site diagrams to show the locations of equipment, fittings and cabling.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to conduct site survey

1.1 Stakeholders are identified and client requirements and expectations for off-grid system obtained

- 1.2 Work health and safety (WHS)/occupational health and safety (OHS) requirements, relevant legislated requirements, and workplace procedures relevant to site survey are obtained and applied
 - 1.3 Equipment and documentation needed for the site inspection are obtained in accordance with workplace procedures
 - 1.4 Requirements for site survey and roles/responsibilities of people involved in site survey, design and installation are discussed with client
 - 1.5 General information about industry standards, building/electrical regulations and codes, and risk minimisation is provided to client
 - 1.6 Advice on the benefits of renewable energy generation systems and energy management is provided to client
 - 1.7 Current client energy usage data is collected, and future changes identified
 - 1.8 Resources, information sources and other people that will support gathering required site survey information are identified
- 2 Undertake and document site survey**
- 2.1 Site survey for the proposed installation is safely undertaken
 - 2.2 Current and expected future client energy generation needs are discussed, and expectations are clarified
 - 2.3 Potential locations of equipment are discussed with client and preferences recorded
 - 2.4 Site hazards that may impact installation are identified and documented
 - 2.5 Information about site access, building structures, existing electrical infrastructure including existing RE and generation elements, available RE resources is gathered and included in report
 - 2.6 Site survey report is prepared and provided to designer in accordance with workplace procedures
 - 2.7 Designer, and other qualified person/s if required, are consulted and briefed on client expectations and

requirements

- 2.8 Designer, and other qualified person/s if required, are consulted and briefed on site access, conditions, risks and potential installation issues
- 2.9 Options for off-grid energy generation and storage equipment to meet site requirements and client expectations are discussed with designer, and other qualified person/s if required
- 2.10 Placement of system components is considered, and any restrictions or issues of concern noted
- 2.11 Final site survey report is prepared after consultation with designer

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Assessment Requirements for UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS), and risk assessment and control procedures
- identifying all relevant stakeholders and qualified personnel required to complete site survey
- communicating effectively with clients to discuss:
 - requirements for site assessment and information to be collected
 - roles/responsibilities of people involved in design, installation and maintenance
 - industry standards, building/electrical regulations and codes, and risk minimisation relevant to the installation
 - benefits and options of renewable energy generation systems and energy management
 - expectation of off-grid PV/genset system - operation, performance, location
- undertaking site survey safely and documenting findings including:
 - potential site hazards that may impact installation
 - site access, layout, distances and building structures
 - solar access and shading
 - gathering information about existing electrical installation and any existing energy generation elements
 - current energy usage including maximum power and energy demand
 - current and expected future energy generation needs including maximum power demand
 - working with qualified personnel as required to complete site survey
 - options for suitable renewable generating systems
 - options for suitable renewable storage systems
 - options for placement of system components, any restrictions or issues of concern
 - potential installation problem/s and recommend solutions
- producing final site survey report.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- relevant WHS/OHS requirements including:
 - safe work method statements (SWMS)/job safety assessments or risk mitigation processes
 - legislated requirements
 - procedures for working in remote areas, safety onsite and while travelling
 - roof access and working at heights
 - electrical safety
- communicating effectively with clients to discuss:
 - requirements for site assessment and information to be collected
 - roles/responsibilities of people involved in design, installation and maintenance
 - industry standards, building/electrical regulations and codes, and risk minimisation relevant to the installation
 - benefits and options of renewable energy generation systems and energy management
- basic energy principles
- stakeholders, required personnel and roles and responsibilities of people involved in design, installation and maintenance
- site survey process and information to be gathered, recorded and analysed
- methods for identifying and recording existing electrical infrastructure including existing renewable energy and generation elements
- relevant local, state and commonwealth requirements
- environmental considerations on site and any authorisations/approvals
- techniques to review existing grid connection when customer wants to go independent from grid
- energy assessment and review including:
 - energy services required by the electrical installation
 - power and energy consumption of individual appliances and systems using appropriate meters or other methods such as label review and data logging
 - consideration of the most appropriate energy source for each of these services
 - methods for discussing with client energy use patterns and future growth in energy use
- off-grid PV/genset systems including:
 - different equipment types and their componentry and system configuration
 - factors that impact equipment type selection related to site and usage characteristics
 - considerations when multiple sources are used
- off-grid energy storage systems including:
 - different equipment types and their componentry and system configuration
 - factors that impact equipment type selection related to site and usage characteristics

- design, installation, and maintenance requirements
- basic operation of integrated off-grid PV/genset systems
- installation consideration and requirements for integrated off-grid PV/genset systems
- smart systems including monitoring and control
- load control and demand management
- methods to identify solar access and shading
- solar resource considerations
- photovoltaic (PV) modules and arrays
- wind resource considerations
- micro-hydro resource considerations
- energy storage systems
- power conversion equipment (PCE) including:
 - types of PCEs
 - the basic function of a PCE
 - PCE operation
 - PCE characteristics
- generating sets including:
 - types of gensets
 - the basic function of a genset
 - genset operation
 - genset characteristics
- electrical diagrams for a RE system including:
 - functional block diagrams for typical off-grid RE system configurations
 - architectural and site diagrams to show the locations of equipment, fittings and cabling.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry

- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0056 Coordinate maintenance of renewable energy (RE) apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0027 Co-ordinate maintenance of renewable energy (RE) apparatus and systems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Amendments to Performance and Knowledge Evidence.

Application

This unit involves the skills and knowledge required to coordinate maintenance of renewable energy (RE) apparatus and systems.

It includes preparing for, conducting and completing coordination of maintenance work.

This unit is appropriate for Licenced Electricians with responsibility for coordinating maintenance personnel.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEERE0082 Maintain renewable energy (RE) apparatus

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to coordinate maintenance of RE apparatus and systems

- 1.1** Work health and safety (WHS)/occupational health and safety (OHS) requirements for relevant work area/s are identified, interpreted and applied
- 1.2** Scope of work is determined from maintenance schedule, manufacturer specifications, workplace policies and procedures and regulatory requirements
- 1.3** Competencies, licences and/or permits required to conduct work are determined from job specifications, workplace policies/procedures, regulatory requirements, and consultations with appropriate person/s
- 1.4** Personnel and materials required for maintenance are arranged in accordance with workplace procedures and against maintenance schedule job requirements
- 1.5** Tools, equipment and testing devices required for maintenance are arranged in accordance with workplace procedures and against maintenance schedule job requirements
- 1.6** Need to test or measure live electrical work is determined from maintenance schedule, and in accordance with WHS/OHS requirements, and considered in the coordination of personnel
- 1.7** Maintenance plan is developed based on maintenance schedule, regulatory and competency requirements, and communicated to relevant personnel

2 Coordinate maintenance of RE apparatus and systems

- 2.1** Maintenance is coordinated in accordance with maintenance schedule and plan
- 2.2** Strategies to deal with unexpected situations are determined based on safety requirements, job specifications, workplace procedures and from discussions with relevant person/s
- 2.3** Maintenance quality checks are conducted to confirm compliance with regulation, technical standards, job specifications, WHS/OHS requirements and workplace procedures
- 2.4** Maintenance activities are evaluated against performance expectations and recommended improvements documented and submitted to appropriate

person/s

- 2.5 Maintenance documentation/reports are checked for compliance with requirements and stored in accordance with workplace procedures, manufacturer and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Coordinating maintenance of renewable energy (RE) apparatus and systems must include:

- coordination of maintenance for multiple sites or types of equipment/systems
- coordination of work for both licenced and unlicenced maintenance personnel.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0027 Co-ordinate maintenance of renewable energy (RE) apparatus and systems.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0056 Coordinate maintenance of renewable energy (RE) apparatus and systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0027 Co-ordinate maintenance of renewable energy (RE) apparatus and systems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Amendments to Performance and Knowledge Evidence.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- determining and applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- correctly interpreting:
 - maintenance schedule
 - manufacturer maintenance specifications
 - relevant regulatory requirements
 - relevant workplace policies and procedures related to maintenance
- arranging appropriate tools, equipment, materials and personnel to complete maintenance requirements
- ensuring personnel completing maintenance have required competencies, licences and/or permits
- developing and implementing a maintenance plan to achieve maintenance requirements
- coordinating and monitoring the quality of maintenance work
- ensuring maintenance records and documentation are completed and stored in accordance with requirements.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- maintenance principles including:
 - maintenance function

- role of maintenance department
- WHS/OHS requirements
- maintenance systems including:
 - maintenance terminology
 - preventative maintenance
 - predictive maintenance
 - corrective maintenance
- data acquisition including:
 - plant history cards/files
 - inspection techniques
 - predictive maintenance
 - remote visual inspection
 - non-destructive testing
 - vibration analysis
 - oil analysis
- maintenance plan including:
 - characteristics of plant operation
 - assessment of failure characteristics
 - link failure characteristics to maintenance systems
 - identify production windows
 - resources
 - labour
 - materials
 - establish plan
 - implementation procedures
- review of maintenance plan including:
 - analysis of records
 - manual recording methods
- computerised recording methods
- relevant manufacturer specifications
- relevant WHS/OHS requirements
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to coordinating maintenance of RE apparatus and systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0057 Coordinate the design of micro-grid renewable energy systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to coordinate the design of micro-grid renewable energy systems.

It includes safe work practices, site survey processes and procedures, service provider responsibilities, consulting with qualified people to assess client energy demand requirements and assessing micro-grid equipment options to meet client requirements and site conditions. It also covers advice to the client on energy storage standards, codes of practices, government/utilities incentive schemes, and information related to the design and installation of a micro-grid renewable energy generation system.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for coordinating site survey for, and the design of, micro-grid renewable energy systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0054 Conduct site survey for grid-connected renewable energy systems

UEERE0055 Conduct site survey for off-grid PV/genset systems

UEERE0060 Design grid-connected energy storage systems

UEERE0061 Design grid-connected photovoltaic power supply systems

UEERE0063 Design off-grid PV Systems

and

UEEEL0039 - Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to coordinate design of micro-grid

2 Coordinate site survey for a micro-grid

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----|--|
| 1.1 | Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures relevant to site assessment are obtained and applied |
| 1.2 | Scope and scale of proposed micro grid is determined from project brief |
| 1.3 | Stakeholders and required experts that need to be consulted and involved are identified and engaged |
| 1.4 | Site survey plan is developed in consultation with required personnel |
| 1.5 | Equipment and documentation needed for the site survey are obtained in accordance with workplace procedures |
| 1.6 | Requirements for site survey, contractual obligations, and roles/responsibilities of people involved are discussed with stakeholder/s |
| 1.7 | Requirements for production and approval of design are identified and documented |
| 2.1 | Details of project brief are verified, and any discrepancies recorded |
| 2.2 | Current stakeholder/s energy usage data is collected and expected future energy generation needs are discussed, and expectations are clarified |

- 2.3 Energy resource data is collected
 - 2.4 Information about site access, building structures and layout, and existing electrical infrastructure is gathered and documented
 - 2.5 Site hazards that may impact installation are identified and documented
 - 2.6 Reports and data from technical experts are obtained and added to site survey data
 - 2.7 Distribution/network requirements are determined where required
 - 2.8 Site survey data is analysed and report prepared
- 3 Coordinate the design of micro-grid**
- 3.1 Any relevant industry standards, building/electrical regulations, codes and jurisdictional approval process are identified
 - 3.2 Qualified person/s are consulted and briefed as required on site conditions, and client requirements and expectations
 - 3.3 Options for micro-grid energy generation equipment to meet site requirements and client expectations are identified and noted
 - 3.4 Different options for micro-grid energy storage equipment to meet site requirements and client expectations are identified and noted
 - 3.5 Placement of system components is considered, and any restrictions or issues of concern noted
 - 3.6 Micro-grid system performance standards and compliance methods are applied to the design development
 - 3.7 Safety, functional and budgetary considerations are incorporated in design
 - 3.8 Qualified person/s are consulted to ensure micro-grid system design draft complies with the design brief, industry standards and regulations, job requirements and workplace procedures
 - 3.9 Micro-grid system design is documented in line with industry standards and regulations, job

requirements and workplace procedures

- 3.10** Micro-grid system design is documented and submitted to relevant person/s for approval

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Assessment Requirements for UEERE0057 Coordinate the design of micro-grid renewable energy systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS), and risk assessment and control procedures
- developing the site survey plan in consultation with the project manager, client, equipment manufacturers, installers and engineers
- identifying, engaging and coordinating and technical expertise required for the site survey and design
- communicating effectively with stakeholders
- undertaking site inspection safely and documenting findings
- coordinating qualified person/s as required to:
 - assess client energy demand requirements
 - develop options for suitable generating systems
 - develop options for suitable storage systems
 - determine impact of site conditions on selection of best options
 - determine placement of system components, any restrictions or issues of concern
 - identify potential installation problem/s and recommend solutions
 - determine any required sign-off or approval for design and final installation
 - produce final site survey report
 - produce micro-grid design
- obtaining approval for final design
- completing relevant organisational documentation.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- relevant WHS/OHS requirements
- relevant manufacturer specifications
- relevant workplace documentation, policies and procedures
- relevant standards, building regulations and codes of practice
- methods to identify and comply with contractual obligations
- customer service responsibilities
- stakeholders involved in the design, installation and maintenance of energy systems and their roles
- methods to identify conditions to drive energy source
- environmental management plan development and implementation
- management of system maintenance processes
- site surveying
- energy assessment and monitoring
- micro-grid energy generating systems
- micro-grid energy storage systems
- basic energy principles
- methods for identifying and recording existing electrical and generation infrastructure
- electricity network requirements and restrictions
- government/utilities incentive schemes
- jurisdictional approvals required before installation
- roles and responsibilities of people involved in design and installation
- load control, demand management and tariffs.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0058 Coordinate the installation, fault finding and repair of micro grid systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to Coordinate the installation, fault finding and repair of micro grid systems.

It includes verifying design and liaising with designer as required, engaging and scheduling contractors and other experts required for completion of work, planning the installation and repair of micro-grid systems, ensuring installed/repared system components are compliant, conducting quality checks, ensuring system is correctly programmed, testing and commissioning the system and completing necessary documentation.

Micro-grids can include a number of different configurations, both grid-connected and off-grid. They require the installation of the individual generation equipment (including renewable energy systems) which supply up to the Point of Common Supply (POCS). Network of data interconnection and the programming require the installation of the individual data communication to a central data network and commissioning of the data system. A team of specialized line workers and engineer would complete the distribution system between the individual systems, this would have been part of the coordinators design brief.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to coordinate work on micro-grid systems

- 1.1** Nature of the installation is verified from design documentation and any design concerns identified referred to designer
- 1.2** Work health and safety (WHS)/occupational health and safety (OHS) processes and procedures are identified and applied in accordance with workplace procedures
- 1.3** Engagement and scheduling of contractors and other experts required for completion of work is arranged, and roles, responsibilities and levels of authority confirmed
- 1.4** Work is planned in consultation with others impacted by the work and sequenced appropriately
- 1.5** Location of system components is verified according to design within the constraints of the building structure and regulations
- 1.6** Materials, components, tools, equipment and testing devices required are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7** Live testing, measurement and isolation requirements determined in accordance with WHS/OHS requirements and workplace procedures

2 Coordinate installation of micro-grid systems

- 2.1** Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2** Transport of equipment to the site is confirmed in accordance with workplace procedures
- 2.3** System components are installed by relevant personnel to comply with design, manufacturer specifications, industry standards and regulatory requirements

- 2.4 Installation/construction work of other parties is confirmed as compliant with industry standards, regulations and manufacturer specifications prior to commencing each stage of the project
 - 2.5 Quality checks of installed apparatus are conducted in accordance with workplace procedures
 - 2.6 System is programmed by relevant personnel in accordance manufacturer specifications and design
 - 2.7 Testing and commissioning of the system is conducted in accordance with design documentation, regulations, relevant industry standards and manufacturer specifications
- 3 Coordinate fault finding and repair of micro-grid systems**
 - 3.1 Nature of reported fault/issue is verified
 - 3.2 Circuits/apparatus are confirmed as isolated in accordance with WHS/OHS requirements and workplace procedures
 - 3.3 Fault or faults are diagnosed, faulty equipment is identified, and the replacement products required are documented by relevant personnel
 - 3.4 System is made safe, faulty apparatus is dismantled, recorded and stored by relevant personnel in accordance with manufacturer guides and stakeholder instructions
 - 3.5 Repaired or replaced apparatus is assembled by relevant personnel in accordance with manufacturer guidelines, industry standards and regulation
 - 3.6 Testing and re-commissioning of the system is conducted in accordance with design documentation, regulations, relevant industry standards and manufacturer specifications
- 4 Complete and report work activities**
 - 4.1 Work area is cleaned and made safe
 - 4.2 'As-installed' system and associated equipment are documented, manuals produced, and system is handed over to required person/s as per legislation, regulations, industry standards and job requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installation, fault finding and repair of micro grid systems must include:

- verification of design
- confirming assembly of micro-grid components is compliant with regulation and manufacturer specification
- confirming commissioning of micro-grid system is in accordance with design documentation, regulations, relevant industry standards and manufacturer specifications.

Unit Mapping Information

This is a new unit.

Assessment Requirements for UEERE0058 Coordinate the installation, fault finding and repair of micro grid systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- coordinating installation, fault finding and repair of micro-grid systems including:
 - applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
 - verifying design and resolving any issues with designer
 - engaging and scheduling of contractors and other experts required for completion of work and confirming roles, responsibilities and levels of authority
 - planning work in consultation with others impacted by the work and sequenced appropriately
 - ensuring installed/repaired system components comply with design, manufacturer specifications, industry standards and regulatory requirements
 - conducting quality checks of installed apparatus
 - ensuring system is programmed in accordance manufacturer specifications and design
 - testing and commissioning the system in accordance with design, regulations, relevant industry standards and manufacturer specifications
 - completing necessary documentation, including handing over system operational documents to the customer.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- conducting and reporting the outcomes of site surveys for renewable energy systems
- design principles for grid-connected, off-grid and micro-grid systems
- processes, procedures and techniques for the installation of:
 - grid connected photovoltaic systems
 - grid connected energy storage systems

- power conversion equipment to the grid
- power conversion equipment to essential loads
- off-grid systems to an electrical installation
- micro-grid system components and operating systems
- system configurations including multiple energy sources including:
 - systems with d.c. loads only
 - systems with d.c. and a.c. loads
 - systems with a.c. loads
 - renewable energy only systems including PV, wind and micro-hydro
 - hybrid systems comprising one or more RE system with fuel generator
- electrical installation requirements including:
 - methods used in wiring and connecting in accordance with relevant Australian Standards and manufacturers requirements
 - considerations involved in choosing the cable routes
 - selection and locating the associated protection and isolating devices in accordance with relevant Australian standards and industry guidelines
 - wiring diagrams for RE systems showing the general circuit layout and protection between the various system components
- system control installation including:
 - control and monitoring equipment
 - associated cabling
 - control programming
- fault finding, repair and maintenance of grid-connected and off-grid systems
- micro-grid system fault finding including:
 - procedures for individual equipment
 - procedures for interconnected systems
- micro-grid system maintenance procedures including:
 - requirements for individual equipment
 - requirements for interconnected systems.
 - requirements including relevant industry standards, regulations and manufacturer requirements
- micro-grid system quality check procedures
- micro-grid system testing and commissioning procedures including:
 - safe testing of equipment
 - safe testing of system operation
- system documentation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0059 Design energy management controls for electrical installations in buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0010 Design energy management controls for electrical installations in buildings. Modifications include:

- Prerequisite changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements.

Application

This unit involves the skills and knowledge required to design energy management controls for electrical installations in new buildings/structures.

It includes designing and developing energy management control methods to reduce energy use in new buildings/structures, and documenting strategies to effectively reduce energy use in the completed installation.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing energy management controls for electrical installations in buildings.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEIC0013 Develop, enter and verify discrete control programs for programmable controllers

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify energy management techniques for electrical installations in buildings

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

1.2 Scope of the energy management electrical design is determined from specifications of building and its services, plant and machinery and in consultation with relevant person/s

1.3 People or organisations involved in the design and installation are identified and roles clarified

1.4 Industry regulations, legal obligations and job requirements are identified and applied to work in accordance with workplace procedures

2 Design energy management controls for electrical installations

2.1 Energy management controls' performance standards and compliance methods are applied to the design development

2.2 Inspection, tests and measurements are carried out in accordance with WHS/OHS requirements and workplace procedures

2.3 Energy use of building services, plant and machinery is obtained and applied to the energy management design control process

2.4 Energy evaluation tests are set up in accordance with inspection and test methods and workplace procedures

2.5 Strategies to reduce electrical system energy use without compromising occupancy standards are developed in accordance with energy management techniques and evaluation test results

2.6 Safety, functional and budgetary considerations are incorporated in design

2.7 Results of energy management design controls, recommended electrical installation strategies and their criterion for energy reduction are documented in

accordance with workplace procedures

- 2.8** Plans, wiring diagrams and specifications are completed and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing energy management controls for electrical installations in buildings must include at least the following:

- two different building types.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0010 Design energy management controls for electrical installations in buildings.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0059 Design energy management controls for electrical installations in buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0010 Design energy management controls for electrical installations in buildings. Modifications include:

- Prerequisite changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and includes:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- designing energy management controls for electrical installations in accordance with design brief, site, client, safety and functional requirements and budget limitations
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- functions of a building management system (BMS) including:
 - protocol and priority of systems
 - different types and suppliers of building management systems
 - autonomous functions
 - input/output (I/O)
 - general I/O
 - installation management items
 - energy management
 - risk management

- information processing
- objectives
- building running costs
- smoke control as per relevant industry standards
- BMS hardware including:
 - system architecture
 - communication devices
 - substations
 - personal computers
 - interfaces with other systems
- I/O functions including:
 - digital I/O
 - digital output with status feedback
 - analogue I/O
 - sensors
 - alarms
 - equipment data protocols
- energy management including:
 - night cycle
 - optimum stop/start
 - time and event programs
 - night purge
 - outside air percentage control
 - enthalpy control
 - power demand control
 - duty cycle
 - presence detection
 - lighting control
 - schemes to promote to incorporate renewables and energy storage optimisation
 - financial stability
 - maximise benefit/investment
- information processing functions including:
 - computer systems
 - central system management
 - programs
 - system configuration and security
 - operator - machine interface
 - data points
- risk and maintenance management including:

- system files
- fire and intruder control
- access control
- relevant manufacturer specifications
- technical expertise required to support design and where/when they are required
- relevant WHS/OHS requirements
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing energy management controls for electrical installations in buildings
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0060 Design grid-connected battery storage systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE5001 - Design battery storage systems for grid-connected photovoltaic systems. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to performance and knowledge evidence requirements and CVIG content developed
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design battery storage systems.

This unit applies to a person with a sound knowledge of the components and different system configurations of battery storage systems for grid-connected photovoltaic (PV) systems and suitable energy management strategies that can be applied to the site where a system can be installed.

A person competent in this unit will be able to design a system, which includes calculating and selecting the correct sized equipment, so the system output performance meets the client specific objectives, within the guidelines of relevant industry standards, regulations and manufacturer requirements.

The unit involves designing a system taking into consideration all necessary work health and safety requirements relevant for the selected system and documenting the design including all calculations, equipment specifications and layouts.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing grid-connected battery storage systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0054 Conduct site survey for grid-connected photovoltaic and battery storage systems

UEERE0061 Design grid-connected photovoltaic power supply systems

and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable and Sustainable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to design grid-connected battery storage systems

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

1.2 Potential grid-connected battery storage system options are determined from interpretation of site survey and available information

1.3 People or organisations involved in the design and installation are identified and roles clarified

1.4 Industry regulations, legal obligations and job requirements are identified and applied to work in accordance with workplace procedures

2 Develop a grid-connected battery storage system design

2.1 Grid-connected battery storage system, performance standards and compliance methods are applied to the design development

2.2 Safety, functional and budgetary considerations are incorporated in design

2.3 Grid-connected battery storage system design draft is checked for compliance with the design brief, industry

standards and regulations, job requirements and workplace procedures

- 2.4 Grid-connected power supply system design is documented and submitted in line with industry standards and regulations, job requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions can be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE5001 - Design battery storage systems for grid-connected photovoltaic systems

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0060 Design grid-connected battery storage systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE5001 - Design battery storage systems for grid-connected photovoltaic systems. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to performance and knowledge evidence requirements and CVIG content developed
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing grid-connected battery storage system design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- batteries including:
 - meaning of the terms that define aspects of batteries including:
 - battery
 - cell
 - primary and secondary cells

- charge and discharge rate
- depth of discharge (DOD)
- nominal voltage
- amp hour capacity
- state of charge (SOC)
- watt hour capacity
- usable capacity
- cycle life
- hazards associated with batteries and risk control measures
- major features of batteries suitable for grid-connected systems
- factors affecting the life of batteries
- common reasons for failure of batteries
- charging regimes suitable for batteries
- procedures for safe disposal and recycling of batteries
- battery storage energy demand including:
 - load profiles illustrating average demand and maximum demand, based on appliances required during grid outages or during periods of high tariffs
 - total energy demand including:
 - energy required during periods of high tariffs
 - length of time of typical or expected grid outage
- grid connected battery storage systems including:
 - applications for battery storage including:
 - electrical energy supply direct to loads during periods of high tariffs
 - electrical energy supply during grid outages
 - network / aggregator provider requirements
 - communications, monitoring and metering
 - objectives of grid-connected battery storage
 - purpose of each component in a battery storage system for grid-connected PV system
 - typical configurations of battery storage systems for grid-connected PV systems
- types and applications of charge controllers
- diagrams including:
 - single line diagrams of battery storage systems for grid-connected PV systems including modifications to switchboard to cater for specified loads
 - site diagrams to show the locations of equipment, fittings and cabling
- energy management strategies
- power conversion equipment including:
 - differences between multimode and grid-connected
 - output rating of multimode in relation to:
 - capacity for battery charging
 - required maximum demand

- program parameters for a multimode for the correct operation of the system
- blackout protection
- system design including:
 - determining the system components, performance and warranty
 - size and selection of the battery storage to meet the system performance requirements
 - selecting and sizing the balance of system components to meet relevant industry standards, regulations and manufacturer requirements
 - determining labelling to meet relevant industry standards, regulations and manufacturer requirements
 - maintenance requirements to meet relevant industry standards, regulations and manufacturer requirements
 - documentation requirements to meet relevant industry standards, regulations and manufacturer requirements
- Network / aggregator provider requirements
- WHS/OHS policy, workplace procedures and instructions.

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations, current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations, current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- relevant industry standards
- relevant industry product standards
- AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules)
- applicable documentation including:
 - energy assessment forms
 - examples of typical client objectives and site specific details
 - manufacturer data sheets, installation manuals and user guides
 - circuit diagrams
- relevant industry standards and regulations
- solar resource data and electricity tariffs.

Assessment must include the design of battery storage systems for grid-connected PV systems

that meet the specific requirements of the client within the guidelines of relevant Australian Standards, including designs for new and retrofit installations.

UEERE0061 Design grid-connected photovoltaic power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0011 Design grid-connected photovoltaic power supply systems. Modifications include:

- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design grid-connected photovoltaic (PV) power supply systems.

It includes designing grid-connected PV power supply system, following design briefs, utilising data/information from site survey to determine design requirements, ensuring safety and performance standards and functional requirements are met, documenting and obtaining approval for design.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing grid-connected photovoltaic power supply systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0054 Conduct site survey for grid-connected photovoltaic and battery storage systems and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design a grid-connected PV power supply system

2 Develop a grid-connected PV power supply system design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

1.2 Potential grid-connected supply system options are determined from interpretation of site survey and available information

1.3 People or organisations involved in the design and installation are identified and roles clarified

1.4 Industry regulations, legal obligations and job requirements are identified and applied to work in accordance with workplace procedures

2.1 Grid-connected power supply systems, performance standards and compliance methods are applied to the design development

2.2 Safety, functional and budgetary considerations are incorporated in design

2.3 Grid-connected power supply system design draft is checked for compliance with the design brief, industry standards and regulations, job requirements and workplace procedures

2.4 Grid-connected power supply system design is documented and submitted in line with industry standards and regulations, job requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Must provide two PV power systems designs that include:

- different design briefs for different sites
- compliance with industry standards and regulatory requirements.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0011 Design grid-connected photovoltaic power supply systems.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0061 Design grid-connected photovoltaic power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0011 Design grid-connected photovoltaic power supply systems. Modifications include:

- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing grid-connected photovoltaic (PV) power supply system design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- solar resource including:
 - peak sun hours, irradiance, irradiation, latitude, azimuth and altitude angles, tilt angle
 - interpretation of solar irradiation data
 - how irradiation varies throughout the year on the surface of a fixed collector
 - factors affecting the optimal tilt and orientation of PV arrays
 - effect on solar resource of tracking
- PV modules, including:
 - cell, module, array

- types, efficiencies and their typical applications
- mechanical and electrical features necessary for the long life of a PV module
- module characteristics including:
 - I-V curve, operating point, MPP, power and voltage temperature co-efficient, Standard Test Conditions (STC), nominal operating cell temperature (NOCT)
 - major ratings of a PV module from manufacturer's information or nameplate data
 - configuration of a typical PV array
 - the effect of partial shading of a PV module or array
- relevant industry standard requirements for installation of grid-connected PCE
- verification of site survey data and application in design
- PV arrays selection including:
 - selection and sizing of PV array for a grid-connected power conversion equipment (PCE), based on energy demand, budget constraints, architectural constraints or limitations on available PCE sizes
 - determining the minimum and maximum number of PV modules in a string for the specified voltage
- system components selection including:
 - balance of the system components, including cabling and wiring systems, circuit protection and isolation equipment for a grid-connected PV system
 - schematic diagrams of common grid-connected PCE circuit configurations, including metering arrangements, isolation and connection with respect to residual circuit devices (RCDs)
- other design considerations including:
 - energy yield, specific energy yield
 - calculation of incentives
 - regulatory and legal obligations
- PCEs including:
 - types of PCEs used in grid connected systems
 - the basic function of PCEs
 - PCE operation
 - PCE characteristics
- PV grid-connected system operation including operation of grid interactive safety requirements
- grid-connected PCE selection including:
 - operating window of the PCE for the expected minimum and maximum effective cell temperatures
 - selection of an PCE rating with respect to the output power of the array/s
- major installation requirements for all system components which will ensure correct operation, long life, safety and ease of maintenance consistent with industry standards and relevant WHS/OHS guidelines
- selection of a suitable location for the PV array, PCE and other components, at a given installation site

- typical installation configurations for grid connection of PV systems via power conversion equipment
- installation requirements for a grid connected system
- labelling and signage requirements
- relevant manufacturer specifications
- relevant risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0062 Design micro-hydro systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0029 Design micro-hydro systems rated to 6.4 kW. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design micro-hydro systems and their installation.

It includes determining and developing micro-hydro system design, following design briefs, documenting design calculations and criteria, and obtaining design approval for micro-hydro system.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing micro-hydro systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design micro-hydro system

2 Develop micro-hydro system design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Scope of the micro-hydro system electrical installation is determined from design brief
- 1.3 Safety and regulatory requirements to which the electrical installation must comply are identified, obtained and applied
- 1.4 Design development work is planned to meet scheduled timelines in consultation with other person/s involved in the micro-hydro system installation or associated work
- 2.1 Micro-hydro system performance standards and compliance methods are applied to the design
- 2.2 Safety, functionality and budgetary considerations are incorporated in the micro-hydro system design
- 2.3 Power and energy management requirements are incorporated in design
- 2.4 Design aspects are verified by qualified person/s
- 2.5 Micro-hydro system design is drafted and checked for compliance with the design brief and regulatory requirements
- 2.6 Micro-hydro system design is documented for submission to relevant person/s for acceptance and

approval

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing micro-hydro systems must include: • two different micro-hydro systems.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0029 Design micro-hydro systems rated to 6.4 kW.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0062 Design micro-hydro systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0029 Design micro-hydro systems rated to 6.4 kW. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing micro-hydro systems design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- micro-hydro system components and configuration including:
 - structural differences between the various types of turbines and Pumps as Turbines (PATs)
 - system configuration for each turbine type identifying all major components
 - for impulse and cross-flow turbine types, the comparison of bucket and blade shapes, nozzle shapes and types, types of hydraulic and electrical controllers/governors, speed increasers and over speed clutches and their basic operation and appropriate application

- operational parameters and efficiency of different turbines
- circumstances under which battery storage would be used
- respective merits and suitability of various turbine types for various micro-hydroelectric applications
- advantages and disadvantages of water energy storage systems with other energy storage systems, such as battery banks
- relevant Australian micro-hydro systems standards and guidelines
- micro-hydro systems drawings including:
 - schematic and wiring diagrams for the micro-hydro system showing the general circuit layout and protection between the micro-hydro system, batteries, inverter and loads
- site survey including:
 - definition of the terms: potential and kinetic energy, micro-hydro system, gross head, net head and flow rate
 - available head at a site using common industry methods
 - the accuracy, advantages and disadvantages of different method for flow and head assessment
 - the flow rate of a given site using common industry methods
 - effects of seasonal variation using long-term weather data
 - effect of the energy demand profiles both daily and seasonally at the site on the system sizing
 - government regulatory requirements such as those covered under environmental or water resource legislation
 - environmental constraints at a site, including minimum stream flow rates, ecological impacts, visual and noise impacts
- system design including:
 - suitable micro-hydro system characteristics to suit site load, hydraulic head and stream flow rate characteristics and a suitable type of commercially available micro-hydro system to suit
 - frictional losses in delivery pipes using manufacturer's data
 - calculation of the energy output of the selected micro-hydro system at the site from water flow rate, head and manufacturer's data, allowing for seasonal variations in performance and environmental constraints
 - design of any required weirs or dams, open races or penstocks, strainer and intake systems
 - suitable balance of system components, including delivery pipe and fittings, transmission cable and voltage, voltage and frequency regulation, battery storage type and capacity, battery charger, inverter, back-up generator and load dump
 - likely environmental impacts of the micro-hydro system and appropriate measures to minimise these impacts
- system costing including:
 - major costs, including external costs, to be considered in the life cycle costing method
 - calculation of the capital and life cycle cost that includes the cost of various system configurations for a micro-hydro application

- micro-hydro systems installation and maintenance processes including:
 - appropriate installation, commissioning, fault diagnosis and rectification procedures and maintenance methods using appropriate safety procedures
 - maintenance schedule for the system
 - safety procedures for the installation, commissioning, fault diagnosis and maintenance of system components, seasonal variations in performance and environmental constraints
- WHS/OHS policy, workplace procedures and instructions
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- resources that reflect current industry practices in relation to designing micro-hydro systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0063 Design off-grid photovoltaic/generating set systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0031 Design stand-alone renewable energy (RE) systems. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design off-grid photovoltaic (PV) / generating set (Genset) systems.

It includes determining and developing off-grid PV systems design including gensets, following design briefs, documenting design calculations and criteria, and obtaining design approval.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing off-grid photovoltaic/generating set systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to design off-grid PV/genset system

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

1.2 Scope of the off-grid PV/genset system and electrical installation is determined from site survey report and design brief

1.3 Safety and regulatory requirements to which the electrical installation must comply are identified, obtained and applied

1.4 Design development work is planned to meet scheduled timelines in consultation with other person/s involved in the off-grid system installation or associated work

2 Develop off-grid PV/genset system design

2.1 Off-grid PV/genset system performance standards and compliance methods are applied to the design

2.2 Safety, functionality and budgetary considerations are incorporated in the off-grid PV/genset system design

2.3 Power and energy management requirements are incorporated in design

2.4 Design aspects are verified by qualified person/s

2.5 Off-grid PV/genset system design is drafted and checked for compliance with the design brief and regulatory requirements

2.6 Off-grid PV/genset system design is documented and submitted in line with industry standards and regulations, job requirements and workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing of-grid PV systems must include:

- two different off-grid PV/genset systems

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0031 Design stand-alone renewable energy (RE) systems.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0063 Design off-grid photovoltaic/generating set systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0031 Design stand-alone renewable energy (RE) systems. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing off-grid PV/genset systems design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- off-grid PV/genset system design, including:
 - power and energy usage analysis and projected use including maximum demand and surge demand
 - determining the available solar resource
 - incorporating fuel generating plant
 - selecting off grid PV system configuration
 - determining the system operation

- component selection including:
 - selected system configuration and operation requirements
 - matching component rating to required and projected power/energy usage
 - matching power, voltage and current of the individual system components
 - intended installation environment
 - maintenance and serviceability requirements
- selecting cabling, circuit protection and switching requirements in accordance to relevant Australian standard
- off grid PV system installation requirement in accordance with relevant Australian standards and manufacturers requirements
- schematic and wiring diagrams for the off grid PV/genset system showing the general circuit layout and protection between the various system components
- installed capital and life cycle costs of selected system configuration
- energy storage design
- system control requirements and configuration
- fuel storage requirements
- autonomy factors
- solar resource including:
 - peak sun hours, irradiance, irradiation, latitude, azimuth and altitude angles, tilt angle
 - interpretation of solar irradiation data
 - how irradiation varies throughout the year on the surface of a fixed collector
 - effect on solar resource of tracking
- PV modules, including:
 - cell, module, array
 - types, efficiencies and their typical applications
 - mechanical and electrical features necessary for the long life of a PV module
- module characteristics including:
 - I-V curve, operating point, maximum power point (MPP), power and voltage temperature co-efficient, Standard Test Conditions (STC), nominal operating cell temperature (NOCT)
 - major ratings of a PV module from manufacturer's information or nameplate data
 - configuration of a typical PV array
 - the effect of partial shading of a PV module or array
 - effect of temperature on module power output
 - function of blocking and bypass diodes
 - factors affecting the optimal tilt and orientation of PV arrays
- power conversion equipment (PCE) including:
 - types of PCEs used in renewable energy systems
 - the basic function of a PCE
 - PCE operation

- PCE characteristics
- generating sets including:
 - types of generating sets
 - the basic function of a generating set
 - generating set operation
 - generating set characteristics
- batteries including:
 - meaning of the terms that define aspects of batteries including:
 - cell
 - battery
 - nominal voltage
 - amp hour capacity
 - watt hour capacity
 - charge and discharge rate
 - fault/short-circuit current
 - useable capacity
 - depth of discharge (DOD)
 - state of charge (SOC)
 - cycle life
 - hazards associated with batteries and risk control measures
 - major features of batteries suitable for off-grid systems
 - factors affecting the life of batteries
 - common reasons for failure of batteries
 - charging regimes suitable for batteries
 - procedures for safe disposal and recycling of batteries
- environmental considerations and required approvals
- relevant WHS/OHS requirements, job safety assessments or risk mitigation processes
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy

requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, design tasks and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to designing stand-alone RE systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0064 Design renewable energy heating systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0030 Design renewable energy (RE) heating systems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design a renewable energy (RE) heating system and its installation.

It includes determining and developing RE heating systems design, following design brief, documenting design calculations and criteria and obtaining approval for system design.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing RE heating systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems
and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design RE heating system

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied

1.2 Scope of the RE heating system electrical installation is determined from design brief

1.3 Safety and regulatory requirements to which the electrical installation must comply are identified, obtained and applied

1.4 Design development work is planned to meet scheduled timelines in consultation with other person/s involved in the RE heating system installation or associated work

2 Develop heating system design

2.1 RE heating system performance standards and compliance methods are applied to the design

2.2 Safety, functionality and budgetary considerations are incorporated in the RE heating system design

2.3 Power and energy management requirements are incorporated in design

2.4 Design aspects are verified by qualified person/s

2.5 RE heating system design is drafted and checked for compliance with the design brief and regulatory requirements

2.6 RE heating system design is documented for submission to relevant person/s for acceptance and approval

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of

competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing RE heating systems must include:

- two different RE heating systems.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0030 Design renewable energy (RE) heating systems.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0064 Design renewable energy heating systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0030 Design renewable energy (RE) heating systems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing Renewable Energy (RE) system design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- heating system technologies including:
 - types and their application
 - operating parameters of common systems
 - system component parameters and specifications
 - system performance and requirements
 - installation specifications and requirements including commissioning
- design of RE heating, including:
 - heat transfer including:

- modes of heat transfer
- conduction through a flat plate, series flat plates, thick and thin wall pipe, and composite pipes (e.g. lagged pipes and drums)
- convection at a flat surface or tube
- radiation from a flat surface or tube for black or grey bodies
- combined conduction and convection through single or multiple flat plates or thin wall tubes
- combined convection and radiation
- combined conduction, convection and radiation such as fluid in a tank (convection to wall), through wall and/or insulation (conduction) to outside air (convection and radiation)
- heat exchangers - parallel, counter flow and cross flow
- combustion and fuels including:
 - the combustion process
 - fuels - desirable and undesirable characteristics, solid, liquid and gaseous types, their relative advantages and disadvantages and common methods of combustion
- steam including:
 - importance of steam for heat transfer and power production
 - steam/water properties and the interrelationship between the various properties for unsaturated or saturated water or steam either superheated, saturated or wet
 - saturation temperature and pressure, specific enthalpy, specific volume and dryness fraction
- refrigeration/heat pump including:
 - basic principles and terminology
 - vapour compression cycle
 - performance criteria
 - types of refrigerant - designation, properties advantages and disadvantages
- daily irradiation including:
 - definition of the terms: declination angle, reflectance, sunshine hours and extra-terrestrial irradiation
 - solar radiation data tables and contour maps
- energy balance including:
 - definitions of the terms: transmittance, absorptance, emittance, specific heat, absorber, heat removal factor and stagnation temperature
 - ways to reduce heat losses from a collector
- solar collector including:
 - five major factors that affect the selection of materials for solar collectors
 - features of collectors for low, medium and high temperature applications in terms of heat transfer, optical properties and materials of construction
- solar collector performance including:
 - instantaneous efficiency of a solar collector for different inlet temperatures and flow

rates

- effect of varying inlet temperature and flow rate on the performance of a solar collector
- hydraulic circuits including:
 - definition of the terms: equivalent length, static head, dynamic head and heat exchanger
 - function of the components in the circuit
 - effects of water quality on the life and performance of components in the hydraulic circuit
 - suitable type and size components to minimise hydraulic and energy losses, including pipes, pumps, heat exchangers, expansion tanks, valves and filters for a hydraulic circuit with a given flow rate and head
 - safety requirements of the hydraulic circuit in terms of temperature, pressure and hydrogen gas release
 - requirements to balance flow through parallel/series combinations of collector arrays
 - suitable types and level of insulation for system components to minimise heat losses
- domestic solar water heaters including:
 - definition of the terms: thermosiphon system, pumped storage system and sacrificial anode
 - function of the components in a domestic solar water heater, including the collector, storage tank, valves, piping, differential controllers, pumps, insulation and support frames
 - schematic diagram of different types of system configurations showing collectors, storage tank, piping, pumps, filters, valves, heat exchangers and expansion tanks
 - factors which affect system performance, including storage tank and collector design, system location and collector orientation, water quality, hot water demand and usage pattern
 - safety requirements that prevent injury from high temperature water and hydrogen gas explosions during installation, maintenance and use of solar water heaters
 - demand for hot water and irradiation for a given location and collector tilt angle, orientation and shading
 - selection a suitably sized system for a given demand and location
 - consequences of under/oversizing of solar water heating systems in terms of the effect on system performance,
 - installation, commissioning and maintenance requirements for a given situation including location and mounting of collectors, storage tanks, valves, pumps, pipes and ancillary fittings
 - the capital cost, simple pay back and life cycle cost of solar and electric or gas hot water heaters according to Industry Standards
- commercial solar hot water heaters including:
 - schematic diagrams for different types of system configurations showing collectors, storage tank, piping, pumps, filters, valves, heat exchangers and expansion tanks
 - steps involved in the design of a commercial solar water heating system

- assessment of the demand for hot water and irradiation for a given location and collector tilt angle, orientation and shading
- selection of a suitably sized system for a given demand and location
- consequences of under/oversizing of a solar water heating system in terms of system performance,
- installation, commissioning and maintenance requirements for a given situation, including location and mounting of collectors, storage tanks, valves, pumps, pipes and ancillary fittings
- the capital cost, simple payback time and life cycle cost of solar and electric or gas hot water heaters according to Industry Standards
- pool solar hot water heaters including:
 - function of the components of solar pool heating systems
 - typical system configuration
 - two factors which affect system performance
 - installation specifications and requirements
- WHS/OHS policy, workplace procedures and instructions
- relevant manufacturer specifications
- relevant Industry Standards.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- resources that reflect current industry practices in relation to designing RE heating systems.

UEERE0065 Design wind energy systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0032 Design wind energy conversion systems (WECS) rated to 10 kW. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Application

This unit involves the skills and knowledge required to design wind energy systems and their installation.

It includes determining and developing wind energy system design, following design briefs, documenting design calculations and criteria, and obtaining design approval for wind energy system.

The unit covers domestic and small commercial applications. It does not include utility scale wind generation.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for designing wind energy systems.

Licensing, legislative or certification requirements that apply to this unit may differ between jurisdictions and system types. They should be checked prior to commencing this unit.

Pre-requisite Unit

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to design wind energy system

2 Develop wind energy system design

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures for a given work area are identified, obtained and applied
- 1.2 Scope of the wind energy system is determined from design brief
- 1.3 Safety and regulatory requirements to which the electrical installation must comply are identified, obtained and applied
- 1.4 Design development work is planned to meet scheduled timelines in consultation with other person/s involved in the wind energy system installation or associated work
- 2.1 Wind energy system performance standards and compliance methods are applied to the design
- 2.2 Safety, functionality and budgetary considerations are incorporated in the wind energy system design
- 2.3 Power and energy management requirements are incorporated in design
- 2.4 Design aspects are verified by qualified person/s
- 2.5 Wind energy system design is drafted and checked for compliance with the design brief and regulatory requirements
- 2.6 Wind energy system design is documented for submission to relevant person/s for acceptance and

approval

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Designing wind energy system must include: • two different wind energy systems.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0032 Design wind energy conversion systems (WECS) rated to 10 kW.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0065 Design wind energy systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0032 Design wind energy conversion systems (WECS) rated to 10 kW. Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence
- Assessment conditions updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant workplace procedures and practices, work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- developing wind energy system design based on site survey data and within safety and functional requirements and budget limitations and meet design brief
- documenting and presenting final design.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- types, construction and operating features of small wind energy system including:
 - basic operation of lift and drag type wind energy system
 - characteristics of wind energy system in terms of power and torque, efficiency (power and output co-efficient), solidity and tip speed ratio
 - major categories and sub-categories of wind energy system
 - advantages and disadvantages of each type of wind energy system
 - suitable materials for the construction of wind energy system taking into consideration

- fatigue stresses and environmental conditions such as salt air, humidity and ice
- typical system configurations and components for off grid systems
- strategies and/or mechanisms to control mechanical stresses on the wind energy system in gale force winds and power output for battery charging
- appropriate types of wind energy system for a particular application
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- design of small wind energy system, including:
 - wind characteristics including:
 - definition of the terms: weather charts, isobars, fronts and troughs, cyclone and anti-cyclone, gradient wind, wind shear and wind rose
 - major global wind circulations and the formation of major wind flows over the continent
 - factors that effect the available useable wind due to height, topographical features, surface roughness, temperature inversion etc
 - typical diurnal, monthly and seasonal patterns of winds over the local area
 - the formation and likely effects of extreme winds and wind shear
 - wind speed data measurement and analysis including:
 - definition of the terms: porosity, internal boundary layer, speed-up factor, temperature inversion factor, wind speed frequency distribution, lull period and calms
 - site assessment and selection including:
 - the likely effects of local topography, surface roughness, isolated barriers and temperature inversions on a wind energy system at a given site
 - assessment of available local or regional wind speed, wind energy and direction data
 - selection of the most appropriate site-monitoring location taking into consideration factors such as topography, accessibility, surface roughness, shielding from isolated barriers (obstacles), turbulence, temperature inversions, power transmission distance, environmental and heritage impacts e.g. noise, visual, bird life, national parks or Indigenous sites
 - measurement of wind speed and direction data at an appropriate site and height(s) using a data logging anemometer over a sufficient period of time
 - analysis of the recorded wind speed and direction data to determine if the site is suitable for wind energy utilisation
 - selection of wind energy system including:
 - selection of suitable wind energy system specifications to suit site load and wind speed data according to relevant Australian Standards or industry guidelines, including cut-in, rated and furling wind speeds, blade diameter, rated power at an appropriate rated wind speed and materials of construction
 - suitable commercially available wind energy system that most closely fits the specifications above
 - suitable tower requirements at the site, including site access, soil type and foundations, structural certification and planning approvals

- calculation of the monthly and annual energy output of the selected wind energy system at the site from wind speed data and load data using appropriate computer software and in accordance with relevant Australian Standards or industry guidelines
- height of the tower and the size of the wind energy system for optimum use
- suitable system configurations
- balance of system components, including battery storage, inverter, regulator, transmission cable, back-up battery charger and generator
- equipment reliability and manufacturer/supplier back-up service, including availability of spare parts and service personnel
- capital and life cycle costs of selected system configuration
- environmental, cultural and social factors that impact on the implementation of a wind energy system such as external costs, noise levels, visual amenity and RFI
- relevant WHS/OHS requirements, risk assessment and mitigation processes
- relevant manufacturer specifications.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- resources that reflect current industry practices in relation to designing wind energy system

UEERE0066 Develop effective engineering strategies for energy reduction in buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0012 Develop effective engineering strategies for energy reduction in buildings. Modifications include:

- Prerequisite removed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed.

Application

This unit involves the skills and knowledge required to develop effective engineering strategies for energy reduction in buildings.

It includes developing and documenting engineering strategies/methods to effectively reduce energy use in buildings. It also includes documenting and reporting engineering strategies for energy reduction in buildings.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

Not applicable

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Identify engineering energy strategies for a building

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied
- 1.2 Scope of engineering evaluation is determined from specifications of building, services, plant and machinery and in consultation with relevant person/s
- 1.3 Advice is sought from work supervisor to ensure work is coordinated effectively with relevant person/s
- 1.4 Tools, testing devices and materials needed to carry out work are obtained and checked for correct operation and safety
- 1.5 Industry regulations, legal obligations and job requirements are identified and applied to work in accordance with workplace procedures

2 Develop engineering strategies for energy reduction in a building

- 2.1 Inspection, tests and measurements are carried out in accordance with WHS/OHS requirements and workplace procedures
- 2.2 Energy use of building, services, plant and machinery is obtained and applied to the engineering evaluation process
- 2.3 Energy evaluation tests are set up in accordance with inspection and test methods and workplace procedures
- 2.4 Engineering strategies to reduce energy use without compromising occupancy standards are developed in accordance with energy management techniques and evaluation test results
- 2.5 Engineering evaluation is carried out without damage to systems, circuits, the surrounding environment or services using sustainable energy practices
- 2.6 Worksite is cleaned and made safe in accordance with workplace procedures
- 2.7 Results of energy use evaluation and recommended engineering strategies and their criterion for energy reduction are documented in accordance with workplace procedures

- 2.8 Engineering energy reduction report is completed and forwarded to relevant person/s

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Developing engineering strategies for effective energy reduction must include at least the following:

- two different buildings.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0012 Develop effective engineering strategies for energy reduction in buildings.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0066 Develop effective engineering strategies for energy reduction in buildings

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0012 Develop effective engineering strategies for energy reduction in buildings. Modifications include:

- Prerequisite removed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Updates to performance and knowledge evidence requirements and CVIG content developed.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements
- determining the extent of the evaluation
- setting up and conducting appropriate examinations and tests
- reporting evaluation including recommendation for improving energy efficiency
- developing sustainable engineering strategies for energy reduction in buildings
- documenting and reporting engineering strategies for effective energy reduction in buildings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- climate and thermal comfort
- emerging technologies
- solar geometry and radiation
- heat transfer
- glazing systems
- insulation
- thermal mass
- comfort control strategies

- thermal performance of a building
- methods to predict dynamic performance
- use of simulation to predict performance
- energy rating schemes
- sustainable and safe building materials
- engineering principles
- relevant job safety assessments or risk mitigation processes
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- sustainable energy principles and practices.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry
- resources that reflect current industry practices in relation to developing strategies for effective energy reduction in buildings
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0067 Develop engineering solutions to renewable energy (RE) problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0033 Develop engineering solutions to renewable energy (RE) problems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence and CVIG content developed.

Application

This unit involves the skills and knowledge required to apply engineering principles to develop engineering solutions to renewable energy (RE) problems.

It includes determining and applying engineering solutions to RE systems and components and their operating parameters. It also includes applying problem-solving techniques, and testing and documenting alternative engineering solutions to RE problems.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for developing engineering solutions to renewable energy (RE) problems.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEECD0062 Write specifications for renewable energy engineering projects

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

UEERE0063 Design off-grid photovoltaic/generating set systems

and

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Determine RE problem and plan work

1.1 Nature and scope of the RE problem is determined from relevant documentation and consultation with relevant person/s

1.2 Relevant work health and safety (WHS)/occupational health and safety (OHS) processes and workplace procedures are identified

1.3 Established technical and practical engineering methods are identified for application to solution development

1.4 Technical and practical techniques, tools and resources appropriate for solution development are identified and planned

1.5 Personnel required to support solution development and implementation are identified, consulted and roles and responsibilities confirmed

1.6 Project plan including quality measures is developed and tested in consultation with relevant person/s

2 Develop engineering solutions for RE problem

2.1 WHS/OHS risk control measures and workplace procedures are followed for carrying out work

2.2 Information/data is gathered and analysed in accordance with project plan

2.3 RE systems, components, construction, operation characteristics and applications are analysed in accordance with project plan

- 2.4 Parameters, specifications and performance requirements in relation to RE work are determined in accordance with project plan
 - 2.5 Systematic synthesis and design processes are applied to development of engineering solution options to achieve project requirements
 - 2.6 Work is monitored in accordance with established quality measures, relevant industry standards and project plan
- 3 **Test, document and implement engineering principles**
 - 3.1 Engineering solution/s are tested to determine their effectiveness and modified, as required
 - 3.2 Engineering solutions are documented and instructions for implementation that incorporate risk control measures included
 - 3.3 Competent person/s to implement engineering solutions are identified and coordinated in accordance with regulatory requirements and workplace policies
 - 3.4 Justification for engineering solution/s used are documented and included in work/project records in accordance with relevant industry standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Must include developing at least two different solutions to solve the problem. The solutions must involve at least two of the following areas:

- energy efficiency
- demand management
- heat loss management
- electrical equipment options
- renewable energy
- non-electrical resource management.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0033 Develop engineering solutions to renewable energy (RE) problems.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0067 Develop engineering solutions to renewable energy (RE) problems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0033 Develop engineering solutions to renewable energy (RE) problems. Modifications include:

- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence and CVIG content developed.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- determining the nature and scope of renewable energy (RE) problem
- developing and implementing a project plan appropriate for the nature and scope of the RE problem
- identifying and applying technical and practical engineering methods, techniques, tools and resources to development of solution
- identifying and consulting personnel and stakeholders required to support solution development and implementation
- developing and testing effective engineering solution/s and modifying as/if required
- selecting, documenting and implementing engineering solution/s.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of (refer UEE Training Package Companion Volume Implementation Guide for more detail about each item):

- energy resources
- energy and humanity
- basic energy concepts
- monitoring, measurement and verification of data management and cyber security
- energy application technologies

- electrical application technologies
- energy transfer in closed and open systems
- AC v DC power generation/transmission
- Gases
- heat engines and their performance
- electrical power distribution systems operation
- protection and relaying
- distributed generation issues
- RE supply issues
- factors affecting the uptake of distributed generation
- asset management
- life-cycle management
- impact of climate change on electrical infrastructure
- benefits, issues and impacts of options and solutions to problems
- relevant manufacturer specifications
- jurisdictional Electrical Licencing requirements relevant to RE
- technical and non-technical jurisdictional requirements related to grid connection
- relevant workplace documentation, policies and procedures
- relevant WHS/OHS requirements including:
 - risk assessment and mitigation
 - legislated requirements
 - design and implementation of site-specific guidelines for access to apparatus
 - requirements for working with HV versus LV
 - safe systems of work
- engineering methods, tools and techniques relevant to solving RE problems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated suitable workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or simulations
- relevant and appropriate materials, tools, facilities and equipment currently used in industry

- resources that reflect current industry practices in relation to developing engineering solutions to RE problems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0068 Develop strategies to address sustainability issues for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0014 Develop strategies to address sustainability issues for electrical installations. Modifications include:

- Prerequisites changed
- Several unnecessary performance criteria and ones that duplicated others removed
- Performance and Knowledge Evidence updated.

Application

This unit involves the skills and knowledge required to develop strategies to address sustainability issues for electrical installation.

It includes identifying, developing and documenting strategies to address sustainability issues. It also includes developing strategies to address greenhouse gases and sustainability issues for residential, commercial and industrial electrical installations; gathering and analysing data and applying problem-solving techniques.

This unit is appropriate for Licenced Electricians or Electrical Engineers with responsibility for developing strategies to address sustainability issues for electrical installations.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

or

UEERE0051 Apply electrical principles to renewable energy design

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Identify sustainability issues for electrical installation

1.1 Work health and safety (WHS)/occupational health and safety (OHS) requirements and workplace procedures are identified and applied

1.2 Extent of sustainability issues are determined from performance specifications, situation reports and in consultation with relevant person/s

1.3 Work activities are planned to meet scheduled timelines in consultation with relevant person/s

1.4 Strategies are determined to ensure solution development and implementation is completed

2 Develop strategies to address electrical installation sustainability issues

2.1 Sustainability principles are applied to develop strategies to address greenhouse gas emissions

2.2 Parameters, specifications and performance requirements of sustainability issues are determined in accordance with workplace procedures

2.3 Solutions for sustainability issues are analysed and selected

2.4 Quality of work is monitored against workplace procedures

3 Document strategies for electrical installation sustainability issues

3.1 Solutions to sustainability issues are tested for effectiveness and modified, as required

3.2 Final solutions are documented, including instructions for implementation, and relevant person/s notified in accordance with workplace procedures

3.3 Person/s authorised and qualified to implement solutions to sustainability issues is consulted in accordance with workplace procedures

3.4 Solutions used to solve sustainability issues are justified and documented in accordance with workplace

procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0014 Develop strategies to address sustainability issues for electrical installations.

Links

Companion Volume Implementation Guides are found in VETNet -

Assessment Requirements for UEERE0068 Develop strategies to address sustainability issues for electrical installations

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0014 Develop strategies to address sustainability issues for electrical installations. Modifications include:

- Prerequisites changed
- Several unnecessary performance criteria and ones that duplicated others removed
- Performance and Knowledge Evidence updated.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including implementing risk control measures
- understanding the extent of the electrical installation energy problem/s
- forming effective strategies for solution development and implementation
- obtaining energy system/component parameters, specifications and performance requirements appropriate to each problem
- analysing and selecting solutions for sustainability issues
- testing solutions to energy problems
- identifying, developing and documenting strategies to address sustainability issues
- documenting instruction for implementation of solutions that incorporate risk control measure to be followed
- documenting justification of solutions implemented in accordance with professional standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical installation energy sustainability strategies, including:
 - energy management, legislation and regulation encompassing:
 - energy management
 - climate change
 - greenhouse effect/greenhouse gases

- standards and codes
- legislation and regulations
- energy audits
- electrical motors, pumps and fans encompassing:
 - motor construction, components and losses
 - motor efficiency (AS/NZS 1359.5 Rotating electrical machines - General requirements - Three-phase cage induction motors - High efficiency and minimum energy performance standards requirements)
- appliances encompassing:
 - energy star ratings
 - washing machines
 - clothes dryers
 - dishwashers
 - televisions and computers
 - standby management strategies
- energy efficient lighting encompassing:
 - lighting efficiency
 - efficient lighting design
 - ballasts
 - lighting controls
- water heating encompassing:
 - water heating systems and losses
 - electric, gas, oil, heat pump and solar water heater design
 - control strategies
- space heating and cooling encompassing:
 - space heating systems and losses
 - space cooling systems and losses
 - heating - electric, gas, oil, heat pump and solar heater design
 - cooling – direct expansion, chilled water and ventilation
 - control strategies
- solar energy encompassing:
 - system design fundamentals
 - solar photovoltaic (PV) design elements
 - solar PV system performance
 - analysis of system capital and operating cost performance
- quality assurance
- relevant job safety assessments or risk mitigation processes, including risk control measures
- relevant manufacturer specifications
- relevant WHS/OHS legislated requirements
- relevant workplace documentation, policies and procedures

- solution development and implementation techniques and strategies.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0069 Diagnose and rectify faults in renewable energy (RE) control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0034 Diagnose and rectify faults in renewable energy control systems. Modifications include:

- Licensing statement updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Performance Evidence amended to reflect changed elements and performance criteria.

Application

This unit involves the skills and knowledge required to diagnose and rectify faults in renewable energy (RE) control systems.

It includes preparing to work on RE control systems, diagnosing and rectifying faults in RE control systems, and completing and reporting fault-finding and repair activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEERE0054 Conduct site survey for grid-connected renewable energy systems

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to diagnose and rectify faults

- 1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and procedures for relevant work area are identified and applied in accordance with workplace procedures
- 1.2 The nature of the fault/issue is identified from stakeholders and relevant data and documentation
- 1.3 Requirements for working with other stakeholders are confirmed and applied
- 1.4 Required materials, tools, apparatus and testing devices are identified, accessed and checked for correct operation and safety
- 1.5 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures

2 Diagnose and rectify faults in RE control systems

- 2.1 Circuits/apparatus are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2 Nature of reported fault/issue is verified
- 2.3 System testing is conducted and documented
- 2.4 Fault/s are diagnosed, faulty equipment is identified, and the replacement products required are documented
- 2.5 System is made safe, faulty apparatus is dismantled, recorded and stored in accordance with manufacturer guides and stakeholder instructions
- 2.6 Repaired or replaced apparatus is assembled in accordance with manufacturer guidelines, industry standards and regulation

- 3 Complete and report fault-finding and repair activities**
- 3.1** Repaired apparatus is tested and commissioned in accordance with manufacturer guidelines, industry standards and regulation
 - 3.2** Work area is cleaned and made safe
 - 3.3** Repair is documented and stakeholders notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

RE system fault finding and repairing must include at least four of the following:

- open circuit
- short circuit
- incorrect connections
- insulation failure
- unsafe condition
- apparatus/component failure
- related mechanical failure.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0034 Diagnose and rectify faults in renewable energy control systems.

Links

Companion Volume Implementation Guides are found in VETNet - <https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=b8a8f136-5421-4ce1-92e0-2b50341431b6>

Assessment Requirements for UEERE0069 Diagnose and rectify faults in renewable energy (RE) control systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to UEERE0034 Diagnose and rectify faults in renewable energy control systems. Modifications include:

- Licensing statement updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Performance Evidence amended to reflect changed elements and performance criteria.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) procedures
- finding and repairing faults/issues in renewable energy (RE) control systems including:
 - verifying the reported faults/issues
 - diagnosing fault/issue based on measured and expected values
 - determining and implementing solution
 - documenting issue and justification for the solution used.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- renewable energy (RE) system electronics, including:
 - fault-finding techniques encompassing:
 - factors to consider in clarifying the nature of a fault:
 - initial fault report
 - confirmation of symptoms of the fault
 - comparison of symptoms with normal operation
 - effect to cause reasoning — assumptions of possible causes
 - methods for testing assumptions:

- visual inspection
- sectional testing
- split-half tests
- component isolation
- dealing with intermittent faults
- semiconductor components encompassing:
 - symbols for common semiconductor components, including rectifier diodes, light-emitting diodes (LEDs), zener diodes, bipolar transistors, darlington pairs, MOSFETs, IGBTs, SCRs and triacs
 - basic function of these devices above
 - major rating parameters of devices above
 - applications for each device
 - I-V curve characteristics of diodes and the current gain characteristic of bipolar transistors
- linear regulated direct current (d.c.) power supplies encompassing:
 - label circuit diagrams for half wave and full wave, single phase and three phase rectifiers
 - voltage and current waveforms for these rectifier circuits with and without capacitor filtering
 - peak output voltages from single phase and three phase rectifier circuits
 - block diagram showing the structure of a regulated d.c. power supply
 - main features of linear integrated circuit and voltage regulator integrated circuits
 - each of the major components and their physical location in a regulated power supply
- switching power control circuits encompassing:
 - power dissipation of a transistor when operated as a switch
 - how pulse width modulation (PWM) can provide a variable output voltage from a switch mode regulator
 - advantages and disadvantages of switch mode power circuits compared with linear power circuits
 - block diagram of a basic photovoltaic (PV) switching voltage regulator for battery charging
 - applications of switch mode circuits found in RE systems
 - how power control in alternating current (a.c.) circuits is achieved using SCRs and triacs
 - methods used to reduce radio frequency interference (RFI) in d.c. and a.c. circuits utilising high-speed switching
- digital electronic circuits encompassing:
 - characteristic features that distinguish analogue and digital devices and circuits
 - how numbers or text information can be represented using binary numbers and how these are represented in digital circuits
 - operation of voltage comparators, analogue to digital (A-D) converters, and digital to analogue (D-A) converters, and examples of each one's use in a RE application

- basic function of microcontrollers, volatile and non-volatile memory devices
- operation of a solar hot water (SHW) system pump differential controller as an example of the use of logic in digital circuits
- power conversion equipment encompassing:
 - basic function of inverters and d.c converters and their use in RE systems
 - the operation of an inverter bridge and half-bridge
 - output voltage waveforms for square wave, modified square wave and synthesised sine wave inverters showing typical voltages and timing
 - the function of PWM techniques in modified square wave and synthesised sine wave inverters
 - block diagrams showing the structure of common forms of d.c converters and inverters used in RE applications
- maintenance encompassing:
 - safety procedures for work on electronic systems, circuits and apparatus
 - hazards that may be encountered when performing tests on inverters, battery chargers or other equipment containing low voltage (LV) circuits
 - functionality of electronic equipment through appropriate client questioning and application of systematic tests and observation
 - various types of common faults and their causes in RE electronic equipment
 - typical test equipment used to repair electronic and electrical equipment
 - safe and correct use of tools and test equipment to locate electronic equipment faults under the direction of an electronics technician
 - replacement of circuit boards, observing appropriate handling precautions for static sensitive devices
 - replacement of socketed integrated circuits such as EPROMs or microprocessors using appropriate tools and methods
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant WHS/OHS legislated requirements
- relevant workplace documentation
- relevant workplace policies and procedures
- RE control systems.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do

so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to diagnosing faults in RE control systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0070 Fault find and repair grid-connected photovoltaic power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair grid-connected photovoltaic (PV) power supply systems.

It includes providing known solutions to predictable problems in photovoltaic modules arrays and energy storage systems.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace, where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Note: Those holding an Unrestricted Electrician's Licence or equivalent issued in an Australian state or territory meet the prerequisite requirement for UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories. Other prerequisites must still be completed.

Pre-requisite Unit

UEERE0054 Conduct site survey for grid-connected photovoltaic and battery storage systems

UEEEL0012 Install low voltage wiring, appliances, switchgear and associated accessories

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to fault find and repair grid-connected PV systems

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and procedures for relevant work area are identified and applied in accordance with workplace procedures

1.2 The nature of the fault/issue is identified from stakeholders and relevant data and documentation

1.3 Requirements for working with other stakeholders are confirmed and applied

1.4 Required materials, tools, apparatus and testing devices are identified, accessed and checked for correct operation and safety

1.5 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures

2 Fault find and repair grid-connected PV systems

2.1 Circuits/apparatus are isolated in accordance with WHS/OHS requirements and workplace procedures

2.2 Nature of reported fault/issue is verified

2.3 System testing is conducted and documented

2.4 Fault or faults are diagnosed, faulty equipment is identified, and the replacement products required are documented

2.5 System is made safe, faulty apparatus is dismantled, recorded and stored in accordance with manufacturer guides and stakeholder instructions

2.6 Repaired or replaced apparatus is assembled in accordance with manufacturer guidelines, industry standards and regulation

3 Complete and report repair work activities

3.1 Repaired apparatus is tested and commissioned in accordance with manufacturer guidelines, industry standards and regulation

3.2 Work area is cleaned and made safe

3.3 Repair is documented and stakeholders notified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Fault finding and repair grid-connected photovoltaic power supply systems must include at least three of the following:

- determining the operating parameters of an existing apparatus/modules
- identifying and locating electrical faults
- determining solar radiation faults and problems
- identifying and locating mechanical fault.

Unit Mapping Information

This is a new unit

Assessment Requirements for UEERE0070 Fault find and repair grid-connected photovoltaic power supply systems

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) procedures
- finding and repairing faults/issues in grid-connected photovoltaic power supply systems including:
 - verifying the reported faults/issues
 - diagnosing fault/issue based on measured and expected values
 - determining and implementing solution
 - documenting issue and justification for the solution used.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- grid-connected system fault finding:
 - procedures for individual equipment
 - procedures for interconnected systems
- grid-connected system maintenance procedures including:
 - requirements for individual equipment
 - requirements for interconnected systems.
 - requirements including relevant industry standards, regulations and manufacturer requirements
- grid-connected system testing and commissioning procedures including:
 - safe testing of equipment
 - safe testing of system operation
- daily irradiation

- PV modules
- module characteristics including:
 - definition of the terms: I-V curve, operating point, MPP, cell temperature co-efficient, voltage and power output co-efficient
 - family of current - voltage (I-V) curves for a PV module, labelling major points and showing the effects of variation in irradiance and variation in cell temperature
 - major ratings of a PV module from manufacturer's information or nameplate data
 - configuration of a typical PV array
 - the effect of partial shading of a PV module or array, the impact of bypass diodes and the significance of their configuration on output current in typical operating conditions
 - the scope and content of Australian or international standards relevant to the performance of PV modules
 - module level power electronics
- calculation of the daily energy output of a PV array in accordance with relevant industry standards, and by using "rule of thumb" de-rating factors
- relevant manufacturer specifications
- workplace documentation for reporting repair activities.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0071 Fault find and repair off-grid photovoltaic/generating set systems to an electrical installation

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to fault find and repair off-grid photovoltaic (PV)/generating set (genset) systems to an electrical installation.

It includes preparing to work on off grid systems, solving problems in off grid systems and completing work and documenting problem-solving activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations, which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1 Prepare to fault find and repair off-grid PV/genset systems

1.1 Work health and safety (WHS)/occupational health and safety (OHS) processes and procedures for relevant work area are identified and applied in accordance with workplace procedures

1.2 The nature of the fault/issue is identified from stakeholders and relevant data and documentation

1.3 Requirements for working with other stakeholders are confirmed and applied

1.4 Required materials, tools, apparatus and testing devices are identified, accessed and checked for correct operation and safety

1.5 Need to test or measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures

2 Fault find and repair off-grid PV/genset systems

2.1 Circuits/apparatus are isolated in accordance with WHS/OHS requirements and workplace procedures

2.2 Nature of reported fault/issue is verified

2.3 System testing is conducted and documented

2.4 Fault or faults are diagnosed, faulty equipment is identified, and the replacement products required are documented

2.5 System is made safe, faulty apparatus is dismantled, recorded and stored in accordance with manufacturer guides and stakeholder instructions

2.6 Repaired or replaced apparatus is assembled in accordance with manufacturer guidelines, industry standards and regulation

3 Complete and report repair work activities

Assessment Requirements for UEERE0071 Fault find and repair off-grid photovoltaic/generating set systems to an electrical installation

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions on at least two occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) procedures
- finding and repairing faults/issues in off-grid PV/genset systems including:
 - verifying the reported faults/issues
 - diagnosing fault/issue based on measured and expected values
 - determining and implementing solution
 - documenting issue and justification for the solution used.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements, performance criteria and range of conditions and include knowledge of:

- off-grid PV/genset systems maintenance processes including:
 - correct isolation and shutdown procedures prior to carrying out maintenance tasks
 - appropriate maintenance methods for the various system components using appropriate safety procedures
 - maintenance schedule for the system
 - problem-solving techniques, including measuring and calculating value requirements
- off-grid PV/genset systems fault finding:
 - procedures for individual equipment
 - procedures for interconnected systems
- off-grid PV/genset systems maintenance procedures including:
 - requirements for individual equipment
 - requirements for interconnected systems.
 - requirements including relevant industry standards, regulations and manufacturer

requirements

- off-grid PV/genset systems testing and commissioning procedures including:
 - safe testing of equipment
 - safe testing of system operation
- system configurations including multiple energy sources including:
 - systems with d.c. loads only
 - systems with d.c. and ac. loads
 - systems with a.c. loads
 - renewable energy only systems including PV, wind and micro-hydro
 - hybrid systems comprising one or more RE system with fuel generator
- electrical installation requirements including:
 - methods used in wiring and connecting the following in accordance with relevant Australian Standards and manufacturers requirements:
 - multiple PCEs and associated control equipment
 - PCEs with generating sets
 - PCEs and fuel generators directly with loads or with switchboards or distributions board
 - selection and locating the associated protection and isolating devices in accordance with relevant Australian standards and industry guidelines
 - wiring diagrams for the off-grid RE system showing the general circuit layout and protection between the various system components
- system control installation including:
 - control and monitoring equipment
 - associated cabling
 - control programming
- system testing and commissioning
- system documentation
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in suitable workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in suitable simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- resources that reflect current industry practices in relation to fault finding and repair of PV/genset systems
- applicable documentation, including workplace procedures, equipment specifications, regulations, codes of practice and operation manuals.

UEERE0072 Inspect grid connected renewable energy systems

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Application

This unit involves the skills and knowledge required to conduct compliance inspection of grid connected renewable energy systems.

It includes reviewing relevant industry/regulatory standards that must be complied with, preparing inspection checklists, conducting compliance inspection, and actioning and reporting on findings.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c.).

Competency development activities in this unit are subject to regulations directly related to licensing.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

PERFORMANCE CRITERIA

Elements describe the essential Performance criteria describe the performance needed to

outcomes.

demonstrate achievement of the element.

1 Prepare to conduct grid connected system compliance inspection

- 1.1 WHS/OHS processes and procedures for work are identified and applied in accordance with workplace procedures
- 1.2 Installation documentation and relevant industry/regulatory standards are reviewed and applied
- 1.3 Inspection checklists are prepared in accordance with relevant industry standards and regulatory requirements
- 1.4 Appropriate person/s is consulted to ensure the work is coordinated effectively with others
- 1.5 Tools, equipment and testing devices to verify compliance are obtained and checked for operation and safety in accordance with workplace procedures
- 1.6 Need to test and measure live electrical work is determined in accordance with WHS/OHS requirements and workplace procedures

2 Conduct compliance inspection of grid connected renewable energy system

- 2.1 Circuits/machines/plant are checked and isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.2 Inspection of the system is conducted against checklist in accordance with relevant industry standards and regulatory requirements
- 2.3 Electrical equipment compliance with relevant safety requirements and industry standards is obtained from appropriate person/s
- 2.4 Areas of compliance are verified, and non-compliance identified in accordance with relevant industry standards and regulatory requirements

3 Act and report on grid connected systems inspection findings

- 3.1 Inspection findings are documented in accordance with relevant industry standards and regulatory requirements
- 3.2 Actions for non-compliance within the scope of inspection responsibilities are determined in accordance with relevant industry standards and regulatory requirements

- 3.3** Inspection report is completed and issued to appropriate person/s in accordance with relevant industry standards and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Electrotechnology Training Package Companion Volume Implementation Guide.

- Inspection of grid connected renewable energy systems must include:
- at least one each of the following:
 - photovoltaic systems to power conversion equipment
 - photovoltaic power conversion equipment to grid
 - energy storage to power conversion equipment
 - energy storage equipment power conversion equipment to grid.

Assessment Requirements for UEERE0072 Inspect grid connected renewable energy systems

Modification History

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- obtaining required information and documentation in preparation for the inspection
- preparing grid connected system inspection checklists based on industry standards and regulatory requirements
- conducting detailed inspections and testing of grid connected systems
- verifying grid connected system compliance, and identifying non-compliance, with industry/regulatory standards
- acting within the inspection authority when dealing with non-compliance
- documenting and reporting inspection findings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG).

- inspections and safety compliance audits of grid connected renewable energy systems, including:
 - inspection types and their scope
 - scope of inspection responsibilities
 - inspection methods and procedures
 - inspection documentation
 - grid connected renewable energy systems including:
 - installation of photovoltaic systems to power conversion equipment
 - installation of battery storage equipment power conversion equipment to grid
 - installation of battery storage to power conversion equipment
 - installation of photovoltaic power conversion equipment to grid

- fault finding and repair of grid-connected photovoltaic power supply systems relevant industry standards
- relevant regulatory requirements
- relevant manufacturer specifications
- considerations when inspecting different types of installations
- processes for confirming that performance standards have been met
- actions and procedures for dealing with non-compliance defect
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS and legislated requirements
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Release 1. This is the first release of this unit of competency in the Electrotechnology Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two separate occasions and include:

- applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
- obtaining required information and documentation in preparation for the inspection
- preparing off-grid system inspection checklists based on industry standards and regulatory requirements
- conducting detailed inspections and testing of off-grid systems
- verifying off-grid system compliance, and identifying non-compliance, with industry/regulatory standards
- acting within the inspection authority when dealing with non-compliance
- documenting and reporting inspection findings.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of the following. Additional advice and definitions for some items is provided in the UEE Training Package Companion Volume Implementation Guide (CVIG):

- inspections and safety compliance audits of off-grid renewable energy systems, including:
 - inspection types and their scope
 - scope of inspection responsibilities
 - inspection methods and procedures
 - inspection documentation
- off-grid renewable energy systems including:
 - installation of photovoltaic systems to power conversion equipment
 - installation of battery storage to power conversion equipment
 - installation and maintenance of wind energy systems to power conversion equipment
 - installation and maintenance of micro hydro energy systems to power conversion equipment

- installation of off-grid power conversion equipment to electrical installation
- fault finding and repair off-grid photovoltaic/generating set systems to an electrical installation
- relevant industry standards
- relevant regulatory requirements
- relevant manufacturer specifications
- considerations when inspecting different types of installations
- processes for confirming that performance standards have been met
- actions and procedures for dealing with non-compliance defect
- relevant job safety assessments or risk mitigation processes
- relevant WHS/OHS and legislated requirements.
- relevant workplace documentation, policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment (PPE) currently used in industry
- applicable documentation, including workplace procedures, equipment specifications, industry standards, regulations, codes of practice and operation manuals.

UEERE0075 Install and maintain micro hydro energy systems to power conversion equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to:

- UEERE0037 Install, configure and commission LV micro-hydro systems rated up to 6.4 kW, and
- UEERE0039 Install, set up and maintain ELV micro-hydro systems rated up to 6.4 kW

Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence.

Application

This unit involves the skills and knowledge required to install and maintain micro-hydro energy systems to power conversion equipment.

It includes preparing, installing and maintaining micro-hydro systems as well as maintenance and reporting activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations, which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.

Additional and/or other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to work health and safety (WHS)/occupational health and safety (OHS) regulations.

Pre-requisite Unit

UEEEL0039 Design, install and verify compliance and functionality of general electrical installations

UEERE0055 Conduct site survey for off-grid photovoltaic/generating set systems

UEERE0078 Install battery storage to power conversion equipment

UEERE0079 Install off-grid power conversion equipment to electrical installation

Competency Field

Renewable Energy

Unit Sector

Electrotechnology

Elements and Performance Criteria

ELEMENTS

Elements describe the essential outcomes.

1 Prepare to work on micro-hydro systems

PERFORMANCE CRITERIA

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 WHS/OHS processes and procedures for relevant work area are identified and applied in accordance with workplace procedures
- 1.2 WHS/OHS hazards are identified, risks assessed, reported to relevant person/s and workplace procedures for risk control measures applied in preparation for work
- 1.3 Nature, scope and location of the work are determined from documentation or relevant person/s
- 1.4 Work is planned in consultation with the customer and others impacted by the work and sequenced appropriately
- 1.5 Engagement and scheduling of contractors and other experts required for completion of work are arranged, and roles, responsibilities and levels of authority confirmed
- 1.6 Materials, components, tools, equipment and testing devices required are obtained in accordance with workplace procedures and checked for correct operation and safety
- 1.7 Live testing, measurement and isolation requirements determined in accordance with WHS/OHS requirements and workplace procedures

2 Install micro-hydro systems

- 2.1** Nature of the installation is verified from design documentation and any design concerns identified referred to designer
- 2.2** Transport of equipment to the site is confirmed in accordance with workplace procedures
- 2.3** Installation/construction work of other parties is confirmed as compliant with industry standards, regulations and manufacturer specifications prior to commencing each stage of the project
- 2.4** Circuits/machines/plant are isolated in accordance with WHS/OHS requirements and workplace procedures
- 2.5** System is installed in compliance with industry standards, regulations and job/manufacturer specifications, and with sufficient access to enable terminations, adjustment and maintenance
- 2.6** Wiring is terminated at components and associated equipment in accordance with manufacturer specifications and functional and regulatory requirements
- 2.7** Quality checks of installed apparatus are conducted in accordance with workplace procedures
- 2.8** Testing and commissioning of the system is conducted in accordance with design documentation, regulations, relevant industry standards and manufacturer specifications
- 2.9** Worksite is cleaned and made safe in accordance with workplace procedures
- 2.10** 'As-installed' system and associated equipment are documented, manuals produced, and system is handed over to required person/s as per legislation, regulations, industry standards and job requirements

3 Maintain micro-hydro systems

- 3.1** Scope and nature of the maintenance is verified from relevant documentation and relevant person/s
- 3.2** Live testing, measurement and isolation requirements determined and applied in accordance with WHS/OHS requirements and workplace procedures
- 3.3** System is dismantled in accordance with manufacturer

guides and instructions from relevant person/s

- 3.4 Component parts are tagged during dismantling to ensure correct and efficient reassembly and stored to protect against loss or damage
- 3.5 System is reassembled in required sequence with all parts placed, secured and connected in accordance with manufacturer guides or industry practice
- 3.6 Repairs are completed in accordance with industry standards, regulations and manufacturer specification
- 3.7 Testing, commissioning and reinstatement of the system is conducted in accordance with design documentation, regulations, relevant industry standards and manufacturer specifications
- 3.8 Worksite is cleaned and made safe in accordance with workplace procedures
- 3.9 'As-installed' system and associated equipment are documented, manuals updated, and system is handed over to required person/s as per legislation, regulations, industry standards and job requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the UEE Electrotechnology Training Package Companion Volume Implementation Guide.

Installation and maintenance of micro hydro energy systems to power conversion equipment must include:

- verification of design
- confirming assembly of micro hydro mechanical parts is compliant with regulation and manufacturer specification
- electrically interconnecting the micro hydro system to PCE and associated equipment.

Unit Mapping Information

This unit replaces and is not equivalent to UEERE0037 Install, configure and commission LV micro-hydro systems rated up to 6.4 kW and UEERE0039 Install, set up and maintain ELV micro-hydro systems rated up to 6.4 kW

Assessment Requirements for UEERE0075 Install and maintain micro hydro energy systems to power conversion equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to:

- UEERE0037 Install, configure and commission LV micro-hydro systems rated up to 6.4 kW, and
- UEERE0039 Install, set up and maintain ELV micro-hydro systems rated up to 6.4 kW

Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least two occasions and include:

- installing and maintaining micro-hydro systems, including:
 - applying relevant work health and safety (WHS)/occupational health and safety (OHS) requirements, including using risk control measures
 - verifying design and resolving any issues with designer
 - coordinating work with relevant person/s
 - determining and applying live testing, measurement and isolation requirements
 - reading and interpreting drawings/diagrams related to apparatus locations and circuit connections
 - applying appropriate installation methods for micro-hydro system
 - testing and verification micro-hydro system safely
 - connecting and commissioning in accordance with industry standards and regulations
 - completing maintenance of micro hydro systems
 - completing documentation according to regulatory and industry standards.

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all of

the requirements of the elements and performance criteria and include knowledge of:

- micro-hydro systems installation and maintenance processes, including:
 - micro-hydro systems installation processes including:
 - selection of an appropriate micro-hydro system taking into account the topology of the site, local council approvals, environmental considerations, site access and transport of equipment, water and power transmission distances
 - appropriate methods and safety procedures for dam or weir construction, watercourse construction and/or penstock installation, and turbine installation
 - appropriate installation, testing, commissioning, fault diagnosis and rectification procedures using appropriate safety procedures
 - schematic and wiring diagrams for the micro-hydro system showing the general circuit layout and protection between the micro-hydro system and PCE in accordance with relevant Australian standards
 - safety procedures for the installation, commissioning, fault diagnosis of system components
 - micro-hydro systems maintenance processes encompassing:
 - appropriate maintenance methods using appropriate safety procedures
 - maintenance schedule for the system
 - safety procedures for the maintenance of system components
- relevant manufacturer specifications
- relevant safe work method statements (SWMS)/job safety assessments or risk mitigation processes
- relevant workplace documentation
- relevant workplace policies and procedures.

Assessment Conditions

Assessors must hold credentials specified within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must satisfy the Principles of Assessment and Rules of Evidence and all regulatory requirements included within the Standards for Registered Training Organisations current at the time of assessment.

Assessment must occur in workplace operational situations where it is appropriate to do so; where this is not appropriate, assessment must occur in simulated workplace operational situations that replicate workplace conditions.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- an operational micro-hydro unit used to:
 - demonstrate the installation of a micro-hydro system

- facilitate the electrical interconnection to the PCE
- demonstrate the maintenance of a micro-hydro system

UEERE0076 Install and maintain wind energy systems to power conversion equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEE Electrotechnology Training Package.

This unit replaces and is not equivalent to:

- UEERE0036 Install small wind energy conversion systems rated up to 10 kW for ELV stand-alone applications, and
- UEERE0038 Install, configure and commission LV wind energy conversion systems rated up to 10 kW

Modifications include:

- Unit title changed
- Unit application updated
- Prerequisites changed
- Significant amendments made to Elements and Performance Criteria
- Range of conditions updated
- Significant amendments to Performance and Knowledge Evidence.

Application

This unit involves the skills and knowledge required to install and maintain wind energy systems to power conversion equipment.

It includes preparing, installing and maintaining wind energy systems as well as maintenance and reporting activities.

The skills and knowledge described in this unit require a licence or permit to practice in the workplace where work is carried out on electrical installations, which are designed to operate at voltages greater than 50 volt (V) alternating current (a.c.) or 120 V direct current (d.c).

Competency development activities in this unit are subject to regulations directly related to licensing. Where a licence or permit to practice is not held, a relevant contract of training, such as an Australian Apprenticeship, is required.
